[(N, 2) array-like] The path vertices, as an array, masked array or sequence of pairs. Masked values, if any, will be converted to NaNs, which are then handled correctly by the Agg PathIterator and other consumers of path data, such as *iter_segments()*.

codes

[array-like or None, optional] N-length array of integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

_interpolation_steps

[int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

closed

[bool, optional] If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon. Note that the last vertex will then be ignored (as the corresponding code will be set to *CLOSEPOLY*).

readonly

[bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

CLOSEPOLY = np.uint8(79)

CURVE3 = np.uint8(3)

CURVE4 = np.uint8(4)

LINETO = np.uint8(2)

MOVETO = np.uint8(1)

NUM_VERTICES_FOR_CODE = {np.uint8(0): 1, np.uint8(1): 1, np.uint8(2): 1, np.uint8(3): 2, np.uint8(4): 3, np.uint8(79): 1}

A dictionary mapping Path codes to the number of vertices that the code expects.

STOP = np.uint8(0)

classmethod arc(*theta1*, *theta2*, *n=None*, *is_wedge=False*)

Return a *Path* for the unit circle arc from angles *theta1* to *theta2* (in degrees).

theta2 is unwrapped to produce the shortest arc within 360 degrees. That is, if *theta2* > *theta1* + 360, the arc will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

classmethod circle(*center=(0.0, 0.0)*, *radius=1.0*, *readonly=False*)

Return a `Path` representing a circle of a given radius and center.

Parameters

center

[(float, float), default: (0, 0)] The center of the circle.

radius

[float, default: 1] The radius of the circle.

readonly

[bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

Notes

The circle is approximated using 8 cubic Bézier curves, as described in

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

cleaned(*transform=None*, *remove_nans=False*, *clip=None*, ***, *simplify=False*, *curves=False*, *stroke_width=1.0*, *snap=False*, *sketch=None*)

Return a new `Path` with vertices and codes cleaned according to the parameters.

See also

Path.iter_segments

for details of the keyword arguments.

clip_to_bbox(*bbox*, *inside=True*)

Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If *inside* is `True`, clip to the inside of the box, otherwise to the outside of the box.

code_type

alias of `uint8`

property codes

The list of codes in the *Path* as a 1D array.

Each code is one of *STOP*, *MOVETO*, *LINETO*, *CURVE3*, *CURVE4* or *CLOSEPOLY*. For codes that correspond to more than one vertex (*CURVE3* and *CURVE4*), that code will be repeated so that the length of *vertices* and *codes* is always the same.

contains_path(*path*, *transform=None*)

Return whether this (closed) path completely contains the given path.

If *transform* is not None, the path will be transformed before checking for containment.

contains_point(*point*, *transform=None*, *radius=0.0*)

Return whether the area enclosed by the path contains the given point.

The path is always treated as closed; i.e. if the last code is not *CLOSEPOLY* an implicit segment connecting the last vertex to the first vertex is assumed.

Parameters

point

[(float, float)] The point (x, y) to check.

transform

[*Transform*, optional] If not None, *point* will be compared to self transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *point*.

radius

[float, default: 0] Additional margin on the path in coordinates of *point*. The path is extended tangentially by *radius/2*; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns

bool

Notes

The current algorithm has some limitations:

- The result is undefined for points exactly at the boundary (i.e. at the path shifted by *radius/2*).
- The result is undefined if there is no enclosed area, i.e. all vertices are on a straight line.
- If bounding lines start to cross each other due to *radius* shift, the result is not guaranteed to be correct.

contains_points(*points*, *transform=None*, *radius=0.0*)

Return whether the area enclosed by the path contains the given points.

The path is always treated as closed; i.e. if the last code is not *CLOSEPOLY* an implicit segment connecting the last vertex to the first vertex is assumed.

Parameters

points

[(N, 2) array] The points to check. Columns contain x and y values.

transform

[*Transform*, optional] If not `None`, *points* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *points*.

radius

[float, default: 0] Additional margin on the path in coordinates of *points*. The path is extended tangentially by *radius/2*; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns

length-N bool array

Notes

The current algorithm has some limitations:

- The result is undefined for points exactly at the boundary (i.e. at the path shifted by *radius/2*).
- The result is undefined if there is no enclosed area, i.e. all vertices are on a straight line.
- If bounding lines start to cross each other due to *radius* shift, the result is not guaranteed to be correct.

copy()

Return a shallow copy of the *Path*, which will share the vertices and codes with the source *Path*.

deepcopy(*memo=None*)

Return a deep copy of the *Path*. The *Path* will not be readonly, even if the source *Path* is.

Parameters

memo

[dict, optional] A dictionary to use for memoizing, passed to `copy.deepcopy`.

Returns

Path

A deep copy of the *Path*, but not readonly.

get_extents(*transform=None*, ***kwargs*)

Get Bbox of the path.

Parameters

transform

[*Transform*, optional] Transform to apply to path before computing extents, if any.

****kwargs**

Forwarded to *iter_bezier*.

Returns

matplotlib.transforms.Bbox

The extents of the path Bbox([[xmin, ymin], [xmax, ymax]])

static hatch(*hatchpattern*, *density=6*)

Given a hatch specifier, *hatchpattern*, generates a *Path* that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

interpolated(*steps*)

Return a new path with each segment divided into *steps* parts.

Codes other than *LINETO*, *MOVETO*, and *CLOSEPOLY* are not handled correctly.

Parameters

steps

[int] The number of segments in the new path for each in the original.

Returns

Path

The interpolated path.

intersects_bbox(*bbox*, *filled=True*)

Return whether this path intersects a given *Bbox*.

If *filled* is True, then this also returns True if the path completely encloses the *Bbox* (i.e., the path is treated as filled).

The bounding box is always considered filled.

intersects_path(*other*, *filled=True*)

Return whether if this path intersects another given path.

If *filled* is True, then this also returns True if one path completely encloses the other (i.e., the paths are treated as filled).

iter_bezier(***kwargs*)

Iterate over each Bézier curve (lines included) in a *Path*.

Parameters

****kwargs**

Forwarded to *iter_segments*.

Yields

B

[*BezierSegment*] The Bézier curves that make up the current path. Note in particular that freestanding points are Bézier curves of order 0, and lines are Bézier curves of order 1 (with two control points).

code

[*code_type*] The code describing what kind of curve is being returned. *MOVETO*, *LINETO*, *CURVE3*, and *CURVE4* correspond to Bézier curves with 1, 2, 3, and 4 control points (respectively). *CLOSEPOLY* is a *LINETO* with the control points correctly chosen based on the start/end points of the current stroke.

iter_segments(*transform=None*, *remove_nans=True*, *clip=None*, *snap=False*, *stroke_width=1.0*, *simplify=None*, *curves=True*, *sketch=None*)

Iterate over all curve segments in the path.

Each iteration returns a pair `(vertices, code)`, where `vertices` is a sequence of 1-3 coordinate pairs, and `code` is a *Path* code.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

Parameters

transform

[None or *Transform*] If not None, the given affine transformation will be applied to the path.

remove_nans

[bool, optional] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

clip

[None or (float, float, float, float), optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

snap

[None or bool, optional] If True, snap all nodes to pixels; if False, don't snap them. If None, snap if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.

stroke_width

[float, optional] The width of the stroke being drawn (used for path snapping).

simplify

[None or bool, optional] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the *should_simplify* attribute. See also *rcParams["path.simplify"]* (default: `True`) and *rcParams["path.simplify_threshold"]* (default: `0.111111111111`).

curves

[bool, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

sketch

[None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

classmethod make_compound_path(**args*)

Concatenate a list of *Path*s into a single *Path*, removing all *STOP*s.

classmethod make_compound_path_from_polys(*XY*)

Make a compound *Path* object to draw a number of polygons with equal numbers of sides.

Parameters

XY

[(numpolys, numsides, 2) array]

property readonly

`True` if the *Path* is read-only.

property should_simplify

`True` if the vertices array should be simplified.

property simplify_threshold

The fraction of a pixel difference below which vertices will be simplified out.

to_polygons(*transform=None*, *width=0*, *height=0*, *closed_only=True*)

Convert this path to a list of polygons or polylines. Each polygon/polyline is an (N, 2) array of vertices. In other words, each polygon has no *MOVETO* instructions or curves. This is useful for displaying in backends that do not support compound paths or Bézier curves.

If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of (0, 0), (width, height) will be clipped.

The resulting polygons will be simplified if the *Path.should_simplify* attribute of the path is `True`.

If *closed_only* is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed_only* is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

transformed(*transform*)

Return a transformed copy of the path.

See also

matplotlib.transforms.TransformedPath

A specialized path class that will cache the transformed result and automatically update when the transform changes.

classmethod unit_circle()

Return the readonly *Path* of the unit circle.

For most cases, *Path.circle()* will be what you want.

classmethod unit_circle_righthalf()

Return a *Path* of the right half of a unit circle.

See *Path.circle* for the reference on the approximation used.

classmethod unit_rectangle()

Return a *Path* instance of the unit rectangle from (0, 0) to (1, 1).

classmethod unit_regular_asterisk(*numVertices*)

Return a *Path* for a unit regular asterisk with the given numVertices and radius of 1.0, centered at (0, 0).

classmethod unit_regular_polygon(*numVertices*)

Return a *Path* instance for a unit regular polygon with the given *numVertices* such that the circumscribing circle has radius 1.0, centered at (0, 0).

classmethod unit_regular_star(*numVertices*, *innerCircle=0.5*)

Return a *Path* for a unit regular star with the given numVertices and radius of 1.0, centered at (0, 0).

property vertices

The vertices of the *Path* as an (N, 2) array.

classmethod wedge(*theta1*, *theta2*, *n=None*)

Return a *Path* for the unit circle wedge from angles *theta1* to *theta2* (in degrees).

theta2 is unwrapped to produce the shortest wedge within 360 degrees. That is, if *theta2* > *theta1* + 360, the wedge will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

See *Path.arc* for the reference on the approximation used.

matplotlib.path.**get_path_collection_extents**(*master_transform*, *paths*, *transforms*, *offsets*, *offset_transform*)

Get bounding box of a *PathCollection*s internal objects.

That is, given a sequence of *Path*s, *Transform*s objects, and offsets, as found in a *PathCollection*, return the bounding box that encapsulates all of them.

Parameters

master_transform

[*Transform*] Global transformation applied to all paths.

paths

[list of *Path*]

transforms

[list of *Affine2DBase*] If non-empty, this overrides *master_transform*.

offsets

[(N, 2) array-like]

offset_transform

[*Affine2DBase*] Transform applied to the offsets before offsetting the path.

Notes

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections: each is iterated over independently, so if you have 3 paths (A, B, C), 2 transforms (α, β) and 1 offset (O), their combinations are as follows:

- (A, α, O)
- (B, β, O)

- (C, α, O)

7.2.39 matplotlib.patheffects

Defines classes for path effects. The path effects are supported in *Text*, *Line2D* and *Patch*.

See also

Path effects guide

class matplotlib.patheffects.**AbstractPathEffect**(*offset=(0.0, 0.0)*)

Bases: object

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, measured in points.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace=None*)

Derived should override this method. The arguments are the same as *matplotlib.backend_bases.RendererBase.draw_path()* except the first argument is a renderer.

class matplotlib.patheffects.**Normal**(*offset=(0.0, 0.0)*)

Bases: *AbstractPathEffect*

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, measured in points.

class matplotlib.patheffects.**PathEffectRenderer**(*path_effects*, *renderer*)

Bases: *RendererBase*

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate *AbstractPathEffect* draw method.

> **Note**
>
> Not all methods have been overridden on this RendererBase subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

Parameters

path_effects

[iterable of *AbstractPathEffect*] The path effects which this renderer represents.

renderer

[*RendererBase* subclass]

close_group(*s*)

Close a grouping element with label *s*.

Only used by the SVG renderer.

copy_with_path_effect(*path_effects*)

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, **args*, ***kwargs*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[*color*, optional]

draw_path(*gc*, *tpath*, *affine*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, **args*, ***kwargs*)

Draw a collection of *paths*.

Each path is first transformed by the corresponding entry in *all_transforms* (a list of (3, 3) matrices) and then by *master_transform*. They are then translated by the corresponding entry in *offsets*, which has been first transformed by *offset_trans*.

facecolors, *edgecolors*, *linewidths*, *linestyles*, and *antialiased* are lists that set the corresponding properties.

offset_position is unused now, but the argument is kept for backwards compatibility.

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths` and `_iter_collection` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection* can be made globally.

open_group(*s*, *gid=None*)

Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

class matplotlib.patheffects.**PathPatchEffect**(*offset=(0, 0)*, ***kwargs*)

Bases: *AbstractPathEffect*

Draws a *PathPatch* instance whose Path comes from the original PathEffect artist.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, in points.

****kwargs**

All keyword arguments are passed through to the *PathPatch* constructor. The properties which cannot be overridden are "path", "clip_box" "transform" and "clip_path".

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Derived should override this method. The arguments are the same as *matplotlib.backend_bases.RendererBase.draw_path()* except the first argument is a renderer.

class matplotlib.patheffects.**SimpleLineShadow**(*offset=(2, -2)*, *shadow_color='k'*, *alpha=0.3*, *rho=0.3*, ***kwargs*)

Bases: *AbstractPathEffect*

A simple shadow via a line.

Parameters

offset

[(float, float), default: (2, -2)] The (x, y) offset to apply to the path, in points.

shadow_color

[*color*, default: 'black'] The shadow color. A value of `None` takes the original artist's color with a scale factor of *rho*.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow_color* is `None`.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.**SimplePatchShadow**(*offset=(2, -2)*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: *AbstractPathEffect*

A simple shadow via a filled patch.

Parameters

offset

[(float, float), default: (2, -2)] The (x, y) offset of the shadow in points.

shadow_rgbFace

[*color*] The shadow color.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow_rgbFace* is not specified.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.**Stroke**(*offset=(0, 0)*, ***kwargs*)

Bases: *AbstractPathEffect*

A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

class matplotlib.patheffects.**TickedStroke**(*offset=(0, 0)*, *spacing=10.0*, *angle=45.0*, *length=np.float64(1.4142135623730951)*, ***kwargs*)

Bases: *AbstractPathEffect*

A line-based PathEffect which draws a path with a ticked style.

This line style is frequently used to represent constraints in optimization. The ticks may be used to indicate that one side of the line is invalid or to represent a closed boundary of a domain (i.e. a wall or the edge of a pipe).

The spacing, length, and angle of ticks can be controlled.

This line style is sometimes referred to as a hatched line.

See also the *TickedStroke patheffect* example.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, in points.

spacing

[float, default: 10.0] The spacing between ticks in points.

angle

[float, default: 45.0] The angle between the path and the tick in degrees. The angle is measured as if you were an ant walking along the curve, with zero degrees pointing directly ahead, 90 to your left, -90 to your right, and 180 behind you. To change side of the ticks, change sign of the angle.

length

[float, default: 1.414] The length of the tick relative to spacing. Recommended length = 1.414 (sqrt(2)) when angle=45, length=1.0 when angle=90 and length=2.0 when angle=60.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

Examples

See *TickedStroke patheffect*.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

class matplotlib.patheffects.**withSimplePatchShadow**(*offset=(2, -2)*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: *SimplePatchShadow*

A shortcut PathEffect for applying *SimplePatchShadow* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([patheffects.withSimplePatchShadow()])
```

as a shortcut for

```
artist.set_path_effects([patheffects.SimplePatchShadow(),
                         patheffects.Normal()])
```

Parameters

offset

[(float, float), default: (2, -2)] The (x, y) offset of the shadow in points.

shadow_rgbFace

[*color*] The shadow color.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow_rgbFace* is not specified.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.**withStroke**(*offset=(0, 0)*, ***kwargs*)

Bases: *Stroke*

A shortcut PathEffect for applying *Stroke* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([patheffects.withStroke()])
```

as a shortcut for

```
artist.set_path_effects([patheffects.Stroke(),
                         patheffects.Normal()])
```

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

class matplotlib.patheffects.**withTickedStroke**(*offset=(0, 0)*, *spacing=10.0*, *angle=45.0*, *length=np.float64(1.4142135623730951)*, ***kwargs*)

Bases: *TickedStroke*

A shortcut PathEffect for applying *TickedStroke* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([patheffects.withTickedStroke()])
```

as a shortcut for

```
artist.set_path_effects([patheffects.TickedStroke(),
                         patheffects.Normal()])
```

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, in points.

spacing

[float, default: 10.0] The spacing between ticks in points.

angle

[float, default: 45.0] The angle between the path and the tick in degrees. The angle is measured as if you were an ant walking along the curve, with zero degrees pointing directly ahead, 90 to your left, -90 to your right, and 180 behind you. To change side of the ticks, change sign of the angle.

length

[float, default: 1.414] The length of the tick relative to spacing. Recommended length = 1.414 (sqrt(2)) when angle=45, length=1.0 when angle=90 and length=2.0 when angle=60.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

Examples

See *TickedStroke patheffect*.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

7.2.40 matplotlib.pyplot

matplotlib.pyplot is a state-based interface to matplotlib. It provides an implicit, MATLAB-like, way of plotting. It also opens figures on your screen, and acts as the figure GUI manager.

pyplot is mainly intended for interactive plots and simple cases of programmatic plot generation:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
plt.show()
```

The explicit object-oriented API is recommended for complex plots, though pyplot is still usually used to create the figure and often the Axes in the figure. See *pyplot.figure*, *pyplot.subplots*, and *pyplot.subplot_mosaic* to create figures, and *Axes API* for the plotting methods on an Axes:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
```

(continues on next page)

(continued from previous page)

```
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
plt.show()
```

See *Matplotlib Application Interfaces (APIs)* for an explanation of the tradeoffs between the implicit and explicit interfaces.

Managing Figure and Axes

axes	Add an Axes to the current figure and make it the current Axes.
cla	Clear the current Axes.
clf	Clear the current figure.
close	Close a figure window, and unregister it from pyplot.
delaxes	Remove an *Axes* (defaulting to the current Axes) from its figure.
fignum_exists	Return whether the figure with the given id exists.
figure	Create a new figure, or activate an existing figure.
gca	Get the current Axes.
gcf	Get the current figure.
get_figlabels	Return a list of existing figure labels.
get_fignums	Return a list of existing figure numbers.
sca	Set the current Axes to *ax* and the current Figure to the parent of *ax*.
subplot	Add an Axes to the current figure or retrieve an existing Axes.
subplot2grid	Create a subplot at a specific location inside a regular grid.
subplot_mosaic	Build a layout of Axes based on ASCII art or nested lists.
subplots	Create a figure and a set of subplots.
twinx	Make and return a second Axes that shares the *x*-axis.
twiny	Make and return a second Axes that shares the *y*-axis.

matplotlib.pyplot.axes

matplotlib.pyplot.**axes**(*arg=None*, ***kwargs*)

Add an Axes to the current figure and make it the current Axes.

Call signatures:

```
plt.axes()
plt.axes(rect, projection=None, polar=False, **kwargs)
plt.axes(ax)
```

Parameters

arg

[None or 4-tuple] The exact behavior of this function depends on the type:

- *None*: A new full window Axes is added using `subplot(**kwargs)`.
- 4-tuple of floats *rect* = `(left, bottom, width, height)`. A new Axes is added with dimensions *rect* in normalized (0, 1) units using *add_axes* on the current figure.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared Axes.

label

[str] A label for the returned Axes.

Returns

Axes*, or a subclass of *Axes

The returned Axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	Figure or SubFigure
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	[left, bottom, width, height] or Bbox
prop_cycle	Cycler
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	Transform
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown

Table 227 – continued fro

Property	Description
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5

Examples

```
# Creating a new full window Axes
plt.axes()

# Creating a new Axes with specified dimensions and a grey␣
 ↪background
plt.axes((left, bottom, width, height), facecolor='grey')
```

Examples using `matplotlib.pyplot.axes`

matplotlib.pyplot.cla

matplotlib.pyplot.**cla**()

Clear the current Axes.

matplotlib.pyplot.clf

matplotlib.pyplot.**clf**()

Clear the current figure.

matplotlib.pyplot.close

matplotlib.pyplot.**close**(*fig=None*)

Close a figure window, and unregister it from pyplot.

Parameters

fig

[None or int or str or *Figure*] The figure to close. There are a number of ways to specify this:

- *None*: the current figure
- *Figure*: the given *Figure* instance
- `int`: a figure number
- `str`: a figure name
- 'all': all figures

Notes

pyplot maintains a reference to figures created with *figure()*. When work on the figure is completed, it should be closed, i.e. deregistered from pyplot, to free its memory (see also :rc:figure.max_open_warning). Closing a figure window created by *show()* automatically deregisters the figure. For all other use cases, most prominently *savefig()* without *show()*, the figure must be deregistered explicitly using *close()*.

Examples using `matplotlib.pyplot.close`

matplotlib.pyplot.delaxes

matplotlib.pyplot.**delaxes**(*ax=None*)

Remove an *Axes* (defaulting to the current Axes) from its figure.

matplotlib.pyplot.fignum_exists

matplotlib.pyplot.**fignum_exists**(*num*)

Return whether the figure with the given id exists.

Parameters

num

[int or str] A figure identifier.

Returns

bool

Whether or not a figure with id *num* exists.

matplotlib.pyplot.figure

matplotlib.pyplot.**figure**(*num=None*, *figsize=None*, *dpi=None*, ***, *facecolor=None*, *edgecolor=None*, *frameon=True*, *FigureClass=<class 'matplotlib.figure.Figure'>*, *clear=False*, ***kwargs*)

Create a new figure, or activate an existing figure.

Parameters

num

[int or str or *Figure* or *SubFigure*, optional] A unique identifier for the figure.

If a figure with that identifier already exists, this figure is made active and returned. An integer refers to the `Figure.number` attribute, a string refers to the figure label.

If there is no figure with the identifier or *num* is not given, a new figure is created, made active and returned. If *num* is an int, it will be used for the `Figure.number` attribute, otherwise, an auto-generated integer value is used (starting at 1 and incremented for each new figure). If *num* is a string, the figure label and the window title is set to this value. If num is a `SubFigure`, its parent `Figure` is activated.

figsize

[(float, float), default: *rcParams["figure.figsize"]* (default: `[6.4, 4.8]`)] Width, height in inches.

dpi

[float, default: *rcParams["figure.dpi"]* (default: `100.0`)] The resolution of the figure in dots-per-inch.

facecolor

[*color*, default: *rcParams["figure.facecolor"]* (default: `'white'`)] The background color.

edgecolor

[*color*, default: *rcParams["figure.edgecolor"]* (default: `'white'`)] The border color.

frameon

[bool, default: True] If False, suppress drawing the figure frame.

FigureClass

[subclass of *Figure*] If set, an instance of this subclass will be created, rather than a plain *Figure*.

clear

[bool, default: False] If True and the figure already exists, then it is cleared.

layout

[{'constrained', 'compressed', 'tight', 'none', *LayoutEngine*, None}, default: None] The layout mechanism for positioning of plot elements to avoid overlapping Axes decorations (labels, ticks, etc). Note that layout managers can measurably slow down figure display.

- 'constrained': The constrained layout solver adjusts Axes sizes to avoid overlapping Axes decorations. Can handle complex plot layouts and colorbars, and is thus recommended.

  See *Constrained layout guide* for examples.

- 'compressed': uses the same algorithm as 'constrained', but removes extra space between fixed-aspect-ratio Axes. Best for simple grids of Axes.

- 'tight': Use the tight layout mechanism. This is a relatively simple algorithm that adjusts the subplot parameters so that decorations do not overlap. See *Figure.set_tight_layout* for further details.

- 'none': Do not use a layout engine.

- A *LayoutEngine* instance. Builtin layout classes are *ConstrainedLayoutEngine* and *TightLayoutEngine*, more easily accessible by 'constrained' and 'tight'. Passing an instance allows third parties to provide their own layout engine.

If not given, fall back to using the parameters *tight_layout* and *constrained_layout*, including their config defaults *rcParams["figure.autolayout"]* (default: `False`) and *rcParams["figure.constrained_layout.use"]* (default: `False`).

****kwargs**

Additional keyword arguments are passed to the *Figure* constructor.

Returns

Figure

Notes

A newly created figure is passed to the *new_manager* method or the *new_figure_manager* function provided by the current backend, which install a canvas and a manager on the figure.

Once this is done, *rcParams["figure.hooks"]* (default: `[]`) are called, one at a time, on the figure; these hooks allow arbitrary customization of the figure (e.g., attaching callbacks) or of associated elements (e.g., modifying the toolbar). See *mplcvd -- an example of figure hook* for an example of toolbar customization.

If you are creating many figures, make sure you explicitly call *pyplot.close* on the figures you are not using, because this will enable pyplot to properly clean up the memory.

rcParams defines the default values, which can be modified in the matplotlibrc file.

Examples using `matplotlib.pyplot.figure`

matplotlib.pyplot.gca

matplotlib.pyplot.**gca**()

Get the current Axes.

If there is currently no Axes on this Figure, a new one is created using *Figure.add_subplot*. (To test whether there is currently an Axes on a Figure, check whether `figure.axes` is empty. To test whether there is currently a Figure on the pyplot figure stack, check whether *pyplot.get_fignums()* is empty.)

Notes

> **Note**
>
> This is the *pyplot wrapper* for *Figure.gca*.

Examples using `matplotlib.pyplot.gca`

matplotlib.pyplot.gcf

matplotlib.pyplot.**gcf**()

Get the current figure.

If there is currently no figure on the pyplot figure stack, a new one is created using *figure()*. (To test whether there is currently a figure on the pyplot figure stack, check whether *get_fignums()* is empty.)

matplotlib.pyplot.get_figlabels

matplotlib.pyplot.**get_figlabels**()

Return a list of existing figure labels.

matplotlib.pyplot.get_fignums

matplotlib.pyplot.**get_fignums**()

Return a list of existing figure numbers.

matplotlib.pyplot.sca

matplotlib.pyplot.**sca**(*ax*)

Set the current Axes to *ax* and the current Figure to the parent of *ax*.

matplotlib.pyplot.subplot

matplotlib.pyplot.**subplot**(**args*, ***kwargs*)

Add an Axes to the current figure or retrieve an existing Axes.

This is a wrapper of *Figure.add_subplot* which provides additional behavior when working with the implicit API (see the notes section).

Call signatures:

```
subplot(nrows, ncols, index, **kwargs)
subplot(pos, **kwargs)
subplot(**kwargs)
subplot(ax)
```

Parameters

***args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared Axes.

label

[str] A label for the returned Axes.

Returns

Axes

The Axes of the subplot. The returned Axes can actually be an instance of a subclass, such as *projections.polar.PolarAxes* for polar projections.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or *fc*	*color*
figure	*Figure* or *SubFigure*
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*

Table 228 – continued fro

Property	Description
prop_cycle	Cycler
rasterization_zorder	float or None

Figure.add_subplot
pyplot.subplots
pyplot.axes
Figure.subplots

Notes

Changed in version 3.8: In versions prior to 3.8, any preexisting Axes that overlap with the new Axes beyond sharing a boundary was deleted. Deletion does not happen in more recent versions anymore. Use *Axes.remove* explicitly if needed.

If you do not want this behavior, use the *Figure.add_subplot* method or the *pyplot.axes* function instead.

If no *kwargs* are passed and there exists an Axes in the location specified by *args* then that Axes will be returned rather than a new Axes being created.

If *kwargs* are passed and there exists an Axes in the location specified by *args*, the projection type is the same, and the *kwargs* match with the existing Axes, then the existing Axes is returned. Otherwise a new Axes is created with the specified parameters. We save a reference to the *kwargs* which we use for this comparison. If any of the values in *kwargs* are mutable we will not detect the case where they are mutated. In these cases we suggest using `Figure.add_subplot` and the explicit Axes API rather than the implicit pyplot API.

Examples

```
plt.subplot(221)

# equivalent but more general
ax1 = plt.subplot(2, 2, 1)

# add a subplot with no frame
ax2 = plt.subplot(222, frameon=False)

# add a polar subplot
plt.subplot(223, projection='polar')

# add a red subplot that shares the x-axis with ax1
plt.subplot(224, sharex=ax1, facecolor='red')

# delete ax2 from the figure
plt.delaxes(ax2)

# add ax2 to the figure again
plt.subplot(ax2)

# make the first Axes "current" again
plt.subplot(221)
```

Examples using `matplotlib.pyplot.subplot`

matplotlib.pyplot.subplot2grid

matplotlib.pyplot.**subplot2grid**(*shape*, *loc*, *rowspan=1*, *colspan=1*, *fig=None*, ***kwargs*)

Create a subplot at a specific location inside a regular grid.

Parameters

shape

[(int, int)] Number of rows and of columns of the grid in which to place axis.

loc

[(int, int)] Row number and column number of the axis location within the grid.

rowspan

[int, default: 1] Number of rows for the axis to span downwards.

colspan

[int, default: 1] Number of columns for the axis to span to the right.

fig

[*Figure*, optional] Figure to place the subplot in. Defaults to the current figure.

****kwargs**

Additional keyword arguments are handed to *add_subplot*.

Returns

Axes

The Axes of the subplot. The returned Axes can actually be an instance of a subclass, such as *projections.polar.PolarAxes* for polar projections.

Notes

The following call

```
ax = subplot2grid((nrows, ncols), (row, col), rowspan, colspan)
```

is identical to

```
fig = gcf()
gs = fig.add_gridspec(nrows, ncols)
ax = fig.add_subplot(gs[row:row+rowspan, col:col+colspan])
```

Examples using `matplotlib.pyplot.subplot2grid`

matplotlib.pyplot.subplot_mosaic

matplotlib.pyplot.**subplot_mosaic**(*mosaic*, *, *sharex=False*, *sharey=False*, *width_ratios=None*, *height_ratios=None*, *empty_sentinel='.'*, *subplot_kw=None*, *gridspec_kw=None*, *per_subplot_kw=None*, ***fig_kw*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

See *Complex and semantic figure composition (subplot_mosaic)* for an example and full API documentation

Parameters

mosaic

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.',       'edge']]
```

produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it must be of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

sharex, sharey

[bool, default: False] If True, the x-axis (*sharex*) or y-axis (*sharey*) will be shared among all subplots. In that case, tick label visibility and axis units behave as for *subplots*. If False, each subplot's x- or y-axis will be independent.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width. Convenience for `gridspec_kw={'width_ratios': [...]}`.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height. Convenience for `gridspec_kw={'height_ratios': [...]}`.

empty_sentinel

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `'.'`. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

subplot_kw

[dict, optional] Dictionary with keywords passed to the *Figure.add_subplot* call used to create each subplot. These values may be overridden by values in *per_subplot_kw*.

per_subplot_kw

[dict, optional] A dictionary mapping the Axes identifiers or tuples of identifiers to a dictionary of keyword arguments to be passed to the *Figure.add_subplot* call used to create each subplot. The values in these dictionaries have precedence over the values in *subplot_kw*.

If *mosaic* is a string, and thus all keys are single characters, it is possible to use a single string instead of a tuple as keys; i.e. `"AB"` is equivalent to `("A", "B")`.

Added in version 3.7.

gridspec_kw

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

****fig_kw**

All additional keyword arguments are passed to the *pyplot.figure* call.

Returns

fig

[*Figure*] The new figure

dict[label, Axes]

A dictionary mapping the labels to the Axes objects. The order of the Axes is left-to-right and top-to-bottom of their position in the total layout.

Examples using `matplotlib.pyplot.subplot_mosaic`

matplotlib.pyplot.subplots

matplotlib.pyplot.**subplots**(*nrows=1*, *ncols=1*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *width_ratios=None*, *height_ratios=None*, *subplot_kw=None*, *gridspec_kw=None*, ***fig_kw*)

Create a figure and a set of subplots.

This utility wrapper makes it convenient to create common layouts of subplots, including the enclosing figure object, in a single call.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subplot grid.

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

When subplots have a shared axis that has units, calling *Axis.set_units* will update each axis with the new units.

Note that it is not possible to unshare axes.

squeeze

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of *Axes*:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width. Equivalent to `gridspec_kw={'width_ratios': [...]}`.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height. Convenience for `gridspec_kw={'height_ratios': [...]}`.

subplot_kw

[dict, optional] Dict with keywords passed to the *add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

****fig_kw**

All additional keyword arguments are passed to the *pyplot.figure* call.

Returns

fig

[*Figure*]

ax

[*Axes* or array of Axes] *ax* can be either a single *Axes* object, or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the squeeze keyword, see above.

Typical idioms for handling the return value are:

```
# using the variable ax for single a Axes
fig, ax = plt.subplots()

# using the variable axs for multiple Axes
fig, axs = plt.subplots(2, 2)

# using tuple unpacking for multiple Axes
fig, (ax1, ax2) = plt.subplots(1, 2)
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(2, 2)
```

The names `ax` and pluralized `axs` are preferred over `axes` because for the latter it's not clear if it refers to a single *Axes* instance or a collection of these.

pyplot.figure
pyplot.subplot
pyplot.axes
Figure.subplots
Figure.add_subplot

Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
```

(continues on next page)

(continued from previous page)

```
y = np.sin(x**2)

# Create just a figure and only one subplot
fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
f, (ax1, ax2) = plt.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
fig, axs = plt.subplots(2, 2, subplot_kw=dict(projection="polar"))
axs[0, 0].plot(x, y)
axs[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
plt.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
plt.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
plt.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
plt.subplots(2, 2, sharex=True, sharey=True)

# Create figure number 10 with a single subplot
# and clears it if it already exists.
fig, ax = plt.subplots(num=10, clear=True)
```

Examples using `matplotlib.pyplot.subplots`

matplotlib.pyplot.twinx

matplotlib.pyplot.**twinx**(*ax=None*)

Make and return a second Axes that shares the *x*-axis. The new Axes will overlay *ax* (or the current Axes if *ax* is *None*), and its ticks will be on the right.

Examples

Plots with different scales

Examples using `matplotlib.pyplot.twinx`

matplotlib.pyplot.twiny

matplotlib.pyplot.**twiny**(*ax=None*)

Make and return a second Axes that shares the *y*-axis. The new Axes will overlay *ax* (or the current Axes if *ax* is *None*), and its ticks will be on the top.

Examples

Plots with different scales

Examples using `matplotlib.pyplot.twiny`

Adding data to the plot

Basic

plot	Plot y versus x as lines and/or markers.
errorbar	Plot y versus x as lines and/or markers with attached errorbars.
scatter	A scatter plot of *y* vs.
plot_date	[*Deprecated*] Plot coercing the axis to treat floats as dates.
step	Make a step plot.
loglog	Make a plot with log scaling on both the x- and y-axis.
semilogx	Make a plot with log scaling on the x-axis.
semilogy	Make a plot with log scaling on the y-axis.
fill_between	Fill the area between two horizontal curves.
fill_betweenx	Fill the area between two vertical curves.
bar	Make a bar plot.
barh	Make a horizontal bar plot.
bar_label	Label a bar plot.
stem	Create a stem plot.
eventplot	Plot identical parallel lines at the given positions.
pie	Plot a pie chart.
stackplot	Draw a stacked area plot or a streamgraph.
broken_barh	Plot a horizontal sequence of rectangles.
vlines	Plot vertical lines at each *x* from *ymin* to *ymax*.
hlines	Plot horizontal lines at each *y* from *xmin* to *xmax*.
fill	Plot filled polygons.
polar	Make a polar plot.

continues on next page

Table 229 – continued from previous page

matplotlib.pyplot.plot

matplotlib.pyplot.**plot**(**args*, *scalex=True*, *scaley=True*, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by *x*, *y*.

The optional parameter *fmt* is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the *Notes* section below.

```
>>> plot(x, y)        # plot x and y using default line style and␣
 ↪color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)           # plot y using x as index array 0..N-1
>>> plot(y, 'r+')     # ditto, but with red plusses
```

You can use *Line2D* properties as keyword arguments for more control on the appearance. Line properties and *fmt* can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...      linewidth=2, markersize=12)
```

When conflicting with *fmt*, keyword arguments take precedence.

Plotting labelled data

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in *x* and *y*, you can provide the object in the *data* parameter and just give the labels for *x* and *y*:

```
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a `pandas.DataFrame` or a structured numpy array.

Plotting multiple sets of data

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call *plot* multiple times. Example:

```
>>> plot(x1, y1, 'bo')
>>> plot(x2, y2, 'go')
```

- If *x* and/or *y* are 2D arrays, a separate data set will be drawn for every column. If both *x* and *y* are 2D, they must have the same shape. If only one of them is 2D with shape (N, m) the other must have length N and will be used for every data set m.

  Example:

  ```
  >>> x = [1, 2, 3]
  >>> y = np.array([[1, 2], [3, 4], [5, 6]])
  >>> plot(x, y)
  ```

  is equivalent to:

  ```
  >>> for col in range(y.shape[1]):
  ...     plot(x, y[:, col])
  ```

- The third way is to specify multiple sets of *[x]*, *y*, *[fmt]* groups:

  ```
  >>> plot(x1, y1, 'g^', x2, y2, 'g-')
  ```

  In this case, any additional keyword argument applies to all datasets. Also, this syntax cannot be combined with the *data* parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The *fmt* and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

Parameters

x, y

[array-like or float] The horizontal / vertical coordinates of the data points. *x* values are optional and default to `range(len(y))`.

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

fmt

[str, optional] A format string, e.g. 'ro' for red circles. See the *Notes* section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

> **Note**
>
> Technically there's a slight ambiguity in calls where the second label is a valid *fmt*. `plot('n', 'o', data=obj)` could be `plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

Returns

list of *Line2D*

A list of lines representing the plotted data.

Other Parameters

scalex, scaley

[bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to *autoscale_view*.

****kwargs**

[*Line2D* properties, optional] *kwargs* are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1',␣
 ↪linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you specify multiple lines with one plot call, the kwargs apply to all those lines. In case the label object is iterable, each element is used as labels for each set of data.

Here is a list of available *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*

Table 230 – continued fro

Property	Description
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or *ds*	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	*Figure* or *SubFigure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	*color* or None
gid	str
in_layout	bool
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or *mec*	*color*
markeredgewidth or *mew*	float
markerfacecolor or *mfc*	*color*
markerfacecoloralt or *mfcalt*	*color*
markersize or *ms*	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, f
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also

scatter

XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.plot`.

Format Strings

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If `line` is given, but no `marker`, the data will be a line without markers.

Other combinations such as `[color][marker][line]` are also supported, but note that their parsing may be ambiguous.

Markers

character	description
`'.'`	point marker
`','`	pixel marker
`'o'`	circle marker
`'v'`	triangle_down marker
`'^'`	triangle_up marker
`'<'`	triangle_left marker
`'>'`	triangle_right marker
`'1'`	tri_down marker
`'2'`	tri_up marker
`'3'`	tri_left marker
`'4'`	tri_right marker
`'8'`	octagon marker
`'s'`	square marker
`'p'`	pentagon marker
`'P'`	plus (filled) marker
`'*'`	star marker
`'h'`	hexagon1 marker
`'H'`	hexagon2 marker
`'+'`	plus marker
`'x'`	x marker
`'X'`	x (filled) marker
`'D'`	diamond marker
`'d'`	thin_diamond marker
`'|'`	vline marker
`'_'`	hline marker

Line Styles

character	description
`'-'`	solid line style
`'--'`	dashed line style
`'-.'`	dash-dot line style
`':'`	dotted line style

Example format strings:

```
'b'    # blue markers with default shape
'or'   # red circles
'-g'   # green solid line
'--'   # dashed line with default color
'^k:'  # black triangle_up markers connected by a dotted line
```

Colors

The supported color abbreviations are the single letter codes

character	color
`'b'`	blue
`'g'`	green
`'r'`	red
`'c'`	cyan
`'m'`	magenta
`'y'`	yellow
`'k'`	black
`'w'`	white

and the `'CN'` colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any *matplotlib.colors* spec, e.g. full names (`'green'`) or hex strings (`'#008000'`).

Examples using `matplotlib.pyplot.plot`

matplotlib.pyplot.errorbar

matplotlib.pyplot.**errorbar**(*x*, *y*, *yerr=None*, *xerr=None*, *fmt=''*, ***, *ecolor=None*, *elinewidth=None*, *capsize=None*, *barsabove=False*, *lolims=False*, *uplims=False*, *xlolims=False*, *xuplims=False*, *errorevery=1*, *capthick=None*, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers with attached errorbars.

x, *y* define the data locations, *xerr*, *yerr* define the errorbar sizes. By default, this draws the data markers/lines as well as the errorbars. Use fmt='none' to draw errorbars without any data markers.

Added in version 3.7: Caps and error lines are drawn in polar coordinates on polar plots.

Parameters

x, y

[float or array-like] The data positions.

xerr, yerr

[float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

All values must be >= 0.

See *Different ways of specifying error bars* for an example on the usage of `xerr` and `yerr`.

fmt

[str, default: ''] The format for the data points / data lines. See `plot` for details.

Use 'none' (case-insensitive) to plot errorbars without any data markers.

ecolor

[*color*, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth

[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

capthick

[float, default: None] An alias to the keyword argument *markeredgewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markeredgewidth* are given, then they will over-ride *capthick*. This may change in future releases.

barsabove

[bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

lolims, uplims, xlolims, xuplims

[bool or array-like, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as *xerr* and *yerr*. To use limits with inverted axes, `set_xlim` or `set_ylim` must be called before `errorbar()`. Note the tricky parameter names: setting e.g. *lolims* to True means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

errorevery

[int or (int, int), default: 1] draws error bars on a subset of the data. *errorevery* =N draws error bars on the points (x[::N], y[::N]). *errorevery* =(start, N) draws error bars on the points (x[start::N], y[start::N]). e.g. errorevery=(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

Returns

ErrorbarContainer

The container contains:

- data_line : A `Line2D` instance of x, y plot markers and/or line.
- caplines : A tuple of `Line2D` instances of the error bar caps.
- barlinecols : A tuple of `LineCollection` with the horizontal and vertical error ranges.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*, *xerr*, *yerr*

****kwargs**

All other keyword arguments are passed on to the `plot` call drawing the markers. For example, this code makes big red squares with thick green edges:

```
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where *mfc*, *mec*, *ms* and *mew* are aliases for the longer property names, *markerfacecolor*, *markeredgecolor*, *markersize* and *markeredgewidth*.

Valid kwargs for the marker properties are:

- *dashes*
- *dash_capstyle*
- *dash_joinstyle*
- *drawstyle*
- *fillstyle*
- *linestyle*
- *marker*
- *markeredgecolor*
- *markeredgewidth*
- *markerfacecolor*
- *markerfacecoloralt*
- *markersize*
- *markevery*
- *solid_capstyle*
- *solid_joinstyle*

Refer to the corresponding *Line2D* property for more details:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or *ds*	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	*Figure* or *SubFigure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	*color* or None
gid	str
in_layout	bool
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}

Table 231 – continued fro

ydata	1D array
zorder	float

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.errorbar*.

Examples using `matplotlib.pyplot.errorbar`

matplotlib.pyplot.scatter

matplotlib.pyplot.**scatter**(*x*, *y*, *s=None*, *c=None*, ***, *marker=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *edgecolors=None*, *colorizer=None*, *plotnonfinite=False*, *data=None*, ***kwargs*)

A scatter plot of *y* vs. *x* with varying marker size and/or color.

Parameters

x, y

[float or array-like, shape (n,)] The data positions.

s

[float or array-like, shape (n,), optional] The marker size in points**2 (typographic points are 1/72 in.). Default is `rcParams['lines.markersize'] ** 2`.

The linewidth and edgecolor can visually interact with the marker size, and can lead to artifacts if the marker size is smaller than the linewidth.

If the linewidth is greater than 0 and the edgecolor is anything but *'none'*, then the effective size of the marker will be increased by half the linewidth because the stroke will be centered on the edge of the shape.

To eliminate the marker edge either set *linewidth=0* or *edgecolor='none'*.

c

[array-like or list of *color* or *color*, optional] The marker colors. Possible values:

- A scalar or sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2D array in which the rows are RGB or RGBA.
- A sequence of colors of length n.
- A single color format string.

Note that *c* should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2D array with a single row. Otherwise, value-matching will have precedence in case of a size matching with *x* and *y*.

If you wish to specify a single color for all points prefer the *color* keyword argument.

Defaults to `None`. In that case the marker color is determined by the value of *color*, *facecolor* or *facecolors*. In case those are not specified or `None`, the marker color is determined by the next color of the `Axes`' current "shape and fill" color cycle. This cycle defaults to *rcParams["axes.prop_cycle"]* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

marker

[*MarkerStyle*, default: *rcParams["scatter.marker"]* (default: `'o'`)] The marker style. *marker* can be either an instance of the class or the text shorthand for a particular marker. See *matplotlib.markers* for more information about marker styles.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *c* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *c* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *c* is RGB(A).

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float or array-like, default: *rcParams["lines.linewidth"]* (default: `1.5`)] The linewidth of the marker edges. Note: The default *edgecolors* is 'face'. You may want to change this as well.

edgecolors

[{'face', 'none', *None*} or *color* or list of *color*, default: *rcParams["scatter.edgecolors"]* (default: `'face'`)] The edge color of the marker. Possible values:

- 'face': The edge color will always be the same as the face color.
- 'none': No patch boundary will be drawn.
- A color or sequence of colors.

For non-filled markers, *edgecolors* is ignored. Instead, the color is determined like with 'face', i.e. from *c*, *colors*, or *facecolors*.

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

This parameter is ignored if *c* is RGB(A).

plotnonfinite

[bool, default: False] Whether to plot points with nonfinite *c* (i.e. `inf`, `-inf` or `nan`). If `True` the points are drawn with the *bad* colormap color (see *Colormap.set_bad*).

Returns

PathCollection

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*, *s*, *linewidths*, *edgecolors*, *c*, *facecolor*, *facecolors*, *color*

****kwargs**

[*PathCollection* properties]

Property	Description

See also

plot

To plot scatter plots when markers are identical in size and color.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.scatter*.

- The *plot* function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of *x*, *y*, *s*, and *c* may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1D arrays; *x*, *y*, *s*, and *c* may be input as N-D arrays, but within scatter they will be flattened. The exception is *c*, which will be flattened only if its size matches the size of *x* and *y*.

Examples using `matplotlib.pyplot.scatter`

matplotlib.pyplot.plot_date

matplotlib.pyplot.**plot_date**(*x*, *y*, *fmt='o'*, *tz=None*, *xdate=True*, *ydate=False*, ***, *data=None*, ***kwargs*)

[*Deprecated*] Plot coercing the axis to treat floats as dates.

Deprecated since version 3.9: This method exists for historic reasons and will be removed in version 3.11.

- `datetime`-like data should directly be plotted using *plot*.
- If you need to plot plain numeric data as *Matplotlib date format* or need to set a timezone, call `ax.xaxis.axis_date` / `ax.yaxis.axis_date` before *plot*. See *Axis.axis_date*.

Similar to *plot*, this plots *y* vs. *x* as lines or markers. However, the axis labels are formatted as dates depending on *xdate* and *ydate*. Note that *plot* will work with `datetime` and `numpy.datetime64` objects without resorting to this method.

Parameters

x, y

[array-like] The coordinates of the data points. If *xdate* or *ydate* is *True*, the respective values *x* or *y* are interpreted as *Matplotlib dates*.

fmt

[str, optional] The plot format string. For details, see the corresponding parameter in *plot*.

tz

[timezone string or `datetime.tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] The time zone to use in labeling dates.

xdate

[bool, default: True] If *True*, the *x*-axis will be interpreted as Matplotlib dates.

ydate

[bool, default: False] If *True*, the *y*-axis will be interpreted as Matplotlib dates.

Returns

list of *Line2D*

Objects representing the plotted data.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or *ds*	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	*Figure* or *SubFigure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	*color* or None
gid	str
in_layout	bool
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or *mec*	*color*
markeredgewidth or *mew*	float
markerfacecolor or *mfc*	*color*

transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also

matplotlib.dates

Helper functions on dates.

matplotlib.dates.date2num

Convert dates to num.

matplotlib.dates.num2date

Convert num to dates.

matplotlib.dates.drange

Create an equally spaced sequence of dates.

Notes

Note

This is the *pyplot wrapper* for axes.Axes.plot_date.

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to plot_date. plot_date will set the default tick locator to AutoDateLocator (if the tick locator is not already set to a DateLocator instance) and the default tick formatter to AutoDateFormatter (if the tick formatter is not already set to a DateFormatter instance).

Deprecated since version 3.9: Use plot instead.

matplotlib.pyplot.step

matplotlib.pyplot.**step**(*x*, *y*, **args*, *where='pre'*, *data=None*, ***kwargs*)

Make a step plot.

Call signatures:

```
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around *plot* which changes some formatting options. Most of the concepts and parameters of plot can be used here as well.

Note

This method uses a standard plot with a step drawstyle: The *x* values are the reference positions and steps extend left/right/both directions depending on *where*.

For the common case where you know the values and edges of the steps, use *stairs* instead.

Parameters

x

[array-like] 1D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

y

[array-like] 1D sequence of y levels.

fmt

[str, optional] A format string, e.g. 'g' for a green line. See *plot* for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument *linestyle* instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

where

[{'pre', 'post', 'mid'}, default: 'pre'] Define where the steps should be placed:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

****kwargs**

Additional parameters are the same as those for *plot*.

Returns

list of *Line2D*

Objects representing the plotted data.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.step`.

Examples using `matplotlib.pyplot.step`

matplotlib.pyplot.loglog

`matplotlib.pyplot.`**`loglog`**`(*args, **kwargs)`

Make a plot with log scaling on both the x- and y-axis.

Call signatures:

```
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs* and *nonpositive* control the x/y-axis properties. They are just forwarded to `Axes.set_xscale` and `Axes.set_yscale`. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

Parameters

base

[float, default: 10] Base of the logarithm.

subs

[sequence, optional] The location of the minor ticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale`/`Axes.set_yscale` for details.

nonpositive

[{'mask', 'clip'}, default: 'clip'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

****kwargs**

All parameters supported by `plot`.

Returns

list of *Line2D*

Objects representing the plotted data.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.loglog`.

matplotlib.pyplot.semilogx

matplotlib.pyplot.**semilogx**(**args*, ***kwargs*)

Make a plot with log scaling on the x-axis.

Call signatures:

```
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the x-axis to log scaling. All the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

Parameters

base

[float, default: 10] Base of the x logarithm.

subs

[array-like, optional] The location of the minor xticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` for details.

nonpositive

[{'mask', 'clip'}, default: 'clip'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

****kwargs**

All parameters supported by `plot`.

Returns

list of *Line2D*

Objects representing the plotted data.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.semilogx`.

matplotlib.pyplot.semilogy

matplotlib.pyplot.**semilogy**(**args*, ***kwargs*)

Make a plot with log scaling on the y-axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the y-axis to log scaling. All the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the y-axis properties. They are just forwarded to `Axes.set_yscale`.

Parameters

base

[float, default: 10] Base of the y logarithm.

subs

[array-like, optional] The location of the minor yticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_yscale` for details.

nonposition

[{'mask', 'clip'}, default: 'clip'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

****kwargs**

All parameters supported by `plot`.

Returns

list of *Line2D*

Objects representing the plotted data.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.semilogy`.

matplotlib.pyplot.fill_between

matplotlib.pyplot.**fill_between**(*x*, *y1*, *y2=0*, *where=None*, *interpolate=False*, *step=None*, *, *data=None*, ***kwargs*)

Fill the area between two horizontal curves.

The curves are defined by the points (*x*, *y1*) and (*x*, *y2*). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *x*.

Parameters

x

[array-like] The x coordinates of the nodes defining the curves.

y1

[array-like or float] The y coordinates of the nodes defining the first curve.

y2

[array-like or float, default: 0] The y coordinates of the nodes defining the second curve.

where

[array-like of bool, optional] Define *where* to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates `x[where]`. More precisely, fill between `x[i]` and `x[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *y1* > *y2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *x* array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *x*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

FillBetweenPolyCollection

A *FillBetweenPolyCollection* containing the plotted polygons.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y1*, *y2*, *where*

****kwargs**

All other keyword arguments are passed on to *FillBetweenPolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.fill_between`.

Examples using `matplotlib.pyplot.fill_between`

matplotlib.pyplot.fill_betweenx

`matplotlib.pyplot.`**`fill_betweenx`**(*y*, *x1*, *x2=0*, *where=None*, *step=None*, *interpolate=False*, ***, *data=None*, ***kwargs*)

Fill the area between two vertical curves.

The curves are defined by the points (*y*, *x1*) and (*y*, *x2*). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *y*.

Parameters

y

[array-like] The y coordinates of the nodes defining the curves.

x1

[array-like or float] The x coordinates of the nodes defining the first curve.

x2

[array-like or float, default: 0] The x coordinates of the nodes defining the second curve.

where

[array-like of bool, optional] Define *where* to exclude some vertical regions from being filled. The filled regions are defined by the coordinates `y[where]`. More precisely, fill between `y[i]` and `y[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *x1* > *x2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *y*

array. Such a polygon cannot describe the above semantics close to the intersection. The y-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *y*. The value determines where the step will occur:

- 'pre': The x value is continued constantly to the left from every *y* position, i.e. the interval `(y[i-1], y[i]]` has the value `x[i]`.
- 'post': The y value is continued constantly to the right from every *y* position, i.e. the interval `[y[i], y[i+1])` has the value `x[i]`.
- 'mid': Steps occur half-way between the *y* positions.

Returns

FillBetweenPolyCollection

A *FillBetweenPolyCollection* containing the plotted polygons.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

y, *x1*, *x2*, *where*

****kwargs**

All other keyword arguments are passed on to *FillBetweenPolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.fill_betweenx`.

matplotlib.pyplot.bar

matplotlib.pyplot.**bar**(*x*, *height*, *width=0.8*, *bottom=None*, *, *align='center'*, *data=None*, ***kwargs*)

Make a bar plot.

The bars are positioned at *x* with the given *align*ment. Their dimensions are given by *height* and *width*. The vertical baseline is *bottom* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

x

[float or array-like] The x coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

Bars are often used for categorical data, i.e. string labels below the bars. You can provide a list of strings directly to *x*. `bar(['A', 'B', 'C'], [1, 2, 3])` is often a shorter and more convenient notation compared to `bar(range(3), [1, 2, 3], tick_label=['A', 'B', 'C'])`. They are equivalent as long as the names are unique. The explicit *tick_label* notation draws the names in the sequence given. However, when having duplicate values in categorical *x* data, these values map to the same numerical x coordinate, and hence the corresponding bars are drawn on top of each other.

height

[float or array-like] The height(s) of the bars.

Note that if *bottom* has units (e.g. datetime), *height* should be in units that are a difference from the value of *bottom* (e.g. timedelta).

width

[float or array-like, default: 0.8] The width(s) of the bars.

Note that if *x* has units (e.g. datetime), then *width* should be in units that are a difference (e.g. timedelta) around the *x* values.

bottom

[float or array-like, default: 0] The y coordinate(s) of the bottom side(s) of the bars.

Note that if *bottom* has units, then the y-axis will get a Locator and Formatter appropriate for the units (e.g. dates, or categorical).

align

[{'center', 'edge'}, default: 'center'] Alignment of the bars to the *x* coordinates:

- 'center': Center the base on the *x* positions.
- 'edge': Align the left edges of the bars with the *x* positions.

To align the bars on the right edge pass a negative *width* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[*color* or list of *color*, optional] The colors of the bar faces. This is an alias for *facecolor*. If both are given, *facecolor* takes precedence.

facecolor

[*color* or list of *color*, optional] The colors of the bar faces. If both *color* and *facecolor are given, *facecolor* takes precedence.

edgecolor

[*color* or list of *color*, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

label

[str or list of str, optional] A single label is attached to the resulting *BarContainer* as a label for the whole dataset. If a list is provided, it must be the same length as *x* and labels the individual bars. Repeated labels are not de-duplicated and will cause repeated label entries, so this is best used when bars also differ in style (e.g., by passing a list to *color*.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (Default)

See *Different ways of specifying error bars* for an example on the usage of *xerr* and *yerr*.

ecolor

[*color* or list of *color*, default: 'black'] The line color of the errorbars.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of keyword arguments to be passed to the `errorbar` method. Values of *ecolor* or *capsize* defined here take precedence over the independent keyword arguments.

log

[bool, default: False] If *True*, set the y-axis to be log scale.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

barh

Plot a horizontal bar plot.

Notes

Note

This is the *pyplot wrapper* for axes.Axes.bar.

Stacked bars can be achieved by passing individual *bottom* values per bar. See *Stacked bar chart*.

Examples using `matplotlib.pyplot.bar`

matplotlib.pyplot.barh

matplotlib.pyplot.**barh**(*y*, *width*, *height=0.8*, *left=None*, *, *align='center'*, *data=None*, ***kwargs*)

Make a horizontal bar plot.

The bars are positioned at *y* with the given *align*ment. Their dimensions are given by *width* and *height*. The horizontal baseline is *left* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

y

[float or array-like] The y coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

Bars are often used for categorical data, i.e. string labels below the bars. You can provide a list of strings directly to *y*. `barh(['A', 'B', 'C'], [1, 2, 3])` is often a shorter and more convenient notation compared to `barh(range(3), [1, 2, 3], tick_label=['A', 'B', 'C'])`. They are equivalent as long as the names are unique. The explicit *tick_label* notation draws the names in the sequence given. However, when having duplicate values in categorical *y* data, these values map to the same numerical y coordinate, and hence the corresponding bars are drawn on top of each other.

width

[float or array-like] The width(s) of the bars.

Note that if *left* has units (e.g. datetime), *width* should be in units that are a difference from the value of *left* (e.g. timedelta).

height

[float or array-like, default: 0.8] The heights of the bars.

Note that if *y* has units (e.g. datetime), then *height* should be in units that are a difference (e.g. timedelta) around the *y* values.

left

[float or array-like, default: 0] The x coordinates of the left side(s) of the bars.

Note that if *left* has units, then the x-axis will get a Locator and Formatter appropriate for the units (e.g. dates, or categorical).

align

[{'center', 'edge'}, default: 'center'] Alignment of the base to the *y* coordinates*:

- 'center': Center the bars on the *y* positions.

- 'edge': Align the bottom edges of the bars with the *y* positions.

To align the bars on the top edge pass a negative *height* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[*color* or list of *color*, optional] The colors of the bar faces.

edgecolor

[*color* or list of *color*, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

label

[str or list of str, optional] A single label is attached to the resulting *BarContainer* as a label for the whole dataset. If a list is provided, it must be the same length as *y* and labels the individual bars. Repeated labels are not de-duplicated and will cause repeated label entries, so this is best used when bars also differ in style (e.g., by passing a list to *color*.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (default)

See *Different ways of specifying error bars* for an example on the usage of *xerr* and *yerr*.

ecolor

[*color* or list of *color*, default: 'black'] The line color of the errorbars.

capsize

[float, default: *rcParams["errorbar.capsize"]* (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of keyword arguments to be passed to the *errorbar* method. Values of *ecolor* or *capsize* defined here take precedence over the independent keyword arguments.

log

[bool, default: False] If `True`, set the x-axis to be log scale.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

See also

bar

Plot a vertical bar plot.

Notes

Note

This is the *pyplot wrapper* for axes.Axes.barh.

Stacked bars can be achieved by passing individual *left* values per bar. See *Discrete distribution as horizontal bar chart*.

Examples using matplotlib.pyplot.barh

matplotlib.pyplot.bar_label

matplotlib.pyplot.**bar_label**(*container*, *labels=None*, *, *fmt='%g'*, *label_type='edge'*, *padding=0*, ***kwargs*)

Label a bar plot.

Adds labels to bars in the given BarContainer. You may need to adjust the axis limits to fit the labels.

Parameters

container

[*BarContainer*] Container with all the bars and optionally errorbars, likely returned from *bar* or *barh*.

labels

[array-like, optional] A list of label texts, that should be displayed. If not given, the label texts will be the data values formatted with *fmt*.

fmt

[str or callable, default: '%g'] An unnamed %-style or {}-style format string for the label or a function to call with the value as the first argument. When *fmt* is a string and can be interpreted in both formats, %-style takes precedence over {}-style.

Added in version 3.7: Support for {}-style format string and callables.

label_type

[{'edge', 'center'}, default: 'edge'] The label type. Possible values:

- 'edge': label placed at the end-point of the bar segment, and the value displayed will be the position of that end-point.
- 'center': label placed in the center of the bar segment, and the value displayed will be the length of that segment. (useful for stacked bars, i.e., *Bar chart with labels*)

padding

[float, default: 0] Distance of label from the end of the bar, in points.

****kwargs**

Any remaining keyword arguments are passed through to *Axes.annotate*. The alignment parameters (*horizontalalignment* / *ha*, *verticalalignment* / *va*) are not supported because the labels are automatically aligned to the bars.

Returns

list of *Annotation*

A list of *Annotation* instances for the labels.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.bar_label*.

Examples using `matplotlib.pyplot.bar_label`

matplotlib.pyplot.stem

matplotlib.pyplot.**stem**(**args*, *linefmt=None*, *markerfmt=None*, *basefmt=None*, *bottom=0*, *label=None*, *orientation='vertical'*, *data=None*)

Create a stem plot.

A stem plot draws lines perpendicular to a baseline at each location *locs* from the baseline to *heads*, and places a marker there. For vertical stem plots (the default), the *locs* are *x* positions, and the *heads* are *y* values. For horizontal stem plots, the *locs* are *y* positions, and the *heads* are *x* values.

Call signature:

```
stem([locs,] heads, linefmt=None, markerfmt=None, basefmt=None)
```

The *locs*-positions are optional. *linefmt* may be provided as positional, but all other formats must be provided as keyword arguments.

Parameters

locs

[array-like, default: (0, 1, ..., len(heads) - 1)] For vertical stem plots, the x-positions of the stems. For horizontal stem plots, the y-positions of the stems.

heads

[array-like] For vertical stem plots, the y-values of the stem heads. For horizontal stem plots, the x-values of the stem heads.

linefmt

[str, optional] A string defining the color and/or linestyle of the vertical lines:

Character	Line Style
`'-'`	solid line
`'--'`	dashed line
`'-.'`	dash-dot line
`':'`	dotted line

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: Markers specified through this parameter (e.g. 'x') will be silently ignored. Instead, markers should be specified using *markerfmt*.

markerfmt

[str, optional] A string defining the color and/or shape of the markers at the stem heads. If the marker is not given, use the marker 'o', i.e. filled circles. If the color is not given, use the color from *linefmt*.

basefmt

[str, default: 'C3-' ('C2-' in classic mode)] A format string defining the properties of the baseline.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The orientation of the stems.

bottom

[float, default: 0] The y/x-position of the baseline (depending on *orientation*).

label

[str, optional] The label to use for the stems in legends.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

Returns

StemContainer

The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.stem`.

See also

The MATLAB function stem which inspired this method.

Examples using `matplotlib.pyplot.stem`

matplotlib.pyplot.eventplot

`matplotlib.pyplot.`**`eventplot`**(*positions*, *, *orientation='horizontal'*, *lineoffsets=1*, *linelengths=1*, *linewidths=None*, *colors=None*, *alpha=None*, *linestyles='solid'*, *data=None*, ***kwargs*)

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

Parameters

positions

[array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to *lineoffsets*, *linelengths*, *linewidths*, *colors* and *linestyles*.

Note that *positions* can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The direction of the event sequence:

- 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
- 'vertical': the events are arranged vertically. The indicator lines are horizontal.

lineoffsets

[float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to *orientation*.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linelengths

[float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linewidths

[float or array-like, default: *rcParams["lines.linewidth"]* (default: `1.5`)] The line width(s) of the event lines, in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

colors

[*color* or list of color, default: *rcParams["lines.color"]* (default: `'C0'`)] The color(s) of the event lines.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

alpha

[float or array-like, default: 1] The alpha blending value(s), between 0 (transparent) and 1 (opaque).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linestyles

[str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

positions, *lineoffsets*, *linelengths*, *linewidths*, *colors*, *linestyles*

****kwargs**

Other keyword arguments are line collection properties. See *LineCollection* for a list of the valid properties.

Returns

list of *EventCollection*

The *EventCollection* that were added.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.eventplot*.

For *linelengths*, *linewidths*, *colors*, *alpha* and *linestyles*, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as *positions*, and each value will be applied to the corresponding row of the array.

Examples

matplotlib.pyplot.pie

matplotlib.pyplot.**pie**(*x*, *, *explode=None*, *labels=None*, *colors=None*, *autopct=None*, *pctdistance=0.6*, *shadow=False*, *labeldistance=1.1*, *startangle=0*, *radius=1*, *counterclock=True*, *wedgeprops=None*, *textprops=None*, *center=(0, 0)*, *frame=False*, *rotatelabels=False*, *normalize=True*, *hatch=None*, *data=None*)

Plot a pie chart.

Make a pie chart of array *x*. The fractional area of each wedge is given by `x/sum(x)`.

The wedges are plotted counterclockwise, by default starting from the x-axis.

Parameters

x

[1D array-like] The wedge sizes.

explode

[array-like, default: None] If not *None*, is a `len(x)` array which specifies the fraction of the radius with which to offset each wedge.

labels

[list, default: None] A sequence of strings providing the labels for each wedge

colors

[*color* or list of *color*, default: None] A sequence of colors through which the pie chart will cycle. If *None*, will use the colors in the currently active cycle.

hatch

[str or list, default: None] Hatching pattern applied to all pie wedges or sequence of patterns through which the chart will cycle. For a list of valid patterns, see *Hatch style reference*.

Added in version 3.7.

autopct

[None or str or callable, default: None] If not *None*, *autopct* is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If *autopct* is a format string, the label will be `fmt % pct`. If *autopct* is a function, then it will be called.

pctdistance

[float, default: 0.6] The relative distance along the radius at which the text generated by *autopct* is drawn. To draw the text outside the pie, set *pctdistance* > 1. This parameter is ignored if *autopct* is `None`.

labeldistance

[float or None, default: 1.1] The relative distance along the radius at which the labels are drawn. To draw the labels inside the pie, set *labeldistance* < 1. If set to `None`, labels are not drawn but are still stored for use in *legend*.

shadow

[bool or dict, default: False] If bool, whether to draw a shadow beneath the pie. If dict, draw a shadow passing the properties in the dict to *Shadow*.

Added in version 3.8: *shadow* can be a dict.

startangle

[float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

radius

[float, default: 1] The radius of the pie.

counterclock

[bool, default: True] Specify fractions direction, clockwise or counterclockwise.

wedgeprops

[dict, default: None] Dict of arguments passed to each *patches.Wedge* of the pie. For example, `wedgeprops = {'linewidth': 3}` sets the width of the wedge border lines equal to 3. By default, `clip_on=False`. When there is a conflict between these properties and other keywords, properties passed to *wedgeprops* take precedence.

textprops

[dict, default: None] Dict of arguments to pass to the text objects.

center

[(float, float), default: (0, 0)] The coordinates of the center of the chart.

frame

[bool, default: False] Plot Axes frame with the chart if true.

rotatelabels

[bool, default: False] Rotate each label to the angle of the corresponding slice if true.

normalize

[bool, default: True] When *True*, always make a full pie by normalizing x so that `sum(x) == 1`. *False* makes a partial pie if `sum(x) <= 1` and raises a `ValueError` for `sum(x) > 1`.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *explode*, *labels*, *colors*

Returns

patches

[list] A sequence of *matplotlib.patches.Wedge* instances

texts

[list] A list of the label *Text* instances.

autotexts

[list] A list of *Text* instances for the numeric labels. This will only be returned if the parameter *autopct* is not *None*.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.pie*.

The pie chart will probably look best if the figure and Axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The Axes aspect ratio can be controlled with *Axes.set_aspect*.

Examples using `matplotlib.pyplot.pie`

matplotlib.pyplot.stackplot

matplotlib.pyplot.**stackplot**(*x*, **args*, *labels=()*, *colors=None*, *hatch=None*, *baseline='zero'*, *data=None*, ***kwargs*)

Draw a stacked area plot or a streamgraph.

Parameters

x

[(N,) array-like]

y

[(M, N) array-like] The data can be either stacked or unstacked. Each of the following calls is legal:

```
stackplot(x, y)  # where y has shape (M, N) e.g. y =␣
↪[y1, y2, y3, y4]
stackplot(x, y1, y2, y3, y4)  # where y1, y2, y3, y4␣
↪have length N
```

baseline

[{'zero', 'sym', 'wiggle', 'weighted_wiggle'}] Method used to calculate the baseline:

- `'zero'`: Constant zero baseline, i.e. a simple stacked plot.
- `'sym'`: Symmetric around zero and is sometimes called 'ThemeRiver'.
- `'wiggle'`: Minimizes the sum of the squared slopes.
- `'weighted_wiggle'`: Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at http://leebyron.com/streamgraph/.

labels

[list of str, optional] A sequence of labels to assign to each data series. If unspecified, then no labels will be applied to artists.

colors

[list of *color*, optional] A sequence of colors to be cycled through and used to color the stacked areas. The sequence need not be exactly the same length as the number of provided *y*, in which case the colors will repeat from the beginning.

If not specified, the colors from the Axes property cycle will be used.

hatch

[list of str, default: None] A sequence of hatching styles. See *Hatch style reference*. The sequence will be cycled through for filling the stacked areas from bottom to top. It need not be exactly the same length as the number of provided *y*, in which case the styles will repeat from the beginning.

Added in version 3.9: Support for list input

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

All other keyword arguments are passed to *`Axes.fill_between`*.

Returns

list of *`PolyCollection`*

A list of *`PolyCollection`* instances, one for each element in the stacked area plot.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.stackplot`.

matplotlib.pyplot.broken_barh

`matplotlib.pyplot.`**`broken_barh`**(*xranges*, *yrange*, *, *data=None*, ***kwargs*)

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of *xranges*. All rectangles have the same vertical position and size defined by *yrange*.

Parameters

xranges

[sequence of tuples (*xmin*, *xwidth*)] The x-positions and extents of the rectangles. For each tuple (*xmin*, *xwidth*) a rectangle is drawn from *xmin* to *xmin* + *xwidth*.

yrange

[(*ymin*, *yheight*)] The y-position and extent for all the rectangles.

Returns

`PolyCollection`

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

[*`PolyCollection`* properties] Each *kwarg* can be either a single argument applying to all rectangles, e.g.:

```
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.broken_barh`.

Examples using `matplotlib.pyplot.broken_barh`

matplotlib.pyplot.vlines

matplotlib.pyplot.**vlines**(*x*, *ymin*, *ymax*, *colors=None*, *linestyles='solid'*, *, *label=''*, *data=None*, ***kwargs*)

Plot vertical lines at each *x* from *ymin* to *ymax*.

Parameters

x

[float or array-like] x-indexes where to plot the lines.

ymin, ymax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have the same length.

colors

[*color* or list of color, default: *rcParams["lines.color"]* (default: `'C0'`)]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid']

label

[str, default: '']

Returns

LineCollection

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *ymin*, *ymax*, *colors*

****kwargs**

[*LineCollection* properties.]

See also

hlines

horizontal lines

axvline

vertical line across the Axes

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.vlines`.

Examples using `matplotlib.pyplot.vlines`

matplotlib.pyplot.hlines

`matplotlib.pyplot.`**`hlines`**(*y*, *xmin*, *xmax*, *colors=None*, *linestyles='solid'*, *, *label=''*, *data=None*, ***kwargs*)

Plot horizontal lines at each *y* from *xmin* to *xmax*.

Parameters

y

[float or array-like] y-indexes where to plot the lines.

xmin, xmax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have the same length.

colors

[*color* or list of color , default: *rcParams["lines.color"]* (default: `'C0'`)]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid']

label

[str, default: '']

Returns

LineCollection

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

y, *xmin*, *xmax*, *colors*

****kwargs**

[*LineCollection* properties.]

See also

vlines

vertical lines

axhline

horizontal line across the Axes

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.hlines*.

matplotlib.pyplot.fill

matplotlib.pyplot.**fill**(**args*, *data=None*, ***kwargs*)

Plot filled polygons.

Parameters

***args**

[sequence of x, y, [color]] Each polygon is defined by the lists of *x* and *y* positions of its nodes, optionally followed by a *color* specifier. See *matplotlib.colors* for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple *x*, *y*, *[color]* groups.

For example, each of the following is legal:

```
ax.fill(x, y)                    # a polygon with␣
 ↪default color
ax.fill(x, y, "b")               # a blue polygon
```

(continues on next page)

(continued from previous page)

```
ax.fill(x, y, x2, y2)             # two polygons
ax.fill(x, y, "b", x2, y2, "r")   # a blue and a red␣
 ↪polygon
```

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*, e.g.:

```
ax.fill("time", "signal",
        data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

Returns

list of *Polygon*

Other Parameters

****kwargs**

[*Polygon* properties]

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.fill*.

Use *fill_between()* if you would like to fill the region between two curves.

Examples using `matplotlib.pyplot.fill`

matplotlib.pyplot.polar

matplotlib.pyplot.**polar**(**args*, ***kwargs*)

Make a polar plot.

call signature:

```
polar(theta, r, [fmt], **kwargs)
```

This is a convenience wrapper around *pyplot.plot*. It ensures that the current Axes is polar (or creates one if needed) and then passes all parameters to .pyplot.plot.

> **Note**
>
> When making polar plots using the *pyplot API*, `polar()` should typically be the first command because that makes sure a polar Axes is created. Using other commands such as `plt.title()` before this can lead to the implicit creation of a rectangular Axes, in which case a subsequent `polar()` call will fail.

Examples using `matplotlib.pyplot.polar`

Spans

axhline	Add a horizontal line spanning the whole or fraction of the Axes.
axhspan	Add a horizontal span (rectangle) across the Axes.
axvline	Add a vertical line spanning the whole or fraction of the Axes.
axvspan	Add a vertical span (rectangle) across the Axes.
axline	Add an infinitely long straight line.

matplotlib.pyplot.axhline

`matplotlib.pyplot.`**`axhline`**(*y=0*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal line spanning the whole or fraction of the Axes.

Note: If you want to set x-limits in data coordinates, use *hlines* instead.

Parameters

y

[float, default: 0] y position in *data coordinates*.

xmin

[float, default: 0] The start x-position in *axes coordinates*. Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

xmax

[float, default: 1] The end x-position in *axes coordinates*. Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

Returns

Line2D

A *Line2D* specified via two points `(xmin, y)`, `(xmax, y)`. Its transform is set such that *x* is in *axes coordinates* and *y* is in *data coordinates*.

This is still a generic line and the horizontal character is only realized through using identical *y* values for both points. Thus, if you want to change the *y* value later, you have to provide two values `line.set_ydata([3, 3])`.

Other Parameters

**kwargs

Valid keyword arguments are *Line2D* properties, except for 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dp
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or *ds*	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	*Figure* or *SubFigure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	*color* or None
gid	str
in_layout	bool
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or *mec*	*color*
markeredgewidth or *mew*	float
markerfacecolor or *mfc*	*color*
markerfacecoloralt or *mfcalt*	*color*
markersize or *ms*	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, f
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None

Table 240 – continued fro

Property	Description
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}

xdata	1D array
ydata	1D array
zorder	float

See also

hlines

Add horizontal lines in data coordinates.

axhspan

Add a horizontal span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.axhline*.

Examples

- draw a thick red hline at 'y' = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

Examples using `matplotlib.pyplot.axhline`

matplotlib.pyplot.axhspan

matplotlib.pyplot.**axhspan**(*ymin*, *ymax*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal span (rectangle) across the Axes.

The rectangle spans from *ymin* to *ymax* vertically, and, by default, the whole x-axis horizontally. The x-span can be set using *xmin* (default: 0) and *xmax* (default: 1) which are in axis units; e.g. `xmin = 0.5` always refers to the middle of the x-axis regardless of the limits set by *set_xlim*.

Parameters

ymin

[float] Lower y-coordinate of the span, in data units.

ymax

[float] Upper y-coordinate of the span, in data units.

xmin

[float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

xmax

[float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

Returns

Rectangle

Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

axvspan

Add a vertical span across the Axes.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.axhspan*.

Examples using `matplotlib.pyplot.axhspan`

matplotlib.pyplot.axvline

matplotlib.pyplot.**axvline**(*x=0*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical line spanning the whole or fraction of the Axes.

Note: If you want to set y-limits in data coordinates, use *vlines* instead.

Parameters

x

[float, default: 0] x position in *data coordinates*.

ymin

[float, default: 0] The start y-position in *axes coordinates*. Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax

[float, default: 1] The end y-position in *axes coordinates*. Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns

Line2D

A *Line2D* specified via two points `(x, ymin)`, `(x, ymax)`. Its transform is set such that *x* is in *data coordinates* and *y* is in *axes coordinates*.

This is still a generic line and the vertical character is only realized through using identical *x* values for both points. Thus, if you want to change the *x* value later, you have to provide two values `line.set_xdata([3, 3])`.

Other Parameters

****kwargs**

Valid keyword arguments are *Line2D* properties, except for 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*

Table 242 – continued fro

Property	Description
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or *ds*	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	*Figure* or *SubFigure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	*color* or None
gid	str
in_layout	bool
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or *mec*	*color*
markeredgewidth or *mew*	float
markerfacecolor or *mfc*	*color*
markerfacecoloralt or *mfcalt*	*color*
markersize or *ms*	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, f
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also

vlines

Add vertical lines in data coordinates.

axvspan

Add a vertical span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.axvline`.

Examples

- draw a thick red vline at $x = 0$ that spans the yrange:

```
>>> axvline(linewidth=4, color='r')
```

- draw a default vline at $x = 1$ that spans the yrange:

```
>>> axvline(x=1)
```

- draw a default vline at $x = .5$ that spans the middle half of the yrange:

```
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

Examples using `matplotlib.pyplot.axvline`

matplotlib.pyplot.axvspan

matplotlib.pyplot.**axvspan**(*xmin*, *xmax*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical span (rectangle) across the Axes.

The rectangle spans from *xmin* to *xmax* horizontally, and, by default, the whole y-axis vertically. The y-span can be set using *ymin* (default: 0) and *ymax* (default: 1) which are in axis units; e.g. `ymin = 0.5` always refers to the middle of the y-axis regardless of the limits set by `set_ylim`.

Parameters

xmin

[float] Lower x-coordinate of the span, in data units.

xmax

[float] Upper x-coordinate of the span, in data units.

ymin

[float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).

ymax

[float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

Returns

Rectangle

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

axhspan

Add a horizontal span across the Axes.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.axvspan*.

Examples

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the Axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

Examples using `matplotlib.pyplot.axvspan`

matplotlib.pyplot.axline

matplotlib.pyplot.**axline**(*xy1*, *xy2=None*, ***, *slope=None*, ***kwargs*)

Add an infinitely long straight line.

The line can be defined either by two points *xy1* and *xy2*, or by one point *xy1* and a *slope*.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, *slope* should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points *xy1*, *xy2* for non-linear scales.

The *transform* keyword argument only applies to the points *xy1*, *xy2*. The *slope* (if given) is always in data coordinates. This can be used e.g. with `ax.transAxes` for drawing grid lines with a fixed

slope.

Parameters

xy1, xy2

[(float, float)] Points for the line to pass through. Either *xy2* or *slope* has to be given.

slope

[float, optional] The slope of the line. Either *xy2* or *slope* has to be given.

Returns

AxLine

Other Parameters

****kwargs**

Valid kwargs are *Line2D* properties

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None

axhline

for horizontal lines

axvline

for vertical lines

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.axline*.

Examples

Draw a thick red line passing through (0, 0) and (1, 1):

```
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

Examples using `matplotlib.pyplot.axline`

Spectral

acorr	Plot the autocorrelation of *x*.
angle_spectrum	Plot the angle spectrum.
cohere	Plot the coherence between *x* and *y*.
csd	Plot the cross-spectral density.
magnitude_spectrum	Plot the magnitude spectrum.
phase_spectrum	Plot the phase spectrum.
psd	Plot the power spectral density.
specgram	Plot a spectrogram.
xcorr	Plot the cross correlation between *x* and *y*.

matplotlib.pyplot.acorr

matplotlib.pyplot.**acorr**(*x*, *, *data=None*, ***kwargs*)

Plot the autocorrelation of *x*.

Parameters

x

[array-like] Not run through Matplotlib's unit conversion, so this should be a unitless array.

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the acorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the acorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If `None`, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*`LineCollection`* or *`Line2D`*] *`Artist`* added to the Axes of the correlation:

- *`LineCollection`* if *usevlines* is True.
- *`Line2D`* if *usevlines* is False.

b

[*`Line2D`* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*`Line2D`* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x

****kwargs**

Additional parameters are passed to *`Axes.vlines`* and *`Axes.axhline`* if *usevlines* is `True`; otherwise they are passed to *`Axes.plot`*.

Notes

Note

This is the *pyplot wrapper* for *`axes.Axes.acorr`*.

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Examples using `matplotlib.pyplot.acorr`

matplotlib.pyplot.angle_spectrum

matplotlib.pyplot.**angle_spectrum**(*x*, *, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *data=None*, ***kwargs*)

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the angle spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None

See also

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

phase_spectrum

Plots the unwrapped version of this function.

specgram

Can plot the angle spectrum of segments within the signal in a colormap.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.angle_spectrum*.

matplotlib.pyplot.cohere

matplotlib.pyplot.**cohere**(*x*, *y*, ***, *NFFT=256*, *Fs=2*, *Fc=0*, *detrend=<function detrend_none>*, *window=<function window_hanning>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*, *data=None*, ***kwargs*)

Plot the coherence between *x* and *y*.

Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between blocks.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

Cxy

[1-D array] The coherence vector.

freqs

[1-D array] The frequencies for the elements in *Cxy*.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*

****kwargs**

Keyword arguments control the *Line2D* properties:

matplotlib.pyplot.csd

matplotlib.pyplot.**csd**(*x*, *y*, *, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, *data=None*, ***kwargs*)

Plot the cross-spectral density.

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors x and y are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of x and y are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(x) < *NFFT* or len(y) < *NFFT*, they will be zero padded to *NFFT*.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the

scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxy

[1-D array] The values for the cross spectrum P_{xy} before scaling (complex valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxy*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*

**kwargs

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)

psd

is equivalent to setting `y = x`.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.csd*.

For plotting, the power is plotted as $10\log_{10}(P_{xy})$ for decibels, though P_{xy} itself is returned.

matplotlib.pyplot.magnitude_spectrum

matplotlib.pyplot.**magnitude_spectrum**(*x*, *, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *scale=None*, *data=None*, ***kwargs*)

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude (20 * log10). 'default' is 'linear'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the magnitude spectrum before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi

psd

Plots the power spectral density.

angle_spectrum

Plots the angles of the corresponding frequencies.

phase_spectrum

Plots the phase (unwrapped angle) of the corresponding frequencies.

specgram

Can plot the magnitude spectrum of segments within the signal in a colormap.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.magnitude_spectrum*.

matplotlib.pyplot.phase_spectrum

matplotlib.pyplot.**phase_spectrum**(*x*, *, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *data=None*, ***kwargs*)

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the phase spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

angle_spectrum

Plots the wrapped version of this function.

specgram

Can plot the phase spectrum of segments within the signal in a colormap.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.phase_spectrum`.

matplotlib.pyplot.psd

`matplotlib.pyplot.`**`psd`**(*x*, *, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, *data=None*, ***kwargs*)

Plot the power spectral density.

The power spectral density P_{xx} by Welch's average periodogram method. The vector *x* is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment *i* are averaged to compute P_{xx}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT*, it will be zero padded to *NFFT*.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed

as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxx

[1-D array] The values for the power spectrum P_{xx} before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxx*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x

**kwargs

Keyword arguments control the *Line2D* properties:

Property	Description

See also

specgram

Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

magnitude_spectrum

Plots the magnitude spectrum.

csd

Plots the spectral density between two signals.

Notes

Note

This is the *pyplot wrapper* for axes.Axes.psd.

For plotting, the power is plotted as $10\log_{10}(P_{xx})$ for decibels, though *Pxx* itself is returned.

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

matplotlib.pyplot.specgram

matplotlib.pyplot.**specgram**(*x*, *, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *cmap=None*, *xextent=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*, *scale=None*, *vmin=None*, *vmax=None*, *data=None*, ***kwargs*)

Plot a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using imshow).

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode

[{'default', 'psd', 'magnitude', 'angle', 'phase'}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

noverlap

[int, default: 128] The number of points of overlap between blocks.

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale. When *mode* is 'psd', this is dB power (10 * log10). Otherwise, this is dB amplitude (20 * log10). 'default' is 'dB' if *mode* is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if *mode* is 'angle' or 'phase'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap

[`Colormap`, default: `rcParams["image.cmap"]` (default: `'viridis'`)]

xextent

[*None* or (xmin, xmax)] The image extent along the x-axis. The default sets *xmin* to the left border of the first bin (*spectrum* column) and *xmax* to the right border of the last bin. Note that for *noverlap>0* the width of the bins is smaller than those of the segments.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x

vmin, vmax

[float, optional] vmin and vmax define the data range that the colormap covers. By default, the colormap covers the complete value range of the data.

****kwargs**

Additional keyword arguments are passed on to *imshow* which makes the specgram image. The origin keyword argument is not supported.

Returns

spectrum

[2D array] Columns are the periodograms of successive segments.

freqs

[1-D array] The frequencies corresponding to the rows in *spectrum*.

t

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

im

[*AxesImage*] The image created by imshow containing the spectrogram.

See also

psd

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

magnitude_spectrum

A single spectrum, similar to having a single segment when *mode* is 'magnitude'. Plots a line instead of a colormap.

angle_spectrum

A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

phase_spectrum

A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.specgram`.

The parameters *detrend* and *scale_by_freq* do only apply when *mode* is set to 'psd'.

Examples using `matplotlib.pyplot.specgram`

matplotlib.pyplot.xcorr

matplotlib.pyplot.**xcorr**(*x*, *y*, *, *normed=True*, *detrend=<function detrend_none>*, *usevlines=True*, *maxlags=10*, *data=None*, ***kwargs*)

Plot the cross correlation between *x* and *y*.

The correlation with lag k is defined as $\sum_n x[n+k] \cdot y^*[n]$, where y^* is the complex conjugate of y.

Parameters

x, y

[array-like of length n] Neither *x* nor *y* are run through Matplotlib's unit conversion, so these should be unit-less arrays.

detrend

[callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to *x* and *y*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the xcorr value using `Axes.vlines`. Additionally, a horizontal line is plotted at y=0 using `Axes.axhline`.

If `False`, markers are plotted at the xcorr values using `Axes.plot`.

maxlags

[int, default: 10] Number of lags to show. If None, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the Axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.xcorr*.

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Examples using `matplotlib.pyplot.xcorr`

Statistics

ecdf	Compute and plot the empirical cumulative distribution function of *x*.
boxplot	Draw a box and whisker plot.
violinplot	Make a violin plot.

matplotlib.pyplot.ecdf

matplotlib.pyplot.**ecdf**(*x*, *weights=None*, ***, *complementary=False*, *orientation='vertical'*, *compress=False*, *data=None*, ***kwargs*)

Compute and plot the empirical cumulative distribution function of *x*.

Added in version 3.8.

Parameters

x

[1d array-like] The input data. Infinite entries are kept (and move the relevant end of the ecdf from 0/1), but NaNs and masked values are errors.

weights

[1d array-like or None, default: None] The weights of the entries; must have the same shape as *x*. Weights corresponding to NaN data points are dropped, and then the remaining weights are normalized to sum to 1. If unset, all entries have the same weight.

complementary

[bool, default: False] Whether to plot a cumulative distribution function, which increases from 0 to 1 (the default), or a complementary cumulative distribution function, which decreases from 1 to 0.

orientation

[{"vertical", "horizontal"}, default: "vertical"] Whether the entries are plotted along the x-axis ("vertical", the default) or the y-axis ("horizontal"). This parameter takes the same values as in *hist*.

compress

[bool, default: False] Whether multiple entries with the same values are grouped together (with a summed weight) before plotting. This is mainly useful if *x* contains many identical data points, to decrease the rendering complexity of the plot. If *x* contains no duplicate points, this has no effect and just uses some time and memory.

Returns

Line2D

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *weights*

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.ecdf*.

The ecdf plot can be thought of as a cumulative histogram with one bin per data entry; i.e. it reports on the entire dataset without any arbitrary binning.

If *x* contains NaNs or masked entries, either remove them first from the array (if they should not taken into account), or replace them by -inf or +inf (if they should be sorted at the beginning or the end of the array).

Examples using `matplotlib.pyplot.ecdf`

matplotlib.pyplot.boxplot

matplotlib.pyplot.**boxplot**(*x*, *, *notch=None*, *sym=None*, *vert=None*, *orientation='vertical'*, *whis=None*, *positions=None*, *widths=None*, *patch_artist=None*, *bootstrap=None*, *usermedians=None*, *conf_intervals=None*, *meanline=None*, *showmeans=None*, *showcaps=None*, *showbox=None*, *showfliers=None*, *boxprops=None*, *tick_labels=None*, *flierprops=None*, *medianprops=None*, *meanprops=None*, *capprops=None*, *whiskerprops=None*, *manage_ticks=True*, *autorange=False*, *zorder=None*, *capwidths=None*, *label=None*, *data=None*)

Draw a box and whisker plot.

The box extends from the first quartile (Q1) to the third quartile (Q3) of the data, with a line at the median. The whiskers extend from the box to the farthest data point lying within 1.5x the inter-quartile

range (IQR) from the box. Flier points are those past the end of the whiskers. See https://en.wikipedia.org/wiki/Box_plot for reference.

```
     Q1-1.5IQR   Q1   median  Q3   Q3+1.5IQR
                  |-----:-----|
  o      |--------|     :     |--------|    o  o
                  |-----:-----|
flier             <----------->            fliers
                       IQR
```

Parameters

x

[Array or a sequence of vectors.] The input data. If a 2D array, a boxplot is drawn for each column in *x*. If a sequence of 1D arrays, a boxplot is drawn for each array in *x*.

notch

[bool, default: *rcParams["boxplot.notch"]* (default: `False`)] Whether to draw a notched boxplot (`True`), or a rectangular boxplot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for *bootstrap* describes how the locations of the notches are computed by default, but their locations may also be overridden by setting the *conf_intervals* parameter.

> **Note**
>
> In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

sym

[str, optional] The default symbol for flier points. An empty string ('') hides the fliers. If `None`, then the fliers default to 'b+'. More control is provided by the *flierprops* parameter.

vert

[bool, optional] Deprecated since version 3.11: Use *orientation* instead.

This is a pending deprecation for 3.10, with full deprecation in 3.11 and removal in 3.13. If this is given during the deprecation period, it overrides the *orientation* parameter.

If True, plots the boxes vertically. If False, plots the boxes horizontally.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', plots the boxes horizontally. Otherwise, plots the boxes vertically.

Added in version 3.10.

whis

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above `Q1 - whis*(Q3-Q1)`, and the upper whisker at the highest datum below `Q3 + whis*(Q3-Q1)`, where Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data.

In the edge case where `Q1 == Q3`, *whis* is automatically set to (0, 100) (cover the whole range of the data) if *autorange* is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

bootstrap

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If *bootstrap* is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

usermedians

[1D array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

conf_intervals

[array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not None forces the location of the corresponding notch (which is only drawn if *notch* is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., *bootstrap*).

positions

[array-like, optional] The positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where N is the number of boxes to be drawn.

widths

[float or array-like] The widths of the boxes. The default is 0.5, or `0.15*(distance between extreme positions)`, if that is smaller.

patch_artist

[bool, default: *rcParams["boxplot.patchartist"]* (default: `False`)] If `False` produces boxes with the Line2D artist. Otherwise, boxes are drawn with Patch artists.

tick_labels

[list of str, optional] The tick labels of each boxplot. Ticks are always placed at the box *positions*. If *tick_labels* is given, the ticks are labelled accordingly. Otherwise, they keep their numeric values.

Changed in version 3.9: Renamed from *labels*, which is deprecated since 3.9 and will be removed in 3.11.

manage_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

autorange

[bool, default: False] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, *whis* is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

meanline

[bool, default: *rcParams["boxplot.meanline"]* (default: `False`)] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops* (see below). Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

zorder

[float, default: `Line2D.zorder = 2`] The zorder of the boxplot.

Returns

dict

A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.

- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Other Parameters

showcaps

[bool, default: *rcParams["boxplot.showcaps"]* (default: `True`)] Show the caps on the ends of whiskers.

showbox

[bool, default: *rcParams["boxplot.showbox"]* (default: `True`)] Show the central box.

showfliers

[bool, default: *rcParams["boxplot.showfliers"]* (default: `True`)] Show the outliers beyond the caps.

showmeans

[bool, default: *rcParams["boxplot.showmeans"]* (default: `False`)] Show the arithmetic means.

capprops

[dict, default: None] The style of the caps.

capwidths

[float or array, default: None] The widths of the caps.

boxprops

[dict, default: None] The style of the box.

whiskerprops

[dict, default: None] The style of the whiskers.

flierprops

[dict, default: None] The style of the fliers.

medianprops

[dict, default: None] The style of the median.

meanprops

[dict, default: None] The style of the mean.

label

[str or list of str, optional] Legend labels. Use a single string when all boxes have the same style and you only want a single legend entry for them. Use a list of strings to label all boxes individually. To be distinguishable, the boxes should

be styled individually, which is currently only possible by modifying the returned artists, see e.g. *Boxplots*.

In the case of a single string, the legend entry will technically be associated with the first box only. By default, the legend will show the median line (`result["medians"]`); if *patch_artist* is True, the legend will show the box `Patch` artists (`result["boxes"]`) instead.

Added in version 3.9.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

See also

Axes.bxp

Draw a boxplot from pre-computed statistics.

violinplot

Draw an estimate of the probability density function.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.boxplot`.

Examples using `matplotlib.pyplot.boxplot`

matplotlib.pyplot.violinplot

`matplotlib.pyplot.`**`violinplot`**(*dataset*, *positions=None*, ***, *vert=None*, *orientation='vertical'*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*, *quantiles=None*, *points=100*, *bw_method=None*, *side='both'*, *data=None*)

Make a violin plot.

Make a violin plot for each column of *dataset* or each vector in sequence *dataset*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

Parameters

dataset

[Array or a sequence of vectors.] The input data.

positions

[array-like, default: [1, 2, ..., n]] The positions of the violins; i.e. coordinates on the x-axis for vertical violins (or y-axis for horizontal violins).

vert

[bool, optional] Deprecated since version 3.10: Use *orientation* instead.

If this is given during the deprecation period, it overrides the *orientation* parameter.

If True, plots the violins vertically. If False, plots the violins horizontally.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', plots the violins horizontally. Otherwise, plots the violins vertically.

Added in version 3.10.

widths

[float or array-like, default: 0.5] The maximum width of each violin in units of the *positions* axis. The default is 0.5, which is half the available space when using default *positions*.

showmeans

[bool, default: False] Whether to show the mean with a line.

showextrema

[bool, default: True] Whether to show extrema with a line.

showmedians

[bool, default: False] Whether to show the median with a line.

quantiles

[array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.

points

[int, default: 100] The number of points to evaluate each of the gaussian kernel density estimations at.

bw_method

[{'scott', 'silverman'} or float or callable, default: 'scott'] The method used to calculate the estimator bandwidth. If a float, this will be used directly as `kde.factor`. If a callable, it should take a *matplotlib.mlab.GaussianKDE* instance as its only parameter and return a float.

side

[{'both', 'low', 'high'}, default: 'both'] 'both' plots standard violins. 'low'/'high' only plots the side below/above the positions value.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

dataset

Returns

dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *`PolyCollection`* instances containing the filled area of each violin.
- `cmeans`: A *`LineCollection`* instance that marks the mean values of each of the violin's distribution.
- `cmins`: A *`LineCollection`* instance that marks the bottom of each violin's distribution.
- `cmaxes`: A *`LineCollection`* instance that marks the top of each violin's distribution.
- `cbars`: A *`LineCollection`* instance that marks the centers of each violin's distribution.
- `cmedians`: A *`LineCollection`* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *`LineCollection`* instance created to identify the quantile values of each of the violin's distribution.

See also

`Axes.violin`

Draw a violin from pre-computed statistics.

`boxplot`

Draw a box and whisker plot.

Notes

Note

This is the *pyplot wrapper* for *`axes.Axes.violinplot`*.

Examples using `matplotlib.pyplot.violinplot`

Binned

hexbin	Make a 2D hexagonal binning plot of points *x*, *y*.
hist	Compute and plot a histogram.
hist2d	Make a 2D histogram plot.
stairs	Draw a stepwise constant function as a line or a filled plot.

matplotlib.pyplot.hexbin

matplotlib.pyplot.**hexbin**(*x*, *y*, *C=None*, ***, *gridsize=100*, *bins=None*, *xscale='linear'*, *yscale='linear'*, *extent=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *edgecolors='face'*, *reduce_C_function=<function mean>*, *mincnt=None*, *marginals=False*, *colorizer=None*, *data=None*, ***kwargs*)

Make a 2D hexagonal binning plot of points *x*, *y*.

If *C* is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, *C* specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using *reduce_C_function*.

Parameters

x, y

[array-like] The data positions. *x* and *y* must be of the same length.

C

[array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as *x* and *y*.

gridsize

[int or (int, int), default: 100] If a single int, the number of hexagons in the *x*-direction. The number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple (*nx*, *ny*), the number of hexagons in the *x*-direction and the *y*-direction. In the *y*-direction, counting is done along vertically aligned hexagons, not along the zig-zag chains of hexagons; see the following illustration.

To get approximately regular hexagons, choose $n_x = \sqrt{3}\,n_y$.

bins

['log' or int or sequence, default: None] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.
- If 'log', use a logarithmic scale for the colormap. Internally, $log_{10}(i+1)$ is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
- If a sequence of values, the values of the lower bound of the bins to be used.

xscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

yscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

mincnt

[int >= 0, default: *None*] If not *None*, only display cells with at least *mincnt* number of points in the cell.

marginals

[bool, default: *False*] If marginals is *True*, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

extent

[4-tuple of float, default: *None*] The limits of the bins (xmin, xmax, ymin, ymax). The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Returns

PolyCollection

A *PolyCollection* defining the hexagonal bins.

- *PolyCollection.get_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers in data coordinates.
- *PolyCollection.get_array* contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

Other Parameters

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

alpha

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float, default: *None*] If *None*, defaults to *rcParams["patch.linewidth"]* (default: `1.0`).

edgecolors

[{'face', 'none', *None*} or color, default: 'face'] The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

reduce_C_function

[callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.amax`: value taken from the largest point

By default will only reduce cells with at least 1 point because some reduction functions (such as `numpy.amax`) will error/warn with empty input. Changing *mincnt* will adjust the cutoff, and if set to 0 will pass empty input to the reduction function.

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*, *C*

****kwargs**

[*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown

Table 255 – continu

Property	Description

hist2d

2D histogram rectangular bins

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.hexbin*.

Examples using `matplotlib.pyplot.hexbin`

matplotlib.pyplot.hist

matplotlib.pyplot.**hist**(*x*, *bins=None*, ***, *range=None*, *density=False*, *weights=None*, *cumulative=False*, *bottom=None*, *histtype='bar'*, *align='mid'*, *orientation='vertical'*, *rwidth=None*, *log=False*, *color=None*, *label=None*, *stacked=False*, *data=None*, ***kwargs*)

Compute and plot a histogram.

This method uses `numpy.histogram` to bin the data in *x* and count the number of values in each bin, then draws the distribution either as a *`BarContainer`* or *`Polygon`*. The *bins*, *range*, *density*, and *weights* parameters are forwarded to `numpy.histogram`.

If the data has already been binned and counted, use *`bar`* or *`stairs`* to plot the distribution:

```
counts, bins = np.histogram(x)
plt.stairs(counts, bins)
```

Alternatively, plot pre-computed bins and counts using `hist()` by treating each bin as a single point with a weight equal to its count:

```
plt.hist(bins[:-1], bins, weights=counts)
```

The data input *x* can be a singular array, a list of datasets of potentially different lengths ([*x0*, *x1*, ...]), or a 2D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form. If the input is an array, then the return value is a tuple (*n*, *bins*, *patches*); if the input is a sequence of arrays, then the return value is a tuple ([*n0*, *n1*, ...], *bins*, [*patches0*, *patches1*, ...]).

Masked arrays are not supported.

Parameters

x

[(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

bins

[int or sequence or str, default: *`rcParams["hist.bins"]`* (default: `10`)] If *bins* is an integer, it defines the number of equal-width bins in the range.

If *bins* is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if *bins* is:

```
[1, 2, 3, 4]
```

then the first bin is `[1, 2)` (including 1, but excluding 2) and the second `[2, 3)`. The last bin, however, is `[3, 4]`, which *includes* 4.

If *bins* is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

range

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, *range* is `(x.min(), x.max())`. Range has no effect if *bins* is a sequence.

If *bins* is a sequence or *range* is specified, autoscaling is based on the specified bin range instead of the range of x.

density

[bool, default: False] If `True`, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* (`density = counts / (sum(counts) * np.diff(bins))`), so that the area under the histogram integrates to 1 (`np.sum(density * np.diff(bins)) == 1`).

If *stacked* is also `True`, the sum of the histograms is normalized to 1.

weights

[(n,) array-like or None, default: None] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count (instead of 1). If *density* is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

cumulative

[bool or -1, default: False] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also `True` then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also `True`, then the histogram is normalized such that the first bin equals 1.

bottom

[array-like or float, default: 0] Location of the bottom of each bin, i.e. bins are drawn from `bottom` to `bottom + hist(x, bins)` If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

histtype

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.

- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

align

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', *barh* will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

rwidth

[float or None, default: None] The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if *histtype* is 'step' or 'stepfilled'.

log

[bool, default: False] If `True`, the histogram axis will be set to a log scale.

color

[*color* or list of *color* or None, default: None] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

label

[str or list of str, optional] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that *legend* will work as expected.

stacked

[bool, default: False] If `True`, multiple data are stacked on top of each other If `False` multiple data are arranged side by side if histtype is 'bar' or on top of each other if histtype is 'step'

Returns

n

[array or list of arrays] The values of the histogram bins. See *density* and *weights* for a description of the possible semantics. If input *x* is an array, then this is an array of length *nbins*. If input is a sequence of arrays `[data1, data2, ...]`, then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array *n* (or of its element arrays) will always be float even if no weighting or normalization is used.

bins

[array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

patches

[*BarContainer* or list of a single *Polygon* or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *weights*

****kwargs**

Patch properties. The following properties additionally accept a sequence of values corresponding to the datasets in *x*: *edgecolor*, *facecolor*, *linewidth*, *linestyle*, *hatch*.

Added in version 3.10: Allowing sequences of values in above listed Patch properties.

hist2d

2D histogram with rectangular bins

hexbin

2D histogram with hexagonal bins

stairs

Plot a pre-computed histogram

bar

Plot a pre-computed histogram

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.hist*.

For large numbers of bins (>1000), plotting can be significantly accelerated by using *stairs* to plot a pre-computed histogram (`plt.stairs(*np.histogram(data))`), or by setting *histtype* to 'step' or 'stepfilled' rather than 'bar' or 'barstacked'.

Examples using `matplotlib.pyplot.hist`

matplotlib.pyplot.hist2d

matplotlib.pyplot.**hist2d**(*x*, *y*, *bins=10*, ***, *range=None*, *density=False*, *weights=None*, *cmin=None*, *cmax=None*, *data=None*, ***kwargs*)

Make a 2D histogram plot.

Parameters

x, y

[array-like, shape (n,)] Input values

bins

[None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (`nx = ny = bins`).
- If `[int, int]`, the number of bins in each dimension (`nx, ny = bins`).
- If array-like, the bin edges for the two dimensions (`x_edges = y_edges = bins`).
- If `[array, array]`, the bin edges in each dimension (`x_edges, y_edges = bins`).

The default value is 10.

range

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): `[[xmin, xmax], [ymin, ymax]]`. All values outside of this range will be considered outliers and not tallied in the histogram.

density

[bool, default: False] Normalize histogram. See the documentation for the *density* parameter of *hist* for more details.

weights

[array-like, shape (n,), optional] An array of values w_i weighing each sample (x_i, y_i).

cmin, cmax

[float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to *pcolormesh*) and these count values in the return value count histogram will also be set to nan upon return.

Returns

h

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges

[1D array] The bin edges along the x-axis.

yedges

[1D array] The bin edges along the y-axis.

image

[*QuadMesh*]

Other Parameters

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

alpha

[`0 <= scalar <= 1` or `None`, optional] The alpha blending value.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*, *weights*

****kwargs**

Additional parameters are passed along to the *pcolormesh* method and *QuadMesh* constructor.

See also

hist

1D histogram plotting

hexbin

2D histogram with hexagonal bins

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.hist2d*.

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a *colors.LogNorm* instance to the *norm* keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with *colors.PowerNorm*.

Examples using `matplotlib.pyplot.hist2d`

matplotlib.pyplot.stairs

`matplotlib.pyplot.`**`stairs`**(*values*, *edges=None*, ***, *orientation='vertical'*, *baseline=0*, *fill=False*, *data=None*, ***kwargs*)

Draw a stepwise constant function as a line or a filled plot.

edges define the x-axis positions of the steps. *values* the function values between these steps. Depending on *fill*, the function is drawn either as a continuous line with vertical segments at the edges, or as a filled area.

Parameters

values

[array-like] The step heights.

edges

[array-like] The step positions, with `len(edges) == len(vals) + 1`, between which the curve takes on vals values.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The direction of the steps. Vertical means that *values* are along the y-axis, and edges are along the x-axis.

baseline

[float, array-like or None, default: 0] The bottom value of the bounding edges or when `fill=True`, position of lower edge. If *fill* is True or an array is passed to *baseline*, a closed path is drawn.

If None, then drawn as an unclosed Path.

fill

[bool, default: False] Whether the area under the step curve should be filled.

Passing both `fill=True` ` and ``baseline=None` will likely result in undesired filling: the first and last points will be connected with a straight line and the fill will be between this line and the stairs.

Returns

StepPatch

[*StepPatch*]

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

StepPatch properties

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.stairs*.

Examples using `matplotlib.pyplot.stairs`

Contours

clabel	Label a contour plot.
contour	Plot contour lines.
contourf	Plot filled contours.

matplotlib.pyplot.clabel

matplotlib.pyplot.**clabel**(*CS*, *levels=None*, ***kwargs*)

Label a contour plot.

Adds labels to line contours in given *ContourSet*.

Parameters

CS

[*ContourSet* instance] Line contours to label.

levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

****kwargs**

All other parameters are documented in *clabel*.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.clabel*.

Examples using `matplotlib.pyplot.clabel`

matplotlib.pyplot.contour

matplotlib.pyplot.**contour**(**args*, *data=None*, ***kwargs*)

Plot contour lines.

Call signature:

```
contour([X, Y,] Z, /, [levels], **kwargs)
```

The arguments *X*, *Y*, *Z* are positional-only.

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == N` is the number of columns in *Z* and `len(Y) == M` is the number of rows in *Z*.

X and *Y* must both be ordered monotonically.

If not given, they are assumed to be integer indices, i.e. `X = range(N), Y = range(M)`.

Z

[(M, N) array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: *rcParams["contour.corner_mask"]* (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[*color* or list of *color*, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, a single color may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color.

Changed in version 3.10: Previously a single color had to be expressed as a string, but now any valid color format may be passed.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note

An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call *changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls *changed()*.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend=
 ↪'both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *False*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: *rcParams["contour.linewidth"]* (default: `None`)] *Only applies to* *contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to *rcParams["lines.linewidth"]* (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will instead take their linestyle from the *negative_linestyles* argument.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

negative_linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* `contour`.

If *linestyles* is *None* and the lines are monochrome, this argument specifies the line style for negative contours.

If *negative_linestyles* is *None*, the default is taken from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`).

negative_linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[list[str], optional] *Only applies to* `contourf`.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour.

algorithm

[{'mpl2005', 'mpl2014', 'serial', 'threaded'}, optional] Which contouring algorithm to use to calculate the contour lines and polygons. The algorithms are implemented in ContourPy, consult the ContourPy documentation for further information.

The default is taken from `rcParams["contour.algorithm"]` (default: `'mpl2014'`).

clip_path

[`Patch` or `Path` or `TransformedPath`] Set the clip path. See `set_clip_path`.

Added in version 3.8.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.contour`.

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.

2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

3. *contour* and *contourf* use a marching squares algorithm to compute contour locations. More information can be found in ContourPy documentation.

Examples using `matplotlib.pyplot.contour`

matplotlib.pyplot.contourf

matplotlib.pyplot.**contourf**(**args*, *data=None*, ***kwargs*)

Plot filled contours.

Call signature:

```
contourf([X, Y,] Z, /, [levels], **kwargs)
```

The arguments *X*, *Y*, *Z* are positional-only.

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == N` is the number of columns in *Z* and `len(Y) == M` is the number of rows in *Z*.

X and *Y* must both be ordered monotonically.

If not given, they are assumed to be integer indices, i.e. `X = range(N), Y = range(M)`.

Z

[(M, N) array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: *rcParams["contour.corner_mask"]* (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[*color* or list of *color*, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, a single color may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color.

Changed in version 3.10: Previously a single color had to be expressed as a string, but now any valid color format may be passed.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).

- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note

An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call *changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls *changed()*.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend=
 ↪'both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *False*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: *rcParams["contour.linewidth"]* (default: None)] *Only applies to* *contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to *rcParams["lines.linewidth"]* (default: 1.5).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will instead take their linestyle from the *negative_linestyles* argument.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

negative_linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None* and the lines are monochrome, this argument specifies the line style for negative contours.

If *negative_linestyles* is *None*, the default is taken from *rcParams["contour.negative_linestyle"]* (default: 'dashed').

negative_linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[list[str], optional] *Only applies to* *contourf*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour.

algorithm

[{'mpl2005', 'mpl2014', 'serial', 'threaded'}, optional] Which contouring algorithm to use to calculate the contour lines and polygons. The algorithms are implemented in ContourPy, consult the ContourPy documentation for further information.

The default is taken from *rcParams["contour.algorithm"]* (default: 'mpl2014').

clip_path

[*Patch* or *Path* or *TransformedPath*] Set the clip path. See *set_clip_path*.

Added in version 3.8.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

Notes

> **Note**
>
> This is the *pyplot wrapper* for *axes.Axes.contourf*.

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).
3. *contour* and *contourf* use a marching squares algorithm to compute contour locations. More information can be found in ContourPy documentation.

Examples using `matplotlib.pyplot.contourf`

2D arrays

imshow	Display data as an image, i.e., on a 2D regular raster.
matshow	Display a 2D array as a matrix in a new figure window.
pcolor	Create a pseudocolor plot with a non-regular rectangular grid.
pcolormesh	Create a pseudocolor plot with a non-regular rectangular grid.
spy	Plot the sparsity pattern of a 2D array.
figimage	Add a non-resampled image to the figure.

matplotlib.pyplot.imshow

matplotlib.pyplot.**imshow**(*X*, *cmap=None*, *norm=None*, ***, *aspect=None*, *interpolation=None*, *alpha=None*, *vmin=None*, *vmax=None*, *colorizer=None*, *origin=None*, *extent=None*, *interpolation_stage=None*, *filternorm=True*, *filterrad=4.0*, *resample=None*, *url=None*, *data=None*, ***kwargs*)

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image, set up the colormapping using the parameters `cmap='gray', vmin=0, vmax=255`.

The number of pixels used to render an image is set by the Axes size and the figure *dpi*. This can lead to aliasing artifacts when the image is resampled, because the displayed image size will usually not match the size of *X* (see *Image resampling*). The resampling can be controlled via the *interpolation* parameter and/or *rcParams["image.interpolation"]* (default: `'auto'`).

Parameters

X

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *X* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In

that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *X* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *X* is RGB(A).

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

This parameter is ignored if *X* is RGB(A).

aspect

[{'equal', 'auto'} or float or None, default: None] The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.

Normally, None (the default) means to use *rcParams["image.aspect"]* (default: `'equal'`). However, if the image uses a transform that does not contain the axes data transform, then None means to not modify the axes aspect at all (in that case, directly call *Axes.set_aspect* if desired).

interpolation

[str, default: *rcParams["image.interpolation"]* (default: `'auto'`)] The interpolation method used.

Supported values are 'none', 'auto', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'.

The data *X* is resampled to the pixel size of the image on the figure canvas, using the interpolation method to either up- or downsample the data.

If *interpolation* is 'none', then for the ps, pdf, and svg backends no down- or upsampling occurs, and the image data is passed to the backend as a native image. Note

that different ps, pdf, and svg viewers may display these raw pixels differently. On other backends, 'none' is the same as 'nearest'.

If *interpolation* is the default 'auto', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See *Interpolations for imshow* for an overview of the supported interpolation methods, and *Image resampling* for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

interpolation_stage

[{'auto', 'data', 'rgba'}, default: 'auto'] Supported values:

- 'data': Interpolation is carried out on the data provided by the user This is useful if interpolating between pixels during upsampling.
- 'rgba': The interpolation is carried out in RGBA-space after the color-mapping has been applied. This is useful if downsampling and combining pixels visually.
- 'auto': Select a suitable interpolation stage automatically. This uses 'rgba' when downsampling, or upsampling at a rate less than 3, and 'data' when upsampling at a higher rate.

See *Image resampling* for a discussion of image antialiasing.

alpha

[float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axis points upward for 'lower' but downward for 'upper'.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

extent

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. These values may be unitful and match the units of the Axes. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For `origin == 'upper'` the default is `(-0.5, numcols-0.5, numrows-0.5, -0.5)`.
- For `origin == 'lower'` the default is `(-0.5, numcols-0.5, -0.5, numrows-0.5)`.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: *rcParams["image.resample"]* (default: `True`)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

url

[str, optional] Set the url of the created *AxesImage*. See *Artist.set_url*.

Returns

AxesImage

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

[*Artist* properties] These parameters are passed on to the constructor of the *AxesImage* artist.

See also

matshow

Plot a matrix or an array as an image.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.imshow`.

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

`imshow` expects RGB images adopting the straight (unassociated) alpha representation.

Examples using `matplotlib.pyplot.imshow`

matplotlib.pyplot.matshow

`matplotlib.pyplot.`**`matshow`**(*A*, *fignum=None*, ***kwargs*)

Display a 2D array as a matrix in a new figure window.

The origin is set at the upper left hand corner. The indexing is `(row, column)` so that the first index runs vertically and the second index runs horizontally in the figure:

```
A[0, 0]   … A[0, M-1]
   ⋮              ⋮
A[N-1, 0] … A[N-1, M-1]
```

The aspect ratio of the figure window is that of the array, unless this would make an excessively short or narrow figure.

Tick labels for the xaxis are placed on top.

Parameters

A

[2D array-like] The matrix to be displayed.

fignum

[None or int] If *None*, create a new, appropriately sized figure window.

If 0, use the current Axes (creating one if there is none, without ever adjusting the figure size).

Otherwise, create a new Axes on the figure with the given number (creating it at the appropriate size if it does not exist, but not adjusting the figure size otherwise). Note that this will be drawn on top of any preexisting Axes on the figure.

Returns

AxesImage

Other Parameters

****kwargs**

[*imshow* arguments]

Examples using `matplotlib.pyplot.matshow`

matplotlib.pyplot.pcolor

`matplotlib.pyplot.`**`pcolor`**(**args*, *shading=None*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *colorizer=None*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, /, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

The arguments *X*, *Y*, *C* are positional-only.

Hint

`pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster *pcolormesh* instead. See *Differences between pcolor() and pcolormesh()* for a discussion of the differences.

Parameters

C

[2D array-like] The color-mapped values. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])         (X[i+1, j+1], Y[i+1, j+1])
                       ●———●
                       |   |
                       ●———●
    (X[i, j], Y[i, j])         (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). The color `C[i, j]` will be centered on `(X[i, j], Y[i, j])`.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

shading

[{'flat', 'nearest', 'auto'}, default: *rcParams["pcolor.shading"]* (default: `'auto'`)] The fill style for the quadrilateral. Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See *pcolormesh grids and shading* for more description.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- *None*: *rcParams["patch.edgecolor"]* (default: `'black'`) will be used. Note that currently *rcParams["patch.force_edgecolor"]* (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.PolyQuadMesh

Other Parameters

antialiaseds

[bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not "none", then the default *antialiaseds* is taken from `rcParams["patch.antialiased"]` (default: `True`). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

Additionally, the following arguments are allowed. They are passed along to the *PolyQuadMesh* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*

Table 258 – continu

Property	Description
offsets	(N, 2) or (2,) array-like
path_effects	list of AbstractPathEffect
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

See also

pcolormesh

for an explanation of the differences between pcolor and pcolormesh.

imshow

If *X* and *Y* are each equidistant, imshow can be a faster alternative.

Notes

Note

This is the *pyplot wrapper* for axes.Axes.pcolor.

Masked arrays

X, *Y* and *C* may be masked arrays. If either `C[i, j]`, or one of the vertices surrounding `C[i, j]` (*X* or *Y* at `[i, j]`, `[i+1, j]`, `[i, j+1]`, `[i+1, j+1]`) is masked, nothing is plotted.

Grid orientation

The grid orientation follows the standard matrix convention: An array *C* with shape (nrows, ncolumns) is plotted with the column number as *X* and the row number as *Y*.

Examples using `matplotlib.pyplot.pcolor`

matplotlib.pyplot.pcolormesh

matplotlib.pyplot.**pcolormesh**(**args*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *colorizer=None*, *shading=None*, *antialiased=False*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y,] C, /, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

The arguments *X*, *Y*, *C* are positional-only.

Hint

pcolormesh is similar to *pcolor*. It is much faster and preferred in most cases. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

Parameters

C

[array-like] The mesh data. Supported array shapes are:

- (M, N) or M*N: a mesh with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the mesh data.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])         (X[i+1, j+1], Y[i+1,␣
↪j+1])
                          ●────●
                          │    │
                          ●────●
    (X[i, j], Y[i, j])         (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). For `'nearest'` the color `C[i, j]` is centered on `(X[i, j], Y[i, j])`. For `'gouraud'`, a smooth interpolation is carried out between the quadrilateral corners.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.

- *None*: *rcParams["patch.edgecolor"]* (default: 'black') will be used. Note that currently *rcParams["patch.force_edgecolor"]* (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

shading

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to *rcParams["pcolor.shading"]* (default: 'auto'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by C[i, j]. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners (i', j') are given by C[i', j']. The color values of the area in between is interpolated from the corner values. The dimensions of *X* and *Y* must be the same as *C*. When Gouraud shading is used, *edgecolors* is ignored.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See *pcolormesh grids and shading* for more description.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

rasterized

[bool, optional] Rasterize the pcolormesh when drawing vector graphics. This can speed up rendering and produce smaller files for large data sets. See also *Rasterization for vector graphics*.

Returns

matplotlib.collections.QuadMesh

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

Additionally, the following arguments are allowed. They are passed along to the *QuadMesh* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None

Table 259 – continu

pcolor

An alternative implementation with slightly different features. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

imshow

If *X* and *Y* are each equidistant, `imshow` can be a faster alternative.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.pcolormesh`.

Masked arrays

C may be a masked array. If `C[i, j]` is masked, the corresponding quadrilateral will be transparent. Masking of *X* and *Y* is not supported. Use `pcolor` if you need this functionality.

Grid orientation

The grid orientation follows the standard matrix convention: An array *C* with shape (nrows, ncolumns) is plotted with the column number as *X* and the row number as *Y*.

Differences between pcolor() and pcolormesh()

Both methods are used to create a pseudocolor plot of a 2D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyQuadMesh`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for *C*. However, only `pcolor` supports masked arrays for *X* and *Y*. The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the PolyQuadMesh. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the PolyQuadMesh. Because PolyQuadMesh draws each individual polygon, it also supports applying hatches and linestyles to the collection.

Another difference is the support of Gouraud shading in *pcolormesh*, which is not available with *pcolor*.

Examples using `matplotlib.pyplot.pcolormesh`

matplotlib.pyplot.spy

matplotlib.pyplot.**spy**(*Z*, *, *precision=0*, *marker=None*, *markersize=None*, *aspect='equal'*, *origin='upper'*, ***kwargs*)

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

Image style

If *marker* and *markersize* are *None*, *imshow* is used. Any extra remaining keyword arguments are passed to this method.

Marker style

If *Z* is a `scipy.sparse.spmatrix` or *marker* or *markersize* are *None*, a *Line2D* object will be returned with the value of marker determining the marker type, and any remaining keyword arguments passed to *plot*.

Parameters

Z

[(M, N) array-like] The array to be plotted.

precision

[float or 'present', default: 0] If *precision* is 0, any non-zero value will be plotted. Otherwise, values of $|Z| > precision$ will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

aspect

[{'equal', 'auto', None} or float, default: 'equal'] The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.
- *None*: Use *rcParams["image.aspect"]* (default: `'equal'`).

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention 'upper' is typically used for matrices and images.

Returns

AxesImage* or *Line2D

The return type depends on the plotting style (see above).

Other Parameters

****kwargs**

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of *imshow*:

- *cmap*
- *alpha*
- *url*
- any *Artist* properties (passed on to the *AxesImage*)

For the marker style, you can pass any *Line2D* property except for *linestyle*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or *aa*	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or *ds*	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	*Figure* or *SubFigure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	*color* or None
gid	str
in_layout	bool
label	object

Table 260 – continued fro

Property	Description
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or *mec*	*color*
markeredgewidth or *mew*	float
markerfacecolor or *mfc*	*color*
markerfacecoloralt or *mfcalt*	*color*
markersize or *ms*	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, f
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.spy*.

Examples using `matplotlib.pyplot.spy`

matplotlib.pyplot.figimage

matplotlib.pyplot.**figimage**(*X*, *xo=0*, *yo=0*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *origin=None*, *resize=False*, *, *colorizer=None*, ***kwargs*)

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

Parameters

X

The image data. This is an array of one of the following shapes:

- (M, N): an image with scalar data. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

xo, yo

[int] The *x*/*y* image offset in pixels.

alpha

[None or float] The alpha blending value.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *X* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *X* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *X* is RGB(A).

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: 'upper')] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the Axes.

resize

[bool] If *True*, resize the figure to match the given image size.

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

This parameter is ignored if *X* is RGB(A).

Returns

matplotlib.image.FigureImage

Other Parameters

****kwargs**

Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

Notes

Note

This is the *pyplot wrapper* for *Figure.figimage*.

figimage complements the Axes image (*imshow*) which will be resampled to fit the current Axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0, 0, 1, 1].

Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

Examples using `matplotlib.pyplot.figimage`

Unstructured triangles

triplot	Draw an unstructured triangular grid as lines and/or markers.
tripcolor	Create a pseudocolor plot of an unstructured triangular grid.
tricontour	Draw contour lines on an unstructured triangular grid.
tricontourf	Draw contour regions on an unstructured triangular grid.

matplotlib.pyplot.triplot

matplotlib.pyplot.**triplot**(**args*, ***kwargs*)

Draw an unstructured triangular grid as lines and/or markers.

Call signatures:

```
triplot(triangulation, ...)
triplot(x, y, [triangles], *, [mask=mask], ...)
```

The triangular grid can be specified either by passing a *Triangulation* object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly.

Parameters

triangulation

[*Triangulation*] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See *Triangulation*. This is mutually exclusive with specifying *triangulation*.

other_parameters

All other args and kwargs are forwarded to *plot*.

Returns

lines

[*Line2D*] The drawn triangles edges.

markers

[*Line2D*] The drawn marker nodes.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.triplot`.

Examples using `matplotlib.pyplot.triplot`

matplotlib.pyplot.tripcolor

`matplotlib.pyplot.`**`tripcolor`**(**args*, *alpha=1.0*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading='flat'*, *facecolors=None*, ***kwargs*)

Create a pseudocolor plot of an unstructured triangular grid.

Call signatures:

```
tripcolor(triangulation, c, *, ...)
tripcolor(x, y, c, *, [triangles=triangles], [mask=mask], ...)
```

The triangular grid can be specified either by passing a `Triangulation` object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. See `Triangulation` for an explanation of these parameters.

It is possible to pass the triangles positionally, i.e. `tripcolor(x, y, triangles, c, ...)`. However, this is discouraged. For more clarity, pass *triangles* via keyword argument.

If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly. In this case, it does not make sense to provide colors at the triangle faces via *c* or *facecolors* because there are multiple possible triangulations for a group of points and you don't know which triangles will be constructed.

Parameters

triangulation

[`Triangulation`] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See `Triangulation`. This is mutually exclusive with specifying *triangulation*.

c

[array-like] The color values, either for the points or for the triangles. Which one is automatically inferred from the length of *c*, i.e. does it match the number of points or the number of triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the keyword argument `facecolors=c` instead of just `c`. This parameter is position-only.

facecolors

[array-like, optional] Can be used alternatively to *c* to specify colors at the triangle faces. This parameter takes precedence over *c*.

shading

[{'flat', 'gouraud'}, default: 'flat'] If 'flat' and the color values *c* are defined at points, the color values used for each triangle are from the mean c of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

colorizer

[*Colorizer* or None, default: None] The Colorizer object used to map color to data. If None, a Colorizer object is created from a *norm* and *cmap*.

Returns

PolyCollection* or *TriMesh

The result depends on *shading*: For `shading='flat'` the result is a *PolyCollection*, for `shading='gouraud'` the result is a *TriMesh*.

Other Parameters

****kwargs**

[*Collection* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.tripcolor`.

Examples using `matplotlib.pyplot.tripcolor`

matplotlib.pyplot.tricontour

matplotlib.pyplot.**tricontour**(**args*, ***kwargs*)

Draw contour lines on an unstructured triangular grid.

Call signatures:

```
tricontour(triangulation, z, [levels], ...)
tricontour(x, y, z, [levels], *, [triangles=triangles],␣
↪[mask=mask], ...)
```

The triangular grid can be specified either by passing a `Triangulation` object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. See `Triangulation` for an explanation of these parameters. If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly.

It is possible to pass *triangles* positionally, i.e. `tricontour(x, y, triangles, z, ...)`. However, this is discouraged. For more clarity, pass *triangles* via keyword argument.

Parameters

triangulation

[`Triangulation`, optional] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See `Triangulation`. This is mutually exclusive with specifying *triangulation*.

z

[array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

> **Note**
>
> All values in *z* must be finite. Hence, nan and inf values must either be removed or `set_mask` be used.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[*color* or list of *color*, optional] The colors of the levels, i.e., the contour lines.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it is repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In

that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *z* by specifying the position of `z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of z[0, 0], and (*x1*, *y1*) is the position of z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontour`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the

edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

> **Note**
>
> An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

linewidths

[float or array-like, default: *rcParams["contour.linewidth"]* (default: `None`)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to *rcParams["lines.linewidth"]* (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from *rcParams["contour.negative_linestyle"]* (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

Notes

> **Note**
>
> This is the *pyplot wrapper* for *axes.Axes.tricontour*.

Examples using `matplotlib.pyplot.tricontour`

matplotlib.pyplot.tricontourf

matplotlib.pyplot.**tricontourf**(**args*, ***kwargs*)

Draw contour regions on an unstructured triangular grid.

Call signatures:

```
tricontourf(triangulation, z, [levels], ...)
tricontourf(x, y, z, [levels], *, [triangles=triangles],␣
↪[mask=mask], ...)
```

The triangular grid can be specified either by passing a *Triangulation* object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. See *Triangulation* for an explanation of these parameters. If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly.

It is possible to pass *triangles* positionally, i.e. `tricontourf(x, y, triangles, z, ...)`. However, this is discouraged. For more clarity, pass *triangles* via keyword argument.

Parameters

triangulation

[*Triangulation*, optional] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See *Triangulation*. This is mutually exclusive with specifying *triangulation*.

z

[array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

> **Note**
>
> All values in *z* must be finite. Hence, nan and inf values must either be removed or *set_mask* be used.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[*color* or list of *color*, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it is repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a

norm instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *z* by specifying the position of `z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of z[0, 0], and (*x1*, *y1*) is the position of z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note

An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can

be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

hatches

[list[str], optional] A list of crosshatch patterns to use on the filled areas. If None, no hatching will be added to the contour.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.tricontourf*.

tricontourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.pyplot.tricontourf`

Text and annotations

annotate	Annotate the point *xy* with text *text*.
text	Add text to the Axes.
figtext	Add text to figure.
table	Add a table to an *Axes*.
arrow	[*Discouraged*] Add an arrow to the Axes.
figlegend	Place a legend on the figure.
legend	Place a legend on the Axes.

matplotlib.pyplot.annotate

matplotlib.pyplot.**annotate**(*text*, *xy*, *xytext=None*, *xycoords='data'*, *textcoords=None*, *arrowprops=None*, *annotation_clip=None*, ***kwargs*)

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

Parameters

text

[str] The text of the annotation.

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xytext

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *textcoords*.

xycoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'subfigure points'	Points from the lower left of the subfigure
'subfigure pixels'	Pixels from the lower left of the subfigure
'subfigure fraction'	Fraction of subfigure from lower left
'axes points'	Points from lower left corner of the Axes
'axes pixels'	Pixels from lower left corner of the Axes
'axes fraction'	Fraction of Axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	*(theta, r)* if not native 'data' coordinates

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. *(0, 0)* would be the lower left corner of the bounding box and *(0.5, 1)* would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple *(xcoords, ycoords)* specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced annotation* for more details.

textcoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset, in points, from the *xy* value
'offset pixels'	Offset, in pixels, from the *xy* value
'offset fontsize'	Offset, relative to fontsize, from the *xy* value

arrowprops

[dict, optional] The properties used to draw a `FancyArrowPatch` arrow between the positions *xy* and *xytext*. Defaults to None, i.e. no arrow is drawn.

For historical reasons there are two different ways to specify arrows, "simple" and "fancy":

Simple arrow:

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any `FancyArrowPatch` property

The arrow is attached to the edge of the text box, the exact position (corners or centers) depending on where it's pointing to.

Fancy arrow:

This is used if 'arrowstyle' is provided in the *arrowprops*.

Valid keys are the following `FancyArrowPatch` parameters:

Key	Description
arrowstyle	The arrow style
connectionstyle	The connection style
relpos	See below; default is (0.5, 0.5)
patchA	Default is bounding box of the text
patchB	Default is None
shrinkA	In points. Default is 2 points
shrinkB	In points. Default is 2 points
mutation_scale	Default is text size (in points)
mutation_aspect	Default is 1
?	Any `FancyArrowPatch` property

The exact starting point position of the arrow is defined by *relpos*. It's a tuple of relative coordinates of the text box, where (0, 0) is the lower left corner and (1,

1) is the upper right corner. Values <0 and >1 are supported and specify points outside the text box. By default (0.5, 0.5), so the starting point is centered in the text box.

annotation_clip

[bool or None, default: None] Whether to clip (i.e. not draw) the annotation when the annotation point *xy* is outside the Axes area.

- If *True*, the annotation will be clipped when *xy* is outside the Axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will be clipped when *xy* is outside the Axes and *xycoords* is 'data'.

****kwargs**

Additional kwargs are passed to `Text`.

Returns

Annotation

Annotations

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.annotate`.

Examples using `matplotlib.pyplot.annotate`

matplotlib.pyplot.text

`matplotlib.pyplot.`**`text`**(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to the Axes.

Add the text *s* to the Axes at location *x*, *y* in data coordinates, with a default `horizontalalignment` on the `left` and `verticalalignment` at the `baseline`. See *Text alignment*.

Parameters

x, y

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

s

[str] The text.

fontdict

[dict, default: None]

> **Discouraged**
>
> The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `text(..., **fontdict)`.

A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

Returns

Text

The created *Text* instance.

Other Parameters

****kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) flo
alpha	float or None
animated	bool
antialiased	bool
backgroundcolor	*color*
bbox	dict with properties for *patches.Fancy*
clip_box	unknown
clip_on	unknown
clip_path	unknown
color or *c*	*color*
figure	*Figure* or *SubFigure*
fontfamily or *family* or *fontname*	{FONTNAME, 'serif', 'sans-serif', 'cursive'
fontproperties or *font* or *font_properties*	*font_manager.FontProperties* or
fontsize or *size*	float or {'xx-small', 'x-small', 'small', 'medi
fontstretch or *stretch*	{a numeric value in range 0-1000, 'ultra-co
fontstyle or *style*	{'normal', 'italic', 'oblique'}
fontvariant or *variant*	{'normal', 'small-caps'}
fontweight or *weight*	{a numeric value in range 0-1000, 'ultralig

Table 2

Property	Description
gid	str
horizontalalignment or ha	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or ma	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: flo
snap	bool or None
text	object
transform	Transform
transform_rotates_text	bool
url	str
usetex	bool, default: rcParams["text.uset
verticalalignment or va	{'baseline', 'bottom', 'center', 'center_baseli
visible	bool
wrap	bool
x	float
y	float
zorder	float

Notes

Note

This is the *pyplot wrapper* for axes.Axes.text.

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the Axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

Examples using `matplotlib.pyplot.text`

matplotlib.pyplot.figtext

matplotlib.pyplot.**figtext**(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to figure.

Parameters

x, y

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

s

[str] The text string.

fontdict

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by *rcParams["font.*"]*. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

Returns

Text

Other Parameters

****kwargs**

[*Text* properties] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) flo
alpha	float or None
animated	bool

pyplot.text

Notes

Note

This is the *pyplot wrapper* for `Figure.text`.

matplotlib.pyplot.table

matplotlib.pyplot.**table**(*cellText=None*, *cellColours=None*, *cellLoc='right'*, *colWidths=None*, *rowLabels=None*, *rowColours=None*, *rowLoc='left'*, *colLabels=None*, *colColours=None*, *colLoc='center'*, *loc='bottom'*, *bbox=None*, *edges='closed'*, ***kwargs*)

Add a table to an `Axes`.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the `Table` class and add it to the Axes with `Axes.add_table`.

Parameters

cellText

[2D list of str or pandas.DataFrame, optional] The texts to place into the table cells.

Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

cellColours

[2D list of *color*, optional] The background colors of the cells.

cellLoc

[{'right', 'center', 'left'}] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of *1 / ncols*.

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of *color*, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of *color*, optional] The colors of the column header cells.

colLoc

[{'center', 'left', 'right'}] The text alignment of the column header cells.

loc

[str, default: 'bottom'] The position of the cell with respect to *ax*. This must be one of the `codes`.

bbox

[`Bbox` or [xmin, ymin, width, height], optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

edges

[{'closed', 'open', 'horizontal', 'vertical'} or substring of 'BRTL'] The cell edges to be drawn with a line. See also `visible_edges`.

Returns

`Table`

The created table.

Other Parameters

****kwargs**

`Table` properties.

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure or SubFigure
fontsize	float
gid	str
in_layo	bool
label	object
mouseov	bool
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.table`.

Examples using `matplotlib.pyplot.table`

matplotlib.pyplot.arrow

`matplotlib.pyplot.`**`arrow`**(*x*, *y*, *dx*, *dy*, ***kwargs*)

[*Discouraged*] Add an arrow to the Axes.

This draws an arrow from `(x, y)` to `(x+dx, y+dy)`.

Discouraged

The use of this method is discouraged because it is not guaranteed that the arrow renders reasonably. For example, the resulting arrow is affected by the Axes aspect ratio and limits, which may distort the arrow.

Consider using *annotate* without a text instead, e.g.

```
ax.annotate("", xytext=(0, 0), xy=(0.5, 0.5),
            arrowprops=dict(arrowstyle="->"))
```

Parameters

x, y

[float] The x and y coordinates of the arrow base.

dx, dy

[float] The length of the arrow along x and y direction.

width

[float, default: 0.001] Width of full arrow tail.

length_includes_head

[bool, default: False] True if head is to be counted in calculating the length.

head_width

[float or None, default: 3*width] Total width of the full arrow head.

head_length

[float or None, default: 1.5*head_width] Length of arrow head.

shape

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

overhang

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	CapStyle or {'butt', 'projecting', 'round'}
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	Figure or SubFigure
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

Returns

FancyArrow

The created *FancyArrow* object.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.arrow*.

matplotlib.pyplot.figlegend

matplotlib.pyplot.**figlegend**(**args*, ***kwargs*)

Place a legend on the figure.

Call signatures:

```
figlegend()
figlegend(handles, labels)
figlegend(handles=handles)
figlegend(labels)
```

The call signatures correspond to the following different ways to use this method:

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
plt.plot([1, 2, 3], label='Inline label')
plt.figlegend()
```

or:

```
line, = plt.plot([1, 2, 3])
line.set_label('Label via method')
plt.figlegend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *Figure.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

2. Explicitly listing the artists and labels in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
plt.figlegend([line1, line2, line3], ['label1', 'label2', 'label3
↪'])
```

3. Explicitly listing the artists in the legend

This is similar to 2, but the labels are taken from the artists' label properties. Example:

```
line1, = ax1.plot([1, 2, 3], label='label1')
line2, = ax2.plot([1, 2, 3], label='label2')
plt.figlegend(handles=[line1, line2])
```

4. Labeling existing plot elements

Discouraged

This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
plt.figlegend(['the blues', 'the reds'])
```

Parameters

handles

[list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: 'upper right'] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the figure.

The string `'center'` places the legend at the center of the figure.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in figure coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

If a figure is using the constrained layout manager, the string codes of the *loc* keyword argument can get better layout behaviour using the prefix 'outside'. There is ambiguity at the corners, so 'outside upper right' will make space for the legend above the rest of the axes in the layout, and 'outside right upper' will make space on the right side of the layout. In addition to the values of *loc* listed above, we have 'outside right upper', 'outside right lower', 'outside left upper', and 'outside left lower'. See *Legend guide* for more details.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if `figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the Axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the Axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: `'None'`)] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: `'None'`). If None, use *rcParams["text.color"]* (default: `'black'`).

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: `1.0`)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

Added in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: `False`)] Whether to draw a shadow behind the legend. The shadow can be configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: `False`) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: `'inherit'`)] The legend's background color. If `"inherit"`, use *rcParams["axes.facecolor"]* (default: `'white'`).

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: `'0.8'`)] The legend's background patch edge color. If `"inherit"`, use *rcParams["axes.edgecolor"]* (default: `'black'`).

mode

[{"expand", None}] If *mode* is set to `"expand"` the legend will be horizontally expanded to fill the Axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of `None` (default) the Axes' `transAxes` transform will be used.

title

[str or None] The legend's title. Default is no title (`None`).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: None) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: None)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: *rcParams["legend.borderpad"]* (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: *rcParams["legend.labelspacing"]* (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: *rcParams["legend.handlelength"]* (default: 2.0)] The length of the legend handles, in font-size units.

handleheight

[float, default: *rcParams["legend.handleheight"]* (default: 0.7)] The height of the legend handles, in font-size units.

handletextpad

[float, default: *rcParams["legend.handletextpad"]* (default: 0.8)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: *rcParams["legend.borderaxespad"]* (default: 0.5)] The pad between the Axes and legend border, in font-size units.

columnspacing

[float, default: *rcParams["legend.columnspacing"]* (default: 2.0)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

See also

Axes.legend

Notes

Some artists are not supported by this function. See *Legend guide* for details.

matplotlib.pyplot.legend

matplotlib.pyplot.**legend**(**args*, ***kwargs*)

Place a legend on the Axes.

Call signatures:

```
legend()
legend(handles, labels)
legend(handles=handles)
legend(labels)
```

The call signatures correspond to the following different ways to use this method:

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Note

Specific artists can be excluded from the automatic legend element selection by using a label starting with an underscore, "_". A string starting with an underscore is the default label for all artists, so calling *Axes.legend* without any arguments and without setting the labels manually will result in a `UserWarning` and an empty legend being drawn.

2. Explicitly listing the artists and labels in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
ax.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

3. Explicitly listing the artists in the legend

This is similar to 2, but the labels are taken from the artists' label properties. Example:

```
line1, = ax.plot([1, 2, 3], label='label1')
line2, = ax.plot([1, 2, 3], label='label2')
ax.legend(handles=[line1, line2])
```

4. Labeling existing plot elements

Discouraged

This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

To make a legend for all artists on an Axes, call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.plot([5, 6, 7])
ax.legend(['First line', 'Second line'])
```

Parameters

handles

[list of (*Artist* or tuple of *Artist*), optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

If an entry contains a tuple, then the legend handler for all Artists in the tuple will be placed alongside a single label.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: *rcParams["legend.loc"]* (default: 'best')] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes.

The string 'center' places the legend at the center of the axes.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if `figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the Axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the Axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: 'None')] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: 'None'). If None, use *rcParams["text.color"]* (default: 'black').

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: 1.0)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

Added in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: True)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: False)] Whether to draw a shadow behind the legend. The shadow can be configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: False) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: 'inherit')] The legend's background color. If "inherit", use *rcParams["axes.facecolor"]* (default: 'white').

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: '0.8')] The legend's background patch edge color. If "inherit", use *rcParams["axes.edgecolor"]* (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the Axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: None) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: None)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If

you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: `rcParams["legend.borderpad"]` (default: `0.4`)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: `rcParams["legend.labelspacing"]` (default: `0.5`)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: `rcParams["legend.handlelength"]` (default: `2.0`)] The length of the legend handles, in font-size units.

handleheight

[float, default: `rcParams["legend.handleheight"]` (default: `0.7`)] The height of the legend handles, in font-size units.

handletextpad

[float, default: `rcParams["legend.handletextpad"]` (default: `0.8`)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: `rcParams["legend.borderaxespad"]` (default: `0.5`)] The pad between the Axes and legend border, in font-size units.

columnspacing

[float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

Figure.legend

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.legend`.

Some artists are not supported by this function. See *Legend guide* for details.

Examples

Examples using `matplotlib.pyplot.legend`

Vector fields

barbs	Plot a 2D field of wind barbs.
quiver	Plot a 2D field of arrows.
quiverkey	Add a key to a quiver plot.
streamplot	Draw streamlines of a vector flow.

matplotlib.pyplot.barbs

matplotlib.pyplot.**barbs**(**args*, *data=None*, ***kwargs*)

Plot a 2D field of wind barbs.

Call signature:

```
barbs([X, Y], U, V, [C], /, **kwargs)
```

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally sets the color.

The arguments *X*, *Y*, *U*, *V*, *C* are positional-only and may be 1D or 2D. *U*, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:                      /\     \
:                     /  \     \
```

(continues on next page)

(continued from previous page)

```
:                    /     \     \     \
:                   /       \     \     \
:                  ------------------------------
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[*color* or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[*color* or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float

Table 268 – continu

Property	Description
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.barbs*.

Examples using `matplotlib.pyplot.barbs`

matplotlib.pyplot.quiver

matplotlib.pyplot.**quiver**(**args*, *data=None*, ***kwargs*)

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], /, **kwargs)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color. The arguments *X*, *Y*, *U*, *V*, *C* are positional-only.

Arrow length

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The arrow shape is determined by *width*, *headwidth*, *headlength* and *headaxislength*. See the notes below.

Arrow styling

Each arrow is internally represented by a filled polygon with a default edge linewidth of 0. As a result, an arrow is rather a filled area, not a line with a head, and *PolyCollection* properties like *linewidth*, *edgecolor*, *facecolor*, etc. act accordingly.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors. The interpretation of these components (in data or in screen space) depends on *angles*.

U and *V* must have the same number of elements, matching the number of arrow locations in *X*, *Y*. *U* and *V* may be masked. Locations masked in any of *U*, *V*, and *C* will not be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': Arrow directions are based on *display coordinates*; i.e. a 45° angle will always show up as diagonal on the screen, irrespective of figure or Axes aspect ratio or Axes data ranges. This is useful when the arrows represent a quantity whose direction is not tied to the x and y data coordinates.

  If *U* == *V* the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

- 'xy': Arrow direction in data coordinates, i.e. the arrows point from (x, y) to (x+u, y+v). This is ideal for vector fields or gradient plots where the arrows should directly represent movements or gradients in the x and y directions.

- Arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case *U*, *V* is only used to determine the length of the arrows.

  For example, `angles=[30, 60, 90]` will orient the arrows at 30, 60, and 90 degrees respectively, regardless of the *U* and *V* components.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

scale

[float, optional] Scales the length of the arrow inversely.

Number of data values represented by one unit of arrow length on the plot. For example, if the data represents velocity in meters per second (m/s), the scale parameter determines how many meters per second correspond to one unit of arrow length relative to the width of the plot. Smaller scale parameter makes the arrow longer.

By default, an autoscaling algorithm is used to scale the arrow length to a reasonable size, which is based on the average vector length and the number of vectors.

The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The physical image unit, which is used for rendering the scaled arrow data *U*, *V*.

The rendered arrow length is given by

length in x direction = $frac{u}{mathrm{scale}} mathrm{scale_unit}$

length in y direction = $frac{v}{mathrm{scale}} mathrm{scale_unit}$

For example, `(u, v) = (0.5, 0)` with `scale=10`, `scale_units="width"` results in a horizontal arrow with a length of *0.5 / 10 * "width"*, i.e. 0.05 times the Axes width.

Supported values are:

- **'width' or 'height': The arrow length is scaled relative to the width or height**

  of the Axes. For example, `scale_units='width', scale=1.0`, will result in an arrow length of width of the Axes.

- 'dots': The arrow length of the arrows is in measured in display dots (pixels).

- **'inches': Arrow lengths are scaled based on the DPI (dots per inch) of the figure.**

  This ensures that the arrows have a consistent physical size on the figure, in inches, regardless of data values or plot scaling. For example, `(u, v) = (1, 0)` with `scale_units='inches', scale=2` results in a 0.5 inch-long arrow.

- **'x' or 'y': The arrow length is scaled relative to the x or y axis units.**

For example, `(u, v) = (0, 1)` with `scale_units='x', scale=1` results in a vertical arrow with the length of 1 x-axis unit.

- **'xy': Arrow length will be same as 'x' or 'y' units.**

  This is useful for creating vectors in the x-y plane where u and v have the same units as x and y. To plot vectors in the x-y plane with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

Note: Setting *scale_units* without setting scale does not have any effect because the scale units only differ by a constant factor and that is rescaled through autoscaling.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] Affects the arrow size (except for the length). In particular, the shaft *width* is measured in multiples of this unit.

Supported values are:

- 'width', 'height': The width or height of the Axes.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': X, Y or $\sqrt{X^2 + Y^2}$ in data units.

The following table summarizes how these values affect the visible arrow size under zooming and figure size changes:

units	zoom	figure size change
'x', 'y', 'xy'	arrow size scales	—
'width', 'height'	—	arrow size scales
'dots', 'inches'	—	—

width

[float, optional] Shaft width in arrow units. All head parameters are relative to *width*.

The default depends on choice of *units* above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft *width*. See the notes below.

headlength

[float, default: 5] Head length as multiple of shaft *width*. See the notes below.

headaxislength

[float, default: 4.5] Head length at shaft intersection as multiple of shaft *width*. See the notes below.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

color

[*color* or list *color*, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the `PolyCollection` *facecolor* parameter.

Returns

Quiver

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

[`PolyCollection` properties, optional] All other keyword arguments are passed on to `PolyCollection`:

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float arra
`alpha`	array-like or float or None
`animated`	bool
`antialiased` or `aa` or `antialiaseds`	bool or list of bools
`array`	array-like or None
`capstyle`	`CapStyle` or {'butt', 'projecting', 'round'}
`clim`	(vmin: float, vmax: float)
`clip_box`	`BboxBase` or None
`clip_on`	bool
`clip_path`	Patch or (Path, Transform) or None
`cmap`	`Colormap` or str or None
`color`	*color* or list of RGBA tuples
`edgecolor` or `ec` or `edgecolors`	*color* or list of *color* or 'face'
`facecolor` or `facecolors` or `fc`	*color* or list of *color*
`figure`	`Figure` or `SubFigure`
`gid`	str

Table 269 – continu

Property	Description
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

See also

Axes.quiverkey

Add a key to a quiver plot.

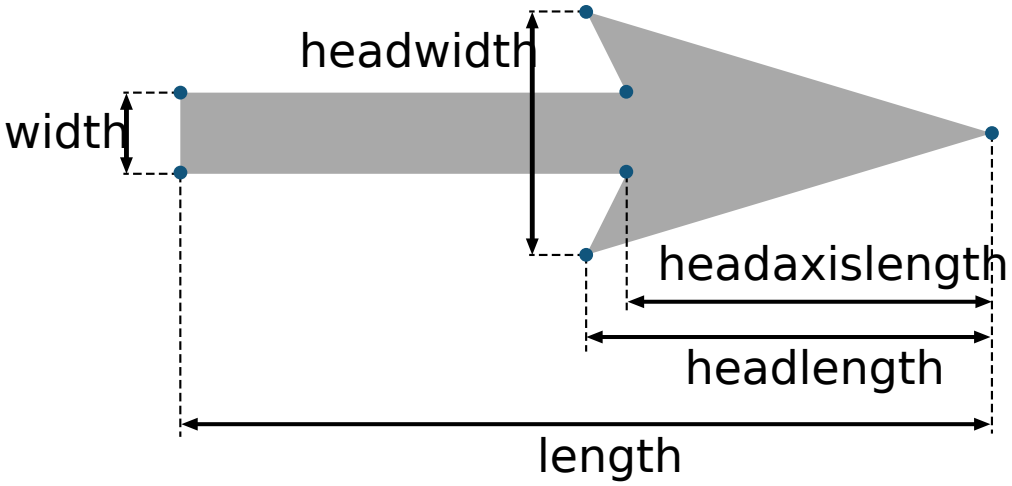
Notes

Note

This is the *pyplot wrapper* for *axes.Axes.quiver*.

Arrow shape

The arrow is drawn as a polygon using the nodes as shown below. The values *headwidth*, *headlength*, and *headaxislength* are in units of *width*.



The defaults give a slightly swept-back arrow. Here are some guidelines how to get other head shapes:

- To make the head a triangle, make *headaxislength* the same as *headlength*.
- To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*.
- To make the head smaller relative to the shaft, scale down all the head parameters proportionally.
- To remove the head completely, set all *head* parameters to 0.
- To get a diamond-shaped head, make *headaxislength* larger than *headlength*.
- Warning: For *headaxislength* < (*headlength* / *headwidth*), the "headaxis" nodes (i.e. the ones connecting the head with the shaft) will protrude out of the head in forward direction so that the arrow head looks broken.

Examples using `matplotlib.pyplot.quiver`

matplotlib.pyplot.quiverkey

`matplotlib.pyplot.`**`quiverkey`**(*Q*, *X*, *Y*, *U*, *label*, ***kwargs*)

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the horizontal axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[*color*] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[*color*, default: `rcParams["text.color"]` (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: *family*, *style*, *variant*, *size*, *weight*.

zorder

[float] The zorder of the key. The default is 0.1 above *Q*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.quiverkey`.

Examples using `matplotlib.pyplot.quiverkey`

matplotlib.pyplot.streamplot

matplotlib.pyplot.**streamplot**(*x*, *y*, *u*, *v*, *density=1*, *linewidth=None*, *color=None*, *cmap=None*, *norm=None*, *arrowsize=1*, *arrowstyle='-|>'*, *minlength=0.1*, *transform=None*, *zorder=None*, *start_points=None*, *maxlength=4.0*, *integration_direction='both'*, *broken_streamlines=True*, *, *data=None*)

Draw streamlines of a vector flow.

Parameters

x, y

[1D/2D arrays] Evenly spaced strictly increasing arrays to make a grid. If 2D, all rows of *x* must be equal and all columns of *y* must be equal; i.e., they must be as if generated by `np.meshgrid(x_1d, y_1d)`.

u, v

[2D arrays] *x* and *y*-velocities. The number of rows and columns must match the length of *y* and *x*, respectively.

density

[float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).

linewidth

[float or 2D array] The width of the streamlines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.

color

[*color* or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.

cmap, norm

Data normalization and colormapping parameters for *color*; only used if *color* is an array of floats. See *imshow* for a detailed description.

arrowsize

[float] Scaling factor for the arrow size.

arrowstyle

[str] Arrow style specification. See *FancyArrowPatch*.

minlength

[float] Minimum length of streamline in axes coordinates.

start_points

[(N, 2) array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the *x* and *y* arrays).

zorder

[float] The zorder of the streamlines and arrows. Artists with lower zorder values are drawn first.

maxlength

[float] Maximum length of streamline in axes coordinates.

integration_direction

[{'forward', 'backward', 'both'}, default: 'both'] Integrate the streamline in forward, backward or both directions.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*, *u*, *v*, *start_points*

broken_streamlines

[boolean, default: True] If False, forces streamlines to continue until they leave the plot domain. If True, they may be terminated if they come too close to another streamline.

Returns

StreamplotSet

Container object with attributes

- `lines`: *`LineCollection`* of streamlines
- `arrows`: *`PatchCollection`* containing *`FancyArrowPatch`* objects representing the arrows half-way along streamlines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

Notes

Note

This is the *pyplot wrapper* for *`axes.Axes.streamplot`*.

Examples using `matplotlib.pyplot.streamplot`

Axis configuration

autoscale	Autoscale the axis view to the data (toggle).
axis	Convenience method to get or set some axis properties.
box	Turn the Axes box on or off on the current Axes.
grid	Configure the grid lines.
locator_params	Control behavior of major tick locators.
minorticks_off	Remove minor ticks from the Axes.
minorticks_on	Display minor ticks on the Axes.
rgrids	Get or set the radial gridlines on the current polar plot.
thetagrids	Get or set the theta gridlines on the current polar plot.
tick_params	Change the appearance of ticks, tick labels, and gridlines.
ticklabel_format	Configure the *ScalarFormatter* used by default for linear Axes.
xlabel	Set the label for the x-axis.
xlim	Get or set the x limits of the current Axes.
xscale	Set the xaxis' scale.
xticks	Get or set the current tick locations and labels of the x-axis.
ylabel	Set the label for the y-axis.
ylim	Get or set the y-limits of the current Axes.
yscale	Set the yaxis' scale.
yticks	Get or set the current tick locations and labels of the y-axis.
suptitle	Add a centered super title to the figure.
title	Set a title for the Axes.

matplotlib.pyplot.autoscale

matplotlib.pyplot.**autoscale**(*enable=True*, *axis='both'*, *tight=None*)

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or Axes.

Parameters

enable

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

axis

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate. (For 3D Axes, *axis* can also be set to 'z', and 'both' refers to all three Axes.)

tight

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to `autoscale_view` (regardless of its value); see the description of its behavior there.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.autoscale`.

matplotlib.pyplot.axis

`matplotlib.pyplot.`**`axis`**(*arg=None*, */*, ***, *emit=True*, ***kwargs*)

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'off' or False	Hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_off()*.
'on' or True	Do not hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_on()*.
'equal'	Set equal scaling (i.e., make circles circular) by changing the axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.axis*.

For 3D Axes, this method additionally takes *zmin*, *zmax* as parameters and likewise returns them.

Examples using `matplotlib.pyplot.axis`

matplotlib.pyplot.box

`matplotlib.pyplot.`**`box`**(*on=None*)

Turn the Axes box on or off on the current Axes.

Parameters

on

[bool or None] The new *Axes* box state. If `None`, toggle the state.

See also

matplotlib.axes.Axes.set_frame_on()
matplotlib.axes.Axes.get_frame_on()

matplotlib.pyplot.grid

`matplotlib.pyplot.`**`grid`**(*visible=None*, *which='major'*, *axis='both'*, ***kwargs*)

Configure the grid lines.

Parameters

visible

[bool or None, optional] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *visible* will be set to True.

If *visible* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

which

[{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

axis

[{'both', 'x', 'y'}, optional] The axis to apply the changes on.

****kwargs**

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	CapStyle or {'butt', 'projecting', 'round'}
dash_joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, defaul
figure	Figure or SubFigure
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, Path or MarkerStyle
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, f
mouseover	bool
path_effects	list of AbstractPathEffect
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	CapStyle or {'butt', 'projecting', 'round'}
solid_joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.grid`.

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the `Line2D` objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

Examples using `matplotlib.pyplot.grid`

matplotlib.pyplot.locator_params

`matplotlib.pyplot.`**`locator_params`**(*axis='both'*, *tight=None*, ***kwargs*)

Control behavior of major tick locators.

Because the locator is involved in autoscaling, `autoscale_view` is called automatically after the parameters are changed.

Parameters

axis

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate. (For 3D Axes, *axis* can also be set to 'z', and 'both' refers to all three axes.)

tight

[bool or None, optional] Parameter passed to `autoscale_view`. Default is None, for no change.

Other Parameters

****kwargs**

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example `set_params` for the `ticker.MaxNLocator` used by default for linear.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.locator_params`.

Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

matplotlib.pyplot.minorticks_off

matplotlib.pyplot.**minorticks_off**()

Remove minor ticks from the Axes.

Notes

> **Note**
>
> This is the *pyplot wrapper* for *axes.Axes.minorticks_off*.

matplotlib.pyplot.minorticks_on

matplotlib.pyplot.**minorticks_on**()

Display minor ticks on the Axes.

Displaying minor ticks may reduce performance; you may turn them off using *minorticks_off()* if drawing speed is a problem.

Notes

> **Note**
>
> This is the *pyplot wrapper* for *axes.Axes.minorticks_on*.

matplotlib.pyplot.rgrids

matplotlib.pyplot.**rgrids**(*radii=None*, *labels=None*, *angle=None*, *fmt=None*, ***kwargs*)

Get or set the radial gridlines on the current polar plot.

Call signatures:

```
lines, labels = rgrids()
lines, labels = rgrids(radii, labels=None, angle=22.5, fmt=None,␣
↪**kwargs)
```

When called with no arguments, *rgrids* simply returns the tuple (*lines*, *labels*). When called with arguments, the labels will appear at the specified radial distances and angle.

Parameters

radii

[tuple with floats] The radii for the radial gridlines

labels

[tuple with strings or None] The labels to use at each radial gridline. The *matplotlib.ticker.ScalarFormatter* will be used if None.

angle

[float] The angular position of the radius labels in degrees.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'.

Returns

lines

[list of *lines.Line2D*] The radial gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

See also

pyplot.thetagrids
projections.polar.PolarAxes.set_rgrids
Axis.get_gridlines
Axis.get_ticklabels

Examples

```
# set the locations of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0) )

# set the locations and labels of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0), ('Tom', 'Dick', 'Harry'␣
↪))
```

matplotlib.pyplot.thetagrids

matplotlib.pyplot.**thetagrids**(*angles=None*, *labels=None*, *fmt=None*, ***kwargs*)

Get or set the theta gridlines on the current polar plot.

Call signatures:

```
lines, labels = thetagrids()
lines, labels = thetagrids(angles, labels=None, fmt=None, **kwargs)
```

When called with no arguments, *thetagrids* simply returns the tuple (*lines*, *labels*). When called with arguments, the labels will appear at the specified angles.

Parameters

angles

[tuple with floats, degrees] The angles of the theta gridlines.

labels

[tuple with strings or None] The labels to use at each radial gridline. The *projections.polar.ThetaFormatter* will be used if None.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'. Note that the angle in radians will be used.

Returns

lines

[list of *lines.Line2D*] The theta gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

See also

pyplot.rgrids
projections.polar.PolarAxes.set_thetagrids
Axis.get_gridlines
Axis.get_ticklabels

Examples

```
# set the locations of the angular gridlines
lines, labels = thetagrids(range(45, 360, 90))

# set the locations and labels of the angular gridlines
lines, labels = thetagrids(range(45, 360, 90), ('NE', 'NW', 'SW',
 ↪'SE'))
```

matplotlib.pyplot.tick_params

matplotlib.pyplot.**tick_params**(*axis='both'*, ***kwargs*)

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless *reset* is True. For the current style settings, see *Axis.get_tick_params*.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to which the parameters are applied.

which

[{'major', 'minor', 'both'}, default: 'major'] The group of ticks to which the parameters are applied.

reset

[bool, default: False] Whether to reset the ticks to defaults before updating them.

Other Parameters

direction

[{'in', 'out', 'inout'}] Puts ticks inside the Axes, outside the Axes, or both.

length

[float] Tick length in points.

width

[float] Tick width in points.

color

[*color*] Tick color.

pad

[float] Distance in points between tick and label.

labelsize

[float or str] Tick label font size in points or as a string (e.g., 'large').

labelcolor

[*color*] Tick label color.

labelfontfamily

[str] Tick label font.

colors

[*color*] Tick color and label color.

zorder

[float] Tick and label zorder.

bottom, top, left, right

[bool] Whether to draw the respective ticks.

labelbottom, labeltop, labelleft, labelright

[bool] Whether to draw the respective tick labels.

labelrotation

[float] Tick label rotation

grid_color

[*color*] Gridline color.

grid_alpha

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

grid_linewidth

[float] Width of gridlines in points.

grid_linestyle

[str] Any valid *Line2D* line style spec.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.tick_params*.

Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Examples using `matplotlib.pyplot.tick_params`

matplotlib.pyplot.ticklabel_format

matplotlib.pyplot.**ticklabel_format**(*, *axis='both'*, *style=None*, *scilimits=None*, *useOffset=None*, *useLocale=None*, *useMathText=None*)

Configure the *ScalarFormatter* used by default for linear Axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to configure. Only major ticks are affected.

style

[{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation. 'sci' is equivalent to 'scientific'.

scilimits

[pair of ints (m, n)] Scientific notation is used only for numbers outside the range 10^m to 10^n (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where m != 0 to fix the order of magnitude to 10^m. The formatter default is *rcParams["axes.formatter.limits"]* (default: `[-5, 6]`).

useOffset

[bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is *rcParams["axes.formatter.useoffset"]* (default: `True`).

useLocale

[bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is *rcParams["axes.formatter.use_locale"]* (default: `False`).

useMathText

[bool] Render the offset and scientific notation in mathtext. The formatter default is *rcParams["axes.formatter.use_mathtext"]* (default: `False`).

Raises

AttributeError

If the current formatter is not a *ScalarFormatter*.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.ticklabel_format*.

matplotlib.pyplot.xlabel

matplotlib.pyplot.**xlabel**(*xlabel*, *fontdict=None*, *labelpad=None*, *, *loc=None*, ***kwargs*)

Set the label for the x-axis.

Parameters

xlabel

[str] The label text.

labelpad

[float, default: *rcParams["axes.labelpad"]* (default: 4.0)] Spacing in points from the Axes bounding box including ticks and tick labels. If None, the previous value is left as is.

loc

[{'left', 'center', 'right'}, default: *rcParams["xaxis.labellocation"]* (default: 'center')] The label position. This is a high-level alternative for passing parameters *x* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

See also

text

Documents the properties supported by *Text*.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.set_xlabel*.

Examples using `matplotlib.pyplot.xlabel`

matplotlib.pyplot.xlim

matplotlib.pyplot.**xlim**(**args*, ***kwargs*)

Get or set the x limits of the current Axes.

Call signatures:

```
left, right = xlim()   # return the current xlim
xlim((left, right))    # set the xlim to left, right
xlim(left, right)      # set the xlim to left, right
```

If you do not specify args, you can pass *left* or *right* as kwargs, i.e.:

```
xlim(right=3)  # adjust the right leaving left unchanged
xlim(left=1)  # adjust the left leaving right unchanged
```

Setting limits turns autoscaling off for the x-axis.

Returns

left, right

A tuple of the new x-axis limits.

Notes

Calling this function with no arguments (e.g. `xlim()`) is the pyplot equivalent of calling *get_xlim* on the current Axes. Calling this function with arguments is the pyplot equivalent of calling *set_xlim* on the current Axes. All arguments are passed though.

Examples using `matplotlib.pyplot.xlim`

matplotlib.pyplot.xscale

matplotlib.pyplot.**xscale**(*value*, ***kwargs*)

Set the xaxis' scale.

Parameters

value

[str or *ScaleBase*] The axis scale type to apply. Valid string values are the names of scale classes ("linear", "log", "function",...). These may be the names of any of the *built-in scales* or of any custom scales registered using *matplotlib.scale.register_scale*.

****kwargs**

If *value* is a string, keywords are passed to the instantiation method of the respective class.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `axes.Axes.set_xscale`.

matplotlib.pyplot.xticks

`matplotlib.pyplot.`**`xticks`**(*ticks=None*, *labels=None*, *, *minor=False*, ***kwargs*)

Get or set the current tick locations and labels of the x-axis.

Pass no arguments to return the current values without modifying them.

Parameters

ticks

[array-like, optional] The list of xtick locations. Passing an empty list removes all xticks.

labels

[array-like, optional] The labels to place at the given *ticks* locations. This argument can only be passed if *ticks* is passed as well.

minor

[bool, default: False] If `False`, get/set the major ticks/labels; if `True`, the minor ticks/labels.

****kwargs**

`Text` properties can be used to control the appearance of the labels.

> **Warning**
>
> This only sets the properties of the current ticks, which is only sufficient if you either pass *ticks*, resulting in a fixed list of ticks, or if the plot is static.
>
> Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Use `tick_params` instead if possible.

Returns

locs

The list of xtick locations.

labels

The list of xlabel *Text* objects.

Notes

Calling this function with no arguments (e.g. `xticks()`) is the pyplot equivalent of calling *get_xticks* and *get_xticklabels* on the current Axes. Calling this function with arguments is the pyplot equivalent of calling *set_xticks* and *set_xticklabels* on the current Axes.

Examples

```
>>> locs, labels = xticks()  # Get the current locations and␣
 ↪labels.
>>> xticks(np.arange(0, 1, step=0.2))  # Set label locations.
>>> xticks(np.arange(3), ['Tom', 'Dick', 'Sue'])  # Set text␣
 ↪labels.
>>> xticks([0, 1, 2], ['January', 'February', 'March'],
...         rotation=20)  # Set text labels and properties.
>>> xticks([])  # Disable xticks.
```

Examples using `matplotlib.pyplot.xticks`

matplotlib.pyplot.ylabel

`matplotlib.pyplot.`**`ylabel`**(*ylabel*, *fontdict=None*, *labelpad=None*, *, *loc=None*, ***kwargs*)

Set the label for the y-axis.

Parameters

ylabel

[str] The label text.

labelpad

[float, default: *rcParams["axes.labelpad"]* (default: `4.0`)] Spacing in points from the Axes bounding box including ticks and tick labels. If None, the previous value is left as is.

loc

[{'bottom', 'center', 'top'}, default: *rcParams["yaxis.labellocation"]* (default: `'center'`)] The label position. This is a high-level alternative for passing parameters *y* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

See also

text

Documents the properties supported by *Text*.

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.set_ylabel*.

Examples using `matplotlib.pyplot.ylabel`

matplotlib.pyplot.ylim

matplotlib.pyplot.**ylim**(**args*, ***kwargs*)

Get or set the y-limits of the current Axes.

Call signatures:

```
bottom, top = ylim()  # return the current ylim
ylim((bottom, top))   # set the ylim to bottom, top
ylim(bottom, top)     # set the ylim to bottom, top
```

If you do not specify args, you can alternatively pass *bottom* or *top* as kwargs, i.e.:

```
ylim(top=3)  # adjust the top leaving bottom unchanged
ylim(bottom=1)  # adjust the bottom leaving top unchanged
```

Setting limits turns autoscaling off for the y-axis.

Returns

bottom, top

A tuple of the new y-axis limits.

Notes

Calling this function with no arguments (e.g. `ylim()`) is the pyplot equivalent of calling *get_ylim* on the current Axes. Calling this function with arguments is the pyplot equivalent of calling *set_ylim* on the current Axes. All arguments are passed though.

Examples using `matplotlib.pyplot.ylim`

matplotlib.pyplot.yscale

`matplotlib.pyplot.`**`yscale`**(*value*, ***kwargs*)

Set the yaxis' scale.

Parameters

value

[str or *ScaleBase*] The axis scale type to apply. Valid string values are the names of scale classes ("linear", "log", "function",...). These may be the names of any of the *built-in scales* or of any custom scales registered using *matplotlib.scale.register_scale*.

****kwargs**

If *value* is a string, keywords are passed to the instantiation method of the respective class.

Notes

> **Note**
>
> This is the *pyplot wrapper* for *axes.Axes.set_yscale*.

Examples using `matplotlib.pyplot.yscale`

matplotlib.pyplot.yticks

`matplotlib.pyplot.`**`yticks`**(*ticks=None*, *labels=None*, ***, *minor=False*, ***kwargs*)

Get or set the current tick locations and labels of the y-axis.

Pass no arguments to return the current values without modifying them.

Parameters

ticks

[array-like, optional] The list of ytick locations. Passing an empty list removes all yticks.

labels

[array-like, optional] The labels to place at the given *ticks* locations. This argument can only be passed if *ticks* is passed as well.

minor

[bool, default: False] If `False`, get/set the major ticks/labels; if `True`, the minor ticks/labels.

****kwargs**

Text properties can be used to control the appearance of the labels.

> **Warning**
>
> This only sets the properties of the current ticks, which is only sufficient if you either pass *ticks*, resulting in a fixed list of ticks, or if the plot is static.
>
> Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Use *tick_params* instead if possible.

Returns

locs

The list of ytick locations.

labels

The list of ylabel *Text* objects.

Notes

Calling this function with no arguments (e.g. `yticks()`) is the pyplot equivalent of calling *get_yticks* and *get_yticklabels* on the current Axes. Calling this function with arguments is the pyplot equivalent of calling *set_yticks* and *set_yticklabels* on the current Axes.

Examples

```
>>> locs, labels = yticks()  # Get the current locations and␣
 ↪labels.
>>> yticks(np.arange(0, 1, step=0.2))  # Set label locations.
>>> yticks(np.arange(3), ['Tom', 'Dick', 'Sue'])  # Set text␣
 ↪labels.
>>> yticks([0, 1, 2], ['January', 'February', 'March'],
...        rotation=45)  # Set text labels and properties.
>>> yticks([])  # Disable yticks.
```

Examples using `matplotlib.pyplot.yticks`

matplotlib.pyplot.suptitle

matplotlib.pyplot.**suptitle**(*t*, ***kwargs*)

Add a centered super title to the figure.

Parameters

t

[str] The super title text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.98] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.titlesize"]* (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.titleweight"]* (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the super title.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.titlesize"]* (default: `'large'`) and *rcParams["figure.titleweight"]* (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `Figure.suptitle`.

Examples using `matplotlib.pyplot.suptitle`

matplotlib.pyplot.title

matplotlib.pyplot.**title**(*label*, *fontdict=None*, *loc=None*, *pad=None*, *, *y=None*, ***kwargs*)

Set a title for the Axes.

Set one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[str] Text to use for the title

fontdict

[dict]

> **Discouraged**
>
> The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_title(..., **fontdict)`.

A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[{'center', 'left', 'right'}, default: *rcParams["axes.titlelocation"]* (default: `'center'`)] Which title to set.

y

[float, default: *rcParams["axes.titley"]* (default: `None`)] Vertical Axes location for the title (1.0 is the top). If None (the default) and *rcParams["axes.titley"]* (default: `None`) is also None, y is determined automatically to avoid decorators on the Axes.

pad

[float, default: `rcParams["axes.titlepad"]` (default: `6.0`)] The offset of the title from the top of the Axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

****kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

Notes

Note

This is the *pyplot wrapper* for `axes.Axes.set_title`.

Examples using `matplotlib.pyplot.title`

Layout

margins	Set or retrieve margins around the data for autoscaling axis limits.
subplots_adjust	Adjust the subplot layout parameters.
subplot_tool	Launch a subplot tool window for a figure.
tight_layout	Adjust the padding between and around subplots.

matplotlib.pyplot.margins

matplotlib.pyplot.**margins**(**margins*, *x=None*, *y=None*, *tight=True*)

Set or retrieve margins around the data for autoscaling axis limits.

This allows to configure the padding around the data without having to set explicit limits using *set_xlim* / *set_ylim*.

Autoscaling determines the axis limits by adding *margin* times the data interval as padding around the data. See the following illustration:

All input parameters must be floats greater than -0.5. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain unchanged and simply be returned.

The default margins are *rcParams["axes.xmargin"]* (default: 0.05) and *rcParams["axes.ymargin"]* (default: 0.05).

Parameters

***margins**

[float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

x, y

[float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

tight

[bool or None, default: True] The *tight* parameter is passed to *autoscale_view*, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting *tight* to *None* preserves the previous setting.

Returns

xmargin, ymargin

[float]

See also

Axes.set_xmargin*, *Axes.set_ymargin

Notes

Note

This is the *pyplot wrapper* for *axes.Axes.margins*.

If a previously used Axes method such as *pcolor()* has set *use_sticky_edges* to True, only the limits not set by the "sticky artists" will be modified. To force all margins to be set, set *use_sticky_edges* to False before calling *margins()*.

Examples using `matplotlib.pyplot.margins`

matplotlib.pyplot.subplots_adjust

matplotlib.pyplot.**subplots_adjust**(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by *rcParams["figure.subplot.[name]"]*.

Parameters

left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

hspace

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

Notes

Note

This is the *pyplot wrapper* for *Figure.subplots_adjust*.

Examples using `matplotlib.pyplot.subplots_adjust`

matplotlib.pyplot.subplot_tool

matplotlib.pyplot.**subplot_tool**(*targetfig=None*)

Launch a subplot tool window for a figure.

Returns

matplotlib.widgets.SubplotTool

matplotlib.pyplot.tight_layout

matplotlib.pyplot.**tight_layout**(*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust the padding between and around subplots.

To exclude an artist on the Axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), set `a.set_in_layout(False)` for that artist.

Parameters

pad

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float, default: *pad*] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

rect

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

See also

Figure.set_layout_engine
pyplot.tight_layout

Notes

Note

This is the *pyplot wrapper* for `Figure.tight_layout`.

Examples using `matplotlib.pyplot.tight_layout`

Colormapping

clim	Set the color limits of the current image.
colorbar	Add a colorbar to a plot.
gci	Get the current colorable artist.
sci	Set the current image.
get_cmap	Get a colormap instance, defaulting to rc values if *name* is None.
set_cmap	Set the default colormap, and applies it to the current image if any.
imread	Read an image from a file into an array.
imsave	Colormap and save an array as an image file.

matplotlib.pyplot.clim

matplotlib.pyplot.**clim**(*vmin=None*, *vmax=None*)

Set the color limits of the current image.

If either *vmin* or *vmax* is None, the image min/max respectively will be used for color scaling.

If you want to set the clim of multiple images, use *set_clim* on every image, for example:

```
for im in gca().get_images():
    im.set_clim(0, 0.5)
```

matplotlib.pyplot.colorbar

matplotlib.pyplot.**colorbar**(*mappable=None*, *cax=None*, *ax=None*, ***kwargs*)

Add a colorbar to a plot.

Parameters

mappable

The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),␣
↪ax=ax)
```

cax

[*Axes*, optional] Axes into which the colorbar will be drawn. If None, then a new Axes is created and the space for it will be stolen from the Axes(s) specified in *ax*.

ax

[*Axes* or iterable or `numpy.ndarray` of Axes, optional] The one or more parent Axes from which space for a new colorbar Axes will be stolen. This parameter is only used if *cax* is not set.

Defaults to the Axes that contains the mappable used to create the colorbar.

use_gridspec

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of Axes. If *ax* is positioned with a subplotspec and *use_gridspec* is `True`, then *cax* is also positioned with a subplotspec.

Returns

colorbar

[*Colorbar*]

Other Parameters

location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent Axes, where the colorbar Axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

fraction

[float, default: 0.15] Fraction of original Axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original Axes between colorbar and new image Axes.

anchor

[(float, float), optional] The anchor point of the colorbar Axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent Axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

extend

[{'neither', 'both', 'min', 'max'}] Make pointed end(s) for out-of-range values (unless 'neither'). These are set for a given colormap using the colormap set_under and set_over methods.

extendfrac

[{*None*, 'auto', length, lengths}] If set to *None*, both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting).

If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional').

If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.

extendrect

[bool] If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.

ticks

[None or list of ticks or Locator] If None, ticks are determined automatically from the input.

format

[None or str or Formatter] If None, `ScalarFormatter` is used. Format strings, e.g., `"%4.2e"` or `"{x:.2e}"`, are supported. An alternative `Formatter` may be given instead.

drawedges

[bool] Whether to draw lines at color boundaries.

label

[str] The label on the colorbar's long axis.

boundaries, values

[None or a sequence] If unset, the colormap will be displayed on a 0-1 scale. If sequences, *values* must have a length 1 less than *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in *values* will be used. The size of each region is determined by the *spacing* parameter. Normally only useful for indexed colors (i.e. `norm=NoNorm()`) or other unusual circumstances.

spacing

[{'uniform', 'proportional'}] For discrete colorbars (*BoundaryNorm* or contours), 'uniform' gives each color the same space; 'proportional' makes the space proportional to the data interval.

Notes

Note

This is the *pyplot wrapper* for *Figure.colorbar*.

If *mappable* is a *ContourSet*, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the Axes. Note that if *cax* is specified, it determines the size of the colorbar, and *shrink* and *aspect* are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the Axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) render white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However, this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

Examples using `matplotlib.pyplot.colorbar`

matplotlib.pyplot.gci

`matplotlib.pyplot.`**`gci`**`()`

Get the current colorable artist.

Specifically, returns the current *ScalarMappable* instance (`Image` created by *imshow* or *figimage*, *Collection* created by *pcolor* or *scatter*, etc.), or *None* if no such instance has been defined.

The current image is an attribute of the current Axes, or the nearest earlier Axes in the current figure that contains an image.

Notes

Historically, the only colorable artists were images; hence the name `gci` (get current image).

matplotlib.pyplot.sci

`matplotlib.pyplot.`**`sci`**(*im*)

Set the current image.

This image will be the target of colormap functions like `pyplot.viridis`, and other functions such as *clim*. The current image is an attribute of the current Axes.

matplotlib.pyplot.get_cmap

`matplotlib.pyplot.`**`get_cmap`**(*name=None*, *lut=None*)

Get a colormap instance, defaulting to rc values if *name* is None.

Parameters

name

[*Colormap* or str or None, default: None] If a *Colormap* instance, it will be returned. Otherwise, the name of a colormap known to Matplotlib, which will be resampled by *lut*. The default, None, means *rcParams["image.cmap"]* (default: `'viridis'`).

lut

[int or None, default: None] If *name* is not already a Colormap instance and *lut* is not None, the colormap will be resampled to have *lut* entries in the lookup table.

Returns

Colormap

Examples using `matplotlib.pyplot.get_cmap`

matplotlib.pyplot.set_cmap

`matplotlib.pyplot.`**`set_cmap`**(*cmap*)

Set the default colormap, and applies it to the current image if any.

Parameters

cmap

[*Colormap* or str] A colormap instance or the name of a registered colormap.

See also

colormaps
get_cmap

matplotlib.pyplot.imread

matplotlib.pyplot.**imread**(*fname*, *format=None*)

Read an image from a file into an array.

Note

This function exists for historical reasons. It is recommended to use `PIL.Image.open` instead for loading images.

Parameters

fname

[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

Passing a URL is deprecated. Please open the URL for reading and pass the result to Pillow, e.g. with `np.array(PIL.Image.open(urllib.request.urlopen(url)))`.

format

[str, optional] The image file format assumed for reading the data. The image is loaded as a PNG file if *format* is set to "png", if *fname* is a path or opened file with a ".png" extension, or if it is a URL. In all other cases, *format* is ignored and the format is auto-detected by `PIL.Image.open`.

Returns

numpy.array

The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

PNG images are returned as float arrays (0-1). All other formats are returned as int arrays, with a bit depth determined by the file's contents.

Notes

> **Note**
>
> This is equivalent to *matplotlib.image.imread*.

Examples using `matplotlib.pyplot.imread`

matplotlib.pyplot.imsave

matplotlib.pyplot.**imsave**(*fname*, *arr*, ***kwargs*)

Colormap and save an array as an image file.

RGB(A) images are passed through. Single channel images will be colormapped according to *cmap* and *norm*.

> **Note**
>
> If you want to save a single channel image as gray scale please use an image I/O library (such as pillow, tifffile, or imageio) directly.

Parameters

fname

[str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from *rcParams["savefig.format"]* (default: 'png') otherwise. If *format* is set, it determines the output format.

arr

[array-like] The image data. Accepts NumPy arrays or sequences (e.g., lists or tuples). The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

vmin, vmax

[float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

format

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: `'upper'`)] Indicates whether the `(0, 0)` index of the array is in the upper left or lower left corner of the Axes.

dpi

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

metadata

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information. Currently only supported for "png", "pdf", "ps", "eps", and "svg".

pil_kwargs

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

Notes

Note

This is equivalent to *matplotlib.image.imsave*.

Colormaps are available via the colormap registry *matplotlib.colormaps*. For convenience this registry is available in `pyplot` as

`matplotlib.pyplot.`**`colormaps`**

Container for colormaps that are known to Matplotlib by name.

The universal registry instance is *matplotlib.colormaps*. There should be no need for users to instantiate *ColormapRegistry* themselves.

Read access uses a dict-like interface mapping names to *Colormap*s:

```
import matplotlib as mpl
cmap = mpl.colormaps['viridis']
```

Returned *Colormap*s are copies, so that their modification does not change the global definition of the colormap.

Additional colormaps can be added via *ColormapRegistry.register*:

```
mpl.colormaps.register(my_colormap)
```

To get a list of all registered colormaps, you can do:

```
from matplotlib import colormaps
list(colormaps)
```

Additionally, there are shortcut functions to set builtin colormaps; e.g. `plt.viridis()` is equivalent to `plt.set_cmap('viridis')`.

matplotlib.pyplot.**color_sequences**

Container for sequences of colors that are known to Matplotlib by name.

The universal registry instance is *matplotlib.color_sequences*. There should be no need for users to instantiate *ColorSequenceRegistry* themselves.

Read access uses a dict-like interface mapping names to lists of colors:

```
import matplotlib as mpl
colors = mpl.color_sequences['tab10']
```

For a list of built in color sequences, see *Named color sequences*. The returned lists are copies, so that their modification does not change the global definition of the color sequence.

Additional color sequences can be added via *ColorSequenceRegistry.register*:

```
mpl.color_sequences.register('rgb', ['r', 'g', 'b'])
```

Configuration

rc	Set the current *rcParams*. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., (*xtick*, *ytick*). *kwargs* is a dictionary attribute name/value pairs, e.g.,::.
rc_context	Return a context manager for temporarily changing rcParams.
rcdefaults	Restore the *rcParams* from Matplotlib's internal default style.

matplotlib.pyplot.rc

matplotlib.pyplot.**rc**(*group*, ***kwargs*)

Set the current *rcParams*. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., (*xtick*, *ytick*). *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current *rcParams* and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above call as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or *rcdefaults()* to restore the default *rcParams* after changes.

Notes

Note

This is equivalent to *matplotlib.rc*.

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({"lines.linewidth": 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

Examples using `matplotlib.pyplot.rc`

matplotlib.pyplot.rc_context

matplotlib.pyplot.**rc_context**(*rc=None*, *fname=None*)

Return a context manager for temporarily changing rcParams.

The *rcParams["backend"]* will not be reset by the context manager.

rcParams changed both through the context manager invocation and in the body of the context will be reset on context exit.

Parameters

rc

[dict] The rcParams to temporarily set.

fname

[str or path-like] A file with Matplotlib rc settings. If both *fname* and *rc* are given, settings from *rc* take precedence.

See also

The matplotlibrc file

Notes

Note

This is equivalent to *matplotlib.rc_context*.

Examples

Passing explicit values via a dict:

```
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y)  # uses 'print.rc'
```

Setting in the context body:

```
with mpl.rc_context():
    # will be reset
    mpl.rcParams['lines.linewidth'] = 5
    plt.plot(x, y)
```

Examples using `matplotlib.pyplot.rc_context`

matplotlib.pyplot.rcdefaults

matplotlib.pyplot.**rcdefaults**()

Restore the *rcParams* from Matplotlib's internal default style.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

See also

matplotlib.rc_file_defaults

Restore the *rcParams* from the rc file originally loaded by Matplotlib.

matplotlib.style.use

Use a specific style file. Call `style.use('default')` to restore the default style.

Notes

Note

This is equivalent to *matplotlib.rcdefaults*.

Examples using `matplotlib.pyplot.rcdefaults`

Output

draw	Redraw the current figure.
draw_if_interactive	Redraw the current figure if in interactive mode.
ioff	Disable interactive mode.
ion	Enable interactive mode.
install_repl_displayhook	Connect to the display hook of the current shell.
isinteractive	Return whether plots are updated after every plotting command.
pause	Run the GUI event loop for *interval* seconds.
savefig	Save the current figure as an image or vector graphic to a file.

continues on next page

Table 275 – continued from previous page

show	Display all open figures.
switch_backend	Set the pyplot backend.
uninstall_repl_displayhook	Disconnect from the display hook of the current shell.

matplotlib.pyplot.draw

matplotlib.pyplot.**draw**()

Redraw the current figure.

This is used to update a figure that has been altered, but not automatically re-drawn. If interactive mode is on (via *ion()*), this should be only rarely needed, but there may be ways to modify the state of a figure without marking it as "stale". Please report these cases as bugs.

This is equivalent to calling `fig.canvas.draw_idle()`, where `fig` is the current figure.

See also

FigureCanvasBase.draw_idle
FigureCanvasBase.draw

Examples using `matplotlib.pyplot.draw`

matplotlib.pyplot.draw_if_interactive

matplotlib.pyplot.**draw_if_interactive**()

Redraw the current figure if in interactive mode.

Warning

End users will typically not have to call this function because the the interactive mode takes care of this.

matplotlib.pyplot.ioff

matplotlib.pyplot.**ioff**()

Disable interactive mode.

See *pyplot.isinteractive* for more details.

See also

ion

Enable interactive mode.

isinteractive

Whether interactive mode is enabled.

show

Show all figures (and maybe block).

pause

Show all figures, and block for a time.

Notes

For a temporary change, this can be used as a context manager:

```
# if interactive mode is on
# then figures will be shown on creation
plt.ion()
# This figure will be shown immediately
fig = plt.figure()

with plt.ioff():
    # interactive mode will be off
    # figures will not automatically be shown
    fig2 = plt.figure()
    # ...
```

To enable optional usage as a context manager, this function returns a context manager object, which is not intended to be stored or accessed by the user.

matplotlib.pyplot.ion

matplotlib.pyplot.**ion**()

Enable interactive mode.

See *pyplot.isinteractive* for more details.

See also

ioff

Disable interactive mode.

isinteractive

Whether interactive mode is enabled.

show

Show all figures (and maybe block).

pause

Show all figures, and block for a time.

Notes

For a temporary change, this can be used as a context manager:

```
# if interactive mode is off
# then figures will not be shown on creation
plt.ioff()
# This figure will not be shown immediately
fig = plt.figure()

with plt.ion():
    # interactive mode will be on
    # figures will automatically be shown
    fig2 = plt.figure()
    # ...
```

To enable optional usage as a context manager, this function returns a context manager object, which is not intended to be stored or accessed by the user.

matplotlib.pyplot.install_repl_displayhook

matplotlib.pyplot.**install_repl_displayhook**()

Connect to the display hook of the current shell.

The display hook gets called when the read-evaluate-print-loop (REPL) of the shell has finished the execution of a command. We use this callback to be able to automatically update a figure in interactive mode.

This works both with IPython and with vanilla python shells.

matplotlib.pyplot.isinteractive

matplotlib.pyplot.**isinteractive**()

Return whether plots are updated after every plotting command.

The interactive mode is mainly useful if you build plots from the command line and want to see the effect of each command while you are building the figure.

In interactive mode:

- newly created figures will be shown immediately;
- figures will automatically redraw on change;
- *pyplot.show* will not block by default.

In non-interactive mode:

- newly created figures and changes to figures will not be reflected until explicitly asked to be;
- *pyplot.show* will block by default.

See also

ion
: Enable interactive mode.

ioff
: Disable interactive mode.

show
: Show all figures (and maybe block).

pause
: Show all figures, and block for a time.

matplotlib.pyplot.pause

matplotlib.pyplot.**pause**(*interval*)

Run the GUI event loop for *interval* seconds.

If there is an active figure, it will be updated and displayed before the pause, and the GUI event loop (if any) will run during the pause.

This can be used for crude animation. For more complex animation use *matplotlib.animation*.

If there is no active figure, sleep for *interval* seconds instead.

See also

matplotlib.animation
: Proper animations

show
: Show all figures and optional block until all figures are closed.

Examples using `matplotlib.pyplot.pause`

matplotlib.pyplot.savefig

matplotlib.pyplot.**savefig**(**args*, ***kwargs*)

Save the current figure as an image or vector graphic to a file.

Call signature:

```
savefig(fname, *, transparent=None, dpi='figure', format=None,
        metadata=None, bbox_inches=None, pad_inches=0.1,
        facecolor='auto', edgecolor='auto', backend=None,
        **kwargs
       )
```

The available output formats depend on the backend being used.

Parameters

fname

[str or path-like or binary file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as *matplotlib.backends.backend_pdf.PdfPages*.

If *format* is set, it determines the output format, and the file is saved as *fname*. Note that *fname* is used verbatim, and there is no attempt to make the extension, if any, of *fname* match *format*, and no extension is appended.

If *format* is not set, then the format is inferred from the extension of *fname*, if there is one. If *format* is not set and *fname* has no extension, then the file is saved with *rcParams["savefig.format"]* (default: `'png'`) and the appropriate extension is appended to *fname*.

Other Parameters

transparent

[bool, default: *rcParams["savefig.transparent"]* (default: `False`)] If *True*, the Axes patches will all be transparent; the Figure patch will also be transparent unless *facecolor* and/or *edgecolor* are specified via kwargs.

If *False* has no effect and the color of the Axes and Figure patches are unchanged (unless the Figure patch is specified via the *facecolor* and/or *edgecolor* keyword arguments in which case those colors are used).

The transparency of these patches will be restored to their original values upon exit of this function.

This is useful, for example, for displaying a plot on top of a colored background on a web page.

dpi

[float or 'figure', default: *rcParams["savefig.dpi"]* (default: `'figure'`)] The resolution in dots per inch. If 'figure', use the figure's dpi value.

format

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

metadata

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter `metadata` of *`print_png`*.
- 'pdf' with pdf backend: See the parameter `metadata` of *`PdfPages`*.
- 'svg' with svg backend: See the parameter `metadata` of *`print_svg`*.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

Not supported for 'pgf', 'raw', and 'rgba' as those formats do not support embedding metadata. Does not currently support 'jpg', 'tiff', or 'webp', but may include embedding EXIF metadata in the future.

bbox_inches

[str or *`Bbox`*, default: *`rcParams["savefig.bbox"]`* (default: `None`)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float or 'layout', default: *`rcParams["savefig.pad_inches"]`* (default: `0.1`)] Amount of padding in inches around the figure when bbox_inches is 'tight'. If 'layout' use the padding from the constrained or compressed layout engine; ignored if one of those engines is not in use.

facecolor

[*color* or 'auto', default: *`rcParams["savefig.facecolor"]`* (default: `'auto'`)] The facecolor of the figure. If 'auto', use the current figure facecolor.

edgecolor

[*color* or 'auto', default: *`rcParams["savefig.edgecolor"]`* (default: `'auto'`)] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

orientation

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

papertype

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

bbox_extra_artists

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

Notes

> **Note**
>
> This is the *pyplot wrapper* for *Figure.savefig*.

Examples using `matplotlib.pyplot.savefig`

matplotlib.pyplot.show

`matplotlib.pyplot.`**`show`**(*, *block=None*)

Display all open figures.

Parameters

block

[bool, optional] Whether to wait for all figures to be closed before returning.

If `True` block and run the GUI main loop until all figure windows are closed.

If `False` ensure that all figure windows are displayed and return immediately. In this case, you are responsible for ensuring that the event loop is running to have responsive figures.

Defaults to True in non-interactive mode and to False in interactive mode (see *pyplot.isinteractive*).

> **See also**
>
> ***ion***
>
> Enable interactive mode, which shows / updates the figure after every plotting command, so that calling `show()` is not necessary.
>
> ***ioff***
>
> Disable interactive mode.
>
> ***savefig***
>
> Save the figure to an image file instead of showing it on screen.

Notes

Saving figures to file and showing a window at the same time

If you want an image file as well as a user interface window, use *pyplot.savefig* before *pyplot.show*. At the end of (a blocking) `show()` the figure is closed and thus unregistered from pyplot. Calling *pyplot.savefig* afterwards would save a new and thus empty figure. This limitation of command order does not apply if the show is non-blocking or if you keep a reference to the figure and use *Figure.savefig*.

Auto-show in jupyter notebooks

The jupyter backends (activated via `%matplotlib inline`, `%matplotlib notebook`, or `%matplotlib widget`), call `show()` at the end of every cell by default. Thus, you usually don't have to call it explicitly there.

Examples using `matplotlib.pyplot.show`

matplotlib.pyplot.switch_backend

matplotlib.pyplot.**switch_backend**(*newbackend*)

Set the pyplot backend.

Switching to an interactive backend is possible only if no event loop for another interactive backend has started. Switching to and from non-interactive backends is always possible.

If the new backend is different than the current backend then all open Figures will be closed via `plt.close('all')`.

Parameters

newbackend

[str] The case-insensitive name of the backend to use.

matplotlib.pyplot.uninstall_repl_displayhook

matplotlib.pyplot.**uninstall_repl_displayhook**()

Disconnect from the display hook of the current shell.

Other

connect	Bind function *func* to event *s*.
disconnect	Disconnect the callback with id *cid*.
findobj	Find artist objects.
get	Return the value of an *Artist*'s *property*, or print all of them.

continues on next page

Table 276 – continued from previous page

getp	Return the value of an *Artist*'s *property*, or print all of them.
get_current_fig_manager	Return the figure manager of the current figure.
ginput	Blocking call to interact with a figure.
new_figure_manager	Create a new figure manager instance.
set_loglevel	Configure Matplotlib's logging levels.
setp	Set one or more properties on an *Artist*, or list allowed values.
waitforbuttonpress	Blocking call to interact with the figure.
xkcd	Turn on xkcd sketch-style drawing mode.

matplotlib.pyplot.connect

matplotlib.pyplot.**connect**(*s*, *func*)

Bind function *func* to event *s*.

Parameters

s

[str] One of the following events ids:

- 'button_press_event'
- 'button_release_event'
- 'draw_event'
- 'key_press_event'
- 'key_release_event'
- 'motion_notify_event'
- 'pick_event'
- 'resize_event'
- 'scroll_event'
- 'figure_enter_event',
- 'figure_leave_event',
- 'axes_enter_event',
- 'axes_leave_event'
- 'close_event'.

func

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the Axes, the `inaxes` attribute of the event will be set to the *Axes* the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See *KeyEvent* and *MouseEvent* for more info.

Note

If func is a method, this only stores a weak reference to the method. Thus, the figure does not influence the lifetime of the associated object. Usually, you want to make sure that the object is kept alive throughout the lifetime of the figure by holding a reference to it.

Returns

cid

A connection id that can be used with *FigureCanvasBase.mpl_disconnect*.

Notes

Note

This is the *pyplot wrapper* for *FigureCanvasBase.mpl_connect*.

Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

Examples using `matplotlib.pyplot.connect`

matplotlib.pyplot.disconnect

`matplotlib.pyplot.`**`disconnect`**(*cid*)

Disconnect the callback with id *cid*.

Notes

> **Note**
>
> This is the *pyplot wrapper* for `FigureCanvasBase.mpl_disconnect`.

Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

Examples using `matplotlib.pyplot.disconnect`

matplotlib.pyplot.findobj

matplotlib.pyplot.**findobj**(*o=None*, *match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of `Artist`

matplotlib.pyplot.get

matplotlib.pyplot.**get**(*obj*, **args*, ***kwargs*)

Return the value of an `Artist`'s *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it's None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

See also

setp

Notes

Note

This is equivalent to *matplotlib.artist.getp*.

matplotlib.pyplot.getp

`matplotlib.pyplot.`**`getp`**(*obj*, **args*, ***kwargs*)

Return the value of an *Artist*'s *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it's None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

See also

setp

Notes

Note

This is equivalent to *matplotlib.artist.getp*.

Examples using `matplotlib.pyplot.getp`

matplotlib.pyplot.get_current_fig_manager

matplotlib.pyplot.**get_current_fig_manager**()

Return the figure manager of the current figure.

The figure manager is a container for the actual backend-depended window that displays the figure on screen.

If no current figure exists, a new one is created, and its figure manager is returned.

Returns

***FigureManagerBase* or backend-dependent subclass thereof**

matplotlib.pyplot.ginput

matplotlib.pyplot.**ginput**(*n=1*, *timeout=30*, *show_clicks=True*, *mouse_add=MouseButton.LEFT*, *mouse_pop=MouseButton.RIGHT*, *mouse_stop=MouseButton.MIDDLE*)

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse_add*, *mouse_pop* and *mouse_stop*.

Parameters

n

[int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

timeout

[float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never time out.

show_clicks

[bool, default: True] If True, show a red cross at the location of each click.

mouse_add

[*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

mouse_pop

[*MouseButton* or None, default: *MouseButton.RIGHT*] Mouse button used to remove the most recently added point.

mouse_stop

[*MouseButton* or None, default: *MouseButton.MIDDLE*] Mouse button used to stop input.

Returns

list of tuples

A list of the clicked (x, y) coordinates.

Notes

Note

This is the *pyplot wrapper* for *Figure.ginput*.

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right-clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

Examples using `matplotlib.pyplot.ginput`

matplotlib.pyplot.new_figure_manager

matplotlib.pyplot.**new_figure_manager**(*num*, **args*, ***kwargs*)

Create a new figure manager instance.

matplotlib.pyplot.set_loglevel

matplotlib.pyplot.**set_loglevel**(**args*, ***kwargs*)

Configure Matplotlib's logging levels.

Matplotlib uses the standard library `logging` framework under the root logger 'matplotlib'. This is a helper function to:

- set Matplotlib's root logger level
- set the root logger handler's level, creating the handler if it does not exist yet

Typically, one should call `set_loglevel("info")` or `set_loglevel("debug")` to get additional debugging information.

Users or applications that are installing their own logging handlers may want to directly manipulate `logging.getLogger('matplotlib')` rather than use this function.

Parameters

level

[{"notset", "debug", "info", "warning", "error", "critical"}] The log level of the handler.

Notes

> **Note**
>
> This is equivalent to *matplotlib.set_loglevel*.

The first time this function is called, an additional handler is attached to Matplotlib's root handler; this handler is reused every time and this function simply manipulates the logger and handler's level.

matplotlib.pyplot.setp

matplotlib.pyplot.**setp**(*obj*, **args*, ***kwargs*)

Set one or more properties on an *Artist*, or list allowed values.

Parameters

obj

[*Artist* or list of *Artist*] The artist(s) whose properties are being set or queried. When setting properties, all artists are affected; when querying the allowed values, only the first instance in the sequence is queried.

For example, two lines can be made thicker and red with a single call:

```
>>> x = arange(0, 1, 0.01)
>>> lines = plot(x, sin(2*pi*x), x, sin(4*pi*x))
>>> setp(lines, linewidth=2, color='r')
```

file

[file-like, default: `sys.stdout`] Where *setp* writes its output when asked to list allowed values.

```
>>> with open('output.log') as file:
...     setp(line, file=file)
```

The default, `None`, means `sys.stdout`.

***args, **kwargs**

The properties to set. The following combinations are supported:

- Set the linestyle of a line to be dashed:

```
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

- Set multiple properties at once:

```
>>> setp(line, linewidth=2, color='r')
```

- List allowed values for a line's linestyle:

```
>>> setp(line, 'linestyle')
linestyle: {'-', '--', '-.', ':', '', (offset, on-
 ↪off-seq), ...}
```

- List all properties that can be set, and their allowed values:

```
>>> setp(line)
agg_filter: a filter function, ...
[long output listing omitted]
```

setp also supports MATLAB style string/value pairs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r')  #␣
 ↪MATLAB style
>>> setp(lines, linewidth=2, color='r')        #␣
 ↪Python style
```

See also

getp

Notes

Note

This is equivalent to *matplotlib.artist.setp*.

Examples using `matplotlib.pyplot.setp`

matplotlib.pyplot.waitforbuttonpress

matplotlib.pyplot.**waitforbuttonpress**(*timeout=-1*)

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

Notes

Note

This is the *pyplot wrapper* for *Figure.waitforbuttonpress*.

Examples using `matplotlib.pyplot.waitforbuttonpress`

matplotlib.pyplot.xkcd

matplotlib.pyplot.**xkcd**(*scale=1*, *length=100*, *randomness=2*)

Turn on xkcd sketch-style drawing mode.

This will only have an effect on things drawn after this function is called.

For best results, install the xkcd script font; xkcd fonts are not packaged with Matplotlib.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line.

length

[float, optional] The length of the wiggle along the line.

randomness

[float, optional] The scale factor by which the length is shrunken or expanded.

Notes

This function works by a number of rcParams, so it will probably override others you have set before.

If you want the effects of this function to be temporary, it can be used as a context manager, for example:

```
with plt.xkcd():
    # This figure will be in XKCD-style
    fig1 = plt.figure()
    # ...

# This figure will be in regular style
fig2 = plt.figure()
```

Examples using `matplotlib.pyplot.xkcd`

7.2.41 `matplotlib.projections`

Non-separable transforms that map from data space to screen space.

Projections are defined as *Axes* subclasses. They include the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and Matplotlib has a facility to help with doing so.
- Setting up default values (overriding *cla*), since the defaults for a rectilinear Axes may not be appropriate.
- Defining the shape of the Axes, for example, an elliptical Axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an "advanced" feature left to the reader, but there is an example of this for polar plots in *matplotlib.projections.polar*.
- Any additional methods for additional convenience or features.

Once the projection Axes is defined, it can be used in one of two ways:

- By defining the class attribute `name`, the projection Axes can be registered with *matplotlib.projections.register_projection* and subsequently simply invoked by name:

```
fig.add_subplot(projection="my_proj_name")
```

- For more complex, parameterisable projections, a generic "projection" object may be defined which includes the method `_as_mpl_axes`. `_as_mpl_axes` should take no arguments and return the projection's Axes subclass and a dictionary of additional arguments to pass to the subclass' `__init__` method. Subsequently a parameterised projection can be initialised with:

```
fig.add_subplot(projection=MyProjection(param1=param1_value))
```

where MyProjection is an object which implements a `_as_mpl_axes` method.

A full-fledged and heavily annotated example is in *Custom projection*. The polar plot functionality in *matplotlib.projections.polar* may also be of interest.

class matplotlib.projections.**ProjectionRegistry**

Bases: `object`

A mapping of registered projection names to projection classes.

get_projection_class(*name*)

Get a projection class from its *name*.

get_projection_names()

Return the names of all projections currently registered.

register(**projections*)

Register a new set of projections.

matplotlib.projections.**get_projection_class**(*projection=None*)

Get a projection class from its name.

If *projection* is None, a standard rectilinear projection is returned.

matplotlib.projections.**get_projection_names**()

Return the names of all projections currently registered.

matplotlib.projections.**register_projection**(*cls*)

Built-in projections

Matplotlib has built-in support for polar and some geographic projections. See the following pages for more information:

matplotlib.projections.polar

class matplotlib.projections.polar.**InvertedPolarTransform**(*axis=None*, *use_rmin=True*, ***, *apply_theta_transforms=True*)

Bases: *Transform*

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

Parameters

axis

[*Axis*, optional] Axis associated with this transform. This is used to get the minimum radial limit.

use_rmin

[bool, optional] If True, add the minimum radial axis limit after transforming from Cartesian coordinates. *axis* must also be specified for this to take effect.

has_inverse = True

True if this transform has a corresponding inverse transform.

input_dims = 2

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

output_dims = 2

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

class matplotlib.projections.polar.**PolarAffine**(*scale_transform*, *limits*)

Bases: *Affine2DBase*

The affine part of the polar projection.

Scales the output so that maximum radius rests on the edge of the Axes circle and the origin is mapped to (0.5, 0.5). The transform applied is the same to x and y components and given by:

$$x_1 = 0.5 \left[\frac{x_0}{(r_{\max} - r_{\min})} + 1 \right]$$

$r_{\min}, r_{\max}$ are the minimum and maximum radial limits after any scaling (e.g. log scaling) has been removed.

Parameters

scale_transform

[*Transform*] Scaling transform for the data. This is used to remove any scaling from the radial view limits.

limits

[*BboxBase*] View limits of the data. The only part of its bounds that is used is the y limits (for the radius limits).

get_matrix()

Get the matrix for the affine part of this transform.

class matplotlib.projections.polar.**PolarAxes**(**args*, *theta_offset=0*, *theta_direction=1*, *rlabel_position=22.5*, ***kwargs*)

Bases: *Axes*

A polar graph projection, where the input dimensions are *theta*, *r*.

Theta starts pointing east and goes anti-clockwise.

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or *fc*	*color*
figure	*Figure* or *SubFigure*
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown

Table 277 – continued fro

Property	Description
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	*Transform*
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

class InvertedPolarTransform(*axis=None*, *use_rmin=True*, ***, *apply_theta_transforms=True*)

Bases: *Transform*

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

Parameters

axis

[*Axis*, optional] Axis associated with this transform. This is used to get the minimum radial limit.

use_rmin

[bool, optional] If `True`, add the minimum radial axis limit after transforming from Cartesian coordinates. *axis* must also be specified for this to take effect.

has_inverse = True

True if this transform has a corresponding inverse transform.

input_dims = 2

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

output_dims = 2

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

class PolarAffine(*scale_transform*, *limits*)

Bases: *Affine2DBase*

The affine part of the polar projection.

Scales the output so that maximum radius rests on the edge of the Axes circle and the origin is mapped to (0.5, 0.5). The transform applied is the same to x and y components and given by:

$$x_1 = 0.5 \left[\frac{x_0}{(r_{\max} - r_{\min})} + 1 \right]$$

$r_{\min}, r_{\max}$ are the minimum and maximum radial limits after any scaling (e.g. log scaling) has been removed.

Parameters

scale_transform

[*Transform*] Scaling transform for the data. This is used to remove any scaling from the radial view limits.

limits

[*BboxBase*] View limits of the data. The only part of its bounds that is used is the y limits (for the radius limits).

get_matrix()

Get the matrix for the affine part of this transform.

class PolarTransform(*axis=None*, *use_rmin=True*, *, *apply_theta_transforms=True*, *scale_transform=None*)

Bases: *Transform*

The base polar transform.

This transform maps polar coordinates θ, r into Cartesian coordinates $x, y = r\cos(\theta), r\sin(\theta)$ (but does not fully transform into Axes coordinates or handle positioning in screen space).

This transformation is designed to be applied to data after any scaling along the radial axis (e.g. log-scaling) has been applied to the input data.

Path segments at a fixed radius are automatically transformed to circular arcs as long as `path._interpolation_steps > 1`.

Parameters

axis

[*Axis*, optional] Axis associated with this transform. This is used to get the minimum radial limit.

use_rmin

[`bool`, optional] If `True`, subtract the minimum radial axis limit before transforming to Cartesian coordinates. *axis* must also be specified for this to take effect.

has_inverse = True

True if this transform has a corresponding inverse transform.

input_dims = 2

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

output_dims = 2

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

transform_path_non_affine(*path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

class RadialLocator(*base*, *axes=None*)

Bases: *Locator*

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis).

nonsingular(*vmin*, *vmax*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the Axes if the Axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

set_axis(*axis*)

view_limits(*vmin*, *vmax*)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class ThetaFormatter

Bases: *Formatter*

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

class ThetaLocator(*base*)

Bases: *Locator*

Used to locate theta ticks.

This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

set_axis(*axis*)

view_limits(*vmin*, *vmax*)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

can_pan()

Return whether this Axes supports the pan/zoom button functionality.

For a polar Axes, this is slightly misleading. Both panning and zooming are performed by the same button. Panning is performed in azimuth while zooming is done along the radial.

can_zoom()

Return whether this Axes supports the zoom box button functionality.

A polar Axes does not support zoom boxes.

clear()

Clear the Axes.

drag_pan(*button*, *key*, *x*, *y*)

Called when the mouse moves during a pan operation.

Parameters

button

[*MouseButton*] The pressed mouse button.

key

[str or None] The pressed key, if any.

x, y

[float] The mouse coordinates in display coords.

Notes

This is intended to be overridden by new projection types.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

end_pan()

Called when a pan operation completes (when the mouse button is up.)

Notes

This is intended to be overridden by new projection types.

format_coord(*theta*, *r*)

Return a format string formatting the *x*, *y* coordinates.

get_data_ratio()

Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

get_rlabel_position()

Returns

float

The theta position of the radius labels in degrees.

get_rmax()

Returns

float

Outer radial limit.

get_rmin()

Returns

float

The inner radial limit.

get_rorigin()

Returns

float

get_rsign()

get_theta_direction()

Get the direction in which theta increases.

-1:

Theta increases in the clockwise direction

1:

Theta increases in the counterclockwise direction

get_theta_offset()

Get the offset for the location of 0 in radians.

get_thetamax()

Return the maximum theta limit in degrees.

get_thetamin()

Get the minimum theta limit in degrees.

get_xaxis_text1_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing x-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_text2_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_transform(*which='grid'*)

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

> **Note**
>
> This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Parameters

which

[{'grid', 'tick1', 'tick2'}]

get_yaxis_text1_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing y-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_text2_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_transform(*which='grid'*)

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

> **Note**
>
> This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Parameters

which

[{'grid', 'tick1', 'tick2'}]

name = 'polar'

set(*, *adjustable=<UNSET>*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *anchor=<UNSET>*, *animated=<UNSET>*, *aspect=<UNSET>*, *autoscale_on=<UNSET>*, *autoscalex_on=<UNSET>*, *autoscaley_on=<UNSET>*, *axes_locator=<UNSET>*, *axisbelow=<UNSET>*, *box_aspect=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *facecolor=<UNSET>*, *forward_navigation_events=<UNSET>*, *frame_on=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *navigate=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *prop_cycle=<UNSET>*, *rasterization_zorder=<UNSET>*, *rasterized=<UNSET>*, *rgrids=<UNSET>*, *rlabel_position=<UNSET>*, *rlim=<UNSET>*, *rmax=<UNSET>*, *rmin=<UNSET>*, *rorigin=<UNSET>*, *rscale=<UNSET>*, *rticks=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *subplotspec=<UNSET>*, *theta_direction=<UNSET>*, *theta_offset=<UNSET>*, *theta_zero_location=<UNSET>*, *thetagrids=<UNSET>*, *thetalim=<UNSET>*, *thetamax=<UNSET>*, *thetamin=<UNSET>*, *title=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xbound=<UNSET>*, *xlabel=<UNSET>*, *xlim=<UNSET>*, *xmargin=<UNSET>*, *xscale=<UNSET>*, *xticklabels=<UNSET>*, *xticks=<UNSET>*, *ybound=<UNSET>*, *ylabel=<UNSET>*, *ylim=<UNSET>*, *ymargin=<UNSET>*, *yscale=<UNSET>*, *yticklabels=<UNSET>*, *yticks=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
`adjustable`	{'box', 'datalim'}
`agg_filter`	a filter function, which takes a (m, n, 3) float array and a dpi value
`alpha`	float or None

set_rgrids(*radii*, *labels=None*, *angle=None*, *fmt=None*, ***kwargs*)

Set the radial gridlines on a polar plot.

Parameters

radii

[tuple with floats] The radii for the radial gridlines

labels

[tuple with strings or None] The labels to use at each radial gridline. The *matplotlib.ticker.ScalarFormatter* will be used if None.

angle

[float] The angular position of the radius labels in degrees.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'.

Returns

lines

[list of *lines.Line2D*] The radial gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional `Text` properties for the labels.

> **Warning**
>
> This only sets the properties of the current ticks. Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Use `set_tick_params` instead if possible.

> **See also**
>
> ***PolarAxes.set_thetagrids***
> ***Axis.get_gridlines***
> ***Axis.get_ticklabels***

set_rlabel_position(*value*)

Update the theta position of the radius labels.

Parameters

value

[number] The angular position of the radius labels in degrees.

set_rlim(*bottom=None*, *top=None*, *, *emit=True*, *auto=False*, ***kwargs*)

Set the radial axis view limits.

This function behaves like `Axes.set_ylim`, but additionally supports *rmin* and *rmax* as aliases for *bottom* and *top*.

> **See also**
>
> ***Axes.set_ylim***

set_rmax(*rmax*)

Set the outer radial limit.

Parameters

rmax

[float]

set_rmin(*rmin*)

Set the inner radial limit.

Parameters

rmin

[float]

set_rorigin(*rorigin*)

Update the radial origin.

Parameters

rorigin

[float]

set_rscale(**args*, ***kwargs*)

set_rticks(**args*, ***kwargs*)

set_theta_direction(*direction*)

Set the direction in which theta increases.

clockwise, -1:

Theta increases in the clockwise direction

counterclockwise, anticlockwise, 1:

Theta increases in the counterclockwise direction

set_theta_offset(*offset*)

Set the offset for the location of 0 in radians.

set_theta_zero_location(*loc*, *offset=0.0*)

Set the location of theta's zero.

This simply calls *set_theta_offset* with the correct value in radians.

Parameters

loc

[str] May be one of "N", "NW", "W", "SW", "S", "SE", "E", or "NE".

offset

[float, default: 0] An offset in degrees to apply from the specified *loc*. **Note:** this offset is *always* applied counter-clockwise regardless of the direction setting.

set_thetagrids(*angles*, *labels=None*, *fmt=None*, ***kwargs*)

Set the theta gridlines in a polar plot.

Parameters

angles

[tuple with floats, degrees] The angles of the theta gridlines.

labels

[tuple with strings or None] The labels to use at each theta gridline. The *projections.polar.ThetaFormatter* will be used if None.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'. Note that the angle that is used is in radians.

Returns

lines

[list of *lines.Line2D*] The theta gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

Warning

This only sets the properties of the current ticks. Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).

Use *set_tick_params* instead if possible.

See also

PolarAxes.set_rgrids
Axis.get_gridlines
Axis.get_ticklabels

set_thetalim(**args*, ***kwargs*)

Set the minimum and maximum theta values.

Can take the following signatures:

- `set_thetalim(minval, maxval)`: Set the limits in radians.
- `set_thetalim(thetamin=minval, thetamax=maxval)`: Set the limits in degrees.

where minval and maxval are the minimum and maximum limits. Values are wrapped in to the range $[0, 2\pi]$ (in radians), so for example it is possible to do `set_thetalim(-np.pi / 2, np.pi / 2)` to have an axis symmetric around 0. A ValueError is raised if the absolute angle difference is larger than a full circle.

set_thetamax(*thetamax*)

Set the maximum theta limit in degrees.

set_thetamin(*thetamin*)

Set the minimum theta limit in degrees.

set_yscale(**args*, ***kwargs*)

Set the yaxis' scale.

Parameters

value

[str or *ScaleBase*] The axis scale type to apply. Valid string values are the names of scale classes ("linear", "log", "function",...). These may be the names of any of the *built-in scales* or of any custom scales registered using *matplotlib.scale.register_scale*.

****kwargs**

If *value* is a string, keywords are passed to the instantiation method of the respective class.

start_pan(*x*, *y*, *button*)

Called when a pan operation has started.

Parameters

x, y

[float] The mouse coordinates in display coords.

button

[*MouseButton*] The pressed mouse button.

Notes

This is intended to be overridden by new projection types.

class matplotlib.projections.polar.**PolarTransform**(*axis=None*, *use_rmin=True*, *, *apply_theta_transforms=True*, *scale_transform=None*)

Bases: *Transform*

The base polar transform.

This transform maps polar coordinates θ, r into Cartesian coordinates $x, y = r\cos(\theta), r\sin(\theta)$ (but does not fully transform into Axes coordinates or handle positioning in screen space).

This transformation is designed to be applied to data after any scaling along the radial axis (e.g. log-scaling) has been applied to the input data.

Path segments at a fixed radius are automatically transformed to circular arcs as long as `path._interpolation_steps > 1`.

Parameters

axis

[*Axis*, optional] Axis associated with this transform. This is used to get the minimum radial limit.

use_rmin

[`bool`, optional] If `True`, subtract the minimum radial axis limit before transforming to Cartesian coordinates. *axis* must also be specified for this to take effect.

has_inverse = True

True if this transform has a corresponding inverse transform.

input_dims = 2

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

output_dims = 2

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

transform_path_non_affine(*path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

class matplotlib.projections.polar.**RadialAxis**(**args*, ***kwargs*)

Bases: *YAxis*

A radial Axis.

This overrides certain properties of a *YAxis* to provide special-casing for a radial axis.

Parameters

axes

[*Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

clear

[bool, default: True] Whether to clear the Axis on creation. This is not required, e.g., when creating an Axis as part of an Axes, as `Axes.clear` will call `Axis.clear`. .. versionadded:: 3.8

axis_name = 'radius'

Read-only name identifying the axis.

clear()

Clear the axis.

This resets axis properties to their default values:

- the label
- the scale
- locators, formatters and ticks
- major and minor grid
- units
- registered callbacks

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *converter=<UNSET>*, *data_interval=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *inverted=<UNSET>*, *label=<UNSET>*, *label_coords=<UNSET>*, *label_position=<UNSET>*, *label_text=<UNSET>*, *major_formatter=<UNSET>*, *major_locator=<UNSET>*, *minor_formatter=<UNSET>*, *minor_locator=<UNSET>*, *mouseover=<UNSET>*, *offset_position=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *remove_overlapping_locs=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *tick_params=<UNSET>*, *ticklabels=<UNSET>*, *ticks=<UNSET>*, *ticks_position=<UNSET>*, *transform=<UNSET>*, *units=<UNSET>*, *url=<UNSET>*, *view_interval=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

class matplotlib.projections.polar.**RadialLocator**(*base*, *axes=None*)

Bases: *Locator*

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis).

nonsingular(*vmin*, *vmax*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the Axes if the Axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

set_axis(*axis*)

view_limits(*vmin*, *vmax*)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.projections.polar.**RadialTick**(**args*, ***kwargs*)

Bases: *YTick*

A radial-axis tick.

This subclass of *YTick* provides radial ticks with some small modification to their re-positioning such that ticks are rotated based on axes limits. This results in ticks that are correctly perpendicular to the spine. Labels are also rotated to be perpendicular to the spine, when 'auto' rotation is enabled.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

set(***, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *pad=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure or SubFigure

path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

update_position(*loc*)

Set the location of tick in data coords with scalar *loc*.

class matplotlib.projections.polar.**ThetaAxis**(**args*, ***kwargs*)

Bases: XAxis

A theta Axis.

This overrides certain properties of an XAxis to provide special-casing for an angular axis.

Parameters

axes

[Axes] The Axes to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

clear

[bool, default: True] Whether to clear the Axis on creation. This is not required, e.g., when creating an Axis as part of an Axes, as `Axes.clear` will call `Axis.clear`. .. versionadded:: 3.8

axis_name = 'theta'

Read-only name identifying the axis.

clear()

Clear the axis.

This resets axis properties to their default values:

- the label
- the scale
- locators, formatters and ticks
- major and minor grid
- units
- registered callbacks

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *converter=<UNSET>*, *data_interval=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *inverted=<UNSET>*, *label=<UNSET>*, *label_coords=<UNSET>*, *label_position=<UNSET>*, *label_text=<UNSET>*, *major_formatter=<UNSET>*, *major_locator=<UNSET>*, *minor_formatter=<UNSET>*, *minor_locator=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *remove_overlapping_locs=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *tick_params=<UNSET>*, *ticklabels=<UNSET>*, *ticks=<UNSET>*, *ticks_position=<UNSET>*, *transform=<UNSET>*, *units=<UNSET>*, *url=<UNSET>*, *view_interval=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

class matplotlib.projections.polar.**ThetaFormatter**

Bases: *Formatter*

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

class matplotlib.projections.polar.**ThetaLocator**(*base*)

Bases: *Locator*

Used to locate theta ticks.

This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

set_axis(*axis*)

view_limits(*vmin*, *vmax*)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.projections.polar.**ThetaTick**(*axes*, **args*, ***kwargs*)

Bases: *XTick*

A theta-axis tick.

This subclass of *XTick* provides angular ticks with some small modification to their re-positioning such that ticks are rotated based on tick location. This results in ticks that are correctly perpendicular to the arc spine.

When 'auto' rotation is enabled, labels are also rotated to be parallel to the spine. The label padding is also applied here since it's not possible to use a generic axes transform to produce tick-specific padding.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

set(***, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *pad=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None

rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

update_position(*loc*)

Set the location of tick in data coords with scalar *loc*.

matplotlib.projections.geo

class matplotlib.projections.geo.**AitoffAxes**(**args*, ***kwargs*)

Bases: GeoAxes

Build an Axes in a figure.

Parameters

fig

[Figure] The Axes is built in the Figure *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}

zorder	float

Returns

Axes

The new *Axes* object.

class AitoffTransform(*resolution*)

Bases: _GeoTransform

The base Aitoff transform.

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

class InvertedAitoffTransform(*resolution*)

Bases: _GeoTransform

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

Bases: *Axes*

An abstract base class for geographic projections.

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

Returns

Axes

The new *Axes* object.

RESOLUTION = 75

class ThetaFormatter(*round_to=1.0*)

Bases: *Formatter*

Used to format the theta tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

can_pan()

Return whether this Axes supports the pan/zoom button functionality.

This Axes object does not support interactive pan/zoom.

can_zoom()

Return whether this Axes supports the zoom box button functionality.

This Axes object does not support interactive zoom box.

clear()

Clear the Axes.

drag_pan(*button*, *key*, *x*, *y*)

Called when the mouse moves during a pan operation.

Parameters

button

[*MouseButton*] The pressed mouse button.

key

[str or None] The pressed key, if any.

x, y

[float] The mouse coordinates in display coords.

Notes

This is intended to be overridden by new projection types.

end_pan()

Called when a pan operation completes (when the mouse button is up.)

Notes

This is intended to be overridden by new projection types.

format_coord(*lon*, *lat*)

Return a format string formatting the coordinate.

get_data_ratio()

Return the aspect ratio of the data itself.

get_xaxis_text1_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing x-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_text2_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_transform(*which='grid'*)

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Parameters

which

[{'grid', 'tick1', 'tick2'}]

get_yaxis_text1_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing y-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_text2_transform(*pad*)

Returns

transform

[Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_transform(*which='grid'*)

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

> **Note**
>
> This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Parameters

which

[{'grid', 'tick1', 'tick2'}]

invert_xaxis()

Not supported. Please consider using Cartopy.

invert_yaxis()

Not supported. Please consider using Cartopy.

set_latitude_grid(*degrees*)

Set the number of degrees between each latitude grid.

set_longitude_grid(*degrees*)

Set the number of degrees between each longitude grid.

set_longitude_grid_ends(*degrees*)

Set the latitude(s) at which to stop drawing the longitude grids.

set_xbound(**args*, ***kwargs*)

Not supported. Please consider using Cartopy.

set_xlim(**args*, ***kwargs*)

Not supported. Please consider using Cartopy.

set_xscale(**args*, ***kwargs*)

Set the xaxis' scale.

Parameters

value

[str or *ScaleBase*] The axis scale type to apply. Valid string values are the names of scale classes ("linear", "log", "function",...). These may be the names of any of the *built-in scales* or of any custom scales registered using *matplotlib.scale.register_scale*.

****kwargs**

If *value* is a string, keywords are passed to the instantiation method of the respective class.

set_ybound(**args*, ***kwargs*)

Not supported. Please consider using Cartopy.

set_ylim(**args*, ***kwargs*)

Not supported. Please consider using Cartopy.

set_yscale(**args*, ***kwargs*)

Set the yaxis' scale.

Parameters

value

[str or *ScaleBase*] The axis scale type to apply. Valid string values are the names of scale classes ("linear", "log", "function",...). These may be the names of any of the *built-in scales* or of any custom scales registered using *matplotlib.scale.register_scale*.

****kwargs**

If *value* is a string, keywords are passed to the instantiation method of the respective class.

start_pan(*x*, *y*, *button*)

Called when a pan operation has started.

Parameters

x, y

[float] The mouse coordinates in display coords.

button

[*MouseButton*] The pressed mouse button.

Notes

This is intended to be overridden by new projection types.

class matplotlib.projections.geo.**HammerAxes**(**args*, ***kwargs*)

Bases: *GeoAxes*

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown

yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

class HammerTransform(*resolution*)

Bases: _GeoTransform

The base Hammer transform.

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

class InvertedHammerTransform(*resolution*)

Bases: `_GeoTransform`

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

Returns

Axes

The new *Axes* object.

class InvertedLambertTransform(*center_longitude*, *center_latitude*, *resolution*)

Bases: `_GeoTransform`

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

class LambertTransform(*center_longitude*, *center_latitude*, *resolution*)

Bases: `_GeoTransform`

The base Lambert transform.

Create a new Lambert transform. Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved Lambert space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

clear()

Clear the Axes.

Returns

Axes

The new *Axes* object.

class InvertedMollweideTransform(*resolution*)

Bases: _GeoTransform

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

class MollweideTransform(*resolution*)

Bases: `_GeoTransform`

The base Mollweide transform.

Create a new geographical transform.

Resolution is the number of steps to interpolate between each input line segment to approximate its path in curved space.

has_inverse = True

True if this transform has a corresponding inverse transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

7.2.42 matplotlib.quiver

Support for plotting vector fields.

Presently this contains Quiver and Barb. Quiver plots an arrow in the direction of the vector, with the size of the arrow related to the magnitude of the vector.

Barbs are like quiver in that they point along a vector, but the magnitude of the vector is given schematically by the presence of barbs or flags on the barb.

This will also become a home for things such as standard deviation ellipses, which can and will be derived

very easily from the Quiver code.

Classes

Quiver(ax, *args[, scale, headwidth, ...])	Specialized PolyCollection for arrows.
QuiverKey(Q, X, Y, U, label, *[, angle, ...])	Labelled arrow for use as a quiver plot scale key.
Barbs(ax, *args[, pivot, length, barbcolor, ...])	Specialized PolyCollection for barbs.

matplotlib.quiver.Quiver

class matplotlib.quiver.**Quiver**(*ax*, **args*, *scale=None*, *headwidth=3*, *headlength=5*, *headaxislength=4.5*, *minshaft=1*, *minlength=1*, *units='width'*, *scale_units=None*, *angles='uv'*, *width=None*, *color='k'*, *pivot='tail'*, ***kwargs*)

Bases: *PolyCollection*

Specialized PolyCollection for arrows.

The only API method is set_UVC(), which can be used to change the size, orientation, and color of the arrows; their locations are fixed when the class is instantiated. Possibly this method will be useful in animations.

Much of the work in this class is done in the draw() method so that as much information as possible is available about the plot. In subsequent draw() calls, recalculation is limited to things that might have changed, so there should be no performance penalty from putting the calculations in the draw() method.

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], /, **kwargs)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color. The arguments *X*, *Y*, *U*, *V*, *C* are positional-only.

Arrow length

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The arrow shape is determined by *width*, *headwidth*, *headlength* and *headaxislength*. See the notes below.

Arrow styling

Each arrow is internally represented by a filled polygon with a default edge linewidth of 0. As a result, an arrow is rather a filled area, not a line with a head, and `PolyCollection` properties like *linewidth*, *edgecolor*, *facecolor*, etc. act accordingly.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors. The interpretation of these components (in data or in screen space) depends on *angles*.

U and *V* must have the same number of elements, matching the number of arrow locations in *X*, *Y*. *U* and *V* may be masked. Locations masked in any of *U*, *V*, and *C* will not be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': Arrow directions are based on *display coordinates*; i.e. a 45° angle will always show up as diagonal on the screen, irrespective of figure or Axes aspect ratio or Axes data ranges. This is useful when the arrows represent a quantity whose direction is not tied to the x and y data coordinates.

  If *U* == *V* the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

- 'xy': Arrow direction in data coordinates, i.e. the arrows point from (x, y) to (x+u, y+v). This is ideal for vector fields or gradient plots where the arrows should directly represent movements or gradients in the x and y directions.

- Arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case *U*, *V* is only used to determine the length of the arrows.

For example, `angles=[30, 60, 90]` will orient the arrows at 30, 60, and 90 degrees respectively, regardless of the *U* and *V* components.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

scale

[float, optional] Scales the length of the arrow inversely.

Number of data values represented by one unit of arrow length on the plot. For example, if the data represents velocity in meters per second (m/s), the scale parameter determines how many meters per second correspond to one unit of arrow length relative to the width of the plot. Smaller scale parameter makes the arrow longer.

By default, an autoscaling algorithm is used to scale the arrow length to a reasonable size, which is based on the average vector length and the number of vectors.

The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The physical image unit, which is used for rendering the scaled arrow data *U*, *V*.

The rendered arrow length is given by

length in x direction = $frac{u}{mathrm{scale}} mathrm{scale_unit}$

length in y direction = $frac{v}{mathrm{scale}} mathrm{scale_unit}$

For example, `(u, v) = (0.5, 0)` with `scale=10, scale_units="width"` results in a horizontal arrow with a length of *0.5 / 10 * "width"*, i.e. 0.05 times the Axes width.

Supported values are:

- **'width' or 'height': The arrow length is scaled relative to the width or height**

  of the Axes. For example, `scale_units='width', scale=1.0`, will result in an arrow length of width of the Axes.

- 'dots': The arrow length of the arrows is in measured in display dots (pixels).

- **'inches': Arrow lengths are scaled based on the DPI (dots per inch) of the figure.**

  This ensures that the arrows have a consistent physical size on the figure, in inches, regardless of data values or plot scaling. For example, `(u, v) =`

`(1, 0)` with `scale_units='inches', scale=2` results in a 0.5 inch-long arrow.

- **'x' or 'y': The arrow length is scaled relative to the x or y axis units.**

  For example, `(u, v) = (0, 1)` with `scale_units='x', scale=1` results in a vertical arrow with the length of 1 x-axis unit.

- **'xy': Arrow length will be same as 'x' or 'y' units.**

  This is useful for creating vectors in the x-y plane where u and v have the same units as x and y. To plot vectors in the x-y plane with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

Note: Setting *scale_units* without setting scale does not have any effect because the scale units only differ by a constant factor and that is rescaled through autoscaling.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] Affects the arrow size (except for the length). In particular, the shaft *width* is measured in multiples of this unit.

Supported values are:

- 'width', 'height': The width or height of the Axes.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': X, Y or $\sqrt{X^2 + Y^2}$ in data units.

The following table summarizes how these values affect the visible arrow size under zooming and figure size changes:

units	zoom	figure size change
'x', 'y', 'xy'	arrow size scales	—
'width', 'height'	—	arrow size scales
'dots', 'inches'	—	—

width

[float, optional] Shaft width in arrow units. All head parameters are relative to *width*.

The default depends on choice of *units* above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft *width*. See the notes below.

headlength

[float, default: 5] Head length as multiple of shaft *width*. See the notes below.

headaxislength

[float, default: 4.5] Head length at shaft intersection as multiple of shaft *width*. See the notes below.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

color

[*color* or list *color*, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the `PolyCollection` *facecolor* parameter.

Returns

Quiver

Other Parameters

data

[indexable object, optional] DATA_PARAMETER_PLACEHOLDER

****kwargs**

[`PolyCollection` properties, optional] All other keyword arguments are passed on to `PolyCollection`:

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float arra
`alpha`	array-like or float or None
`animated`	bool
`antialiased` or `aa` or `antialiaseds`	bool or list of bools
`array`	array-like or None
`capstyle`	`CapStyle` or {'butt', 'projecting', 'round'}
`clim`	(vmin: float, vmax: float)
`clip_box`	`BboxBase` or None
`clip_on`	bool
`clip_path`	Patch or (Path, Transform) or None
`cmap`	`Colormap` or str or None
`color`	*color* or list of RGBA tuples
`edgecolor` or `ec` or `edgecolors`	*color* or list of *color* or 'face'

Table 292 – continu

Property	Description
facecolor or *facecolors* or *fc*	*color* or list of *color*

verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

See also

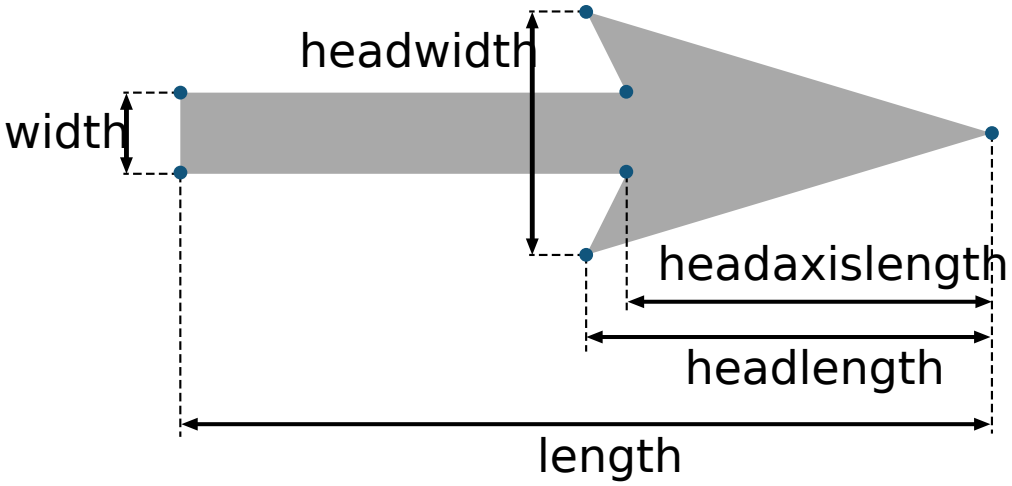
Axes.quiverkey

Add a key to a quiver plot.

Notes

Arrow shape

The arrow is drawn as a polygon using the nodes as shown below. The values *headwidth*, *headlength*, and *headaxislength* are in units of *width*.



The defaults give a slightly swept-back arrow. Here are some guidelines how to get other head shapes:

- To make the head a triangle, make *headaxislength* the same as *headlength*.
- To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*.
- To make the head smaller relative to the shaft, scale down all the head parameters proportionally.
- To remove the head completely, set all *head* parameters to 0.
- To get a diamond-shaped head, make *headaxislength* larger than *headlength*.
- Warning: For *headaxislength* < (*headlength* / *headwidth*), the "headaxis" nodes (i.e. the ones connecting the head with the shaft) will protrude out of the head in forward direction so that the arrow head looks broken.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[`RendererBase` subclass.]

Notes

This method is overridden in the Artist subclasses.

get_datalim(*transData*)

set(*, *UVC=<UNSET>*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *verts_and_codes=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

set_UVC(*U*, *V*, *C=None*)

Examples using matplotlib.quiver.Quiver

matplotlib.quiver.QuiverKey

class matplotlib.quiver.**QuiverKey**(*Q*, *X*, *Y*, *U*, *label*, ***, *angle=0*, *coordinates='axes'*, *color=None*, *labelsep=0.1*, *labelpos='N'*, *labelcolor=None*, *fontproperties=None*, *zorder=None*, ***kwargs*)

Bases: *Artist*

Labelled arrow for use as a quiver plot scale key.

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the horizontal axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[*color*] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[*color*, default: *rcParams["text.color"]* (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

zorder

[float] The zorder of the key. The default is 0.1 above *Q*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

contains(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

halign = {'E': 'left', 'N': 'center', 'S': 'center', 'W': 'right'}

property labelsep

pivot = {'E': 'tip', 'N': 'middle', 'S': 'middle', 'W': 'tail'}

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	unknown
gid	str
in_layo	bool
label	object
mouseov	bool
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

set_figure(*fig*)

Set the *Figure* or *SubFigure* instance the artist belongs to.

Parameters

fig

[*Figure* or *SubFigure*]

```
valign = {'E': 'center', 'N': 'bottom', 'S': 'top', 'W': 'center'}
```

Examples using `matplotlib.quiver.QuiverKey`

matplotlib.quiver.Barbs

class matplotlib.quiver.**Barbs**(*ax*, **args*, *pivot='tip'*, *length=7*, *barbcolor=None*, *flagcolor=None*, *sizes=None*, *fill_empty=False*, *barb_increments=None*, *rounding=True*, *flip_barb=False*, ***kwargs*)

Bases: *PolyCollection*

Specialized PolyCollection for barbs.

The only API method is *set_UVC()*, which can be used to change the size, orientation, and color of the arrows. Locations are changed using the *set_offsets()* collection method. Possibly this method will be useful in animations.

There is one internal function `_find_tails()` which finds exactly what should be put on the barb given the vector magnitude. From there `_make_barbs()` is used to find the vertices of the polygon to represent the barb based on this information.

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of wind barbs.

Call signature:

```
barbs([X, Y], U, V, [C], /, **kwargs)
```

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally sets the color.

The arguments *X*, *Y*, *U*, *V*, *C* are positional-only and may be 1D or 2D. *U*, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:                    /\     \
:                   /  \     \
:                  /    \     \     \
:                 /      \     \     \
:                ------------------------------
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[*color* or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[*color* or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb

- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

data

[indexable object, optional] DATA_PARAMETER_PLACEHOLDER

****kwargs**

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float arra
alpha	array-like or float or None

norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

set(*, *UVC=<UNSET>*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *verts_and_codes=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
UVC	unknown
agg_filter	a filter function, which takes a (m, n, 3) float array ar
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	sequence of pairs of floats
path_effects	list of *AbstractPathEffect*
paths	list of array-like

Table 295 – continued fr

Property	Description
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

set_UVC(*U*, *V*, *C=None*)

set_offsets(*xy*)

Set the offsets for the barb polygons. This saves the offsets passed in and masks them as appropriate for the existing U/V data.

Parameters

xy

[sequence of pairs of floats]

7.2.43 matplotlib.rcsetup

The rcsetup module contains the validation code for customization using Matplotlib's rc settings.

Each rc setting is assigned a function used to validate any attempted changes to that setting. The validation functions are defined in the rcsetup module, and are used to construct the rcParams global object which stores the settings and is referenced throughout Matplotlib.

The default values of the rc settings are set in the default matplotlibrc file. Any additions or deletions to the parameter set listed here should also be propagated to the lib/matplotlib/mpl-data/matplotlibrc in Matplotlib's root source directory.

class matplotlib.rcsetup.**ValidateInStrings**(*key*, *valid*, *ignorecase=False*, *, *_deprecated_since=None*)

Bases: object

valid is a list of legal strings.

matplotlib.rcsetup.**cycler**(**args*, ***kwargs*)

Create a Cycler object much like cycler.cycler(), but includes input validation.

Call signatures:

```
cycler(cycler)
cycler(label=values, label2=values2, ...)
cycler(label, values)
```

Form 1 copies a given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.

Form 3 creates a `Cycler` for a single property. This form exists for compatibility with the original cycler. Its use is discouraged in favor of the kwarg form, i.e. `cycler(label=values)`.

Parameters

cycler

[Cycler] Copy constructor for Cycler.

label

[str] The property key. Must be a valid *`Artist`* property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

values

[iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

Returns

Cycler

A new `Cycler` for the given properties.

Examples

Creating a cycler for a single property:

```
>>> c = cycler(color=['red', 'green', 'blue'])
```

Creating a cycler for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> c = cycler(color=['red', 'green', 'blue'],
...            marker=['o', '+', 'x'])
```

matplotlib.rcsetup.**validate_any**(*s*)

matplotlib.rcsetup.**validate_anylist**(*s*)

matplotlib.rcsetup.**validate_aspect**(*s*)

matplotlib.rcsetup.**validate_axisbelow**(*s*)

matplotlib.rcsetup.**validate_backend**(*s*)

matplotlib.rcsetup.**validate_bbox**(*s*)

matplotlib.rcsetup.**validate_bool**(*b*)

Convert b to `bool` or raise.

matplotlib.rcsetup.**validate_color**(*s*)

Return a valid color arg.

matplotlib.rcsetup.**validate_color_for_prop_cycle**(*s*)

matplotlib.rcsetup.**validate_color_or_auto**(*s*)

matplotlib.rcsetup.**validate_color_or_inherit**(*s*)

Return a valid color arg.

matplotlib.rcsetup.**validate_colorlist**(*s*)

return a list of colorspecs

matplotlib.rcsetup.**validate_cycler**(*s*)

Return a Cycler object from a string repr or the object itself.

matplotlib.rcsetup.**validate_dashlist**(*s*)

return a list of floats

matplotlib.rcsetup.**validate_dpi**(*s*)

Confirm s is string 'figure' or convert s to float or raise.

matplotlib.rcsetup.**validate_fillstylelist**(*s*)

matplotlib.rcsetup.**validate_float**(*s*)

matplotlib.rcsetup.**validate_float_or_None**(*s*)

matplotlib.rcsetup.**validate_floatlist**(*s*)

return a list of floats

matplotlib.rcsetup.**validate_font_properties**(*s*)

matplotlib.rcsetup.**validate_fontsize**(*s*)

matplotlib.rcsetup.**validate_fontsize_None**(*s*)

matplotlib.rcsetup.**validate_fontsizelist**(*s*)

matplotlib.rcsetup.**validate_fontstretch**(*s*)

matplotlib.rcsetup.**validate_fonttype**(*s*)

Confirm that this is a Postscript or PDF font type that we know how to convert to.

matplotlib.rcsetup.**validate_fontweight**(*s*)

matplotlib.rcsetup.**validate_hatch**(*s*)

Validate a hatch pattern. A hatch pattern string can have any sequence of the following characters: \ / | - + * . x o O.

matplotlib.rcsetup.**validate_hatchlist**(*s*)

Validate a hatch pattern. A hatch pattern string can have any sequence of the following characters: \ / | - + * . x o O.

matplotlib.rcsetup.**validate_hist_bins**(*s*)

matplotlib.rcsetup.**validate_int**(*s*)

matplotlib.rcsetup.**validate_int_or_None**(*s*)

matplotlib.rcsetup.**validate_markevery**(*s*)

Validate the markevery property of a Line2D object.

Parameters

s

[None, int, (int, int), slice, float, (float, float), or list[int]]

Returns

None, int, (int, int), slice, float, (float, float), or list[int]

matplotlib.rcsetup.**validate_markeverylist**(*s*)

Validate the markevery property of a Line2D object.

Parameters

s

[None, int, (int, int), slice, float, (float, float), or list[int]]

Returns

None, int, (int, int), slice, float, (float, float), or list[int]

matplotlib.rcsetup.**validate_ps_distiller**(*s*)

matplotlib.rcsetup.**validate_sketch**(*s*)

matplotlib.rcsetup.**validate_string**(*s*)

matplotlib.rcsetup.**validate_string_or_None**(*s*)

matplotlib.rcsetup.**validate_stringlist**(*s*)

return a list of strings

matplotlib.rcsetup.**validate_whiskers**(*s*)

7.2.44 matplotlib.sankey

Module for creating Sankey diagrams using Matplotlib.

class matplotlib.sankey.**Sankey**(*ax=None*, *scale=1.0*, *unit=''*, *format='%G'*, *gap=0.25*, *radius=0.1*, *shoulder=0.03*, *offset=0.15*, *head_angle=100*, *margin=0.4*, *tolerance=1e-06*, ***kwargs*)

Bases: object

Sankey diagram.

Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. Wikipedia (6/1/2011)

Create a new Sankey instance.

The optional arguments listed below are applied to all subdiagrams so that there is consistent alignment and formatting.

In order to draw a complex Sankey diagram, create an instance of *Sankey* by calling it without any kwargs:

```
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```
sankey.add() # 1
sankey.add() # 2
#...
sankey.add() # n
```

Finally, create the full diagram:

```
sankey.finish()
```

Or, instead, simply daisy-chain those calls:

```
Sankey().add().add...  .add().finish()
```

Other Parameters

ax

[*Axes*] Axes onto which the data should be plotted. If *ax* isn't provided, new Axes will be created.

scale

[float] Scaling factor for the flows. *scale* sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).

unit

[str] The physical unit associated with the flow quantities. If *unit* is None, then none of the quantities are labeled.

format

[str or callable] A Python number formatting string or callable used to label the flows with their quantities (i.e., a number times a unit, where the unit is given). If a format string is given, the label will be `format % quantity`. If a callable is given, it will be called with `quantity` as an argument.

gap

[float] Space between paths that break in/break away to/from the top or bottom.

radius

[float] Inner radius of the vertical paths.

shoulder

[float] Size of the shoulders of output arrows.

offset

[float] Text offset (from the dip or tip of the arrow).

head_angle

[float] Angle, in degrees, of the arrow heads (and negative of the angle of the tails).

margin

[float] Minimum space between Sankey outlines and the edge of the plot area.

tolerance

[float] Acceptable maximum of the magnitude of the sum of flows. The magnitude of the sum of connected flows cannot be greater than *tolerance*.

****kwargs**

Any additional keyword arguments will be passed to `add`, which will create the first subdiagram.

See also

Sankey.add
Sankey.finish

Examples

add (*patchlabel=''*, *flows=None*, *orientations=None*, *labels=''*, *trunklength=1.0*, *pathlengths=0.25*, *prior=None*, *connect=(0, 0)*, *rotation=0*, ***kwargs*)

Add a simple Sankey diagram with flows at the same hierarchical level.

Parameters

patchlabel

[str] Label to be placed at the center of the diagram. Note that *label* (not *patchlabel*) can be passed as keyword argument to create an entry in the legend.

flows

[list of float] Array of flow values. By convention, inputs are positive and outputs are negative.

Flows are placed along the top of the diagram from the inside out in order of their index within *flows*. They are placed along the sides of the diagram from the top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a cubic Bézier curve along the top and bottom edges of the trunk.

orientations

[list of {-1, 0, 1}] List of orientations of the flows (or a single orientation to be used for all flows). Valid values are 0 (inputs from the left, outputs to the right), 1 (from and to the top) or -1 (from and to the bottom).

labels

[list of (str or None)] List of labels for the flows (or a single label to be used for all flows). Each label may be *None* (no label), or a labeling string. If an entry is a (possibly empty) string, then the quantity for the corresponding flow will be shown below the string. However, if the *unit* of the main diagram is None, then quantities are never shown, regardless of the value of this argument.

trunklength

[float] Length between the bases of the input and output groups (in data-space units).

pathlengths

[list of float] List of lengths of the vertical arrows before break-in or after break-away. If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The *pathlengths* are not applied to the horizontal inputs and outputs.

prior

[int] Index of the prior diagram to which this diagram should be connected.

connect

[(int, int)] A (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected. If this is the first diagram or *prior* is *None*, *connect* will be ignored.

rotation

[float] Angle of rotation of the diagram in degrees. The interpretation of the *orientations* argument will be rotated accordingly (e.g., if *rotation* == 90, an *orientations* entry of 1 means to/from the left). *rotation* is ignored if this diagram is connected to an existing one (using *prior* and *connect*).

Returns

Sankey

The current *Sankey* instance.

Other Parameters

****kwargs**

Additional keyword arguments set *matplotlib.patches.PathPatch* properties, listed below. For example, one may want to use `fill=False` or `label="A legend entry"`.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and
alpha	unknown
animated	bool
antialiased or *aa*	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	*color*
edgecolor or *ec*	*color* or None
facecolor or *fc*	*color* or None
figure	*Figure* or *SubFigure*
fill	bool

Table 296 – continued from

Property	Description
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

See also

Sankey.finish

finish()

Adjust the Axes and return a list of information about the Sankey subdiagram(s).

Returns a list of subdiagrams with the following fields:

Field	Description
patch	Sankey outline (a *PathPatch*).
flows	Flow values (positive for input, negative for output).
angles	List of angles of the arrows [deg/90]. For example, if the diagram has not been rotated, an input to the top side has an angle of 3 (DOWN), and an output from the top side has an angle of 1 (UP). If a flow has been skipped (because its magnitude is less than *tolerance*), then its angle will be *None*.
tips	(N, 2)-array of the (x, y) positions of the tips (or "dips") of the flow paths. If the magnitude of a flow is less the *tolerance* of this *Sankey* instance, the flow is skipped and its tip will be at the center of the diagram.
text	*Text* instance for the diagram label.
texts	List of *Text* instances for the flow labels.

Sankey.add

7.2.45 matplotlib.scale

Scales define the distribution of data values on an axis, e.g. a log scaling.

The mapping is implemented through *Transform* subclasses.

The following scales are built-in:

Name	Class	Transform	Inverted transform
"asinh"	*AsinhScale*	*AsinhTransform*	*InvertedAsinhTransform*
"function"	*FuncScale*	*FuncTransform*	*FuncTransform*
"functionlog"	*FuncScaleLog*	*FuncTransform* + *LogTransform*	*InvertedLogTransform* + *FuncTransform*
"linear"	*LinearScale*	*IdentityTransform*	*IdentityTransform*
"log"	*LogScale*	*LogTransform*	*InvertedLogTransform*
"logit"	*LogitScale*	*LogitTransform*	*LogisticTransform*
"symlog"	*SymmetricalLogScale*	*SymmetricalLogTransform*	*InvertedSymmetricalLogTransform*

A user will often only use the scale name, e.g. when setting the scale through *set_xscale*: `ax.set_xscale("log")`.

See also the *scales examples* in the documentation.

Custom scaling can be achieved through *FuncScale*, or by creating your own *ScaleBase* subclass and corresponding transforms (see *Custom scale*). Third parties can register their scales by name through *register_scale*.

class matplotlib.scale.**ScaleBase**(*axis*)

Bases: object

The base class for all scales.

Scales are separable transformations, working on a single dimension.

Subclasses should override

name

The scale's name.

get_transform()

A method returning a *Transform*, which converts data coordinates to scaled coordinates. This transform should be invertible, so that e.g. mouse positions can be converted back to data coordinates.

set_default_locators_and_formatters()

A method that sets default locators and formatters for an *Axis* that uses this scale.

limit_range_for_scale()

An optional method that "fixes" the axis range to acceptable values, e.g. restricting log-scaled axes to positive values.

Construct a new scale.

Notes

The following note is for scale implementers.

For back-compatibility reasons, scales take an *Axis* object as first argument. However, this argument should not be used: a single scale object should be usable by multiple *Axis*es at the same time.

get_transform()

Return the *Transform* object associated with this scale.

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

limit_range_for_scale(*vmin*, *vmax*, *minpos*)

Return the range *vmin*, *vmax*, restricted to the domain supported by this scale (if any).

minpos should be the minimum positive value in the data. This is used by log scales to determine a minimum value.

class matplotlib.scale.**LinearScale**(*axis*)

Bases: *ScaleBase*

The default linear scale.

name = 'linear'

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

get_transform()

Return the transform for linear scaling, which is just the *IdentityTransform*.

class matplotlib.scale.**FuncTransform**(*forward*, *inverse*)

Bases: *Transform*

A simple transform that takes and arbitrary function for the forward and inverse transform.

Parameters

forward

[callable] The forward function for the transform. This function must have an inverse and, for best behavior, be monotonic. It must have the signature:

```
def forward(values: array-like) -> array-like
```

inverse

[callable] The inverse of the forward function. Signature as `forward`.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**FuncScale**(*axis*, *functions*)

Bases: *ScaleBase*

Provide an arbitrary scale with user-supplied function for the axis.

Parameters

axis

[*Axis*] The axis for the scale.

functions

[(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```
def forward(values: array-like) -> array-like
```

name = 'function'

get_transform()

Return the *FuncTransform* associated with this scale.

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

class matplotlib.scale.**LogTransform**(*base*, *nonpositive='clip'*)

Bases: *Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**InvertedLogTransform**(*base*)

Bases: *Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**LogScale**(*axis*, *, *base=10*, *subs=None*, *nonpositive='clip'*)

Bases: *ScaleBase*

A standard logarithmic scale. Care is taken to only plot positive values.

Parameters

axis

[*Axis*] The axis for the scale.

base

[float, default: 10] The base of the logarithm.

nonpositive

[{'clip', 'mask'}, default: 'clip'] Determines the behavior for non-positive values. They can either be masked as invalid, or clipped to a very small positive number.

subs

[sequence of int, default: None] Where to place the subticks between each major tick. For example, in a log10 scale, `[2, 3, 4, 5, 6, 7, 8, 9]` will place 8 logarithmically spaced minor ticks between each major tick.

name = 'log'

property base

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

get_transform()

Return the *LogTransform* associated with this scale.

limit_range_for_scale(*vmin*, *vmax*, *minpos*)

Limit the domain to positive values.

class matplotlib.scale.**FuncScaleLog**(*axis*, *functions*, *base=10*)

Bases: *LogScale*

Provide an arbitrary scale with user-supplied function for the axis and then put on a logarithmic axes.

Parameters

axis

[*Axis*] The axis for the scale.

functions

[(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```
def forward(values: array-like) -> array-like
```

base

[float, default: 10] Logarithmic base of the scale.

name = 'functionlog'

property base

get_transform()

Return the *Transform* associated with this scale.

class matplotlib.scale.**SymmetricalLogTransform**(*base*, *linthresh*, *linscale*)

Bases: *Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**InvertedSymmetricalLogTransform**(*base*, *linthresh*, *linscale*)

Bases: *Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**SymmetricalLogScale**(*axis*, *, *base=10*, *linthresh=2*, *subs=None*, *linscale=1*)

Bases: *ScaleBase*

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (-*linthresh*, *linthresh*).

See *Symlog scale* for a detailed description.

Parameters

base

[float, default: 10] The base of the logarithm.

linthresh

[float, default: 2] Defines the range `(-x, x)`, within which the plot is linear. This avoids having the plot go to infinity around zero.

subs

[sequence of int] Where to place the subticks between each major tick. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]` will place 8 logarithmically spaced minor ticks between each major tick.

linscale

[float, optional] This allows the linear range `(-linthresh, linthresh)` to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

Construct a new scale.

Notes

The following note is for scale implementers.

For back-compatibility reasons, scales take an *Axis* object as first argument. However, this argument should not be used: a single scale object should be usable by multiple *Axis*es at the same time.

name = 'symlog'

property base

property linthresh

property linscale

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

get_transform()

Return the *SymmetricalLogTransform* associated with this scale.

class matplotlib.scale.**AsinhTransform**(*linear_width*)

Bases: *Transform*

Inverse hyperbolic-sine transformation used by *AsinhScale*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**InvertedAsinhTransform**(*linear_width*)

Bases: *Transform*

Hyperbolic sine transformation used by *AsinhScale*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**AsinhScale**(*axis*, *, *linear_width=1.0*, *base=10*, *subs='auto'*, ***kwargs*)

Bases: *ScaleBase*

A quasi-logarithmic scale based on the inverse hyperbolic sine (asinh)

For values close to zero, this is essentially a linear scale, but for large magnitude values (either positive or negative) it is asymptotically logarithmic. The transition between these linear and logarithmic regimes is smooth, and has no discontinuities in the function gradient in contrast to the *SymmetricalLogScale* ("symlog") scale.

Specifically, the transformation of an axis coordinate a is $a \to a_0 \sinh^{-1}(a/a_0)$ where a_0 is the effective width of the linear region of the transformation. In that region, the transformation is $a \to a + \mathcal{O}(a^3)$. For large values of a the transformation behaves as $a \to a_0 \operatorname{sgn}(a) \ln|a| + \mathcal{O}(1)$.

Note

This API is provisional and may be revised in the future based on early user feedback.

Parameters

linear_width

[float, default: 1] The scale parameter (elsewhere referred to as a_0) defining the extent of the quasi-linear region, and the coordinate values beyond which the transformation becomes asymptotically logarithmic.

base

[int, default: 10] The number base used for rounding tick locations on a logarithmic scale. If this is less than one, then rounding is to the nearest integer multiple of powers of ten.

subs

[sequence of int] Multiples of the number base used for minor ticks. If set to 'auto', this will use built-in defaults, e.g. (2, 5) for base=10.

name = 'asinh'

auto_tick_multipliers = {3: (2,), 4: (2,), 5: (2,), 8: (2, 4), 10: (2, 5), 16: (2, 4, 8), 64: (4, 16), 1024: (256, 512)}

property linear_width

get_transform()

Return the *Transform* object associated with this scale.

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

class matplotlib.scale.**LogitTransform**(*nonpositive='mask'*)

Bases: *Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

logit transform (base 10), masked or clipped

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**LogisticTransform**(*nonpositive='mask'*)

Bases: *Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

input_dims = 1

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

output_dims = 1

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform_non_affine(*values*)

logistic transform (base 10)

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

has_inverse = True

True if this transform has a corresponding inverse transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.scale.**LogitScale**(*axis*, *nonpositive='mask'*, ***, *one_half=\\frac{1}{2}'*, *use_overline=False*)

Bases: *ScaleBase*

Logit scale for data between zero and one, both excluded.

This scale is similar to a log scale close to zero and to one, and almost linear around 0.5. It maps the interval]0, 1[onto]-infty, +infty[.

Parameters

axis

[*Axis*] Currently unused.

nonpositive

[{'mask', 'clip'}] Determines the behavior for values beyond the open interval]0, 1[. They can either be masked as invalid, or clipped to a number very close to 0 or 1.

use_overline

[bool, default: False] Indicate the usage of survival notation (overline{x}) in place of standard notation (1-x) for probability close to one.

one_half

[str, default: r"frac{1}{2}"] The string used for ticks formatter to represent 1/2.

name = 'logit'

get_transform()

Return the *LogitTransform* associated with this scale.

set_default_locators_and_formatters(*axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

limit_range_for_scale(*vmin*, *vmax*, *minpos*)

Limit the domain to values between 0 and 1 (excluded).

matplotlib.scale.**get_scale_names**()

Return the names of the available scales.

matplotlib.scale.**scale_factory**(*scale*, *axis*, ***kwargs*)

Return a scale class by name.

Parameters

scale

[{'asinh', 'function', 'functionlog', 'linear', 'log', 'logit', 'symlog'}]

axis

[*Axis*]

matplotlib.scale.**register_scale**(*scale_class*)

Register a new kind of scale.

Parameters

scale_class

[subclass of *ScaleBase*] The scale to register.

7.2.46 matplotlib.sphinxext.mathmpl

A role and directive to display mathtext in Sphinx

The mathmpl Sphinx extension creates a mathtext image in Matplotlib and shows it in html output. Thus, it is a true and faithful representation of what you will see if you pass a given LaTeX string to Matplotlib (see *Writing mathematical expressions*).

Warning

In most cases, you will likely want to use one of Sphinx's builtin Math extensions instead of this one. The builtin Sphinx math directive uses MathJax to render mathematical expressions, and addresses accessibility concerns that mathmpl doesn't address.

Mathtext may be included in two ways:

1. Inline, using the role:

```
This text uses inline math: :mathmpl:`\alpha > \beta`.
```

   which produces:

   This text uses inline math: $\alpha > \beta$.

2. Standalone, using the directive:

```
Here is some standalone math:

.. mathmpl::

    \alpha > \beta
```

   which produces:

   Here is some standalone math:

$$\alpha > \beta \tag{7.1}$$

Options

The mathmpl role and directive both support the following options:

fontset

[str, default: 'cm'] The font set to use when displaying math. See *rcParams["mathtext.fontset"]* (default: 'dejavusans').

fontsize

[float] The font size, in points. Defaults to the value from the extension configuration option defined below.

Configuration options

The mathtext extension has the following configuration options:

mathmpl_fontsize

[float, default: 10.0] Default font size, in points.

mathmpl_srcset

[list of str, default: []] Additional image sizes to generate when embedding in HTML, to support responsive resolution images. The list should contain additional x-descriptors (`'1.5x'`, `'2x'`, etc.) to generate (1x is the default and always included.)

class matplotlib.sphinxext.mathmpl.**MathDirective**(*name*, *arguments*, *options*, *content*, *lineno*, *content_offset*, *block_text*, *state*, *state_machine*)

The `.. mathmpl::` directive, as documented in the module's docstring.

final_argument_whitespace = False

May the final argument contain whitespace?

has_content = True

May the directive have content?

option_spec = {'fontset': <function fontset_choice>, 'fontsize': <function _make_type_validator.<locals>.validate_float_or_None>}

Mapping of option names to validator functions.

optional_arguments = 0

Number of optional arguments after the required arguments.

required_arguments = 0

Number of required directive arguments.

7.2.47 matplotlib.sphinxext.plot_directive

A directive for including a Matplotlib plot in a Sphinx document

This is a Sphinx extension providing a reStructuredText directive `.. plot::` for including a plot in a Sphinx document.

In HTML output, `.. plot::` will include a .png file with a link to a high-res .png and .pdf. In LaTeX output, it will include a .pdf.

The plot content may be defined in one of three ways:

1. **A path to a source file** as the argument to the directive:

```
.. plot:: path/to/plot.py
```

When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

```
.. plot:: path/to/plot.py

   The plot caption.
```

Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:

```
.. plot:: path/to/plot.py plot_function1
```

2. Included as **inline content** to the directive:

```
.. plot::

   import matplotlib.pyplot as plt
   plt.plot([1, 2, 3], [4, 5, 6])
   plt.title("A plotting exammple")
```

3. Using **doctest** syntax:

```
.. plot::

   A plotting example:
   >>> import matplotlib.pyplot as plt
   >>> plt.plot([1, 2, 3], [4, 5, 6])
```

Options

The `.. plot::` directive supports the following options:

`:format:`

[{'python', 'doctest'}] The format of the input. If unset, the format is auto-detected.

`:include-source:`

[bool] Whether to display the source code. The default can be changed using the `plot_include_source` variable in `conf.py` (which itself defaults to False).

`:show-source-link:`

[bool] Whether to show a link to the source in HTML. The default can be changed using the `plot_html_show_source_link` variable in `conf.py` (which itself defaults to True).

`:context:`

[bool or str] If provided, the code will be run in the context of all previous plot directives for which the `:context:` option was specified. This only applies to inline code plot directives, not those run from files. If the `:context: reset` option is specified, the context is reset for this and future plots, and previous figures are closed prior to running the code. `:context: close-figs` keeps the context but closes previous figures before running the code.

:nofigs:

[bool] If specified, the code block will be run, but no figures will be inserted. This is usually useful with the `:context:` option.

:caption:

[str] If specified, the option's argument will be used as a caption for the figure. This overwrites the caption given in the content, when the plot is generated from a file.

Additionally, this directive supports all the options of the image directive, except for `:target:` (since plot will add its own target). These include `:alt:`, `:height:`, `:width:`, `:scale:`, `:align:` and `:class:`.

Configuration options

The plot directive has the following configuration options:

plot_include_source

Default value for the include-source option (default: False).

plot_html_show_source_link

Whether to show a link to the source in HTML (default: True).

plot_pre_code

Code that should be executed before each plot. If None (the default), it will default to a string containing:

```
import numpy as np
from matplotlib import pyplot as plt
```

plot_basedir

Base directory, to which `plot::` file names are relative to. If None or empty (the default), file names are relative to the directory where the file containing the directive is.

plot_formats

File formats to generate (default: ['png', 'hires.png', 'pdf']). List of tuples or strings:

```
[(suffix, dpi), suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through sphinx_build the list should be passed as suffix:dpi,suffix:dpi, ...

plot_html_show_formats

Whether to show links to the files in HTML (default: True).

plot_rcparams

A dictionary containing any non-standard rcParams that should be applied before each plot (default: {}).

plot_apply_rcparams

By default, rcParams are applied when `:context:` option is not used in a plot directive. If set, this configuration option overrides this behavior and applies rcParams before each plot.

plot_working_directory

By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also its path will be added to `sys.path` so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to `sys.path`) where data files and helper modules for all code are located.

plot_template

Provide a customized template for preparing restructured text.

plot_srcset

Allow the srcset image option for responsive image resolutions. List of strings with the multiplicative factors followed by an "x". e.g. ["2.0x", "1.5x"]. "2.0x" will create a png with the default "png" resolution from plot_formats, multiplied by 2. If plot_srcset is specified, the plot directive uses the *matplotlib.sphinxext.figmpl_directive* (instead of the usual figure directive) in the intermediary rst file that is generated. The plot_srcset option is incompatible with *singlehtml* builds, and an error will be raised.

Notes on how it works

The plot directive runs the code it is given, either in the source file or the code under the directive. The figure created (if any) is saved in the sphinx build directory under a subdirectory named `plot_directive`. It then creates an intermediate rst file that calls a `.. figure:` directive (or `.. figmpl::` directive if `plot_srcset` is being used) and has links to the `*.png` files in the `plot_directive` directory. These translations can be customized by changing the *plot_template*. See the source of *matplotlib.sphinxext.plot_directive* for the templates defined in *TEMPLATE* and *TEMPLATE_SRCSET*.

class matplotlib.sphinxext.plot_directive.**PlotDirective**(*name*, *arguments*, *options*, *content*, *lineno*, *content_offset*, *block_text*, *state*, *state_machine*)

The `.. plot::` directive, as documented in the module's docstring.

final_argument_whitespace = False

May the final argument contain whitespace?

has_content = True

May the directive have content?

option_spec = {'align': <function Image.align>, 'alt': <function unchanged>, 'caption': <function unchanged>, 'class': <function class_option>, 'context': <function _option_context>, 'format': <function _option_format>, 'height': <function length_or_unitless>, 'include-source': <function _option_boolean>, 'nofigs': <function flag>, 'scale': <function nonnegative_int>, 'show-source-link': <function _option_boolean>, 'width': <function length_or_percentage_or_unitless>}

Mapping of option names to validator functions.

optional_arguments = 2

Number of optional arguments after the required arguments.

required_arguments = 0

Number of required directive arguments.

run()

Run the plot directive.

exception matplotlib.sphinxext.plot_directive.**PlotError**

matplotlib.sphinxext.plot_directive.**mark_plot_labels**(*app*, *document*)

To make plots referenceable, we need to move the reference from the "htmlonly" (or "latexonly") node to the actual figure node itself.

matplotlib.sphinxext.plot_directive.**out_of_date**(*original*, *derived*, *includes=None*)

Return whether *derived* is out-of-date relative to *original* or any of the RST files included in it using the RST include directive (*includes*). *derived* and *original* are full paths, and *includes* is optionally a list of full paths which may have been included in the *original*.

matplotlib.sphinxext.plot_directive.**render_figures**(*code*, *code_path*, *output_dir*, *output_base*, *context*, *function_name*, *config*, *context_reset=False*, *close_figs=False*, *code_includes=None*)

Run a pyplot script and save the images in *output_dir*.

Save the images under *output_dir* with file names derived from *output_base*

7.2.48 matplotlib.sphinxext.figmpl_directive

Add a `figure-mpl` directive that is a responsive version of `figure`.

This implementation is very similar to `.. figure::`, except it also allows a `srcset=` argument to be passed to the image tag, hence allowing responsive resolution images.

There is no particular reason this could not be used standalone, but is meant to be used with *matplotlib.sphinxext.plot_directive*.

Note that the directory organization is a bit different than `.. figure::`. See the *FigureMpl* documentation below.

class matplotlib.sphinxext.figmpl_directive.**FigureMpl**(*name*, *arguments*, *options*, *content*, *lineno*, *content_offset*, *block_text*, *state*, *state_machine*)

Implements a directive to allow an optional hidpi image.

Meant to be used with the *plot_srcset* configuration option in conf.py, and gets set in the TEMPLATE of plot_directive.py

e.g.:

```
.. figure-mpl:: plot_directive/some_plots-1.png
    :alt: bar
    :srcset: plot_directive/some_plots-1.png,
             plot_directive/some_plots-1.2x.png 2.00x
    :class: plot-directive
```

The resulting html (at `some_plots.html`) is:

```
<img src="sphx_glr_bar_001_hidpi.png"
    srcset="_images/some_plot-1.png,
            _images/some_plots-1.2x.png 2.00x",
    alt="bar"
    class="plot_directive" />
```

Note that the handling of subdirectories is different than that used by the sphinx figure directive:

```
.. figure-mpl:: plot_directive/nestedpage/index-1.png
    :alt: bar
    :srcset: plot_directive/nestedpage/index-1.png
             plot_directive/nestedpage/index-1.2x.png 2.00x
    :class: plot_directive
```

The resulting html (at `nestedpage/index.html`):

```
<img src="../_images/nestedpage-index-1.png"
    srcset="../_images/nestedpage-index-1.png,
            ../_images/_images/nestedpage-index-1.2x.png 2.00x",
    alt="bar"
    class="sphx-glr-single-img" />
```

where the subdirectory is included in the image name for uniqueness.

final_argument_whitespace = False

May the final argument contain whitespace?

has_content = False

May the directive have content?

option_spec = {'align': <function Image.align>, 'alt': <function unchanged>, 'caption': <function unchanged>, 'class': <function class_option>, 'height': <function length_or_unitless>, 'scale': <function nonnegative_int>, 'srcset': <function unchanged>, 'width': <function length_or_percentage_or_unitless>}

Mapping of option names to validator functions.

optional_arguments = 2

Number of optional arguments after the required arguments.

required_arguments = 1

Number of required directive arguments.

class matplotlib.sphinxext.figmpl_directive.**figmplnode**(*rawsource=''*, **children*, ***attributes*)

7.2.49 matplotlib.sphinxext.roles

Custom roles for the Matplotlib documentation.

Warning

These roles are considered semi-public. They are only intended to be used in the Matplotlib documentation.

However, it can happen that downstream packages end up pulling these roles into their documentation, which will result in documentation build errors. The following describes the exact mechanism and how to fix the errors.

There are two ways, Matplotlib docstrings can end up in downstream documentation. You have to subclass a Matplotlib class and either use the `:inherited-members:` option in your autodoc configuration, or you have to override a method without specifying a new docstring; the new method will inherit the original docstring and still render in your autodoc. If the docstring contains one of the custom sphinx roles, you'll see one of the following error messages:

```
Unknown interpreted text role "mpltype".
Unknown interpreted text role "rc".
```

To fix this, you can add this module as extension to your sphinx `conf.py`:

```
extensions = [
    'matplotlib.sphinxext.roles',
    # Other extensions.
]
```

Warning

Direct use of these roles in other packages is not officially supported. We reserve the right to modify or remove these roles without prior notification.

matplotlib.sphinxext.roles.**_mpltype_role**(*name*, *rawtext*, *text*, *lineno*, *inliner*, *options=None*, *content=None*)

Sphinx role `:mpltype:` for custom matplotlib types.

In Matplotlib, there are a number of type-like concepts that do not have a direct type representation; example: color. This role allows to properly highlight them in the docs and link to their definition.

Currently supported values:

- `:mpltype:`color`` will render as: *color*

matplotlib.sphinxext.roles.**_rcparam_role**(*name*, *rawtext*, *text*, *lineno*, *inliner*, *options=None*, *content=None*)

Sphinx role `:rc:` to highlight and link `rcParams` entries.

Usage: Give the desired `rcParams` key as parameter.

`:rc:`figure.dpi`` will render as: *rcParams["figure.dpi"]* (default: `100.0`)

7.2.50 matplotlib.spines

class matplotlib.spines.**Spine**(*axes*, *spine_type*, *path*, ***kwargs*)

Bases: *Patch*

An axis spine -- the line noting the data area boundaries.

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See *set_position* for more information.

The default position is `('outward', 0)`.

Spines are subclasses of *Patch*, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending on if *set_patch_line*, *set_patch_circle*, or *set_patch_arc* has been called. Line-like is the default.

For examples see *Spines*.

Parameters

axes

[*Axes*] The *Axes* instance containing the spine.

spine_type

[str] The spine type.

path

[*Path*] The *Path* instance used to draw the spine.

Other Parameters

****kwargs**

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or *aa*	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	*color*
edgecolor or *ec*	*color* or None
facecolor or *fc*	*color* or None
figure	*Figure* or *SubFigure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

classmethod arc_spine(*axes*, *spine_type*, *center*, *radius*, *theta1*, *theta2*, ***kwargs*)

Create and return an arc *Spine*.

classmethod circular_spine(*axes*, *center*, *radius*, ***kwargs*)

Create and return a circular *Spine*.

clear()

Clear the current spine.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_bounds()

Get the bounds of the spine.

get_patch_transform()

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the path of this patch.

get_position()

Return the spine position.

get_spine_transform()

Return the spine transform.

get_window_extent(*renderer=None*)

Return the window extent of the spines in display space, including padding for ticks (but not their labels)

See also

matplotlib.axes.Axes.get_tightbbox
matplotlib.axes.Axes.get_window_extent

classmethod linear_spine(*axes*, *spine_type*, ***kwargs*)

Create and return a linear *Spine*.

register_axis(*axis*)

Register an axis.

An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *bounds=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *patch_arc=<UNSET>*, *patch_circle=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	float or None
animated	bool
antialiased or *aa*	bool or None
bounds	(low: float, high: float)
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	*color*
edgecolor or *ec*	*color* or None
facecolor or *fc*	*color* or None
figure	*Figure* or *SubFigure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float or None
mouseover	bool
patch_arc	unknown
patch_circle	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	unknown
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*

Table 298 – continued from previous

Property	Description
url	str
visible	bool
zorder	float

set_bounds(*low=None*, *high=None*)

Set the spine bounds.

Parameters

low

[float or None, optional] The lower spine bound. Passing *None* leaves the limit unchanged.

The bounds may also be passed as the tuple (*low*, *high*) as the first positional argument.

high

[float or None, optional] The higher spine bound. Passing *None* leaves the limit unchanged.

set_color(*c*)

Set the edgecolor.

Parameters

c

[*color*]

Notes

This method does not modify the facecolor (which defaults to "none"), unlike the *Patch.set_color* method defined in the parent class. Use *Patch.set_facecolor* to set the facecolor.

set_patch_arc(*center*, *radius*, *theta1*, *theta2*)

Set the spine to be arc-like.

set_patch_circle(*center*, *radius*)

Set the spine to be circular.

set_patch_line()

Set the spine to be linear.

set_position(*position*)

Set the position of the spine.

Spine position is specified by a 2 tuple of (position type, amount). The position types are:

- 'outward': place the spine out from the data area by the specified number of points. (Negative values place the spine inwards.)
- 'axes': place the spine at the specified Axes coordinate (0 to 1).
- 'data': place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:

- 'center' -> `('axes', 0.5)`
- 'zero' -> `('data', 0.0)`

Examples

Spine placement

class matplotlib.spines.**Spines**(***kwargs*)

Bases: `MutableMapping`

The container of all *Spine*s in an Axes.

The interface is dict-like mapping names (e.g. 'left') to *Spine* objects. Additionally, it implements some pandas.Series-like features like accessing elements by attribute:

```
spines['top'].set_visible(False)
spines.top.set_visible(False)
```

Multiple spines can be addressed simultaneously by passing a list:

```
spines[['top', 'right']].set_visible(False)
```

Use an open slice to address all spines:

```
spines[:].set_visible(False)
```

The latter two indexing methods will return a *SpinesProxy* that broadcasts all `set_*()` and `set()` calls to its members, but cannot be used for any other operation.

classmethod from_dict(*d*)

class matplotlib.spines.**SpinesProxy**(*spine_dict*)

Bases: `object`

A proxy to broadcast `set_*()` and `set()` method calls to contained *Spines*.

The proxy cannot be used for any other operations on its members.

The supported methods are determined dynamically based on the contained spines. If not all spines support a given method, it's executed only on the subset of spines that support it.

7.2.51 matplotlib.style

Styles are predefined sets of *rcParams* that define the visual appearance of a plot.

Customizing Matplotlib with style sheets and rcParams describes the mechanism and usage of styles.

The *Style sheets reference* gives an overview of the builtin styles.

matplotlib.style.**context**(*style*, *after_reset=False*)

Context manager for using style settings temporarily.

Parameters

style

[str, dict, Path or list] A style specification. Valid options are:

str

- One of the style names in *style.available* (a builtin style or a style installed in the user library path).
- A dotted name of the form "package.style_name"; in that case, "package" should be an importable Python package name, e.g. at `/path/to/package/__init__.py`; the loaded style file is `/path/to/package/style_name.mplstyle`. (Style files in subpackages are likewise supported.)
- The path or URL to a style file, which gets loaded by *rc_params_from_file*.

dict

A mapping of key/value pairs for *matplotlib.rcParams*.

Path

The path to a style file, which gets loaded by *rc_params_from_file*.

list

A list of style specifiers (str, Path or dict), which are applied from first to last in the list.

after_reset

[bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

matplotlib.style.**reload_library**()

Reload the style library.

matplotlib.style.**use**(*style*)

Use Matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.

Note

This updates the *rcParams* with the settings from the style. *rcParams* not defined in the style are kept.

Parameters

style

[str, dict, Path or list] A style specification. Valid options are:

str

- One of the style names in *style.available* (a builtin style or a style installed in the user library path).
- A dotted name of the form "package.style_name"; in that case, "package" should be an importable Python package name, e.g. at `/path/to/package/__init__.py`; the loaded style file is `/path/to/package/style_name.mplstyle`. (Style files in subpackages are likewise supported.)
- The path or URL to a style file, which gets loaded by *rc_params_from_file*.

dict

A mapping of key/value pairs for *matplotlib.rcParams*.

Path

The path to a style file, which gets loaded by *rc_params_from_file*.

list

A list of style specifiers (str, Path or dict), which are applied from first to last in the list.

Notes

The following *rcParams* are not related to style and will be ignored if found in a style specification:

- backend
- backend_fallback
- date.epoch
- docstring.hardcopy
- figure.max_open_warning
- figure.raise_window
- interactive

- savefig.directory
- timezone
- tk.window_focus
- toolbar
- webagg.address
- webagg.open_in_browser
- webagg.port
- webagg.port_retries

`matplotlib.style.`**`library`**

A dict mapping from style name to *rcParams* defining that style.

This is meant to be read-only. Use *reload_library* to update.

`matplotlib.style.`**`available`**

List of the names of the available styles.

This is meant to be read-only. Use *reload_library* to update.

7.2.52 matplotlib.table

Tables drawing.

> **Note**
>
> The table implementation in Matplotlib is lightly maintained. For a more featureful table implementation, you may wish to try blume.

Use the factory function *table* to create a ready-made table from texts. If you need more control, use the *Table* class and its methods.

The table consists of a grid of cells, which are indexed by (row, column). The cell (0, 0) is positioned at the top left.

Thanks to John Gill for providing the class and table.

class `matplotlib.table.`**`Cell`**(*xy*, *width*, *height*, *, *edgecolor='k'*, *facecolor='w'*, *fill=True*, *text=''*, *loc='right'*, *fontproperties=None*, *visible_edges='closed'*)

Bases: *Rectangle*

A cell is a *Rectangle* with some associated *Text*.

As a user, you'll most likely not creates cells yourself. Instead, you should use either the *table* factory function or *Table.add_cell*.

Parameters

xy

[2-tuple] The position of the bottom left corner of the cell.

width

[float] The cell width.

height

[float] The cell height.

edgecolor

[*color*, default: 'k'] The color of the cell border.

facecolor

[*color*, default: 'w'] The cell facecolor.

fill

[bool, default: True] Whether the cell background is filled.

text

[str, optional] The cell text.

loc

[{'right', 'center', 'left'}] The alignment of the text within the cell.

fontproperties

[dict, optional] A dict defining the font properties of the text. Supported keys and values are the keyword arguments accepted by *FontProperties*.

visible_edges

[{'closed', 'open', 'horizontal', 'vertical'} or substring of 'BRTL'] The cell edges to be drawn with a line: a substring of 'BRTL' (bottom, right, top, left), or one of 'open' (no edges drawn), 'closed' (all edges drawn), 'horizontal' (bottom and top), 'vertical' (right and left).

PAD = 0.1

Padding between text and rectangle.

auto_set_font_size(*renderer*)

Shrink font size until the text fits into the cell width.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_fontsize()

Return the cell fontsize.

get_path()

Return a *Path* for the *visible_edges*.

get_required_width(*renderer*)

Return the minimal required width for the cell.

get_text()

Return the cell *Text* instance.

get_text_bounds(*renderer*)

Return the text bounds as *(x, y, width, height)* in table coordinates.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *angle=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *bounds=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *fontsize=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text_props=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *x=<UNSET>*, *xy=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	float or None
angle	unknown
animated	bool
antialiased or *aa*	bool or None
bounds	(left, bottom, width, height)
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	*color*

Table 299 – continued from previous

Property	Description
edgecolor or *ec*	*color* or None
facecolor or *fc*	*color* or None
figure	unknown
fill	bool
fontsize	unknown
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
height	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text_props	unknown
transform	unknown
url	str
visible	bool
width	unknown
x	unknown
xy	(float, float)
y	unknown
zorder	float

set_figure(*fig*)

Set the *Figure* or *SubFigure* instance the artist belongs to.

Parameters

fig

[*Figure* or *SubFigure*]

set_fontsize(*size*)

Set the text fontsize.

set_text_props(***kwargs*)

Update the text properties.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float ar
alpha	float or None
animated	bool
antialiased	bool
backgroundcolor	*color*
bbox	dict with properties for *patches.FancyBbo*
clip_box	unknown
clip_on	unknown
clip_path	unknown
color or *c*	*color*
figure	*Figure* or *SubFigure*
fontfamily or *family* or *fontname*	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fan
fontproperties or *font* or *font_properties*	*font_manager.FontProperties* or *st*
fontsize or *size*	float or {'xx-small', 'x-small', 'small', 'medium',
fontstretch or *stretch*	{a numeric value in range 0-1000, 'ultra-conde
fontstyle or *style*	{'normal', 'italic', 'oblique'}
fontvariant or *variant*	{'normal', 'small-caps'}
fontweight or *weight*	{a numeric value in range 0-1000, 'ultralight', 'l
gid	str
horizontalalignment or *ha*	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or *ma*	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool, default: *rcParams["text.usetex"*
verticalalignment or *va*	{'baseline', 'bottom', 'center', 'center_baseline', '
visible	bool
wrap	bool

Table 300

Property	Description
x	float
y	float
zorder	float

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

property visible_edges

The cell edges to be drawn with a line.

Reading this property returns a substring of 'BRTL' (bottom, right, top, left').

When setting this property, you can use a substring of 'BRTL' or one of {'open', 'closed', 'horizontal', 'vertical'}.

matplotlib.table.**CustomCell**

alias of *Cell*

class matplotlib.table.**Table**(*ax*, *loc=None*, *bbox=None*, ***kwargs*)

Bases: *Artist*

A table of cells.

The table consists of a grid of cells, which are indexed by (row, column).

For a simple table, you'll have a full grid of cells with indices from (0, 0) to (num_rows-1, num_cols-1), in which the cell (0, 0) is positioned at the top left. However, you can also add cells with negative indices. You don't have to add a cell to every grid position, so you can create tables that have holes.

Note: You'll usually not create an empty table from scratch. Instead use *table* to create a table from data.

Parameters

ax

[*Axes*] The *Axes* to plot the table into.

loc

[str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

bbox

[*Bbox* or [xmin, ymin, width, height], optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

Other Parameters

****kwargs**

Artist properties.

AXESPAD = 0.02

The border between the Axes and the table edge in Axes units.

FONTSIZE = 10

add_cell(*row*, *col*, **args*, ***kwargs*)

Create a cell and add it to the table.

Parameters

row

[int] Row index.

col

[int] Column index.

***args, **kwargs**

All other parameters are passed on to *Cell*.

Returns

Cell

The created cell.

auto_set_column_width(*col*)

Automatically set the widths of given columns to optimal sizes.

Parameters

col

[int or sequence of ints] The indices of the columns to auto-scale.

auto_set_font_size(*value=True*)

Automatically set font size.

codes = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'center left': 5, 'center right': 6, 'left': 15, 'lower center': 7, 'lower left': 3, 'lower right': 4, 'right': 14, 'top': 16, 'top left': 11, 'top right': 10, 'upper center': 8, 'upper left': 2, 'upper right': 1}

Possible values where to place the table relative to the Axes.

contains(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

property edges

The default value of *visible_edges* for newly added cells using *add_cell*.

Notes

This setting does currently only affect newly created cells using *add_cell*.

To change existing cells, you have to set their edges explicitly:

```
for c in tab.get_celld().values():
    c.visible_edges = 'horizontal'
```

get_celld()

Return a dict of cells in the table mapping *(row, column)* to *Cell*s.

Notes

You can also directly index into the Table object to access individual cells:

```
cell = table[row, col]
```

get_children()

Return the Artists contained by the table.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the Axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

scale(*xscale*, *yscale*)

Scale column widths by *xscale* and row heights by *yscale*.

set(**, agg_filter=<UNSET>, alpha=<UNSET>, animated=<UNSET>, clip_box=<UNSET>, clip_on=<UNSET>, clip_path=<UNSET>, fontsize=<UNSET>, gid=<UNSET>, in_layout=<UNSET>, label=<UNSET>, mouseover=<UNSET>, path_effects=<UNSET>, picker=<UNSET>, rasterized=<UNSET>, sketch_params=<UNSET>, snap=<UNSET>, transform=<UNSET>, url=<UNSET>, visible=<UNSET>, zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure or SubFigure
fontsize	float
gid	str
in_layo	bool
label	object
mouseov	bool
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

set_fontsize(*size*)

Set the font size, in points, of the cell text.

Parameters

size

[float]

Notes

As long as auto font size has not been disabled, the value will be clipped such that the text fits horizontally into the cell.

You can disable this behavior using auto_set_font_size.

```
>>> the_table.auto_set_font_size(False)
>>> the_table.set_fontsize(20)
```

However, there is no automatic scaling of the row height so that the text may exceed the cell boundary.

matplotlib.table.**table**(*ax*, *cellText=None*, *cellColours=None*, *cellLoc='right'*, *colWidths=None*, *rowLabels=None*, *rowColours=None*, *rowLoc='left'*, *colLabels=None*, *colColours=None*, *colLoc='center'*, *loc='bottom'*, *bbox=None*, *edges='closed'*, ***kwargs*)

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the Axes with *Axes.add_table*.

Parameters

cellText

[2D list of str or pandas.DataFrame, optional] The texts to place into the table cells.

Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

cellColours

[2D list of *color*, optional] The background colors of the cells.

cellLoc

[{'right', 'center', 'left'}] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of *1 / ncols*.

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of *color*, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of *color*, optional] The colors of the column header cells.

colLoc

[{'center', 'left', 'right'}] The text alignment of the column header cells.

loc

[str, default: 'bottom'] The position of the cell with respect to *ax*. This must be one of the `codes`.

bbox

[`Bbox` or [xmin, ymin, width, height], optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

edges

[{'closed', 'open', 'horizontal', 'vertical'} or substring of 'BRTL'] The cell edges to be drawn with a line. See also `visible_edges`.

Returns

Table

The created table.

Other Parameters

****kwargs**

`Table` properties.

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
clip_bo	*BboxBase* or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	*Figure* or *SubFigure*
fontsize	float
gid	str
in_layo	bool
label	object
mouseov	bool
path_ef	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
*sketch_*	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

7.2.53 matplotlib.testing

matplotlib.testing

Helper functions for testing.

matplotlib.testing.**ipython_in_subprocess**(*requested_backend_or_gui_framework*, *all_expected_backends*)

matplotlib.testing.**is_ci_environment**()

matplotlib.testing.**set_font_settings_for_testing**()

matplotlib.testing.**set_reproducibility_for_testing**()

matplotlib.testing.**setup**()

matplotlib.testing.**subprocess_run_for_testing**(*command*, *env=None*, *timeout=60*, *stdout=None*, *stderr=None*, *check=False*, *text=True*, *capture_output=False*)

Create and run a subprocess.

Thin wrapper around `subprocess.run`, intended for testing. Will mark fork() failures on Cygwin as expected failures: not a success, but not indicating a problem with the code either.

Parameters

args

[list of str]

env

[dict[str, str]]

timeout

[float]

stdout, stderr
check

[bool]

text

[bool] Also called `universal_newlines` in subprocess. I chose this name since the main effect is returning bytes (`False`) vs. str (`True`), though it also tries to normalize newlines across platforms.

capture_output

[bool] Set stdout and stderr to subprocess.PIPE

Returns

proc

[subprocess.Popen]

Raises

pytest.xfail

If platform is Cygwin and subprocess reports a fork() failure.

See also

`subprocess.run`

matplotlib.testing.**subprocess_run_helper**(*func*, **args*, *timeout*, *extra_env=None*)

Run a function in a sub-process.

Parameters

func

[function] The function to be run. It must be in a module that is importable.

***args**

[str] Any additional command line arguments to be passed in the first argument to `subprocess.run`.

extra_env

[dict[str, str]] Any additional environment variables to be set for the subprocess.

matplotlib.testing.compare

Utilities for comparing image results.

matplotlib.testing.compare.**calculate_rms**(*expected_image*, *actual_image*)

Calculate the per-pixel errors, then compute the root mean square error.

matplotlib.testing.compare.**comparable_formats**()

Return the list of file formats that *compare_images* can compare on this system.

Returns

list of str

E.g. `['png', 'pdf', 'svg', 'eps']`.

matplotlib.testing.compare.**compare_images**(*expected*, *actual*, *tol*, *in_decorator=False*)

Compare two "image" files checking differences within a tolerance.

The two given filenames may point to files which are convertible to PNG via the `converter` dictionary. The underlying RMS is calculated with the *calculate_rms* function.

Parameters

expected

[str] The filename of the expected image.

actual

[str] The filename of the actual image.

tol

[float] The tolerance (a color value difference, where 255 is the maximal difference). The test fails if the average pixel difference is greater than this value.

in_decorator

[bool] Determines the output format. If called from image_comparison decorator, this should be True. (default=False)

Returns

None or dict or str

Return *None* if the images are equal within the given tolerance.

If the images differ, the return value depends on *in_decorator*. If *in_decorator* is true, a dict with the following entries is returned:

- *rms*: The RMS of the image difference.
- *expected*: The filename of the expected image.
- *actual*: The filename of the actual image.
- *diff_image*: The filename of the difference image.
- *tol*: The comparison tolerance.

Otherwise, a human-readable multi-line string representation of this information is returned.

Examples

```
img1 = "./baseline/plot.png"
img2 = "./output/plot.png"
compare_images(img1, img2, 0.001)
```

matplotlib.testing.decorators

matplotlib.testing.decorators.**check_figures_equal**(*, *extensions=('png', 'pdf', 'svg')*, *tol=0*)

Decorator for test cases that generate and compare two figures.

The decorated function must take two keyword arguments, *fig_test* and *fig_ref*, and draw the test and reference images on them. After the function returns, the figures are saved and compared.

This decorator should be preferred over *image_comparison* when possible in order to keep the size of the test suite from ballooning.

Parameters

extensions

[list, default: ["png", "pdf", "svg"]] The extensions to test.

tol

[float] The RMS threshold above which the test is considered failed.

Raises

RuntimeError

If any new figures are created (and not subsequently closed) inside the test function.

Examples

Check that calling *Axes.plot* with a single argument plots it against `[0, 1, 2, ...]`:

```
@check_figures_equal()
def test_plot(fig_test, fig_ref):
    fig_test.subplots().plot([1, 3, 5])
    fig_ref.subplots().plot([0, 1, 2], [1, 3, 5])
```

matplotlib.testing.decorators.**image_comparison**(*baseline_images*, *extensions=None*, *tol=0*, *freetype_version=None*, *remove_text=False*, *savefig_kwarg=None*, *style=('classic', '_classic_test_patch')*)

Compare images generated by the test with those specified in *baseline_images*, which must correspond, else an *ImageComparisonFailure* exception will be raised.

Parameters

baseline_images

[list or None] A list of strings specifying the names of the images generated by calls to *Figure.savefig*.

If *None*, the test function must use the `baseline_images` fixture, either as a parameter or with `pytest.mark.usefixtures`. This value is only allowed when using pytest.

extensions

[None or list of str] The list of extensions to test, e.g. `['png', 'pdf']`.

If *None*, defaults to all supported extensions: png, pdf, and svg.

When testing a single extension, it can be directly included in the names passed to *baseline_images*. In that case, *extensions* must not be set.

In order to keep the size of the test suite from ballooning, we only include the `svg` or `pdf` outputs if the test is explicitly exercising a feature dependent on that backend (see also the *check_figures_equal* decorator for that purpose).

tol

[float, default: 0] The RMS threshold above which the test is considered failed.

Due to expected small differences in floating-point calculations, on 32-bit systems an additional 0.06 is added to this threshold.

freetype_version

[str or tuple] The expected freetype version or range of versions for this test to pass.

remove_text

[bool] Remove the title and tick text from the figure before comparison. This is useful to make the baseline images independent of variations in text rendering between different versions of FreeType.

This does not remove other, more deliberate, text, such as legends and annotations.

savefig_kwarg

[dict] Optional arguments that are passed to the savefig method.

style

[str, dict, or list] The optional style(s) to apply to the image test. The test itself can also apply additional styles if desired. Defaults to `["classic", "_classic_test_patch"]`.

matplotlib.testing.decorators.**remove_ticks_and_titles**(*figure*)

matplotlib.testing.exceptions

exception matplotlib.testing.exceptions.**ImageComparisonFailure**

Bases: AssertionError

Raise this exception to mark a test as a comparison between two images.

Testing with optional dependencies

For more information on fixtures, see pytest fixtures.

matplotlib.testing.conftest.**pd**()

Fixture to import and configure pandas. Using this fixture, the test is skipped when pandas is not installed. Use this fixture instead of importing pandas in test files.

Examples

Request the pandas fixture by passing in `pd` as an argument to the test

```
def test_matshow_pandas(pd):

    df = pd.DataFrame({'x':[1,2,3], 'y':[4,5,6]})
```

(continues on next page)

(continued from previous page)

```
    im = plt.figure().subplots().matshow(df)
    np.testing.assert_array_equal(im.get_array(), df)
```

matplotlib.testing.conftest.**xr**()

Fixture to import xarray so that the test is skipped when xarray is not installed. Use this fixture instead of importing xrray in test files.

Examples

Request the xarray fixture by passing in `xr` as an argument to the test

```
def test_imshow_xarray(xr):

    ds = xr.DataArray(np.random.randn(2, 3))
    im = plt.figure().subplots().imshow(ds)
    np.testing.assert_array_equal(im.get_array(), ds)
```

7.2.54 matplotlib.text

Classes for including text in a figure.

class matplotlib.text.**Text**(*x=0*, *y=0*, *text=''*, ***, *color=None*, *verticalalignment='baseline'*, *horizontalalignment='left'*, *multialignment=None*, *fontproperties=None*, *rotation=None*, *linespacing=None*, *rotation_mode=None*, *usetex=None*, *wrap=False*, *transform_rotates_text=False*, *parse_math=None*, *antialiased=None*, ***kwargs*)

Bases: *Artist*

Handle storing and drawing of text in window or data coordinates.

Create a *Text* instance at *x*, *y* with string *text*.

The text is aligned relative to the anchor point (*x*, *y*) according to `horizontalalignment` (default: 'left') and `verticalalignment` (default: 'baseline'). See also *Text alignment*.

While Text accepts the 'label' keyword argument, by default it is not added to the handles of a legend.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array a
alpha	float or None
animated	bool
antialiased	bool
backgroundcolor	*color*
bbox	dict with properties for *patches.FancyBboxPa*

wrap	bool
x	float
y	float
zorder	float

contains(*mouseevent*)

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_antialiased()

Return whether antialiased rendering is used.

get_bbox_patch()

Return the bbox Patch, or None if the *patches.FancyBboxPatch* is not made.

get_c()

Alias for *get_color*.

get_color()

Return the color of the text.

get_family()

Alias for *get_fontfamily*.

get_font()

Alias for *get_fontproperties*.

get_font_properties()

Alias for *get_fontproperties*.

get_fontfamily()

Return the list of font families used for font lookup.

See also

font_manager.FontProperties.get_family

get_fontname()

Return the font name as a string.

See also

font_manager.FontProperties.get_name

get_fontproperties()

Return the *font_manager.FontProperties*.

get_fontsize()

Return the font size as an integer.

> **See also**
>
> ***font_manager.FontProperties.get_size_in_points***

get_fontstyle()

Return the font style as a string.

> **See also**
>
> ***font_manager.FontProperties.get_style***

get_fontvariant()

Return the font variant as a string.

> **See also**
>
> ***font_manager.FontProperties.get_variant***

get_fontweight()

Return the font weight as a string or a number.

> **See also**
>
> ***font_manager.FontProperties.get_weight***

get_ha()

Alias for *get_horizontalalignment*.

get_horizontalalignment()

Return the horizontal alignment as a string. Will be one of 'left', 'center' or 'right'.

get_math_fontfamily()

Return the font family name for math text rendered by Matplotlib.

The default value is *rcParams["mathtext.fontset"]* (default: `'dejavusans'`).

> **See also**
>
> *set_math_fontfamily*

get_name()
Alias for *get_fontname*.

get_parse_math()
Return whether mathtext parsing is considered for this *Text*.

get_position()
Return the (x, y) position of the text.

get_rotation()
Return the text angle in degrees between 0 and 360.

get_rotation_mode()
Return the text rotation mode.

get_size()
Alias for *get_fontsize*.

get_stretch()
Return the font stretch as a string or a number.

> **See also**
>
> *font_manager.FontProperties.get_stretch*

get_style()
Alias for *get_fontstyle*.

get_text()
Return the text string.

get_transform_rotates_text()
Return whether rotations of the transform affect the text direction.

get_unitless_position()
Return the (x, y) unitless position of the text.

get_usetex()
Return whether this *Text* object uses TeX for rendering.

get_va()
Alias for *get_verticalalignment*.

get_variant()

Alias for *get_fontvariant*.

get_verticalalignment()

Return the vertical alignment as a string. Will be one of 'top', 'center', 'bottom', 'baseline' or 'center_baseline'.

get_weight()

Alias for *get_fontweight*.

get_window_extent(*renderer=None*, *dpi=None*)

Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first draw. In practice, it is usually easier to trigger a draw first, e.g. by calling *draw_without_rendering* or `plt.show()`.

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.get_figure(root=True).dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

get_wrap()

Return whether the text can be wrapped.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *backgroundcolor=<UNSET>*, *bbox=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *fontfamily=<UNSET>*, *fontproperties=<UNSET>*, *fontsize=<UNSET>*, *fontstretch=<UNSET>*, *fontstyle=<UNSET>*, *fontvariant=<UNSET>*, *fontweight=<UNSET>*, *gid=<UNSET>*, *horizontalalignment=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linespacing=<UNSET>*, *math_fontfamily=<UNSET>*, *mouseover=<UNSET>*, *multialignment=<UNSET>*, *parse_math=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *rasterized=<UNSET>*, *rotation=<UNSET>*, *rotation_mode=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text=<UNSET>*, *transform=<UNSET>*, *transform_rotates_text=<UNSET>*, *url=<UNSET>*, *usetex=<UNSET>*, *verticalalignment=<UNSET>*, *visible=<UNSET>*, *wrap=<UNSET>*, *x=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and
alpha	float or None
animated	bool
antialiased	bool
backgroundcolor	*color*
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	unknown
clip_on	unknown
clip_path	unknown
color	*color*
figure	*Figure* or *SubFigure*
fontfamily or *fontname*	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
fontproperties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-lar
fontstretch	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed'
fontstyle	{'normal', 'italic', 'oblique'}
fontvariant	{'normal', 'small-caps'}
fontweight	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular'
gid	str
horizontalalignment	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool, default: *rcParams["text.usetex"]* (default: `False`)
verticalalignment	{'baseline', 'bottom', 'center', 'center_baseline', 'top'}
visible	bool
wrap	bool
x	float

Table 302 – continued

Property	Description
y	float
zorder	float

set_antialiased(*antialiased*)

Set whether to use antialiased rendering.

Parameters

antialiased

[bool]

Notes

Antialiasing will be determined by *rcParams["text.antialiased"]* (default: `True`) and the parameter *antialiased* will have no effect if the text contains math expressions.

set_backgroundcolor(*color*)

Set the background color of the text by updating the bbox.

Parameters

color

[*color*]

See also

set_bbox

To change the position of the bounding box

set_bbox(*rectprops*)

Draw a bounding box around self.

Parameters

rectprops

[dict with properties for *patches.FancyBboxPatch*] The default boxstyle is 'square'. The mutation scale of the *patches.FancyBboxPatch* is set to the fontsize.

Examples

```
t.set_bbox(dict(facecolor='red', alpha=0.5))
```

set_c(*color*)

Alias for *set_color*.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_color(*color*)

Set the foreground color of the text

Parameters

color

[*color*]

set_family(*fontname*)

Alias for *set_fontfamily*.

set_font(*fp*)

Alias for *set_fontproperties*.

set_font_properties(*fp*)

Alias for *set_fontproperties*.

set_fontfamily(*fontname*)

Set the font family. Can be either a single string, or a list of strings in decreasing priority. Each string may be either a real font name or a generic font class name. If the latter, the specific font names will be looked up in the corresponding rcParams.

If a *Text* instance is constructed with `fontfamily=None`, then the font is set to *rcParams["font.family"]* (default: `['sans-serif']`), and the same is done when *set_fontfamily()* is called on an existing *Text* instance.

Parameters

fontname

[{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also

font_manager.FontProperties.set_family

set_fontname(*fontname*)

Alias for *set_fontfamily*.

One-way alias only: the getter differs.

Parameters

fontname

[{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also

font_manager.FontProperties.set_family

set_fontproperties(*fp*)

Set the font properties that control the text.

Parameters

fp

[*font_manager.FontProperties* or `str` or `pathlib.Path`] If a `str`, it is interpreted as a fontconfig pattern parsed by *FontProperties*. If a `pathlib.Path`, it is interpreted as the absolute path to a font file.

set_fontsize(*fontsize*)

Set the font size.

Parameters

fontsize

[float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] If a float, the fontsize in points. The string values denote sizes relative to the default font size.

See also

font_manager.FontProperties.set_size

set_fontstretch(*stretch*)

Set the font stretch (horizontal condensation or expansion).

Parameters

stretch

[{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'}]

See also

font_manager.FontProperties.set_stretch

set_fontstyle(*fontstyle*)

Set the font style.

Parameters

fontstyle

[{'normal', 'italic', 'oblique'}]

See also

font_manager.FontProperties.set_style

set_fontvariant(*variant*)

Set the font variant.

Parameters

variant

[{'normal', 'small-caps'}]

See also

font_manager.FontProperties.set_variant

set_fontweight(*weight*)

Set the font weight.

Parameters

weight

[{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}]

See also

font_manager.FontProperties.set_weight

set_ha(*align*)

Alias for *set_horizontalalignment*.

set_horizontalalignment(*align*)

Set the horizontal alignment relative to the anchor point.

See also *Text alignment*.

Parameters

align

[{'left', 'center', 'right'}]

set_linespacing(*spacing*)

Set the line spacing as a multiple of the font size.

The default line spacing is 1.2.

Parameters

spacing

[float (multiple of font size)]

set_ma(*align*)

Alias for `set_multialignment`.

set_math_fontfamily(*fontfamily*)

Set the font family for math text rendered by Matplotlib.

This does only affect Matplotlib's own math renderer. It has no effect when rendering with TeX (`usetex=True`).

Parameters

fontfamily

[str] The name of the font family.

Available font families are defined in the *default matplotlibrc file*.

See also

get_math_fontfamily

set_multialignment(*align*)

Set the text alignment for multiline texts.

The layout of the bounding box of all the lines is determined by the horizontalalignment and verticalalignment properties. This property controls the alignment of the text lines within that box.

Parameters

align

[{'left', 'right', 'center'}]

set_name(*fontname*)

Alias for *set_fontname*.

set_parse_math(*parse_math*)

Override switch to disable any mathtext parsing for this *Text*.

Parameters

parse_math

[bool] If False, this *Text* will never use mathtext. If True, mathtext will be used if there is an even number of unescaped dollar signs.

set_position(*xy*)

Set the (*x*, *y*) position of the text.

Parameters

xy

[(float, float)]

set_rotation(*s*)

Set the rotation of the text.

Parameters

s

[float or {'vertical', 'horizontal'}] The rotation angle in degrees in mathematically positive direction (counterclockwise). 'horizontal' equals 0, 'vertical' equals 90.

set_rotation_mode(*m*)

Set text rotation mode.

Parameters

m

[{None, 'default', 'anchor'}] If `"default"`, the text will be first rotated, then aligned according to their horizontal and vertical alignments. If `"anchor"`, then alignment occurs before rotation. Passing `None` will set the rotation mode to `"default"`.

set_size(*fontsize*)

Alias for *set_fontsize*.

set_stretch(*stretch*)

Alias for *set_fontstretch*.

set_style(*fontstyle*)

Alias for *set_fontstyle*.

set_text(*s*)

Set the text string *s*.

It may contain newlines (`\n`) or math in LaTeX syntax.

Parameters

s

[object] Any object gets converted to its `str` representation, except for `None` which is converted to an empty string.

set_transform_rotates_text(*t*)

Whether rotations of the transform affect the text direction.

Parameters

t

[bool]

set_usetex(*usetex*)

Parameters

usetex

[bool or None] Whether to render using TeX, `None` means to use *rcParams["text.usetex"]* (default: `False`).

set_va(*align*)

Alias for *set_verticalalignment*.

set_variant(*variant*)

Alias for *set_fontvariant*.

set_verticalalignment(*align*)

Set the vertical alignment relative to the anchor point.

See also *Text alignment*.

Parameters

align

[{'baseline', 'bottom', 'center', 'center_baseline', 'top'}]

set_weight(*weight*)

Alias for *set_fontweight*.

set_wrap(*wrap*)

Set whether the text can be wrapped.

Wrapping makes sure the text is confined to the (sub)figure box. It does not take into account any other artists.

Parameters

wrap

[bool]

Notes

Wrapping does not work together with `savefig(..., bbox_inches='tight')` (which is also used internally by `%matplotlib inline` in IPython/Jupyter). The 'tight' setting rescales the canvas to accommodate all content and happens before wrapping.

set_x(*x*)

Set the *x* position of the text.

Parameters

x

[float]

set_y(*y*)

Set the *y* position of the text.

Parameters

y

[float]

update(*kwargs*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_bbox_position_size(*renderer*)

Update the location and the size of the bbox.

This method should be used when the position and size of the bbox needs to be updated before actually drawing the bbox.

update_from(*other*)

Copy properties from *other* to *self*.

zorder = 3

class matplotlib.text.**Annotation**(*text*, *xy*, *xytext=None*, *xycoords='data'*, *textcoords=None*, *arrowprops=None*, *annotation_clip=None*, ***kwargs*)

Bases: *Text*, _AnnotationBase

An *Annotation* is a *Text* that can refer to a specific position *xy*. Optionally an arrow pointing from the text to *xy* can be drawn.

Attributes

xy

The annotated position.

xycoords

The coordinate system for *xy*.

arrow_patch

A *FancyArrowPatch* to point from *xytext* to *xy*.

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

Parameters

text

[str] The text of the annotation.

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xytext

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *textcoords*.

xycoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'subfigure points'	Points from the lower left of the subfigure
'subfigure pixels'	Pixels from the lower left of the subfigure
'subfigure fraction'	Fraction of subfigure from lower left
'axes points'	Points from lower left corner of the Axes
'axes pixels'	Pixels from lower left corner of the Axes
'axes fraction'	Fraction of Axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	*(theta, r)* if not native 'data' coordinates

  Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. *(0, 0)* would be the lower left corner of the bounding box and *(0.5, 1)* would be the center top of the bounding box.

- A *Transform* to transform *xy* to screen coordinates.

- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

  where *renderer* is a *RendererBase* subclass.

  The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple *(xcoords, ycoords)* specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced annotation* for more details.

textcoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset, in points, from the *xy* value
'offset pixels'	Offset, in pixels, from the *xy* value
'offset fontsize'	Offset, relative to fontsize, from the *xy* value

arrowprops

[dict, optional] The properties used to draw a `FancyArrowPatch` arrow between the positions *xy* and *xytext*. Defaults to None, i.e. no arrow is drawn.

For historical reasons there are two different ways to specify arrows, "simple" and "fancy":

Simple arrow:

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any `FancyArrowPatch` property

The arrow is attached to the edge of the text box, the exact position (corners or centers) depending on where it's pointing to.

Fancy arrow:

This is used if 'arrowstyle' is provided in the *arrowprops*.

Valid keys are the following `FancyArrowPatch` parameters:

Key	Description
arrowstyle	The arrow style
connectionstyle	The connection style
relpos	See below; default is (0.5, 0.5)
patchA	Default is bounding box of the text
patchB	Default is None
shrinkA	In points. Default is 2 points
shrinkB	In points. Default is 2 points
mutation_scale	Default is text size (in points)
mutation_aspect	Default is 1
?	Any `FancyArrowPatch` property

The exact starting point position of the arrow is defined by *relpos*. It's a tuple of relative coordinates of the text box, where (0, 0) is the lower left corner and (1,

1) is the upper right corner. Values <0 and >1 are supported and specify points outside the text box. By default (0.5, 0.5), so the starting point is centered in the text box.

annotation_clip

[bool or None, default: None] Whether to clip (i.e. not draw) the annotation when the annotation point *xy* is outside the Axes area.

- If *True*, the annotation will be clipped when *xy* is outside the Axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will be clipped when *xy* is outside the Axes and *xycoords* is 'data'.

****kwargs**

Additional kwargs are passed to *Text*.

Returns

Annotation

See also

Annotations

property anncoords

The coordinate system to use for *Annotation.xyann*.

contains(*mouseevent*)

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_anncoords()

Return the coordinate system to use for *Annotation.xyann*.

See also *xycoords* in *Annotation*.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_window_extent(*renderer=None*)

Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first draw. In practice, it is usually easier to trigger a draw first, e.g. by calling *draw_without_rendering* or `plt.show()`.

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.get_figure(root=True).dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *anncoords=<UNSET>*, *annotation_clip=<UNSET>*, *antialiased=<UNSET>*, *backgroundcolor=<UNSET>*, *bbox=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *fontfamily=<UNSET>*, *fontproperties=<UNSET>*, *fontsize=<UNSET>*, *fontstretch=<UNSET>*, *fontstyle=<UNSET>*, *fontvariant=<UNSET>*, *fontweight=<UNSET>*, *gid=<UNSET>*, *horizontalalignment=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linespacing=<UNSET>*, *math_fontfamily=<UNSET>*, *mouseover=<UNSET>*, *multialignment=<UNSET>*, *parse_math=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *rasterized=<UNSET>*, *rotation=<UNSET>*, *rotation_mode=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text=<UNSET>*, *transform=<UNSET>*, *transform_rotates_text=<UNSET>*, *url=<UNSET>*, *usetex=<UNSET>*, *verticalalignment=<UNSET>*, *visible=<UNSET>*, *wrap=<UNSET>*, *x=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float ar
alpha	float or None
animated	bool
anncoords	unknown
annotation_clip	bool or None
antialiased	bool
backgroundcolor	*color*
bbox	dict with properties for *patches.FancyBbo*
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
figure	unknown
fontfamily or *family* or *fontname*	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fan
fontproperties or *font* or *font_properties*	*font_manager.FontProperties* or *st*
fontsize or *size*	float or {'xx-small', 'x-small', 'small', 'medium',
fontstretch or *stretch*	{a numeric value in range 0-1000, 'ultra-conde
fontstyle or *style*	{'normal', 'italic', 'oblique'}
fontvariant or *variant*	{'normal', 'small-caps'}
fontweight or *weight*	{a numeric value in range 0-1000, 'ultralight', 'l
gid	str
horizontalalignment or *ha*	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool

Table 303

Property	Description
multialignment or *ma*	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool, default: *rcParams["text.usetex"*
verticalalignment or *va*	{'baseline', 'bottom', 'center', 'center_baseline', '
visible	bool
wrap	bool
x	float
y	float
zorder	float

set_anncoords(*coords*)

Set the coordinate system to use for *Annotation.xyann*.

See also *xycoords* in *Annotation*.

set_figure(*fig*)

Set the *Figure* or *SubFigure* instance the artist belongs to.

Parameters

fig

[*Figure* or *SubFigure*]

update_positions(*renderer*)

Update the pixel positions of the annotation text and the arrow patch.

property xyann

The text position.

See also *xytext* in *Annotation*.

property xycoords

class matplotlib.text.**OffsetFrom**(*artist*, *ref_coord*, *unit='points'*)

Bases: object

Callable helper class for working with *Annotation*.

Parameters

artist

[*Artist* or *BboxBase* or *Transform*] The object to compute the offset from.

ref_coord

[(float, float)] If *artist* is an *Artist* or *BboxBase*, this values is the location to of the offset origin in fractions of the *artist* bounding box.

If *artist* is a transform, the offset origin is the transform applied to this value.

unit

[{'points, 'pixels'}, default: 'points'] The screen units to use (pixels or points) for the offset input.

get_unit()

Return the unit for input to the transform used by __call__.

set_unit(*unit*)

Set the unit for input to the transform used by __call__.

Parameters

unit

[{'points', 'pixels'}]

class matplotlib.text.**TextPath**(*xy*, *s*, *size=None*, *prop=None*, *_interpolation_steps=1*, *usetex=False*)

Bases: *Path*

Create a path from the text.

Create a path from the text. Note that it simply is a path, not an artist. You need to use the *PathPatch* (or other artists) to draw this path onto the canvas.

Parameters

xy

[tuple or array of two float values] Position of the text. For no offset, use xy=(0, 0).

s

[str] The text to convert to a path.

size

[float, optional] Font size in points. Defaults to the size specified via the font properties *prop*.

prop

[*FontProperties*, optional] Font property. If not provided, will use a default *FontProperties* with parameters from the *rcParams*.

_interpolation_steps

[int, optional] (Currently ignored)

usetex

[bool, default: False] Whether to use tex rendering.

Examples

The following creates a path from the string "ABC" with Helvetica font face; and another path from the latex fraction 1/2:

```
from matplotlib.text import TextPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Helvetica", style="italic")
path1 = TextPath((12, 12), "ABC", size=12, prop=fp)
path2 = TextPath((0, 0), r"$\frac{1}{2}$", size=12, usetex=True)
```

Also see *Using a text as a Path*.

property codes

Return the codes

get_size()

Get the text size.

set_size(*size*)

Set the text size.

property vertices

Return the cached path after updating it if necessary.

class matplotlib.text.**TextToPath**

Bases: object

A class that converts strings to paths.

DPI = 72

FONT_SCALE = 100.0

get_glyphs_mathtext (*prop*, *s*, *glyph_map=None*, *return_new_glyphs_only=False*)

Parse mathtext string *s* and convert it to a (vertices, codes) pair.

get_glyphs_tex (*prop*, *s*, *glyph_map=None*, *return_new_glyphs_only=False*)

Convert the string *s* to vertices and codes using usetex mode.

get_glyphs_with_font (*font*, *s*, *glyph_map=None*, *return_new_glyphs_only=False*)

Convert string *s* to vertices and codes using the provided ttf font.

get_text_path (*prop*, *s*, *ismath=False*)

Convert text *s* to path (a tuple of vertices and codes for matplotlib.path.Path).

Parameters

prop

[*FontProperties*] The font properties for the text.

s

[str] The text to be converted.

ismath

[{False, True, "TeX"}] If True, use mathtext parser. If "TeX", use tex for rendering.

Returns

verts

[list] A list of arrays containing the (x, y) coordinates of the vertices.

codes

[list] A list of path codes.

Examples

Create a list of vertices and codes from a text, and create a *Path* from those:

```
from matplotlib.path import Path
from matplotlib.text import TextToPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Comic Neue", style="italic")
verts, codes = TextToPath().get_text_path(fp, "ABC")
path = Path(verts, codes, closed=False)
```

Also see *TextPath* for a more direct way to create a path from a text.

get_text_width_height_descent (*s*, *prop*, *ismath*)

7.2.55 matplotlib.texmanager

Support for embedded TeX expressions in Matplotlib.

Requirements:

- LaTeX.
- *Agg backends: dvipng>=1.6.
- PS backend: PSfrag, dvips, and Ghostscript>=9.0.
- PDF and SVG backends: if LuaTeX is present, it will be used to speed up some post-processing steps, but note that it is not used to parse the TeX string itself (only LaTeX is supported).

To enable TeX rendering of all text in your Matplotlib figure, set *rcParams["text.usetex"]* (default: `False`) to True.

TeX and dvipng/dvips processing results are cached in ~/.matplotlib/tex.cache for reuse between sessions.

TexManager.get_rgba can also be used to directly obtain raster output as RGBA NumPy arrays.

class matplotlib.texmanager.**TexManager**

Bases: `object`

Convert strings to dvi files using TeX, caching the results to a directory.

The cache directory is called `tex.cache` and is located in the directory returned by *get_cachedir*.

Repeated calls to this constructor always return the same instance.

classmethod get_basefile(*tex*, *fontsize*, *dpi=None*)

Return a filename based on a hash of the string, fontsize, and dpi.

classmethod get_custom_preamble()

Return a string containing user additions to the tex preamble.

classmethod get_font_preamble()

Return a string containing font configuration for the tex preamble.

classmethod get_grey(*tex*, *fontsize=None*, *dpi=None*)

Return the alpha channel.

classmethod get_rgba(*tex*, *fontsize=None*, *dpi=None*, *rgb=(0, 0, 0)*)

Return latex's rendering of the tex string as an RGBA array.

Examples

```
>>> texmanager = TexManager()
>>> s = r"\TeX\ is $\displaystyle\sum_n\frac{-e^{i\pi}}{2^n}$!"
>>> Z = texmanager.get_rgba(s, fontsize=12, dpi=80, rgb=(1, 0,␣
 ↪0))
```

classmethod get_text_width_height_descent(*tex*, *fontsize*, *renderer=None*)

Return width, height and descent of the text.

classmethod make_dvi(*tex*, *fontsize*)

Generate a dvi file containing latex's layout of tex string.

Return the file name.

classmethod make_png(*tex*, *fontsize*, *dpi*)

Generate a png file containing latex's rendering of tex string.

Return the file name.

classmethod make_tex(*tex*, *fontsize*)

Generate a tex file to render the tex string at a specific font size.

Return the file name.

7.2.56 matplotlib.ticker

Tick locating and formatting

This module contains classes for configuring tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

Although the locators know nothing about major or minor ticks, they are used by the Axis class to support major and minor tick locating and formatting.

Tick locating

The Locator class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is *MultipleLocator*. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The Locator subclasses defined here are:

AutoLocator	*MaxNLocator* with simple defaults. This is the default tick locator for most plotting.
MaxNLocator	Finds up to a max number of intervals with ticks at nice locations.
LinearLocator	Space ticks evenly from min to max.
LogLocator	Space ticks logarithmically from min to max.
MultipleLocator	Ticks and range are a multiple of base; either integer or float.
FixedLocator	Tick locations are fixed.
IndexLocator	Locator for index plots (e.g., where `x = range(len(y))`).
NullLocator	No ticks.
SymmetricalLogLocator	Locator for use with the symlog norm; works like *LogLocator* for the part outside of the threshold and adds 0 if inside the limits.
AsinhLocator	Locator for use with the asinh norm, attempting to space ticks approximately uniformly.
LogitLocator	Locator for logit scaling.
AutoMinorLocator	Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the *dates* module.

You can define your own locator by deriving from Locator. You must override the `__call__` method, which returns a sequence of locations, and you will probably want to override the autoscale method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the x- or y-axis instance. The relevant methods are:

```
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(yminor_locator)
```

The default minor locator is *NullLocator*, i.e., no minor ticks on by default.

Note

Locator instances should not be used with more than one *Axis* or *Axes*. So instead of:

```
locator = MultipleLocator(5)
ax.xaxis.set_major_locator(locator)
ax2.xaxis.set_major_locator(locator)
```

do the following instead:

```
ax.xaxis.set_major_locator(MultipleLocator(5))
ax2.xaxis.set_major_locator(MultipleLocator(5))
```

Tick formatting

Tick formatting is controlled by classes derived from Formatter. The formatter operates on a single tick value and returns a string to the axis.

NullFormatter	No labels on the ticks.
FixedFormatter	Set the strings manually for the labels.
FuncFormatter	User defined function sets the labels.
StrMethodFormatter	Use string `format` method.
FormatStrFormatter	Use an old-style sprintf format string.
ScalarFormatter	Default formatter for scalars: autopick the format string.
LogFormatter	Formatter for log axes.
LogFormatterExponent	Format values for log axis using `exponent = log_base(value)`.
LogFormatterMathtext	Format values for log axis using `exponent = log_base(value)` using Math text.
LogFormatterSciNotation	Format values for log axis using scientific notation.
LogitFormatter	Probability formatter.
EngFormatter	Format labels in engineering notation.
PercentFormatter	Format labels as a percentage.

You can derive your own formatter from the Formatter base class by simply overriding the `__call__` method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(yminor_formatter)
```

In addition to a *Formatter* instance, *set_major_formatter* and *set_minor_formatter* also accept a `str` or function. `str` input will be internally replaced with an autogenerated *StrMethodFormatter* with the input `str`. For function input, a *FuncFormatter* with the input function will be

generated and used.

See *Major and minor ticks* for an example of setting major and minor ticks. See the `matplotlib.dates` module for more information and examples of using date locators and formatters.

class matplotlib.ticker.**AsinhLocator**(*linear_width*, *numticks=11*, *symthresh=0.2*, *base=10*, *subs=None*)

Bases: `Locator`

Place ticks spaced evenly on an inverse-sinh scale.

Generally used with the `AsinhScale` class.

> **Note**
>
> This API is provisional and may be revised in the future based on early user feedback.

Parameters

linear_width

[float] The scale parameter defining the extent of the quasi-linear region.

numticks

[int, default: 11] The approximate number of major ticks that will fit along the entire axis

symthresh

[float, default: 0.2] The fractional threshold beneath which data which covers a range that is approximately symmetric about zero will have ticks that are exactly symmetric.

base

[int, default: 10] The number base used for rounding tick locations on a logarithmic scale. If this is less than one, then rounding is to the nearest integer multiple of powers of ten.

subs

[tuple, default: None] Multiples of the number base, typically used for the minor ticks, e.g. (2, 5) when base=10.

set_params(*numticks=None*, *symthresh=None*, *base=None*, *subs=None*)

Set parameters within this locator.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

> **Note**
>
> To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.ticker.**AutoLocator**

Bases: *MaxNLocator*

Place evenly spaced ticks, with the step size and maximum number of ticks chosen automatically.

This is a subclass of *MaxNLocator*, with parameters *nbins = 'auto'* and *steps = [1, 2, 2.5, 5, 10]*.

To know the values of the non-public parameters, please have a look to the defaults of *MaxNLocator*.

class matplotlib.ticker.**AutoMinorLocator**(*n=None*)

Bases: *Locator*

Place evenly spaced minor ticks, with the step size and maximum number of ticks chosen automatically.

The Axis must use a linear scale and have evenly spaced major ticks.

Parameters

n

[int or 'auto', default: *rcParams["xtick.minor.ndivs"]* (default: `'auto'`) or *rcParams["ytick.minor.ndivs"]* (default: `'auto'`)] The number of subdivisions of the interval between major ticks; e.g., n=2 will place a single minor tick midway between major ticks.

If *n* is 'auto', it will be set to 4 or 5: if the distance between the major ticks equals 1, 2.5, 5 or 10 it can be perfectly divided in 5 equidistant sub-intervals with a length multiple of 0.05; otherwise, it is divided in 4 sub-intervals.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

> **Note**
>
> To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.ticker.**EngFormatter**(*unit=''*, *places=None*, *sep=' '*, *, *usetex=None*, *useMathText=None*, *useOffset=False*)

Bases: *ScalarFormatter*

Format axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of 1e7.

Parameters

unit

[str, default: ""] Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, 'Hz' or 'm'.

places

[int, default: None] Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format '%g', which displays up to 6 *significant* digits, i.e. the equivalent value for *places* varies between 0 and 5 (inclusive).

sep

[str, default: " "] Separator used between the value and the prefix/unit. For example, one get '3.14 mV' if `sep` is " " (default) and '3.14mV' if `sep` is "". Besides the default behavior, some other useful options may be:

- `sep=""` to append directly the prefix/unit to the value;
- `sep="\N{THIN SPACE}"` (`U+2009`);
- `sep="\N{NARROW NO-BREAK SPACE}"` (`U+202F`);
- `sep="\N{NO-BREAK SPACE}"` (`U+00A0`).

usetex

[bool, default: *rcParams["text.usetex"]* (default: `False`)] To enable/disable the use of TeX's math mode for rendering the numbers in the formatter.

useMathText

[bool, default: *rcParams["axes.formatter.use_mathtext"]* (default: `False`)] To enable/disable the use mathtext for rendering the numbers in the formatter.

useOffset

[bool or float, default: False] Whether to use offset notation with 10^{3*N} based prefixes. This features allows showing an offset with standard SI order of magnitude prefix near the axis. Offset is computed similarly to how *ScalarFormatter*

computes it internally, but here you are guaranteed to get an offset which will make the tick labels exceed 3 digits. See also *set_useOffset*.

Added in version 3.10.

ENG_PREFIXES = {-30: 'q', -27: 'r', -24: 'y', -21: 'z', -18: 'a', -15: 'f', -12: 'p', -9: 'n', -6: 'µ', -3: 'm', 0: '', 3: 'k', 6: 'M', 9: 'G', 12: 'T', 15: 'P', 18: 'E', 21: 'Z', 24: 'Y', 27: 'R', 30: 'Q'}

format_data(*value*)

Format a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```
>>> format_data(0)        # for self.places = 0
'0'
```

```
>>> format_data(1000000)  # for self.places = 1
'1.0 M'
```

```
>>> format_data(-1e-6)   # for self.places = 2
'-1.00 µ'
```

format_eng(*num*)

Alias to EngFormatter.format_data

get_offset()

Return scientific notation, plus offset.

set_locs(*locs*)

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

class matplotlib.ticker.**FixedFormatter**(*seq*)

Bases: *Formatter*

Return fixed strings for tick labels based only on position, not value.

Note

FixedFormatter should only be used together with *FixedLocator*. Otherwise, the labels may end up in unexpected positions.

Set the sequence *seq* of strings that will be used for labels.

get_offset()

set_offset_string(*ofs*)

class matplotlib.ticker.**FixedLocator**(*locs*, *nbins=None*)

Bases: *Locator*

Place ticks at a set of fixed values.

If *nbins* is None ticks are placed at all values. Otherwise, the *locs* array of possible positions will be subsampled to keep the number of ticks $\leq$ *nbins* + 1. The subsampling will be done to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it will be included in the chosen ticks.

set_params(*nbins=None*)

Set parameters within this locator.

tick_values(*vmin*, *vmax*)

Return the locations of the ticks.

> **Note**
>
> Because the values are fixed, vmin and vmax are not used in this method.

class matplotlib.ticker.**FormatStrFormatter**(*fmt*)

Bases: *Formatter*

Use an old-style ('%' operator) format string to format the tick.

The format string should have a single variable format (%) in it. It will be applied to the value (not the position) of the tick.

Negative numeric values (e.g., -1) will use a dash, not a Unicode minus; use mathtext to get a Unicode minus by wrapping the format specifier with $ (e.g. "$%g$").

class matplotlib.ticker.**Formatter**

Bases: *TickHelper*

Create a string based on a tick value and location.

static fix_minus(*s*)

Some classes may want to replace a hyphen for minus with the proper Unicode symbol (U+2212) for typographical correctness. This is a helper method to perform such a replacement when it is enabled via *rcParams["axes.unicode_minus"]* (default: True).

format_data(*value*)

Return the full string representation of the value with the position unspecified.

format_data_short(*value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

format_ticks(*values*)

Return the tick labels for all the ticks at once.

get_offset()

locs = []

set_locs(*locs*)

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

class matplotlib.ticker.**FuncFormatter**(*func*)

Bases: *Formatter*

Use a user-defined function for formatting.

The function should take in two inputs (a tick value `x` and a position `pos`), and return a string containing the corresponding tick label.

get_offset()

set_offset_string(*ofs*)

class matplotlib.ticker.**IndexLocator**(*base*, *offset*)

Bases: *Locator*

Place ticks at every nth point plotted.

IndexLocator assumes index plotting; i.e., that the ticks are placed at integer values in the range between 0 and len(data) inclusive.

Place ticks every *base* data point, starting at *offset*.

set_params(*base=None*, *offset=None*)

Set parameters within this locator

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note

To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.ticker.**LinearLocator**(*numticks=None*, *presets=None*)

Bases: *Locator*

Place ticks at evenly spaced values.

The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter, the number of ticks will be fixed so that interactive navigation will be nice

Parameters

numticks

[int or None, default None] Number of ticks. If None, *numticks* = 11.

presets

[dict or None, default: None] Dictionary mapping `(vmin, vmax)` to an array of locations. Overrides *numticks* if there is an entry for the current `(vmin, vmax)`.

property numticks

set_params(*numticks=None*, *presets=None*)

Set parameters within this locator.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note

To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(*vmin*, *vmax*)

Try to choose the view limits intelligently.

class matplotlib.ticker.**Locator**

Bases: *TickHelper*

Determine tick locations.

Note that the same locator should not be used across multiple *Axis* because the locator stores references to the Axis data and view limits.

MAXTICKS = 1000

nonsingular(*v0*, *v1*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the Axes if the Axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

raise_if_exceeds(*locs*)

Log at WARNING level if *locs* is longer than *Locator.MAXTICKS*.

This is intended to be called immediately before returning *locs* from `__call__` to inform users in case their Locator returns a huge number of ticks, causing Matplotlib to run out of memory.

The "strange" name of this method dates back to when it would raise an exception instead of emitting a log.

set_params(***kwargs*)

Do nothing, and raise a warning. Any locator class not supporting the set_params() function will call this.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

> **Note**
>
> To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:
>
> ```
> >>> print(type(loc))
> <type 'Locator'>
> >>> print(loc())
> [1, 2, 3, 4]
> ```

view_limits(*vmin*, *vmax*)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.ticker.**LogFormatter**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *Formatter*

Base class for formatting ticks on a log or symlog scale.

It may be instantiated directly, or subclassed.

Parameters

base

[float, default: 10.] Base of the logarithm used in all calculations.

labelOnlyBase

[bool, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

minor_thresholds

[(subset, all), default: (1, 0.4)] If labelOnlyBase is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If `numdec <= all`, all minor ticks will be labeled. If `all < numdec <= subset`, then only a subset of minor ticks will be labeled, so as to avoid crowding. If `numdec > subset` then no minor ticks will be labeled.

linthresh

[None or float, default: None] If a symmetric log scale is in use, its `linthresh` parameter must be supplied here.

Notes

The *set_locs* method must be called to enable the subsetting logic controlled by the `minor_thresholds` parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the minor_thresholds logic by using `minor_thresholds=(np.inf, np.inf)`, so that all ticks will be labeled.

To disable labeling of minor ticks when 'labelOnlyBase' is False, use `minor_thresholds=(0, 0)`. This is the default for the "classic" style.

Examples

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use `minor_thresholds=(2, 0.5)`.

To label all minor ticks when the view limits span up to 1.5 decades, use `minor_thresholds=(1.5, 1.5)`.

format_data(*value*)

Return the full string representation of the value with the position unspecified.

format_data_short(*value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

set_base(*base*)

Change the *base* for labeling.

> **Warning**
>
> Should always match the base used for *LogLocator*

set_label_minor(*labelOnlyBase*)

Switch minor tick labeling on or off.

Parameters

labelOnlyBase

[bool] If True, label ticks only at integer powers of base.

set_locs(*locs=None*)

Use axis view limits to control which ticks are labeled.

The *locs* parameter is ignored in the present algorithm.

class matplotlib.ticker.**LogFormatterExponent**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *LogFormatter*

Format values for log axis using `exponent = log_base(value)`.

class matplotlib.ticker.**LogFormatterMathtext**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *LogFormatter*

Format values for log axis using `exponent = log_base(value)`.

class matplotlib.ticker.**LogFormatterSciNotation**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *LogFormatterMathtext*

Format values following scientific notation in a logarithmic axis.

class matplotlib.ticker.**LogLocator**(*base=10.0*, *subs=(1.0,)*, *, *numticks=None*)

Bases: *Locator*

Place logarithmically spaced ticks.

Places ticks at the values `subs[j] * base**i`.

Parameters

base

[float, default: 10.0] The base of the log used, so major ticks are placed at `base**n`, where `n` is an integer.

subs

[None or {'auto', 'all'} or sequence of float, default: (1.0,)] Gives the multiples of integer powers of the base at which to place ticks. The default of `(1.0, )` places ticks only at integer powers of the base. Permitted string values are `'auto'` and `'all'`. Both of these use an algorithm based on the axis view limits to determine whether and how to put ticks between integer powers of the base: - `'auto'`: Ticks are placed only between integer powers. - `'all'`: Ticks are placed between *and* at integer powers. - `None`: Equivalent to `'auto'`.

numticks

[None or int, default: None] The maximum number of ticks to allow on a given axis. The default of `None` will try to choose intelligently as long as this Locator has already been assigned to an axis using *`get_tick_space`*, but otherwise falls back to 9.

`nonsingular`(*vmin*, *vmax*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the Axes if the Axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

`set_params`(*base=None*, *subs=None*, *, *numticks=None*)

Set parameters within this locator.

`tick_values`(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note

To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(*vmin*, *vmax*)

Try to choose the view limits intelligently.

class matplotlib.ticker.**LogitFormatter**(*, *use_overline=False*, *one_half='\\frac{1}{2}'*, *minor=False*, *minor_threshold=25*, *minor_number=6*)

Bases: *Formatter*

Probability formatter (using Math text).

Parameters

use_overline

[bool, default: False] If x > 1/2, with x = 1 - v, indicate if x should be displayed as $overline{v}$. The default is to display $1 - v$.

one_half

[str, default: r"\frac{1}{2}"] The string used to represent 1/2.

minor

[bool, default: False] Indicate if the formatter is formatting minor ticks or not. Basically minor ticks are not labelled, except when only few ticks are provided, ticks with most space with neighbor ticks are labelled. See other parameters to change the default behavior.

minor_threshold

[int, default: 25] Maximum number of locs for labelling some minor ticks. This parameter have no effect if minor is False.

minor_number

[int, default: 6] Number of ticks which are labelled when the number of ticks is below the threshold.

format_data_short(*value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

set_locs(*locs*)

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

set_minor_number(*minor_number*)

Set the number of minor ticks to label when some minor ticks are labelled.

Parameters

minor_number

[int] Number of ticks which are labelled when the number of ticks is below the threshold.

set_minor_threshold(*minor_threshold*)

Set the threshold for labelling minors ticks.

Parameters

minor_threshold

[int] Maximum number of locations for labelling some minor ticks. This parameter have no effect if minor is False.

set_one_half(*one_half*)

Set the way one half is displayed.

one_half

[str] The string used to represent 1/2.

use_overline(*use_overline*)

Switch display mode with overline for labelling p>1/2.

Parameters

use_overline

[bool] If x > 1/2, with x = 1 - v, indicate if x should be displayed as $overline{v}$. The default is to display $1 - v$.

class matplotlib.ticker.**LogitLocator**(*minor=False*, *, *nbins='auto'*)

Bases: *MaxNLocator*

Place ticks spaced evenly on a logit scale.

Parameters

nbins

[int or 'auto', optional] Number of ticks. Only used if minor is False.

minor

[bool, default: False] Indicate if this locator is for minor ticks or not.

property minor

nonsingular(*vmin*, *vmax*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the Axes if the Axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

set_params(*minor=None*, ***kwargs*)

Set parameters within this locator.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

> **Note**
>
> To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:
>
> ```
> >>> print(type(loc))
> <type 'Locator'>
> >>> print(loc())
> [1, 2, 3, 4]
> ```

class matplotlib.ticker.**MaxNLocator**(*nbins=None*, ***kwargs*)

Bases: *Locator*

Place evenly spaced ticks, with a cap on the total number of ticks.

Finds nice tick locations with no more than *nbins* + 1 ticks being within the view limits. Locations beyond the limits are added to support autoscaling.

Parameters

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps

[array-like, optional] Sequence of acceptable tick multiples, starting with 1 and ending with 10. For example, if `steps=[1, 2, 4, 5, 10]`, `20, 40, 60` or `0.4, 0.6, 0.8` would be possible sets of ticks because they are multiples of 2. `30, 60, 90` would not be generated because 3 does not appear in this example list of steps.

integer

[bool, default: False] If True, ticks will take only integer values, provided at least *min_n_ticks* integers are found within the view limits.

symmetric

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune

[{'lower', 'upper', 'both', None}, default: None] Remove the 'lower' tick, the 'upper' tick, or ticks on 'both' sides *if they fall exactly on an axis' edge* (this typically occurs when *rcParams["axes.autolimit_mode"]* (default: 'data') is 'round_numbers'). Removing such ticks is mostly useful for stacked or ganged plots, where the upper tick of an Axes overlaps with the lower tick of the axes above it.

min_n_ticks

[int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

default_params = {'integer': False, 'min_n_ticks': 2, 'nbins': 10, 'prune': None, 'steps': None, 'symmetric': False}

set_params(***kwargs*)

Set parameters for this locator.

Parameters

nbins

[int or 'auto', optional] see *MaxNLocator*

steps

[array-like, optional] see *MaxNLocator*

integer

[bool, optional] see *MaxNLocator*

symmetric

[bool, optional] see *MaxNLocator*

prune

[{'lower', 'upper', 'both', None}, optional] see *MaxNLocator*

min_n_ticks

[int, optional] see *MaxNLocator*

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note

To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(*dmin*, *dmax*)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.ticker.**MultipleLocator**(*base=1.0*, *offset=0.0*)

Bases: *Locator*

Place ticks at every integer multiple of a base plus an offset.

Parameters

base

[float > 0, default: 1.0] Interval between ticks.

offset

[float, default: 0.0] Value added to each multiple of *base*.

Added in version 3.8.

set_params(*base=None*, *offset=None*)

Set parameters within this locator.

Parameters

base

[float > 0, optional] Interval between ticks.

offset

[float, optional] Value added to each multiple of *base*.

Added in version 3.8.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

> **Note**
>
> To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:
>
> ```
> >>> print(type(loc))
> <type 'Locator'>
> >>> print(loc())
> [1, 2, 3, 4]
> ```

view_limits(*dmin*, *dmax*)

Set the view limits to the nearest tick values that contain the data.

class matplotlib.ticker.**NullFormatter**

Bases: *Formatter*

Always return the empty string.

class matplotlib.ticker.**NullLocator**

Bases: *Locator*

No ticks

tick_values(*vmin*, *vmax*)

Return the locations of the ticks.

> **Note**
>
> Because the values are Null, vmin and vmax are not used in this method.

class matplotlib.ticker.**PercentFormatter**(*xmax=100*, *decimals=None*, *symbol='%'*, *is_latex=False*)

Bases: *Formatter*

Format numbers as a percentage.

Parameters

xmax

[float] Determines how the number is converted into a percentage. *xmax* is the data value that corresponds to 100%. Percentages are computed as `x / xmax * 100`. So if the data is already scaled to be percentages, *xmax* will be 100. Another common situation is where *xmax* is 1.0.

decimals

[None or int] The number of decimal places to place after the point. If *None* (the default), the number will be computed automatically.

symbol

[str or None] A string that will be appended to the label. It may be *None* or empty to indicate that no symbol should be used. LaTeX special characters are escaped in *symbol* whenever latex mode is enabled, unless *is_latex* is *True*.

is_latex

[bool] If *False*, reserved LaTeX characters in *symbol* will be escaped.

convert_to_pct(*x*)

format_pct(*x*, *display_range*)

Format the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If `self.decimals` is `None`, the number of digits after the decimal point is set based on the *display_range* of the axis as follows:

display_range	decimals	sample
>50	0	`x = 34.5` => 35%
>5	1	`x = 34.5` => 34.5%
>0.5	2	`x = 34.5` => 34.50%
...	...	...

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

property symbol

The configured percent symbol as a string.

If LaTeX is enabled via *rcParams["text.usetex"]* (default: `False`), the special characters `{'#', '$', '%', '&', '~', '_', '^', '\', '{', '}'}` are automatically escaped in the string.

class matplotlib.ticker.**ScalarFormatter**(*useOffset=None*, *useMathText=None*, *useLocale=None*, *, *usetex=None*)

Bases: *Formatter*

Format tick values as a number.

Parameters

useOffset

[bool or float, default: *rcParams["axes.formatter.useoffset"]* (default: `True`)] Whether to use offset notation. See *set_useOffset*.

useMathText

[bool, default: *rcParams["axes.formatter.use_mathtext"]* (default: `False`)] Whether to use fancy math formatting. See *set_useMathText*.

useLocale

[bool, default: *rcParams["axes.formatter.use_locale"]* (default: `False`).] Whether to use locale settings for decimal sign and positive sign. See *set_useLocale*.

usetex

[bool, default: *rcParams["text.usetex"]* (default: `False`)] To enable/disable the use of TeX's math mode for rendering the numbers in the formatter.

Added in version 3.10.

Notes

In addition to the parameters above, the formatting of scientific vs. floating point representation can be configured via *set_scientific* and *set_powerlimits*).

Offset notation and scientific notation

Offset notation and scientific notation look quite similar at first sight. Both split some information from the formatted tick values and display it at the end of the axis.

- The scientific notation splits up the order of magnitude, i.e. a multiplicative scaling factor, e.g. `1e6`.
- The offset notation separates an additive constant, e.g. `+1e6`. The offset notation label is always prefixed with a + or − sign and is thus distinguishable from the order of magnitude label.

The following plot with x limits `1_000_000` to `1_000_010` illustrates the different formatting. Note the labels at the right edge of the x axis.

format_data(*value*)

Return the full string representation of the value with the position unspecified.

format_data_short(*value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

get_offset()

Return scientific notation, plus offset.

get_useLocale()

Return whether locale settings are used for formatting.

See also

ScalarFormatter.set_useLocale

get_useMathText()

Return whether to use fancy math formatting.

> **See also**
>
> *ScalarFormatter.set_useMathText*

get_useOffset()

Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

> **See also**
>
> *ScalarFormatter.set_useOffset*

get_usetex()

Return whether TeX's math mode is enabled for rendering.

set_locs(*locs*)

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

set_powerlimits(*lims*)

Set size thresholds for scientific notation.

Parameters

lims

[(int, int)] A tuple *(min_exp, max_exp)* containing the powers of 10 that determine the switchover threshold. For a number representable as $a \times 10^{\text{exp}}$ with $1 <= |a| < 10$, scientific notation will be used if `exp <= min_exp` or `exp >= max_exp`.

The default limits are controlled by *rcParams["axes.formatter.limits"]* (default: `[-5, 6]`).

In particular numbers with *exp* equal to the thresholds are written in scientific notation.

Typically, *min_exp* will be negative and *max_exp* will be positive.

For example, `formatter.set_powerlimits((-3, 4))` will provide the following formatting: $1 \times 10^{-3}, 9.9 \times 10^{-3}, 0.01, 9999, 1 \times 10^{4}$.

> **See also**
>
> *ScalarFormatter.set_scientific*

set_scientific(*b*)

Turn scientific notation on or off.

> **See also**
>
> *ScalarFormatter.set_powerlimits*

set_useLocale(*val*)

Set whether to use locale settings for decimal sign and positive sign.

Parameters

val

[bool or None] *None* resets to `rcParams["axes.formatter.use_locale"]` (default: `False`).

set_useMathText(*val*)

Set whether to use fancy math formatting.

If active, scientific notation is formatted as 1.2×10^3.

Parameters

val

[bool or None] *None* resets to `rcParams["axes.formatter.use_mathtext"]` (default: `False`).

set_useOffset(*val*)

Set whether to use offset notation.

When formatting a set numbers whose value is large compared to their range, the formatter can separate an additive constant. This can shorten the formatted numbers so that they are less likely to overlap when drawn on an axis.

Parameters

val

[bool or float]

- If False, do not use offset notation.

- If True (=automatic mode), use offset notation if it can make the residual numbers significantly shorter. The exact behavior is controlled by `rcParams["axes.formatter.offset_threshold"]` (default: `4`).
- If a number, force an offset of the given value.

Examples

With active offset notation, the values

```
100_000, 100_002, 100_004, 100_006, 100_008
```

will be formatted as `0, 2, 4, 6, 8` plus an offset `+1e5`, which is written to the edge of the axis.

set_usetex(*val*)

Set whether to use TeX's math mode for rendering numbers in the formatter.

property useLocale

Return whether locale settings are used for formatting.

> **See also**
>
> *ScalarFormatter.set_useLocale*

property useMathText

Return whether to use fancy math formatting.

> **See also**
>
> *ScalarFormatter.set_useMathText*

property useOffset

Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

> **See also**
>
> *ScalarFormatter.set_useOffset*

property usetex

Return whether TeX's math mode is enabled for rendering.

class matplotlib.ticker.**StrMethodFormatter**(*fmt*)

Bases: *Formatter*

Use a new-style format string (as used by `str.format`) to format the tick.

The field used for the tick value must be labeled *x* and the field used for the tick position must be labeled *pos*.

The formatter will respect *rcParams["axes.unicode_minus"]* (default: `True`) when formatting negative numeric values.

It is typically unnecessary to explicitly construct *StrMethodFormatter* objects, as *set_major_formatter* directly accepts the format string itself.

class matplotlib.ticker.**SymmetricalLogLocator**(*transform=None*, *subs=None*, *linthresh=None*, *base=None*)

Bases: *Locator*

Place ticks spaced linearly near zero and spaced logarithmically beyond a threshold.

Parameters

transform

[*SymmetricalLogTransform*, optional] If set, defines the *base* and *linthresh* of the symlog transform.

base, linthresh

[float, optional] The *base* and *linthresh* of the symlog transform, as documented for *SymmetricalLogScale*. These parameters are only used if *transform* is not set.

subs

[sequence of float, default: [1]] The multiples of integer powers of the base where ticks are placed, i.e., ticks are placed at `[sub * base**i for i in ... for sub in subs]`.

Notes

Either *transform*, or both *base* and *linthresh*, must be given.

set_params(*subs=None*, *numticks=None*)

Set parameters within this locator.

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

> **Note**
>
> To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(*vmin*, *vmax*)

Try to choose the view limits intelligently.

class matplotlib.ticker.**TickHelper**

Bases: object

axis = None

create_dummy_axis(**kwargs*)

set_axis(*axis*)

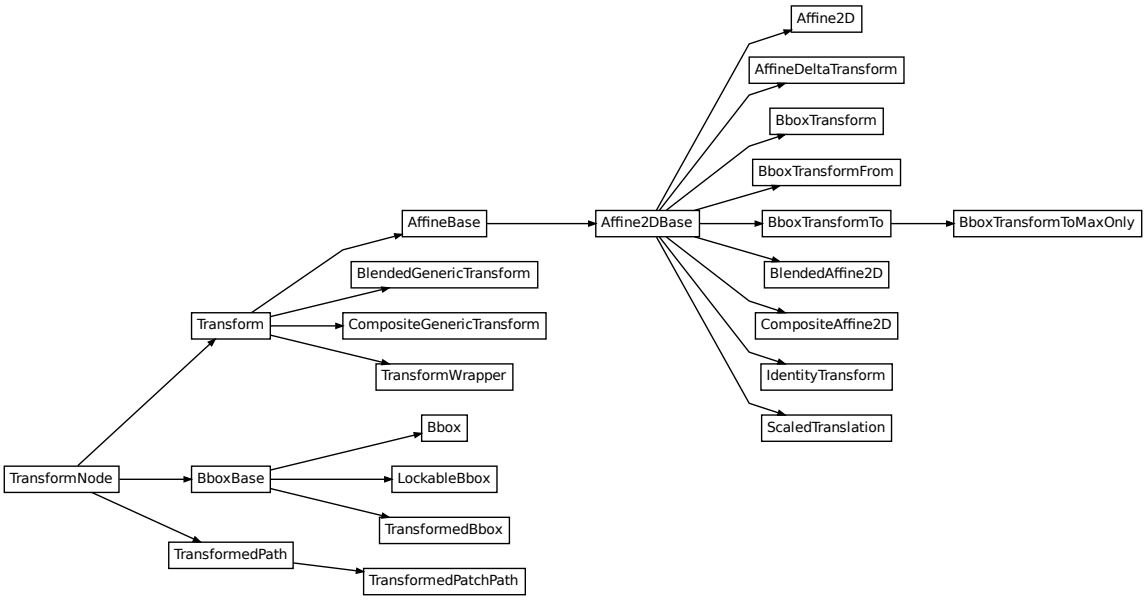
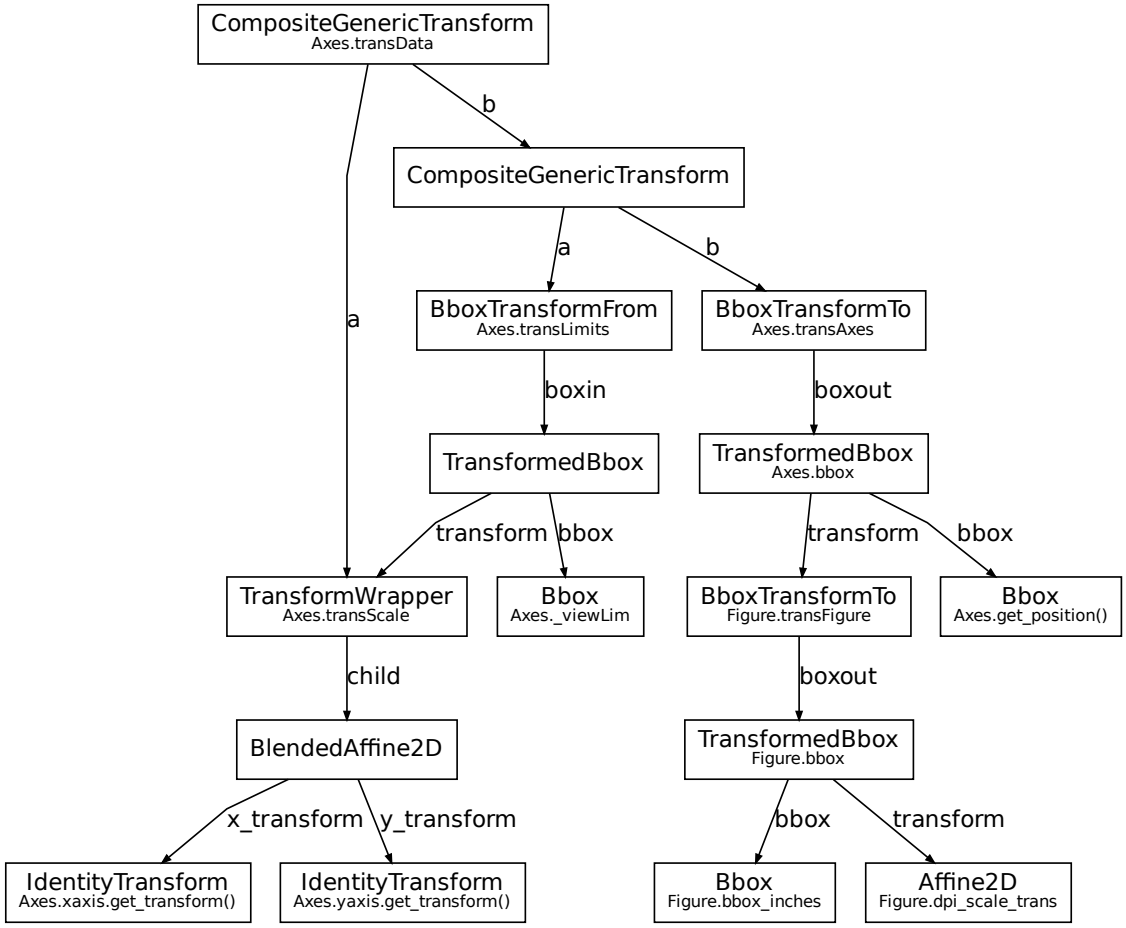
7.2.57 matplotlib.transforms



Matplotlib includes a framework for arbitrary geometric transformations that is used to determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of *TransformNode* objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the figure:



The framework can be used for both affine and non-affine transformations. However, for speed, we want to use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

```
full transform == non-affine part + affine part
```

The backends are not expected to handle non-affine transformations themselves.

See the tutorial *Transformations Tutorial* for examples of how to use transforms.

class matplotlib.transforms.**Affine2D**(*matrix=None*, ***kwargs*)

Bases: *Affine2DBase*

A mutable 2D affine transformation.

Initialize an Affine transform from a 3x3 numpy float array:

```
a c e
```

(continues on next page)

(continued from previous page)

```
b d f
0 0 1
```

If *matrix* is None, initialize with the identity transform.

clear()

Reset the underlying matrix to the identity transform.

static from_values(*a*, *b*, *c*, *d*, *e*, *f*)

Create a new Affine2D instance from the given values:

```
a c e
b d f
0 0 1
```

.

get_matrix()

Get the underlying transformation matrix as a 3x3 array:

```
a c e
b d f
0 0 1
```

.

rotate(*theta*)

Add a rotation (in radians) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

rotate_around(*x*, *y*, *theta*)

Add a rotation (in radians) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

rotate_deg(*degrees*)

Add a rotation (in degrees) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

rotate_deg_around(*x*, *y*, *degrees*)

Add a rotation (in degrees) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

scale(*sx*, *sy=None*)

Add a scale in place.

If *sy* is None, the same scale is applied in both the *x*- and *y*-directions.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

set(*other*)

Set this transformation from the frozen copy of another *Affine2DBase* object.

set_matrix(*mtx*)

Set the underlying transformation matrix from a 3x3 array:

```
a c e
b d f
0 0 1
```

.

skew(*xShear*, *yShear*)

Add a skew in place.

xShear and *yShear* are the shear angles along the *x*- and *y*-axes, respectively, in radians.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

skew_deg(*xShear*, *yShear*)

Add a skew in place.

xShear and *yShear* are the shear angles along the *x*- and *y*-axes, respectively, in degrees.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

translate(*tx*, *ty*)

Add a translation in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

class matplotlib.transforms.**Affine2DBase**(**args*, ***kwargs*)

Bases: *AffineBase*

The base class of all 2D affine transformations.

2D affine transformations are performed using a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

This class provides the read-only interface. For a mutable 2D affine transformation, use *Affine2D*.

Subclasses of this class will generally only need to override a constructor and *get_matrix* that generates a custom 3x3 matrix.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

frozen()

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

has_inverse = True

True if this transform has a corresponding inverse transform.

input_dims = 2

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

property is_separable

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

output_dims = 2

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

to_values()

Return the values of the matrix as an `(a, b, c, d, e, f)` tuple.

transform_affine(*values*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

class matplotlib.transforms.**AffineBase**(**args*, ***kwargs*)

Bases: *Transform*

The base class of all affine transformations of any number of dimensions.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

get_affine()

Get the affine part of this transform.

is_affine = True

transform(*values*)

Apply this transformation on the given array of *values*.

Parameters

values

[array-like] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_affine(*values*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_path(*path*)

Apply the transform to *Path* *path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

transform_path_affine(*path*)

Apply the affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

transform_path_non_affine(*path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

class matplotlib.transforms.**AffineDeltaTransform**(*transform*, ***kwargs*)

Bases: *Affine2DBase*

A transform wrapper for transforming displacements between pairs of points.

This class is intended to be used to transform displacements ("position deltas") between pairs of points (e.g., as the `offset_transform` of *Collection*s): given a transform `t` such that `t = AffineDeltaTransform(t) + offset`, `AffineDeltaTransform` satisfies `AffineDeltaTransform(a - b) == AffineDeltaTransform(a) - AffineDeltaTransform(b)`.

This is implemented by forcing the offset components of the transform matrix to zero.

This class is experimental as of 3.3, and the API may change.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

get_matrix()

Get the matrix for the affine part of this transform.

pass_through = True

If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

class matplotlib.transforms.**Bbox**(*points*, ***kwargs*)

Bases: *BboxBase*

A mutable bounding box.

Examples

Create from known bounds

The default constructor takes the boundary "points" `[[xmin, ymin], [xmax, ymax]]`.

```
>>> Bbox([[1, 1], [3, 7]])
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Alternatively, a Bbox can be created from the flattened points array, the so-called "extents" `(xmin, ymin, xmax, ymax)`

```
>>> Bbox.from_extents(1, 1, 3, 7)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

or from the "bounds" `(xmin, ymin, width, height)`.

```
>>> Bbox.from_bounds(1, 1, 2, 6)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Create from collections of points

The "empty" object for accumulating Bboxs is the null bbox, which is a stand-in for the empty set.

```
>>> Bbox.null()
Bbox([[inf, inf], [-inf, -inf]])
```

Adding points to the null bbox will give you the bbox of those points.

```
>>> box = Bbox.null()
>>> box.update_from_data_xy([[1, 1]])
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
>>> box.update_from_data_xy([[2, 3], [3, 2]], ignore=False)
>>> box
Bbox([[1.0, 1.0], [3.0, 3.0]])
```

Setting `ignore=True` is equivalent to starting over from a null bbox.

```
>>> box.update_from_data_xy([[1, 1]], ignore=True)
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
```

Warning

It is recommended to always specify `ignore` explicitly. If not, the default value of `ignore` can be changed at any time by code with access to your Bbox, for example using the method *`ignore`*.

Properties of the ``null`` bbox

Note

The current behavior of *`Bbox.null()`* may be surprising as it does not have all of the properties of the "empty set", and as such does not behave like a "zero" object in the mathematical sense. We may change that in the future (with a deprecation period).

The null bbox is the identity for intersections

```
>>> Bbox.intersection(Bbox([[1, 1], [3, 7]]), Bbox.null())
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

except with itself, where it returns the full space.

```
>>> Bbox.intersection(Bbox.null(), Bbox.null())
Bbox([[-inf, -inf], [inf, inf]])
```

A union containing null will always return the full space (not the other set!)

```
>>> Bbox.union([Bbox([[0, 0], [0, 0]]), Bbox.null()])
Bbox([[-inf, -inf], [inf, inf]])
```

Parameters

points

[ndarray] A (2, 2) array of the form `[[x0, y0], [x1, y1]]`.

property bounds

Return (*x0*, *y0*, `width`, `height`).

static from_bounds(*x0*, *y0*, *width*, *height*)

Create a new *Bbox* from *x0*, *y0*, *width* and *height*.

width and *height* may be negative.

static from_extents(**args*, *minpos=None*)

Create a new Bbox from *left*, *bottom*, *right* and *top*.

The *y*-axis increases upwards.

Parameters

left, bottom, right, top

[float] The four extents of the bounding box.

minpos

[float or None] If this is supplied, the Bbox will have a minimum positive value set. This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors.

frozen()

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

get_points()

Get the points of the bounding box as an array of the form `[[x0, y0], [x1, y1]]`.

ignore(*value*)

Set whether the existing bounds of the box should be ignored by subsequent calls to *update_from_data_xy()*.

value

[bool]

- When `True`, subsequent calls to *update_from_data_xy* will ignore the existing bounds of the *Bbox*.
- When `False`, subsequent calls to *update_from_data_xy* will include the existing bounds of the *Bbox*.

property intervalx

The pair of *x* coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

property intervaly

The pair of *y* coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

property minpos

The minimum positive value in both directions within the Bbox.

This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors, and will be used as the minimum extent instead of *p0*.

property minposx

The minimum positive value in the *x*-direction within the Bbox.

This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors, and will be used as the minimum *x*-extent instead of *x0*.

property minposy

The minimum positive value in the *y*-direction within the Bbox.

This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors, and will be used as the minimum *y*-extent instead of *y0*.

mutated()

Return whether the bbox has changed since init.

mutatedx()

Return whether the x-limits have changed since init.

mutatedy()

Return whether the y-limits have changed since init.

static null()

Create a new null *Bbox* from (inf, inf) to (-inf, -inf).

property p0

The first pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use `min`).

property p1

The second pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use `max`).

set(*other*)

Set this bounding box from the "frozen" bounds of another *Bbox*.

set_points(*points*)

Set the points of the bounding box directly from an array of the form `[[x0, y0], [x1, y1]]`. No error checking is performed, as this method is mainly for internal use.

static unit()

Create a new unit *Bbox* from (0, 0) to (1, 1).

update_from_data_x(*x*, *ignore=None*)

Update the x-bounds of the *Bbox* based on the passed in data. After updating, the bounds will have positive *width*, and *x0* will be the minimal value.

Parameters

x

[`ndarray`] Array of x-values.

ignore

[bool, optional]

- When `True`, ignore the existing bounds of the *Bbox*.
- When `False`, include the existing bounds of the *Bbox*.
- When `None`, use the last value passed to *ignore()*.

update_from_data_xy(*xy*, *ignore=None*, *updatex=True*, *updatey=True*)

Update the *Bbox* bounds based on the passed in *xy* coordinates.

After updating, the bounds will have positive *width* and *height*; *x0* and *y0* will be the minimal values.

Parameters

xy

[(N, 2) array-like] The (x, y) coordinates.

ignore

[bool, optional]

- When `True`, ignore the existing bounds of the *Bbox*.
- When `False`, include the existing bounds of the *Bbox*.
- When `None`, use the last value passed to *ignore()*.

updatex, updatey

[bool, default: True] When `True`, update the x/y values.

update_from_data_y(*y*, *ignore=None*)

Update the y-bounds of the *Bbox* based on the passed in data. After updating, the bounds will have positive *height*, and *y0* will be the minimal value.

Parameters

y

[`ndarray`] Array of y-values.

ignore

[bool, optional]

- When `True`, ignore the existing bounds of the *Bbox*.
- When `False`, include the existing bounds of the *Bbox*.
- When `None`, use the last value passed to *ignore()*.

update_from_path(*path*, *ignore=None*, *updatex=True*, *updatey=True*)

Update the bounds of the *Bbox* to contain the vertices of the provided path. After updating, the bounds will have positive *width* and *height*; *x0* and *y0* will be the minimal values.

Parameters

path

[*Path*]

ignore

[bool, optional]

- When `True`, ignore the existing bounds of the *Bbox*.
- When `False`, include the existing bounds of the *Bbox*.
- When `None`, use the last value passed to *ignore()*.

updatex, updatey

[bool, default: True] When `True`, update the x/y values.

property x0

The first of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be less than *x1* (for that, use `xmin`).

property x1

The second of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be greater than *x0* (for that, use `xmax`).

property y0

The first of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be less than *y1* (for that, use `ymin`).

property y1

The second of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be greater than *y0* (for that, use `ymax`).

class `matplotlib.transforms.`**BboxBase**(*shorthand_name=None*)

Bases: *TransformNode*

The base class of all bounding boxes.

This class is immutable; *Bbox* is a mutable subclass.

The canonical representation is as two points, with no restrictions on their ordering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

anchored(*c*, *container*)

Return a copy of the *Bbox* anchored to *c* within *container*.

Parameters

c

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}] Either an (*x*, *y*) pair of relative coordinates (0 is left or bottom, 1 is right or top), 'C' (center), or a cardinal direction ('SW', southwest, is bottom left, etc.).

container

[*Bbox*] The box within which the *Bbox* is positioned.

> **See also**
>
> *Axes.set_anchor*

property bounds

Return (*x0*, *y0*, *width*, *height*).

coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.0), 'S': (0.5, 0), 'SE': (1.0, 0), 'SW': (0, 0), 'W': (0, 0.5)}

contains(*x*, *y*)

Return whether `(x, y)` is in the bounding box or on its edge.

containsx(*x*)

Return whether *x* is in the closed (*x0*, *x1*) interval.

containsy(*y*)

Return whether *y* is in the closed (*y0*, *y1*) interval.

corners()

Return the corners of this rectangle as an array of points.

Specifically, this returns the array `[[x0, y0], [x0, y1], [x1, y0], [x1, y1]]`.

count_contains(*vertices*)

Count the number of vertices contained in the *Bbox*. Any vertices with a non-finite x or y value are ignored.

Parameters

vertices

[(N, 2) array]

count_overlaps(*bboxes*)

Count the number of bounding boxes that overlap this one.

Parameters

bboxes

[sequence of *BboxBase*]

expanded(*sw*, *sh*)

Construct a *Bbox* by expanding this one around its center by the factors *sw* and *sh*.

property extents

Return (*x0*, *y0*, *x1*, *y1*).

frozen()

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

fully_contains(*x*, *y*)

Return whether `x, y` is in the bounding box, but not on its edge.

fully_containsx(*x*)

Return whether *x* is in the open (*x0*, *x1*) interval.

fully_containsy(*y*)

Return whether *y* is in the open (*y0*, *y1*) interval.

fully_overlaps(*other*)

Return whether this bounding box overlaps with the other bounding box, not including the edges.

Parameters

other

[*BboxBase*]

get_points()

property height

The (signed) height of the bounding box.

static intersection(*bbox1*, *bbox2*)

Return the intersection of *bbox1* and *bbox2* if they intersect, or None if they don't.

property intervalx

The pair of *x* coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

property intervaly

The pair of *y* coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

is_affine = True

is_bbox = True

property max

The top-right corner of the bounding box.

property min

The bottom-left corner of the bounding box.

overlaps(*other*)

Return whether this bounding box overlaps with the other bounding box.

Parameters

other

[*BboxBase*]

property p0

The first pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use *min*).

property p1

The second pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use *max*).

padded(*w_pad*, *h_pad=None*)

Construct a *Bbox* by padding this one on all four sides.

Parameters

w_pad

[float] Width pad

h_pad

[float, optional] Height pad. Defaults to *w_pad*.

rotated(*radians*)

Return the axes-aligned bounding box that bounds the result of rotating this *Bbox* by an angle of *radians*.

shrunk(*mx*, *my*)

Return a copy of the *Bbox*, shrunk by the factor *mx* in the *x* direction and the factor *my* in the *y* direction. The lower left corner of the box remains unchanged. Normally *mx* and *my* will be less than 1, but this is not enforced.

shrunk_to_aspect(*box_aspect*, *container=None*, *fig_aspect=1.0*)

Return a copy of the *Bbox*, shrunk so that it is as large as it can be while having the desired aspect ratio, *box_aspect*. If the box coordinates are relative (i.e. fractions of a larger box such as a figure) then the physical aspect ratio of that figure is specified with *fig_aspect*, so that *box_aspect* can also be given as a ratio of the absolute dimensions, not the relative dimensions.

property size

The (signed) width and height of the bounding box.

splitx(**args*)

Return a list of new *Bbox* objects formed by splitting the original one with vertical lines at fractional positions given by *args*.

splity(**args*)

Return a list of new *Bbox* objects formed by splitting the original one with horizontal lines at fractional positions given by *args*.

transformed(*transform*)

Construct a *Bbox* by statically transforming this one by *transform*.

translated(*tx*, *ty*)

Construct a *Bbox* by translating this one by *tx* and *ty*.

static union(*bboxes*)

Return a *Bbox* that contains all of the given *bboxes*.

property width

The (signed) width of the bounding box.

property x0

The first of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be less than *x1* (for that, use *xmin*).

property x1

The second of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be greater than *x0* (for that, use *xmax*).

property xmax

The right edge of the bounding box.

property xmin

The left edge of the bounding box.

property y0

The first of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be less than *y1* (for that, use *ymin*).

property y1

The second of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be greater than *y0* (for that, use *ymax*).

property ymax

The top edge of the bounding box.

property ymin

The bottom edge of the bounding box.

class matplotlib.transforms.**BboxTransform**(*boxin*, *boxout*, ***kwargs*)

Bases: *Affine2DBase*

BboxTransform linearly transforms points from one *Bbox* to another.

Create a new *BboxTransform* that linearly transforms points from *boxin* to *boxout*.

get_matrix()

Get the matrix for the affine part of this transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.transforms.**BboxTransformFrom**(*boxin*, ***kwargs*)

Bases: *Affine2DBase*

BboxTransformFrom linearly transforms points from a given *Bbox* to the unit bounding box.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

get_matrix()

Get the matrix for the affine part of this transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.transforms.**BboxTransformTo**(*boxout*, ***kwargs*)

Bases: *Affine2DBase*

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given *Bbox*.

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

get_matrix()

Get the matrix for the affine part of this transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.transforms.**BboxTransformToMaxOnly**(*boxout*, ***kwargs*)

Bases: *BboxTransformTo*

[*Deprecated*] *BboxTransformToMaxOnly* is a transformation that linearly transforms points from the unit bounding box to a given *Bbox* with a fixed upper left of (0, 0).

Notes

Deprecated since version 3.9.

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

get_matrix()

Get the matrix for the affine part of this transform.

class matplotlib.transforms.**BlendedAffine2D**(*x_transform*, *y_transform*, ***kwargs*)

Bases: _BlendedMixin, *Affine2DBase*

A "blended" transform uses one transform for the *x*-direction, and another transform for the *y*-direction.

This version is an optimization for the case where both child transforms are of type *Affine2DBase*.

Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

Both *x_transform* and *y_transform* must be 2D affine transforms.

You will generally not call this constructor directly but use the *blended_transform_factory* function instead, which can determine automatically which kind of blended transform to create.

get_matrix()

Get the matrix for the affine part of this transform.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

class matplotlib.transforms.**BlendedGenericTransform**(*x_transform*, *y_transform*, ***kwargs*)

Bases: _BlendedMixin, *Transform*

A "blended" transform uses one transform for the *x*-direction, and another transform for the *y*-direction.

This "generic" version can handle any given child transform in the *x*- and *y*-directions.

Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

You will generally not call this constructor directly but use the *blended_transform_factory* function instead, which can determine automatically which kind of blended transform to create.

contains_branch(*other*)

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

property depth

Return the number of transforms which have been chained together to form this Transform instance.

> **Note**
>
> For the special case of a Composite transform, the maximum depth of the two is returned.

frozen()

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

get_affine()

Get the affine part of this transform.

property has_inverse

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

input_dims = 2

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

property is_affine

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

is_separable = True

True if this transform is separable in the x- and y- dimensions.

output_dims = 2

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

pass_through = True

If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

class matplotlib.transforms.**CompositeAffine2D**(*a*, *b*, ***kwargs*)

Bases: *Affine2DBase*

A composite transform formed by applying transform *a* then transform *b*.

This version is an optimization that handles the case where both *a* and *b* are 2D affines.

Create a new composite transform that is the result of applying *Affine2DBase* *a* then *Affine2DBase* *b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

property depth

Return the number of transforms which have been chained together to form this Transform instance.

> **Note**
>
> For the special case of a Composite transform, the maximum depth of the two is returned.

get_matrix()

Get the matrix for the affine part of this transform.

class matplotlib.transforms.**CompositeGenericTransform**(*a*, *b*, ***kwargs*)

Bases: *Transform*

A composite transform formed by applying transform *a* then transform *b*.

This "generic" version can handle any two arbitrary transformations.

Create a new composite transform that is the result of applying transform *a* then transform *b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

contains_branch_seperately(*other_transform*)

Return whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an Axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.
↪transData)
```

property depth

Return the number of transforms which have been chained together to form this Transform instance.

> **Note**
>
> For the special case of a Composite transform, the maximum depth of the two is returned.

frozen()

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

get_affine()

Get the affine part of this transform.

property has_inverse

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

property is_affine

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

property is_separable

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

pass_through = True

If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

transform_affine(*values*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_path_non_affine(*path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

class matplotlib.transforms.**IdentityTransform**(**args*, ***kwargs*)

Bases: *Affine2DBase*

A special class that does one thing, the identity transform, in a fast way.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

frozen()

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

get_affine()

Get the affine part of this transform.

get_matrix()

Get the matrix for the affine part of this transform.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

transform(*values*)

Apply this transformation on the given array of *values*.

Parameters

values

[array-like] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_affine(*values*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length `input_dims` or shape (N, `input_dims`).

Returns

array

The output values as an array of length `output_dims` or shape (N, `output_dims`), depending on the input.

transform_path(*path*)

Apply the transform to *Path* *path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

transform_path_affine(*path*)

Apply the affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

transform_path_non_affine(*path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

class matplotlib.transforms.**LockableBbox**(*bbox*, *x0=None*, *y0=None*, *x1=None*, *y1=None*, ***kwargs*)

Bases: *BboxBase*

A *Bbox* where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this bbox will update accordingly with the exception of the locked elements.

Parameters

bbox

[*Bbox*] The child bounding box to wrap.

x0

[float or None] The locked value for x0, or None to leave unlocked.

y0

[float or None] The locked value for y0, or None to leave unlocked.

x1

[float or None] The locked value for x1, or None to leave unlocked.

y1

[float or None] The locked value for y1, or None to leave unlocked.

get_points()

property locked_x0

float or None: The value used for the locked x0.

property locked_x1

float or None: The value used for the locked x1.

property locked_y0

float or None: The value used for the locked y0.

property locked_y1

float or None: The value used for the locked y1.

class matplotlib.transforms.**ScaledTranslation**(*xt*, *yt*, *scale_trans*, ***kwargs*)

Bases: *Affine2DBase*

A transformation that translates by *xt* and *yt*, after *xt* and *yt* have been transformed by *scale_trans*.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

get_matrix()

Get the matrix for the affine part of this transform.

class matplotlib.transforms.**Transform**(*shorthand_name=None*)

Bases: *TransformNode*

The base class of all *TransformNode* instances that actually perform a transformation.

All non-affine transformations should be subclasses of this class. New affine transformations should be subclasses of *Affine2D*.

Subclasses of this class should override the following members (at minimum):

- *input_dims*
- *output_dims*
- *transform()*
- *inverted()* (if an inverse exists)

The following attributes may be overridden if the default is unsuitable:

- *is_separable* (defaults to True for 1D -> 1D transforms, False otherwise)
- *has_inverse* (defaults to True if *inverted()* is overridden, False otherwise)

If the transform needs to do something non-standard with *matplotlib.path.Path* objects, such as adding curves where there were once line segments, it should override:

- *transform_path()*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__add__(*other*)

Compose two transforms together so that *self* is followed by *other*.

`A + B` returns a transform `C` so that `C.transform(x) == B.transform(A.transform(x))`.

__sub__(*other*)

Compose *self* with the inverse of *other*, cancelling identical terms if any:

```
# In general:
A - B == A + B.inverted()
# (but see note regarding frozen transforms below).

# If A "ends with" B (i.e. A == A' + B for some A') we can␣
 ↪cancel
# out B:
(A' + B) - B == A'

# Likewise, if B "starts with" A (B = A + B'), we can cancel␣
 ↪out A:
A - (A + B') == B'.inverted() == B'^-1
```

Cancellation (rather than naively returning `A + B.inverted()`) is important for multiple reasons:

- It avoids floating-point inaccuracies when computing the inverse of B: `B - B` is guaranteed to cancel out exactly (resulting in the identity transform), whereas `B + B.inverted()` may differ by a small epsilon.
- `B.inverted()` always returns a frozen transform: if one computes `A + B + B.inverted()` and later mutates `B`, then `B.inverted()` won't be updated and the last two terms won't cancel out anymore; on the other hand, `A + B - B` will always be equal to `A` even if `B` is mutated.

contains_branch(*other*)

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

contains_branch_seperately(*other_transform*)

Return whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an Axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.
 ↪transData)
```

property depth

Return the number of transforms which have been chained together to form this Transform instance.

> **Note**
>
> For the special case of a Composite transform, the maximum depth of the two is returned.

get_affine()

Get the affine part of this transform.

get_matrix()

Get the matrix for the affine part of this transform.

has_inverse = False

True if this transform has a corresponding inverse transform.

input_dims = None

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted()

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

is_separable = False

True if this transform is separable in the x- and y- dimensions.

output_dims = None

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform(*values*)

Apply this transformation on the given array of *values*.

Parameters

values

[array-like] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

transform_affine(*values*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

transform_angles(*angles*, *pts*, *radians=False*, *pushoff=1e-05*)

Transform a set of angles anchored at specific locations.

Parameters

angles

[(N,) array-like] The angles to transform.

pts

[(N, 2) array-like] The points where the angles are anchored.

radians

[bool, default: False] Whether *angles* are radians or degrees.

pushoff

[float] For each point in *pts* and angle in *angles*, the transformed angle is computed by transforming a segment of length *pushoff* starting at that point and making that angle relative to the horizontal axis, and measuring the angle between the horizontal axis and the transformed segment.

Returns

(N,) array

transform_bbox(*bbox*)

Transform the given bounding box.

For smarter transforms including caching (a common requirement in Matplotlib), see *TransformedBbox*.

transform_non_affine(*values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as an array of length *input_dims* or shape (N, *input_dims*).

Returns

array

The output values as an array of length *output_dims* or shape (N, *output_dims*), depending on the input.

transform_path(*path*)

Apply the transform to *Path* *path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

transform_path_affine(*path*)

Apply the affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

transform_path_non_affine(*path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affi`

transform_point(*point*)

Return a transformed point.

This function is only kept for backcompatibility; the more general *transform* method is capable of transforming both a list of points and a single point.

The point is given as a sequence of length *input_dims*. The transformed point is returned as a sequence of length *output_dims*.

class matplotlib.transforms.**TransformNode**(*shorthand_name=None*)

Bases: `object`

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

frozen()

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

invalidate()

Invalidate this *TransformNode* and triggers an invalidation of its ancestors. Should be called any time the transform changes.

is_affine = False

is_bbox = False

pass_through = False

If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

set_children(**children*)

Set the children of the transform, to let the invalidation system know which transforms can invalidate this transform. Should be called from the constructor of any transforms that depend on other transforms.

class matplotlib.transforms.**TransformWrapper**(*child*)

Bases: *Transform*

A helper class that holds a single child transform and acts equivalently to it.

This is useful if a node of the transform tree must be replaced at run time with a transform of a different type. This class allows that replacement to correctly trigger invalidation.

TransformWrapper instances must have the same input and output dimensions during their entire lifetime, so the child transform may only be replaced with another child transform of the same dimensions.

child: A *Transform* instance. This child may later be replaced with *set()*.

frozen()

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

property has_inverse

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

property input_dims

The type of the None singleton.

property is_affine

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

property is_separable

Returns True when the argument is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

property output_dims

The type of the None singleton.

pass_through = True

If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

set(*child*)

Replace the current child of this transform with another one.

The new child must have the same number of input and output dimensions as the current child.

class matplotlib.transforms.**TransformedBbox**(*bbox*, *transform*, ***kwargs*)

Bases: *BboxBase*

A *Bbox* that is automatically transformed by a given transform. When either the child bounding box or transform changes, the bounds of this bbox will update accordingly.

Parameters

bbox

[*Bbox*]

transform

[*Transform*]

contains(*x*, *y*)

Return whether `(x, y)` is in the bounding box or on its edge.

fully_contains(*x*, *y*)

Return whether `x, y` is in the bounding box, but not on its edge.

get_points()

class matplotlib.transforms.**TransformedPatchPath**(*patch*)

Bases: *TransformedPath*

A *TransformedPatchPath* caches a non-affine transformed copy of the *Patch*. This cached copy is automatically updated when the non-affine part of the transform or the patch changes.

Parameters

patch

[*Patch*]

class matplotlib.transforms.**TransformedPath**(*path*, *transform*)

Bases: *TransformNode*

A *TransformedPath* caches a non-affine transformed copy of the *Path*. This cached copy is automatically updated when the non-affine part of the transform changes.

Note

Paths are considered immutable by this class. Any update to the path's vertices/codes will not trigger a transform recomputation.

Parameters

path

[*Path*]

transform

[*Transform*]

get_affine()

get_fully_transformed_path()

Return a fully-transformed copy of the child path.

get_transformed_path_and_affine()

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation.

get_transformed_points_and_affine()

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike *get_transformed_path_and_affine()*, no interpolation will be performed.

matplotlib.transforms.**blended_transform_factory**(*x_transform*, *y_transform*)

Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

matplotlib.transforms.**composite_transform_factory**(*a*, *b*)

Create a new composite transform that is the result of applying transform a then transform b.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the '+' operator, e.g.:

```
c = a + b
```

matplotlib.transforms.**interval_contains**(*interval*, *val*)

Check, inclusively, whether an interval includes a given value.

Parameters

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

Returns

bool

Whether *val* is within the *interval*.

matplotlib.transforms.**interval_contains_open**(*interval*, *val*)

Check, excluding endpoints, whether an interval includes a given value.

Parameters

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

Returns

bool

Whether *val* is within the *interval*.

matplotlib.transforms.**nonsingular**(*vmin*, *vmax*, *expander=0.001*, *tiny=1e-15*, *increasing=True*)

Modify the endpoints of a range as needed to avoid singularities.

Parameters

vmin, vmax

[float] The initial endpoints.

expander

[float, default: 0.001] Fractional amount by which *vmin* and *vmax* are expanded if the original interval is too small, based on *tiny*.

tiny

[float, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.

increasing

[bool, default: True] If True, swap *vmin*, *vmax* if *vmin* > *vmax*.

Returns

vmin, vmax

[float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns *-expander*, *expander*.

matplotlib.transforms.**offset_copy**(*trans*, *fig=None*, *x=0.0*, *y=0.0*, *units='inches'*)

Return a new transform with an added offset.

Parameters

trans

[*Transform* subclass] Any transform, to which offset will be applied.

fig

[*Figure*, default: None] Current figure. It can be None if *units* are 'dots'.

x, y

[float, default: 0.0] The offset to apply.

units

[{'inches', 'points', 'dots'}, default: 'inches'] Units of the offset.

Returns

***Transform* subclass**

Transform with applied offset.

7.2.58 matplotlib.tri

Unstructured triangular grid functions.

class matplotlib.tri.**Triangulation**(*x*, *y*, *triangles=None*, *mask=None*)

An unstructured triangular grid consisting of npoints points and ntri triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

Parameters

x, y

[(npoints,) array-like] Coordinates of grid points.

triangles

[(ntri, 3) array-like of int, optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[(ntri,) array-like of bool, optional] Which triangles are masked out.

Attributes

triangles

[(ntri, 3) array of int] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If you want to take the *mask* into account, use *get_masked_triangles* instead.

mask

[(ntri, 3) array of bool or None] Masked out triangles.

is_delaunay

[bool] Whether the Triangulation is a calculated Delaunay triangulation (where *triangles* was not specified) or not.

Notes

For a Triangulation to be valid it must not have duplicate points, triangles formed from colinear points, or overlapping triangles.

calculate_plane_coefficients(*z*)

Calculate plane equation coefficients for all unmasked triangles from the point (x, y) coordinates and specified z-array of shape (npoints). The returned array has shape (npoints, 3) and allows z-value at (x, y) position in triangle tri to be calculated using `z = array[tri, 0] * x + array[tri, 1] * y + array[tri, 2]`.

property edges

Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

Each row defines an edge by its start point index and end point index. Each edge appears only once, i.e. for an edge between points *i* and *j*, there will only be either *(i, j)* or *(j, i)*.

get_cpp_triangulation()

Return the underlying C++ Triangulation object, creating it if necessary.

static get_from_args_and_kwargs(**args*, ***kwargs*)

Return a Triangulation object from the args and kwargs, and the remaining args and kwargs with the consumed values removed.

There are two alternatives: either the first argument is a Triangulation object, in which case it is returned, or the args and kwargs are sufficient to create a new Triangulation to return. In the latter case, see Triangulation.__init__ for the possible args and kwargs.

get_masked_triangles()

Return an array of triangles taking the mask into account.

get_trifinder()

Return the default *matplotlib.tri.TriFinder* of this triangulation, creating it if necessary. This allows the same TriFinder object to be easily shared.

property neighbors

Return integer array of shape (ntri, 3) containing neighbor triangles.

For each triangle, the indices of the three triangles that share the same edges, or -1 if there is no such neighboring triangle. `neighbors[i, j]` is the triangle that is the neighbor to the edge from point index `triangles[i, j]` to point index `triangles[i, (j+1)%3]`.

set_mask(*mask*)

Set or clear the mask array.

Parameters

mask

[None or bool array of length ntri]

class matplotlib.tri.**TriContourSet**(*ax*, **args*, ***kwargs*)

Bases: *ContourSet*

Create and store a set of contour lines or filled regions for a triangular grid.

This class is typically not instantiated directly by the user but by *tricontour* and *tricontourf*.

Attributes

levels

[array] The values of the contour levels.

layers

[array] Same as levels for line contours; half-way between levels for filled contours. See `ContourSet._process_colors`.

Draw triangular grid contour lines or filled regions, depending on whether keyword arg *filled* is False (default) or True.

The first argument of the initializer must be an *Axes* object. The remaining arguments and keyword arguments are described in the docstring of *tricontour*.

set (*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array ar
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of RGBA tuples
edgecolor or *ec* or *edgecolors*	*color* or list of *color* or 'face'
facecolor or *facecolors* or *fc*	*color* or list of *color*
figure	*Figure* or *SubFigure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object

Table 304 – continued fr

Property	Description
linestyle or *dashes* or *linestyles* or *ls*	str or tuple or list thereof
linewidth or *linewidths* or *lw*	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or *transOffset*	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

class matplotlib.tri.**TriFinder**(*triangulation*)

Abstract base class for classes used to find the triangles of a Triangulation in which (x, y) points lie.

Rather than instantiate an object of a class derived from TriFinder, it is usually better to use the function *Triangulation.get_trifinder*.

Derived classes implement __call__(x, y) where x and y are array-like point coordinates of the same shape.

class matplotlib.tri.**TrapezoidMapTriFinder**(*triangulation*)

Bases: *TriFinder*

TriFinder class implemented using the trapezoid map algorithm from the book "Computational Geometry, Algorithms and Applications", second edition, by M. de Berg, M. van Kreveld, M. Overmars and O. Schwarzkopf.

The triangulation must be valid, i.e. it must not have duplicate points, triangles formed from colinear points, or overlapping triangles. The algorithm has some tolerance to triangles formed from colinear points, but this should not be relied upon.

class matplotlib.tri.**TriInterpolator**(*triangulation*, *z*, *trifinder=None*)

Abstract base class for classes used to interpolate on a triangular grid.

Derived classes implement the following methods:

- `__call__(x, y)`, where x, y are array-like point coordinates of the same shape, and that returns a masked array of the same shape containing the interpolated z-values.

- `gradient(x, y)`, where x, y are array-like point coordinates of the same shape, and that returns a list of 2 masked arrays of the same shape containing the 2 derivatives of the interpolator (derivatives of interpolated z values with respect to x and y).

class matplotlib.tri.**LinearTriInterpolator**(*triangulation*, *z*, *trifinder=None*)

Bases: *TriInterpolator*

Linear interpolator on a triangular grid.

Each triangle is represented by a plane so that an interpolated value at point (x, y) lies on the plane of the triangle containing (x, y). Interpolated values are therefore continuous across the triangulation, but their first derivatives are discontinuous at edges between triangles.

Parameters

triangulation

[*Triangulation*] The triangulation to interpolate over.

z

[(npoints,) array-like] Array of values, defined at grid points, to interpolate between.

trifinder

[*TriFinder*, optional] If this is not specified, the Triangulation's default TriFinder will be used by calling *Triangulation.get_trifinder*.

Methods

`__call__` (x, y)	(Returns interpolated values at (x, y) points.)
`gradient` (x, y)	(Returns interpolated derivatives at (x, y) points.)

gradient(*x*, *y*)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

Parameters

x, y

[array-like] x and y coordinates of the same shape and any number of dimensions.

Returns

dzdx, dzdy

[np.ma.array] 2 masked arrays of the same shape as *x* and *y*; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

class matplotlib.tri.**CubicTriInterpolator**(*triangulation*, *z*, *kind='min_E'*, *trifinder=None*, *dz=None*)

Bases: *TriInterpolator*

Cubic interpolator on a triangular grid.

In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2D inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The CubicTriInterpolator takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

Parameters

triangulation

[*Triangulation*] The triangulation to interpolate over.

z

[(npoints,) array-like] Array of values, defined at grid points, to interpolate between.

kind

[{'min_E', 'geom', 'user'}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to 'min_E'):

- if 'min_E': (default) The derivatives at each node is computed to minimize a bending energy.
- if 'geom': The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
- if 'user': The user provides the argument *dz*, no computation is hence needed.

trifinder

[*TriFinder*, optional] If not specified, the Triangulation's default TriFinder will be used by calling *Triangulation.get_trifinder*.

dz

[tuple of array-likes (dzdx, dzdy), optional] Used only if *kind* ='user'. In this case *dz* must be provided as (dzdx, dzdy) where dzdx, dzdy are arrays of the same shape as *z* and are the interpolant first derivatives at the *triangulation* points.

Methods

`__call__` (x, y)	(Returns interpolated values at (x, y) points.)
`gradient` (x, y)	(Returns interpolated derivatives at (x, y) points.)

Notes

This note is a bit technical and details how the cubic interpolation is computed.

The interpolation is based on a Clough-Tocher subdivision scheme of the *triangulation* mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [1]. The assembled function is guaranteed to be C1-smooth, i.e. it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case (*kind* ='min_E'), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [2] - PCG sparse solver):

$$E(z) = \frac{1}{2} \int_{\Omega} \left(\left(\frac{\partial^2 z}{\partial x^2} \right)^2 + \left(\frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left(\frac{\partial^2 z}{\partial y \partial x} \right)^2 \right) dx\, dy$$

If the case *kind* ='geom' is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

References

[1], [2]

gradient (*x*, *y*)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

Parameters

x, y

[array-like] x and y coordinates of the same shape and any number of dimensions.

Returns

dzdx, dzdy

[np.ma.array] 2 masked arrays of the same shape as *x* and *y*; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

class matplotlib.tri.**TriRefiner** (*triangulation*)

Abstract base class for classes implementing mesh refinement.

A TriRefiner encapsulates a Triangulation object and provides tools for mesh refinement and interpolation.

Derived classes must implement:

- `refine_triangulation(return_tri_index=False, **kwargs)`, where the optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation, and which returns:
  - a refined triangulation,
  - optionally (depending on *return_tri_index*), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.
- `refine_field(z, triinterpolator=None, **kwargs)`, where:
  - *z* array of field values (to refine) defined at the base triangulation nodes,
  - *triinterpolator* is an optional *TriInterpolator*,
  - the other optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation;

  and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

class matplotlib.tri.**UniformTriRefiner**(*triangulation*)

Bases: *TriRefiner*

Uniform mesh refinement by recursive subdivisions.

Parameters

triangulation

[*Triangulation*] The encapsulated triangulation (to be refined)

refine_field(*z*, *triinterpolator=None*, *subdiv=3*)

Refine a field defined on the encapsulated triangulation.

Parameters

z

[(npoints,) array-like] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (`n_points` is the number of points in the initial triangulation)

triinterpolator

[*TriInterpolator*, optional] Interpolator used for field interpolation. If not specified, a *CubicTriInterpolator* will be used.

subdiv

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into `4**subdiv` child triangles.

Returns

refi_tri

[*Triangulation*] The returned refined triangulation.

refi_z

[1D array of length: *refi_tri* node count.] The returned interpolated field (at *refi_tri* nodes).

refine_triangulation(*return_tri_index=False*, *subdiv=3*)

Compute a uniformly refined triangulation *refi_triangulation* of the encapsulated `triangulation`.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursing *subdiv* times. In the end, each triangle is hence divided into `4**subdiv` child triangles.

Parameters

return_tri_index

[bool, default: False] Whether an index table indicating the father triangle index of each point is returned.

subdiv

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into `4**subdiv` child triangles; hence, the default results in 64 refined subtriangles for each triangle of the initial triangulation.

Returns

refi_triangulation

[*Triangulation*] The refined triangulation.

found_index

[int array] Index of the initial triangulation containing triangle, for each point of *refi_triangulation*. Returned only if *return_tri_index* is set to True.

class matplotlib.tri.**TriAnalyzer**(*triangulation*)

Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a *Triangulation* object and provides basic tools for mesh analysis and mesh improvement.

Parameters

triangulation

[*Triangulation*] The encapsulated triangulation to analyze.

Attributes

scale_factors

Factors to rescale the triangulation into a unit square.

circle_ratios(*rescale=True*)

Return a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always `<= 0.5` and `== 0.5` only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with *scale_factors* (Only if *rescale* is True, which is its default value).

Parameters

rescale

[bool, default: True] If True, internally rescale (based on *scale_factors*), so that the (unmasked) triangles fit exactly inside a unit square mesh.

Returns

masked array

Ratio of the incircle radius over the circumcircle radius, for each 'rescaled' triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.

get_flat_tri_mask(*min_circle_ratio=0.01*, *rescale=True*)

Eliminate excessively flat border triangles from the triangulation.

Returns a mask *new_mask* which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their *circle_ratios()*). This mask is meant to be subsequently applied to the triangulation using *Triangulation.set_mask*. *new_mask* is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The *new_mask* array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus, no new holes in the triangulated domain will be created.

Parameters

min_circle_ratio

[float, default: 0.01] Border triangles with incircle/circumcircle radii ratio r/R will be removed if r/R < *min_circle_ratio*.

rescale

[bool, default: True] If True, first, internally rescale (based on *scale_factors*) so that the (unmasked) triangles fit exactly inside a unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis.

Returns

array of bool

Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the *new_mask*.

Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading to artifacts in plots (especially for high-resolution contouring). Masked with computed *new_mask*, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below *min_circle_ratio*, thus improving the mesh quality for subsequent plots or interpolation.

property scale_factors

Factors to rescale the triangulation into a unit square.

Returns

(float, float)

Scaling factors (kx, ky) so that the triangulation `[triangulation.x * kx, triangulation.y * ky]` fits exactly inside a unit square.

7.2.59 matplotlib.typing

matplotlib.typing.**RGBColorType = tuple[float, float, float] | str**

Represent a union type

E.g. for int | str

matplotlib.typing.**RGBColourType = tuple[float, float, float] | str**

Represent a union type

E.g. for int | str

matplotlib.typing.**RGBAColorType = str | tuple[float, float, float, float] | tuple[tuple[float, float, float] | str, float] | tuple[tuple[float, float, float, float], float]**

Represent a union type

E.g. for int | str

matplotlib.typing.**FillStyleType**

alias of Literal['full', 'left', 'right', 'bottom', 'top', 'none']

matplotlib.typing.**CapStyleType = matplotlib._enums.CapStyle | typing.Literal['butt', 'projecting', 'round']**

Represent a union type

E.g. for int | str

matplotlib.typing.**JoinStyleType = matplotlib._enums.JoinStyle | typing.Literal['miter', 'round', 'bevel']**

Represent a union type

E.g. for int | str

matplotlib.typing.**RcStyleType = str | dict[str, typing.Any] | pathlib.Path | collections.abc.Sequence[str | pathlib.Path | dict[str, typing.Any]]**

Represent a union type

E.g. for int | str

matplotlib.typing.**HashableList**(*iterable=()*, */*)

A nested list of Hashable values.

alias of `list[_HT | HashableList[_HT]]`

7.2.60 matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those that do not expose the array interface but know how to convert themselves to arrays. It also supports classes with units and units conversion. Use cases include converters for custom objects, e.g., a list of datetime objects, as well as for objects that are unit aware. We don't assume any particular units implementation; rather a units implementation must register with the Registry converter dictionary and provide a *ConversionInterface*. For example, here is a complete implementation which supports plotting with native datetime objects:

```
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):

    @staticmethod
    def convert(value, unit, axis):
        "Convert a datetime value to a scalar or array."
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
        "Return major and minor tick locators and formatters."
        if unit != 'date':
            return None
        majloc = dates.AutoDateLocator()
        majfmt = dates.AutoDateFormatter(majloc)
        return units.AxisInfo(majloc=majloc, majfmt=majfmt, label='date
 ↪')

    @staticmethod
    def default_units(x, axis):
        "Return the default unit for x or None."
        return 'date'

# Finally we register our object type with the Matplotlib units␣
 ↪registry.
units.registry[datetime.date] = DateConverter()
```

class matplotlib.units.**AxisInfo**(*majloc=None*, *minloc=None*, *majfmt=None*, *minfmt=None*, *label=None*, *default_limits=None*)

Bases: object

Information to support default axis labeling, tick labeling, and limits.

An instance of this class must be returned by *ConversionInterface.axisinfo*.

Parameters

majloc, minloc

[Locator, optional] Tick locators for the major and minor ticks.

majfmt, minfmt

[Formatter, optional] Tick formatters for the major and minor ticks.

label

[str, optional] The default axis label.

default_limits

[optional] The default min and max limits of the axis if no data has been plotted.

Notes

If any of the above are None, the axis will simply use the default value.

exception matplotlib.units.**ConversionError**

Bases: TypeError

class matplotlib.units.**ConversionInterface**

Bases: object

The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

static axisinfo(*unit*, *axis*)

Return an *AxisInfo* for the axis with the specified units.

static convert(*obj*, *unit*, *axis*)

Convert *obj* using *unit* for the specified *axis*.

If *obj* is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

static default_units(*x*, *axis*)

Return the default unit for *x* or None for the given axis.

class matplotlib.units.**DecimalConverter**

Bases: *ConversionInterface*

Converter for decimal.Decimal data to float.

static convert(*value*, *unit*, *axis*)

Convert Decimals to floats.

The *unit* and *axis* arguments are not used.

Parameters

value

[decimal.Decimal or iterable] Decimal or list of Decimal need to be converted

class matplotlib.units.**Registry**

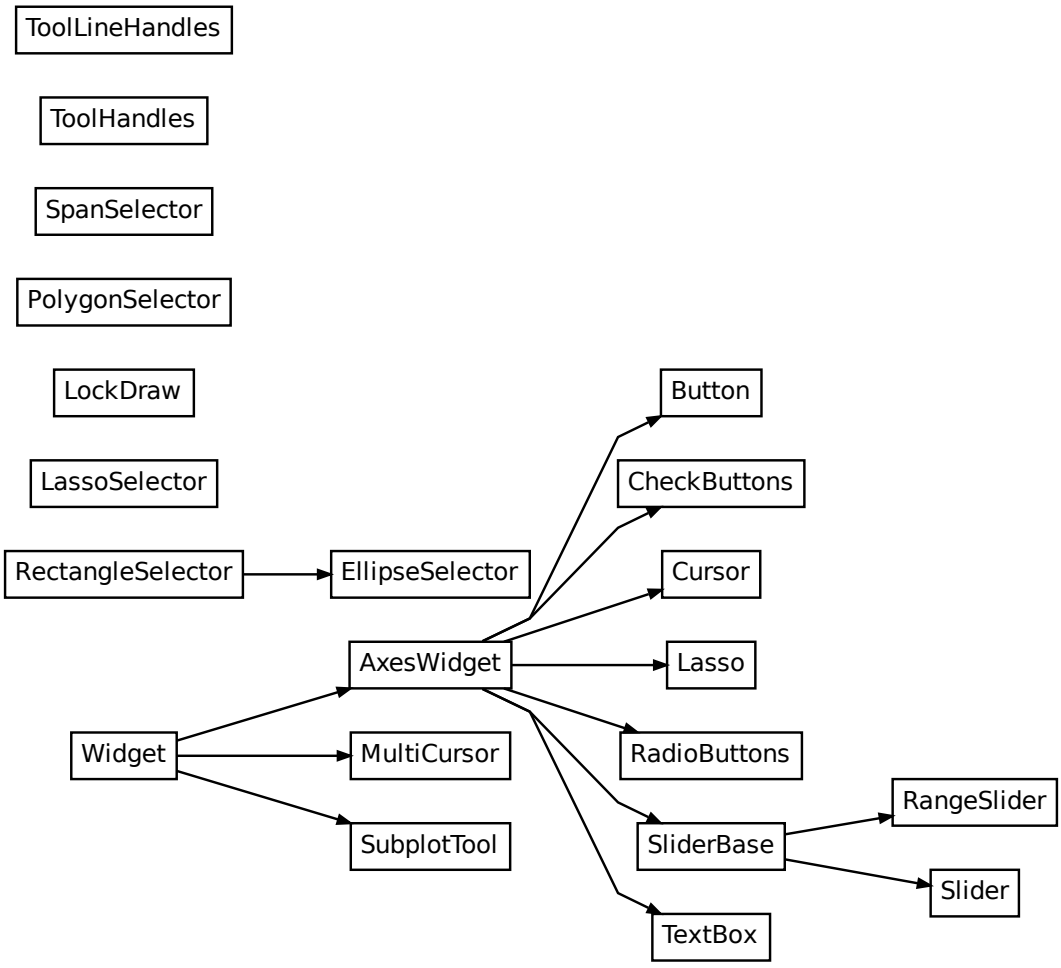
Bases: dict

Register types with conversion interface.

get_converter(*x*)

Get the converter interface instance for *x*, or None.

7.2.61 matplotlib.widgets



GUI neutral widgets

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine an *Axes* instance and pass that as the first parameter. Matplotlib doesn't try to be too smart with respect to layout -- you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

class matplotlib.widgets.**AxesWidget**(*ax*)

Bases: *Widget*

Widget connected to a single *Axes*.

To guarantee that the widget remains responsive and not garbage-collected, a reference to the object

should be maintained by the user.

This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

Attributes

ax

[*Axes*] The parent Axes for the widget.

canvas

[*FigureCanvasBase*] The parent figure canvas for the widget.

active

[bool] Is the widget active?

property canvas

connect_event(*event*, *callback*)

Connect a callback function with an event.

This should be used in lieu of `figure.canvas.mpl_connect` since this function stores callback ids for later clean up.

disconnect_events()

Disconnect all events created by this widget.

class matplotlib.widgets.**Button**(*ax*, *label*, *image=None*, *color='0.85'*, *hovercolor='0.95'*, ***, *useblit=True*)

Bases: *AxesWidget*

A GUI neutral button.

For the button to remain responsive you must keep a reference to it. Call *on_clicked* to connect to the button.

Attributes

ax

The *Axes* the button renders into.

label

A *Text* instance.

color

The color of the button when not hovering.

hovercolor

The color of the button when hovering.

Parameters

ax

[*Axes*] The *Axes* instance the button will be placed into.

label

[str] The button text.

image

[array-like or PIL Image] The image to place in the button, if not *None*. The parameter is directly forwarded to *imshow*.

color

[*color*] The color of the button when not activated.

hovercolor

[*color*] The color of the button when the mouse is over it.

useblit

[bool, default: True] Use blitting for faster drawing if supported by the backend. See the tutorial *Faster rendering by using blitting* for details.

Added in version 3.7.

disconnect(*cid*)

Remove the callback function with connection id *cid*.

on_clicked(*func*)

Connect the callback function *func* to button click events.

Returns a connection id, which can be used to disconnect the callback.

class matplotlib.widgets.**CheckButtons**(*ax*, *labels*, *actives=None*, ***, *useblit=True*, *label_props=None*, *frame_props=None*, *check_props=None*)

Bases: *AxesWidget*

A GUI neutral set of check buttons.

For the check buttons to remain responsive you must keep a reference to this object.

Connect to the CheckButtons with the *on_clicked* method.

Attributes

ax

[*Axes*] The parent Axes for the widget.

labels

[list of *Text*] The text label objects of the check buttons.

Add check buttons to *Axes* instance *ax*.

Parameters

ax

[*Axes*] The parent Axes for the widget.

labels

[list of str] The labels of the check buttons.

actives

[list of bool, optional] The initial check states of the buttons. The list must have the same length as *labels*. If not given, all buttons are unchecked.

useblit

[bool, default: True] Use blitting for faster drawing if supported by the backend. See the tutorial *Faster rendering by using blitting* for details.

Added in version 3.7.

label_props

[dict of lists, optional] Dictionary of *Text* properties to be used for the labels. Each dictionary value should be a list of at least a single element. If the list is of length M, its values are cycled such that the Nth label gets the (N mod M) property.

Added in version 3.7.

frame_props

[dict, optional] Dictionary of scatter *Collection* properties to be used for the check button frame. Defaults (label font size / 2)**2 size, black edgecolor, no facecolor, and 1.0 linewidth.

Added in version 3.7.

check_props

[dict, optional] Dictionary of scatter *Collection* properties to be used for the check button check. Defaults to (label font size / 2)**2 size, black color, and 1.0 linewidth.

Added in version 3.7.

clear()

Uncheck all checkboxes.

disconnect(*cid*)

Remove the observer with connection id *cid*.

get_checked_labels()

Return a list of labels currently checked by user.

get_status()

Return a list of the status (True/False) of all of the check buttons.

on_clicked(*func*)

Connect the callback function *func* to button click events.

Parameters

func

[callable] When the button is clicked, call *func* with button label. When all buttons are cleared, call *func* with None. The callback func must have the signature:

```
def func(label: str | None) -> Any
```

Return values may exist, but are ignored.

Returns

A connection id, which can be used to disconnect the callback.

set_active(*index*, *state=None*)

Modify the state of a check button by index.

Callbacks will be triggered if `eventson` is True.

Parameters

index

[int] Index of the check button to toggle.

state

[bool, optional] If a boolean value, set the state explicitly. If no value is provided, the state is toggled.

Raises

ValueError

If *index* is invalid.

TypeError

If *state* is not boolean.

set_check_props(*props*)

Set properties of the check button checks.

Added in version 3.7.

Parameters

props

[dict] Dictionary of *Collection* properties to be used for the check button check.

set_frame_props(*props*)

Set properties of the check button frames.

Added in version 3.7.

Parameters

props

[dict] Dictionary of *Collection* properties to be used for the check button frames.

set_label_props(*props*)

Set properties of the *Text* labels.

Added in version 3.7.

Parameters

props

[dict] Dictionary of *Text* properties to be used for the labels. Same format as label_props argument of *CheckButtons*.

class matplotlib.widgets.**Cursor**(*ax*, *, *horizOn=True*, *vertOn=True*, *useblit=False*, ***lineprops*)

Bases: *AxesWidget*

A crosshair cursor that spans the Axes and moves with mouse cursor.

For the cursor to remain responsive you must keep a reference to it.

Parameters

ax

[*Axes*] The *Axes* to attach the cursor to.

horizOn

[bool, default: True] Whether to draw the horizontal line.

vertOn

[bool, default: True] Whether to draw the vertical line.

useblit

[bool, default: False] Use blitting for faster drawing if supported by the backend. See the tutorial *Faster rendering by using blitting* for details.

Other Parameters

****lineprops**

Line2D properties that control the appearance of the lines. See also *axhline*.

Examples

See *Cursor*.

clear(*event*)

Internal event handler to clear the cursor.

onmove(*event*)

Internal event handler to draw the cursor when the mouse moves.

class matplotlib.widgets.**EllipseSelector**(*ax*, *onselect=None*, ***, *minspanx=0*, *minspany=0*, *useblit=False*, *props=None*, *spancoords='data'*, *button=None*, *grab_range=10*, *handle_props=None*, *interactive=False*, *state_modifier_keys=None*, *drag_from_anywhere=False*, *ignore_event_outside=False*, *use_data_coordinates=False*)

Bases: *RectangleSelector*

Select an elliptical region of an Axes.

For the cursor to remain responsive you must keep a reference to it.

Press and release events triggered at the same coordinates outside the selection will clear the selector, except when `ignore_event_outside=True`.

Parameters

ax

[*Axes*] The parent Axes for the widget.

onselect

[function, optional] A callback function that is called after a release event and the selection is created, changed or removed. It must have the signature:

```
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where *eclick* and *erelease* are the mouse click and release *MouseEvent*s that start and complete the selection.

minspanx

[float, default: 0] Selections with an x-span less than or equal to *minspanx* are removed (when already existing) or cancelled.

minspany

[float, default: 0] Selections with an y-span less than or equal to *minspanx* are removed (when already existing) or cancelled.

useblit

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

props

[dict, optional] Properties with which the ellipse is drawn. See `Patch` for valid properties. Default:

```
dict(facecolor='red', edgecolor='black', alpha=0.2,
fill=True)
```

spancoords

[{"data", "pixels"}, default: "data"] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

button

[`MouseButton`, list of `MouseButton`, default: all buttons] Button(s) that trigger rectangle selection.

grab_range

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

handle_props

[dict, optional] Properties with which the interactive handles (marker artists) are drawn. See the marker arguments in `Line2D` for valid properties. Default values are defined in `mpl.rcParams` except for the default value of `markeredgecolor` which will be the same as the `edgecolor` property in *props*.

interactive

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

state_modifier_keys

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults, which are:

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Make the shape square, default: "shift".
- "center": change the shape around its center, default: "ctrl".
- "rotate": Rotate the shape around its center between -45° and 45°, default: "r".

"square" and "center" can be combined. The square shape can be defined in data or display coordinates as determined by the `use_data_coordinates` argument specified when creating the selector.

drag_from_anywhere

[bool, default: False] If `True`, the widget can be moved by clicking anywhere within its bounds.

ignore_event_outside

[bool, default: False] If `True`, the event triggered outside the span selector will be ignored.

use_data_coordinates

[bool, default: False] If `True`, the "square" shape of the selector is defined in data coordinates instead of display coordinates.

Examples

Rectangle and ellipse selectors

class matplotlib.widgets.**Lasso**(*ax*, *xy*, *callback*, *, *useblit=True*, *props=None*)

Bases: *AxesWidget*

Selection curve of an arbitrary shape.

The selected path can be used in conjunction with *contains_point* to select data points from an image.

Unlike *LassoSelector*, this must be initialized with a starting point *xy*, and the *Lasso* events are destroyed upon release.

Parameters

ax

[*Axes*] The parent Axes for the widget.

xy

[(float, float)] Coordinates of the start of the lasso.

callback

[callable] Whenever the lasso is released, the *callback* function is called and passed the vertices of the selected path.

useblit

[bool, default: True] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

props: dict, optional

Lasso line properties. See *Line2D* for valid properties. Default *props* are:

```
{'linestyle' : '-', 'color' : 'black', 'lw' : 2}
```

Added in version 3.9.

onmove(*event*)

onrelease(*event*)

class matplotlib.widgets.**LassoSelector**(*ax*, *onselect=None*, ***, *useblit=True*, *props=None*, *button=None*)

Bases: _SelectorWidget

Selection curve of an arbitrary shape.

For the selector to remain responsive you must keep a reference to it.

The selected path can be used in conjunction with *contains_point* to select data points from an image.

In contrast to *Lasso*, *LassoSelector* is written with an interface similar to *RectangleSelector* and *SpanSelector*, and will continue to interact with the Axes until disconnected.

Example usage:

```
ax = plt.subplot()
ax.plot(x, y)

def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

Parameters

ax

[*Axes*] The parent Axes for the widget.

onselect

[function, optional] Whenever the lasso is released, the *onselect* function is called and passed the vertices of the selected path.

useblit

[bool, default: True] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

props

[dict, optional] Properties with which the line is drawn, see *Line2D* for valid properties. Default values are defined in mpl.rcParams.

button

[*MouseButton* or list of *MouseButton*, optional] The mouse buttons used for rectangle selection. Default is `None`, which corresponds to all buttons.

class matplotlib.widgets.**LockDraw**

Bases: `object`

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with `canvas.widgetlock(widget)` before drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).

available(*o*)

Return whether drawing is available to *o*.

isowner(*o*)

Return whether *o* owns this lock.

locked()

Return whether the lock is currently held by an owner.

release(*o*)

Release the lock from *o*.

class matplotlib.widgets.**MultiCursor**(*canvas*, *axes*, *, *useblit=True*, *horizOn=False*, *vertOn=True*, ***lineprops*)

Bases: *Widget*

Provide a vertical (default) and/or horizontal line cursor shared between multiple Axes.

For the cursor to remain responsive you must keep a reference to it.

Parameters

canvas

[object] This parameter is entirely unused and only kept for back-compatibility.

axes

[list of *Axes*] The *Axes* to attach the cursor to.

useblit

[bool, default: True] Use blitting for faster drawing if supported by the backend. See the tutorial *Faster rendering by using blitting* for details.

horizOn

[bool, default: False] Whether to draw the horizontal line.

vertOn

[bool, default: True] Whether to draw the vertical line.

Other Parameters

****lineprops**

Line2D properties that control the appearance of the lines. See also *axhline*.

Examples

See *Multicursor*.

clear(*event*)

Clear the cursor.

connect()

Connect events.

disconnect()

Disconnect events.

onmove(*event*)

class matplotlib.widgets.**PolygonSelector**(*ax*, *onselect=None*, ***, *useblit=False*, *props=None*, *handle_props=None*, *grab_range=10*, *draw_bounding_box=False*, *box_handle_props=None*, *box_props=None*)

Bases: _SelectorWidget

Select a polygon region of an Axes.

Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Once drawn individual vertices can be moved by clicking and dragging with the left mouse button, or removed by clicking the right mouse button.

In addition, the following modifier keys can be used:

- Hold *ctrl* and click and drag a vertex to reposition it before the polygon has been completed.
- Hold the *shift* key and click and drag anywhere in the Axes to move all vertices.
- Press the *esc* key to start a new polygon.

For the selector to remain responsive you must keep a reference to it.

Parameters

ax

[*Axes*] The parent Axes for the widget.

onselect

[function, optional] When a polygon is completed or modified after completion, the *onselect* function is called and passed a list of the vertices as `(xdata, ydata)` tuples.

useblit

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

props

[dict, optional] Properties with which the line is drawn, see *Line2D* for valid properties. Default:

```
dict(color='k', linestyle='-', linewidth=2, alpha=0.5)
```

handle_props

[dict, optional] Artist properties for the markers drawn at the vertices of the polygon. See the marker arguments in *Line2D* for valid properties. Default values are defined in `mpl.rcParams` except for the default value of `markeredgecolor` which will be the same as the `color` property in *props*.

grab_range

[float, default: 10] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within *grab_range* pixels of the vertex.

draw_bounding_box

[bool, optional] If `True`, a bounding box will be drawn around the polygon selector once it is complete. This box can be used to move and resize the selector.

box_handle_props

[dict, optional] Properties to set for the box handles. See the documentation for the *handle_props* argument to *RectangleSelector* for more info.

box_props

[dict, optional] Properties to set for the box. See the documentation for the *props* argument to *RectangleSelector* for more info.

Notes

If only one point remains after removing points, the selector reverts to an incomplete state and you can start drawing a new polygon from the existing point.

Examples

Polygon Selector Select indices from a collection using polygon selector

onmove(*event*)

Cursor move event handler and validator.

property verts

The polygon vertices, as a list of `(x, y)` pairs.

class matplotlib.widgets.**RadioButtons**(*ax*, *labels*, *active=0*, *activecolor=None*, *, *useblit=True*, *label_props=None*, *radio_props=None*)

Bases: *AxesWidget*

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.

Connect to the RadioButtons with the *on_clicked* method.

Attributes

ax

[*Axes*] The parent Axes for the widget.

activecolor

[*color*] The color of the selected button.

labels

[list of *Text*] The button labels.

value_selected

[str] The label text of the currently selected button.

index_selected

[int] The index of the selected button.

Add radio buttons to an *Axes*.

Parameters

ax

[*Axes*] The Axes to add the buttons to.

labels

[list of str] The button labels.

active

[int] The index of the initially selected button.

activecolor

[*color*] The color of the selected button. The default is `'blue'` if not specified here or in *radio_props*.

useblit

[bool, default: True] Use blitting for faster drawing if supported by the backend. See the tutorial *Faster rendering by using blitting* for details.

Added in version 3.7.

label_props

[dict of lists, optional] Dictionary of *Text* properties to be used for the labels. Each dictionary value should be a list of at least a single element. If the list is of length M, its values are cycled such that the Nth label gets the (N mod M) property.

Added in version 3.7.

radio_props

[dict, optional] Dictionary of scatter *Collection* properties to be used for the radio buttons. Defaults to (label font size / 2)**2 size, black edgecolor, and *activecolor* facecolor (when active).

> **Note**
>
> If a facecolor is supplied in *radio_props*, it will override *activecolor*. This may be used to provide an active color per button.

Added in version 3.7.

property activecolor

clear()

Reset the active button to the initially active one.

disconnect(*cid*)

Remove the observer with connection id *cid*.

on_clicked(*func*)

Connect the callback function *func* to button click events.

Parameters

func

[callable] When the button is clicked, call *func* with button label. When all buttons are cleared, call *func* with None. The callback func must have the signature:

```
def func(label: str | None) -> Any
```

Return values may exist, but are ignored.

Returns

A connection id, which can be used to disconnect the callback.

set_active(*index*)

Select button with number *index*.

Callbacks will be triggered if `eventson` is True.

Parameters

index

[int] The index of the button to activate.

Raises

ValueError

If the index is invalid.

set_label_props(*props*)

Set properties of the *Text* labels.

Added in version 3.7.

Parameters

props

[dict] Dictionary of *Text* properties to be used for the labels. Same format as label_props argument of *RadioButtons*.

set_radio_props(*props*)

Set properties of the *Text* labels.

Added in version 3.7.

Parameters

props

[dict] Dictionary of *Collection* properties to be used for the radio buttons.

class matplotlib.widgets.**RangeSlider**(*ax*, *label*, *valmin*, *valmax*, *, *valinit=None*, *valfmt=None*, *closedmin=True*, *closedmax=True*, *dragging=True*, *valstep=None*, *orientation='horizontal'*, *track_color='lightgrey'*, *handle_style=None*, ***kwargs*)

Bases: *SliderBase*

A slider representing a range of floating point values. Defines the min and max of the range via the *val* attribute as a tuple of (min, max).

Create a slider that defines a range contained within [*valmin*, *valmax*] in Axes *ax*. For the slider to remain responsive you must maintain a reference to it. Call *on_changed()* to connect to the slider event.

Attributes

val

[tuple of float] Slider value.

Parameters

ax

[Axes] The Axes to put the slider in.

label

[str] Slider label.

valmin

[float] The minimum value of the slider.

valmax

[float] The maximum value of the slider.

valinit

[tuple of float or None, default: None] The initial positions of the slider. If None the initial positions will be at the 25th and 75th percentiles of the range.

valfmt

[str, default: None] %-format string used to format the slider values. If None, a `ScalarFormatter` is used instead.

closedmin

[bool, default: True] Whether the slider interval is closed on the bottom.

closedmax

[bool, default: True] Whether the slider interval is closed on the top.

dragging

[bool, default: True] If True the slider can be dragged by the mouse.

valstep

[float, default: None] If given, the slider will snap to multiples of *valstep*.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.

track_color

[*color*, default: 'lightgrey'] The color of the background track. The track is accessible for further styling via the *track* attribute.

handle_style

[dict] Properties of the slider handles. Default values are

Key	Value	Default	Description
facecolor	color	'white'	The facecolor of the slider handles.
edgecolor	color	'.75'	The edgecolor of the slider handles.
size	int	10	The size of the slider handles in points.

Other values will be transformed as marker{foo} and passed to the *Line2D* constructor. e.g. `handle_style = {'style'='x'}` will result in `marker-style = 'x'`.

Notes

Additional kwargs are passed on to `self.poly` which is the *Polygon* that draws the slider knob. See the *Polygon* documentation for valid property names (`facecolor`, `edgecolor`, `alpha`, etc.).

on_changed(*func*)

Connect *func* as callback function to changes of the slider value.

Parameters

func

[callable] Function to call when slider is changed. The function must accept a 2-tuple of floats as its argument.

Returns

int

Connection id (which can be used to disconnect *func*).

set_max(*max*)

Set the lower value of the slider to *max*.

Parameters

max

[float]

set_min(*min*)

Set the lower value of the slider to *min*.

Parameters

min

[float]

set_val(*val*)

Set slider value to *val*.

Parameters

val

[tuple or array-like of float]

class matplotlib.widgets.**RectangleSelector**(*ax*, *onselect=None*, ***, *minspanx=0*, *minspany=0*, *useblit=False*, *props=None*, *spancoords='data'*, *button=None*, *grab_range=10*, *handle_props=None*, *interactive=False*, *state_modifier_keys=None*, *drag_from_anywhere=False*, *ignore_event_outside=False*, *use_data_coordinates=False*)

Bases: _SelectorWidget

Select a rectangular region of an Axes.

For the cursor to remain responsive you must keep a reference to it.

Press and release events triggered at the same coordinates outside the selection will clear the selector, except when ignore_event_outside=True.

Parameters

ax

[*Axes*] The parent Axes for the widget.

onselect

[function, optional] A callback function that is called after a release event and the selection is created, changed or removed. It must have the signature:

```
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where *eclick* and *erelease* are the mouse click and release *MouseEvent*s that start and complete the selection.

minspanx

[float, default: 0] Selections with an x-span less than or equal to *minspanx* are removed (when already existing) or cancelled.

minspany

[float, default: 0] Selections with an y-span less than or equal to *minspanx* are removed (when already existing) or cancelled.

useblit

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

props

[dict, optional] Properties with which the rectangle is drawn. See `Patch` for valid properties. Default:

```
dict(facecolor='red', edgecolor='black', alpha=0.2,
fill=True)
```

spancoords

[{"data", "pixels"}, default: "data"] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

button

[`MouseButton`, list of `MouseButton`, default: all buttons] Button(s) that trigger rectangle selection.

grab_range

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

handle_props

[dict, optional] Properties with which the interactive handles (marker artists) are drawn. See the marker arguments in `Line2D` for valid properties. Default values are defined in `mpl.rcParams` except for the default value of `markeredgecolor` which will be the same as the `edgecolor` property in *props*.

interactive

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

state_modifier_keys

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults, which are:

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Make the shape square, default: "shift".
- "center": change the shape around its center, default: "ctrl".
- "rotate": Rotate the shape around its center between -45° and 45°, default: "r".

"square" and "center" can be combined. The square shape can be defined in data or display coordinates as determined by the `use_data_coordinates` argument specified when creating the selector.

drag_from_anywhere

[bool, default: False] If `True`, the widget can be moved by clicking anywhere within its bounds.

ignore_event_outside

[bool, default: False] If `True`, the event triggered outside the span selector will be ignored.

use_data_coordinates

[bool, default: False] If `True`, the "square" shape of the selector is defined in data coordinates instead of display coordinates.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(eclick, erelease):
...     print(eclick.xdata, eclick.ydata)
...     print(erelease.xdata, erelease.ydata)
>>> props = dict(facecolor='blue', alpha=0.5)
>>> rect = mwidgets.RectangleSelector(ax, onselect,␣
 ↪interactive=True,
...                                   props=props)
>>> fig.show()
>>> rect.add_state('square')
```

See also: *Rectangle and ellipse selectors*

property center

Center of rectangle in data coordinates.

property corners

Corners of rectangle in data coordinates from lower left, moving clockwise.

property edge_centers

Midpoint of rectangle edges in data coordinates from left, moving anti-clockwise.

property extents

Return (xmin, xmax, ymin, ymax) in data coordinates as defined by the bounding box before rotation.

property geometry

Return an array of shape (2, 5) containing the x (`RectangleSelector.geometry[1, :]`)

and y (`RectangleSelector.geometry[0, :]`) data coordinates of the four corners of the rectangle starting and ending in the top left corner.

property rotation

Rotation in degree in interval [-45°, 45°]. The rotation is limited in range to keep the implementation simple.

class matplotlib.widgets.**Slider**(*ax*, *label*, *valmin*, *valmax*, *, *valinit=0.5*, *valfmt=None*, *closedmin=True*, *closedmax=True*, *slidermin=None*, *slidermax=None*, *dragging=True*, *valstep=None*, *orientation='horizontal'*, *initcolor='r'*, *track_color='lightgrey'*, *handle_style=None*, **kwargs*)

Bases: *SliderBase*

A slider representing a floating point range.

Create a slider from *valmin* to *valmax* in Axes *ax*. For the slider to remain responsive you must maintain a reference to it. Call *on_changed()* to connect to the slider event.

Attributes

val

[float] Slider value.

Parameters

ax

[Axes] The Axes to put the slider in.

label

[str] Slider label.

valmin

[float] The minimum value of the slider.

valmax

[float] The maximum value of the slider.

valinit

[float, default: 0.5] The slider initial position.

valfmt

[str, default: None] %-format string used to format the slider value. If None, a *ScalarFormatter* is used instead.

closedmin

[bool, default: True] Whether the slider interval is closed on the bottom.

closedmax

[bool, default: True] Whether the slider interval is closed on the top.

slidermin

[Slider, default: None] Do not allow the current slider to have a value less than the value of the Slider *slidermin*.

slidermax

[Slider, default: None] Do not allow the current slider to have a value greater than the value of the Slider *slidermax*.

dragging

[bool, default: True] If True the slider can be dragged by the mouse.

valstep

[float or array-like, default: None] If a float, the slider will snap to multiples of *valstep*. If an array the slider will snap to the values in the array.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.

initcolor

[*color*, default: 'r'] The color of the line at the *valinit* position. Set to `'none'` for no line.

track_color

[*color*, default: 'lightgrey'] The color of the background track. The track is accessible for further styling via the *track* attribute.

handle_style

[dict] Properties of the slider handle. Default values are

Key	Value	Default	Description
facecolor	color	'white'	The facecolor of the slider handle.
edgecolor	color	'.75'	The edgecolor of the slider handle.
size	int	10	The size of the slider handle in points.

Other values will be transformed as marker{foo} and passed to the *Line2D* constructor. e.g. `handle_style = {'style'='x'}` will result in `marker-style = 'x'`.

Notes

Additional kwargs are passed on to `self.poly` which is the *Rectangle* that draws the slider knob. See the *Rectangle* documentation for valid property names (`facecolor`, `edgecolor`, `alpha`, etc.).

on_changed(*func*)

Connect *func* as callback function to changes of the slider value.

Parameters

func

[callable] Function to call when slider is changed. The function must accept a single float as its arguments.

Returns

int

Connection id (which can be used to disconnect *func*).

set_val(*val*)

Set slider value to *val*.

Parameters

val

[float]

class matplotlib.widgets.**SliderBase**(*ax*, *orientation*, *closedmin*, *closedmax*, *valmin*, *valmax*, *valfmt*, *dragging*, *valstep*)

Bases: *AxesWidget*

The base class for constructing Slider widgets. Not intended for direct usage.

For the slider to remain responsive you must maintain a reference to it.

disconnect(*cid*)

Remove the observer with connection id *cid*.

Parameters

cid

[int] Connection id of the observer to be removed.

reset()

Reset the slider to the initial value.

class matplotlib.widgets.**SpanSelector**(*ax*, *onselect*, *direction*, *, *minspan=0*, *useblit=False*, *props=None*, *onmove_callback=None*, *interactive=False*, *button=None*, *handle_props=None*, *grab_range=10*, *state_modifier_keys=None*, *drag_from_anywhere=False*, *ignore_event_outside=False*, *snap_values=None*)

Bases: _SelectorWidget

Visually select a min/max range on a single axis and call a function with those values.

To guarantee that the selector remains responsive, keep a reference to it.

In order to turn off the SpanSelector, set `span_selector.active` to False. To turn it back on, set it to True.

Press and release events triggered at the same coordinates outside the selection will clear the selector, except when `ignore_event_outside=True`.

Parameters

ax

[*Axes*]

onselect

[callable with signature `func(min: float, max: float)`] A callback function that is called after a release event and the selection is created, changed or removed.

direction

[{"horizontal", "vertical"}] The direction along which to draw the span selector.

minspan

[float, default: 0] If selection is less than or equal to *minspan*, the selection is removed (when already existing) or cancelled.

useblit

[bool, default: False] If True, use the backend-dependent blitting features for faster canvas updates. See the tutorial *Faster rendering by using blitting* for details.

props

[dict, default: {'facecolor': 'red', 'alpha': 0.5}] Dictionary of *Patch* properties.

onmove_callback

[callable with signature `func(min: float, max: float)`, optional] Called on mouse move while the span is being selected.

interactive

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

button

[*MouseButton* or list of *MouseButton*, default: all buttons] The mouse buttons which activate the span selector.

handle_props

[dict, default: None] Properties of the handle lines at the edges of the span. Only used when *interactive* is True. See *Line2D* for valid properties.

grab_range

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

state_modifier_keys

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults, which are:

- "clear": Clear the current shape, default: "escape".

drag_from_anywhere

[bool, default: False] If `True`, the widget can be moved by clicking anywhere within its bounds.

ignore_event_outside

[bool, default: False] If `True`, the event triggered outside the span selector will be ignored.

snap_values

[1D array-like, optional] Snap the selector edges to the given values.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...     print(vmin, vmax)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...                              props=dict(facecolor='blue',␣
 ↪alpha=0.5))
>>> fig.show()
```

See also: *Span Selector*

connect_default_events()

Connect the major canvas events to methods.

property direction

Direction of the span selector: 'vertical' or 'horizontal'.

property extents

(float, float)

The values, in data coordinates, for the start and end points of the current selection. If there is no selection then the start and end values will be the same.

new_axes(*ax*, *, *_props=None*, *_init=False*)

Set SpanSelector to operate on a new Axes.

class matplotlib.widgets.**SubplotTool**(*targetfig*, *toolfig*)

Bases: *Widget*

A tool to adjust the subplot params of a *Figure*.

Parameters

targetfig

[*Figure*] The figure instance to adjust.

toolfig

[*Figure*] The figure instance to embed the subplot tool into.

class matplotlib.widgets.**TextBox**(*ax*, *label*, *initial=''*, *, *color='.95'*, *hovercolor='1'*, *label_pad=0.01*, *textalignment='left'*)

Bases: *AxesWidget*

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

Call *on_text_change* to be updated whenever the text changes.

Call *on_submit* to be updated whenever the user hits enter or leaves the text entry field.

Attributes

ax

[*Axes*] The parent Axes for the widget.

label

[*Text*]

color

[*color*] The color of the text box when not hovering.

hovercolor

[*color*] The color of the text box when hovering.

Parameters

ax

[*Axes*] The *Axes* instance the button will be placed into.

label

[str] Label for this text box.

initial

[str] Initial value in the text box.

color

[*color*] The color of the box.

hovercolor

[*color*] The color of the box when the mouse is over it.

label_pad

[float] The distance between the label and the right side of the textbox.

textalignment

[{'left', 'center', 'right'}] The horizontal location of the text.

begin_typing()

disconnect(*cid*)

Remove the observer with connection id *cid*.

on_submit(*func*)

When the user hits enter or leaves the submission box, call this *func* with event.

A connection id is returned which can be used to disconnect.

on_text_change(*func*)

When the text changes, call this *func* with event.

A connection id is returned which can be used to disconnect.

set_val(*val*)

stop_typing()

property text

class matplotlib.widgets.**ToolHandles**(*ax*, *x*, *y*, *, *marker='o'*, *marker_props=None*, *useblit=True*)

Bases: object

Control handles for canvas tools.

Parameters

ax

[*Axes*] Matplotlib Axes where tool handles are displayed.

x, y

[1D arrays] Coordinates of control handles.

marker

[str, default: 'o'] Shape of marker used to display handle. See *plot*.

marker_props

[dict, optional] Additional marker properties. See *Line2D*.

useblit

[bool, default: True] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

property artists

closest(*x*, *y*)

Return index and pixel distance to closest index.

set_animated(*val*)

set_data(*pts*, *y=None*)

Set x and y positions of handles.

set_visible(*val*)

property x

property y

class matplotlib.widgets.**ToolLineHandles**(*ax*, *positions*, *direction*, *, *line_props=None*, *useblit=True*)

Bases: object

Control handles for canvas tools.

Parameters

ax

[*Axes*] Matplotlib Axes where tool handles are displayed.

positions

[1D array] Positions of handles in data coordinates.

direction

[{"horizontal", "vertical"}] Direction of handles, either 'vertical' or 'horizontal'

line_props

[dict, optional] Additional line properties. See *Line2D*.

useblit

[bool, default: True] Whether to use blitting for faster drawing (if supported by the backend). See the tutorial *Faster rendering by using blitting* for details.

property artists

closest(*x*, *y*)

Return index and pixel distance to closest handle.

Parameters

x, y

[float] x, y position from which the distance will be calculated to determinate the closest handle

Returns

index, distance

[index of the handle and its distance from] position x, y

property direction

Direction of the handle: 'vertical' or 'horizontal'.

property positions

Positions of the handle in data coordinates.

remove()

Remove the handles artist from the figure.

set_animated(*value*)

Set the animated state of the handles artist.

set_data(*positions*)

Set x- or y-positions of handles, depending on if the lines are vertical or horizontal.

Parameters

positions

[tuple of length 2] Set the positions of the handle in data coordinates

set_visible(*value*)

Set the visibility state of the handles artist.

class matplotlib.widgets.**Widget**

Bases: object

Abstract base class for GUI neutral widgets.

property active

Is the widget active?

drawon = True

eventson = True

get_active()

Get whether the widget is active.

ignore(*event*)

Return whether *event* should be ignored.

This method should be called at the beginning of any event callback.

set_active(*active*)

Set whether the widget is active.

7.2.62 matplotlib._afm

A python interface to Adobe Font Metrics Files.

Although a number of other Python implementations exist, and may be more complete than this, it was decided not to go with them because they were either:

1) copyrighted or used a non-BSD compatible license

2) had too many dependencies and a free standing lib was needed

3) did more than needed and it was easier to write afresh rather than figure out how to get just what was needed.

It is pretty easy to use, and has no external dependencies:

```
>>> import matplotlib as mpl
>>> from pathlib import Path
>>> afm_path = Path(mpl.get_data_path(), 'fonts', 'afm', 'ptmr8a.afm')
>>>
>>> from matplotlib.afm import AFM
>>> with afm_path.open('rb') as fh:
...     afm = AFM(fh)
>>> afm.string_width_height('What the heck?')
(6220.0, 694)
>>> afm.get_fontname()
'Times-Roman'
```

(continues on next page)

(continued from previous page)

```
>>> afm.get_kern_dist('A', 'f')
0
>>> afm.get_kern_dist('A', 'y')
-92.0
>>> afm.get_bbox_char('!')
[130, -9, 238, 676]
```

As in the Adobe Font Metrics File Format Specification, all dimensions are given in units of 1/1000 of the scale factor (point size) of the font being used.

class matplotlib._afm.**AFM**(*fh*)

Bases: object

Parse the AFM file in file object *fh*.

property family_name

The font family name, e.g., 'Times'.

get_angle()

Return the fontangle as float.

get_bbox_char(*c*, *isord=False*)

get_capheight()

Return the cap height as float.

get_familyname()

Return the font family name, e.g., 'Times'.

get_fontname()

Return the font name, e.g., 'Times-Roman'.

get_fullname()

Return the font full name, e.g., 'Times-Roman'.

get_height_char(*c*, *isord=False*)

Get the bounding box (ink) height of character *c* (space is 0).

get_horizontal_stem_width()

Return the standard horizontal stem width as float, or *None* if not specified in AFM file.

get_kern_dist(*c1*, *c2*)

Return the kerning pair distance (possibly 0) for chars *c1* and *c2*.

get_kern_dist_from_name(*name1*, *name2*)

Return the kerning pair distance (possibly 0) for chars *name1* and *name2*.

get_name_char(*c*, *isord=False*)

Get the name of the character, i.e., ';' is 'semicolon'.

get_str_bbox(*s*)

Return the string bounding box.

get_str_bbox_and_descent(*s*)

Return the string bounding box and the maximal descent.

get_underline_thickness()

Return the underline thickness as float.

get_vertical_stem_width()

Return the standard vertical stem width as float, or *None* if not specified in AFM file.

get_weight()

Return the font weight, e.g., 'Bold' or 'Roman'.

get_width_char(*c*, *isord=False*)

Get the width of the character from the character metric WX field.

get_width_from_char_name(*name*)

Get the width of the character from a type1 character name.

get_xheight()

Return the xheight as float.

property postscript_name

string_width_height(*s*)

Return the string width (including kerning) and string height as a (*w*, *h*) tuple.

class matplotlib._afm.**CharMetrics**(*width*, *name*, *bbox*)

Bases: tuple

Represents the character metrics of a single character.

Notes

The fields do currently only describe a subset of character metrics information defined in the AFM standard.

Create new instance of CharMetrics(width, name, bbox)

bbox

The bbox of the character (B) as a tuple (*llx*, *lly*, *urx*, *ury*).

name

The character name (N).

width

The character width (WX).

class matplotlib._afm.**CompositePart**(*name*, *dx*, *dy*)

Bases: tuple

Represents the information on a composite element of a composite char.

Create new instance of CompositePart(name, dx, dy)

dx

x-displacement of the part from the origin.

dy

y-displacement of the part from the origin.

name

Name of the part, e.g. 'acute'.

7.2.63 matplotlib._api

Helper functions for managing the Matplotlib API.

This documentation is only relevant for Matplotlib developers, not for users.

Warning

This module and its submodules are for internal use only. Do not use them in your own code. We may change the API at any time with no warning.

matplotlib._api.**caching_module_getattr**(*cls*)

Helper decorator for implementing module-level __getattr__ as a class.

This decorator must be used at the module toplevel as follows:

```
@caching_module_getattr
class __getattr__:  # The class *must* be named ``__getattr__``.
    @property  # Only properties are taken into account.
    def name(self): ...
```

The __getattr__ class will be replaced by a __getattr__ function such that trying to access name on the module will resolve the corresponding property (which may be decorated e.g. with _api.deprecated for deprecating module globals). The properties are all implicitly cached. Moreover, a suitable AttributeError is generated and raised if no property with the given name exists.

matplotlib._api.**check_getitem**(*mapping*, /, ***kwargs*)

kwargs must consist of a single *key, value* pair. If *key* is in *mapping*, return mapping[value]; else, raise an appropriate ValueError.

Examples

```
>>> _api.check_getitem({"foo": "bar"}, arg=arg)
```

matplotlib._api.**check_in_list**(*values*, /, *, *_print_supported_values=True*, ***kwargs*)

For each *key, value* pair in *kwargs*, check that *value* is in *values*; if not, raise an appropriate ValueError.

Parameters

values

[iterable] Sequence of values to check on.

Note: All values must support == comparisons. This means in particular the entries must not be numpy arrays.

_print_supported_values

[bool, default: True] Whether to print *values* when raising ValueError.

****kwargs**

[dict] *key, value* pairs as keyword arguments to find in *values*.

Raises

ValueError

If any *value* in *kwargs* is not found in *values*.

Examples

```
>>> _api.check_in_list(["foo", "bar"], arg=arg, other_arg=other_
 ↪arg)
```

matplotlib._api.**check_isinstance**(*types*, /, ***kwargs*)

For each *key, value* pair in *kwargs*, check that *value* is an instance of one of *types*; if not, raise an appropriate TypeError.

As a special case, a `None` entry in *types* is treated as NoneType.

Examples

```
>>> _api.check_isinstance((SomeClass, None), arg=arg)
```

matplotlib._api.**check_shape**(*shape*, /, ***kwargs*)

For each *key, value* pair in *kwargs*, check that *value* has the shape *shape*; if not, raise an appropriate ValueError.

None in the shape is treated as a "free" size that can have any length. e.g. (None, 2) -> (N, 2)

The values checked must be numpy arrays.

Examples

To check for (N, 2) shaped arrays

```
>>> _api.check_shape((None, 2), arg=arg, other_arg=other_arg)
```

class matplotlib._api.**classproperty**(*fget*, *fset=None*, *fdel=None*, *doc=None*)

Bases: object

Like property, but also triggers on access via the class, and it is the *class* that's passed as argument.

Examples

```
class C:
    @classproperty
    def foo(cls):
        return cls.__name__

assert C.foo == "C"
```

property fget

matplotlib._api.**define_aliases**(*alias_d*, *cls=None*)

Class decorator for defining property aliases.

Use as

```
@_api.define_aliases({"property": ["alias", ...], ...})
class C: ...
```

For each property, if the corresponding get_property is defined in the class so far, an alias named get_alias will be defined; the same will be done for setters. If neither the getter nor the setter exists, an exception will be raised.

The alias map is stored as the _alias_map attribute on the class and can be used by *normalize_kwargs* (which assumes that higher priority aliases come last).

matplotlib._api.**kwarg_error**(*name*, *kw*)

Generate a TypeError to be raised by function calls with wrong kwarg.

Parameters

name

[str] The name of the calling function.

kw

[str or Iterable[str]] Either the invalid keyword argument name, or an iterable yielding invalid keyword arguments (e.g., a kwargs dict).

matplotlib._api.**nargs_error**(*name*, *takes*, *given*)

Generate a TypeError to be raised by function calls with wrong arity.

matplotlib._api.**recursive_subclasses**(*cls*)

Yield *cls* and direct and indirect subclasses of *cls*.

matplotlib._api.**select_matching_signature**(*funcs*, **args*, ***kwargs*)

Select and call the function that accepts `*args, **kwargs`.

funcs is a list of functions which should not raise any exception (other than `TypeError` if the arguments passed do not match their signature).

select_matching_signature tries to call each of the functions in *funcs* with `*args, **kwargs` (in the order in which they are given). Calls that fail with a `TypeError` are silently skipped. As soon as a call succeeds, *select_matching_signature* returns its return value. If no function accepts `*args, **kwargs`, then the `TypeError` raised by the last failing call is re-raised.

Callers should normally make sure that any `*args, **kwargs` can only bind a single *func* (to avoid any ambiguity), although this is not checked by *select_matching_signature*.

Notes

select_matching_signature is intended to help implementing signature-overloaded functions. In general, such functions should be avoided, except for back-compatibility concerns. A typical use pattern is

```
def my_func(*args, **kwargs):
    params = select_matching_signature(
        [lambda old1, old2: locals(), lambda new: locals()],
        *args, **kwargs)
    if "old1" in params:
        warn_deprecated(...)
        old1, old2 = params.values()  # note that locals() is␣
↪ordered.
    else:
        new, = params.values()
    # do things with params
```

which allows *my_func* to be called either with two parameters (*old1* and *old2*) or a single one (*new*). Note that the new signature is given last, so that callers get a `TypeError` corresponding to the new signature if the arguments they passed in do not match any signature.

matplotlib._api.**warn_external**(*message*, *category=None*)

`warnings.warn` wrapper that sets *stacklevel* to "outside Matplotlib".

The original emitter of the warning can be obtained by patching this function back to `warnings.warn`, i.e. `_api.warn_external = warnings.warn` (or `functools.partial(warnings.warn, stacklevel=2)`, etc.).

Helper functions for deprecating parts of the Matplotlib API.

This documentation is only relevant for Matplotlib developers, not for users.

Warning

This module is for internal use only. Do not use it in your own code. We may change the API at any time with no warning.

exception matplotlib._api.deprecation.**MatplotlibDeprecationWarning**

Bases: DeprecationWarning

A class for issuing deprecation warnings for Matplotlib users.

matplotlib._api.deprecation.**delete_parameter**(*since*, *name*, *func=None*, ***kwargs*)

Decorator indicating that parameter *name* of *func* is being deprecated.

The actual implementation of *func* should keep the *name* parameter in its signature, or accept a `**kwargs` argument (through which *name* would be passed).

Parameters that come after the deprecated parameter effectively become keyword-only (as they cannot be passed positionally without triggering the DeprecationWarning on the deprecated parameter), and should be marked as such after the deprecation period has passed and the deprecated parameter is removed.

Parameters other than *since*, *name*, and *func* are keyword-only and forwarded to *warn_deprecated*.

Examples

```
@_api.delete_parameter("3.1", "unused")
def func(used_arg, other_arg, unused, more_args): ...
```

matplotlib._api.deprecation.**deprecate_method_override**(*method*, *obj*, **, allow_empty=False, **kwargs*)

Return `obj.method` with a deprecation if it was overridden, else None.

Parameters

method

An unbound method, i.e. an expression of the form `Class.method_name`. Remember that within the body of a method, one can always use `__class__` to refer to the class that is currently being defined.

obj

Either an object of the class where *method* is defined, or a subclass of that class.

allow_empty

[bool, default: False] Whether to allow overrides by "empty" methods without emitting a warning.

****kwargs**

Additional parameters passed to *warn_deprecated* to generate the deprecation warning; must at least include the "since" key.

class matplotlib._api.deprecation.**deprecate_privatize_attribute**(**args*, ***kwargs*)

Bases: object

Helper to deprecate public access to an attribute (or method).

This helper should only be used at class scope, as follows:

```
class Foo:
    attr = _deprecate_privatize_attribute(*args, **kwargs)
```

where *all* parameters are forwarded to *deprecated*. This form makes `attr` a property which forwards read and write access to `self._attr` (same name but with a leading underscore), with a deprecation warning. Note that the attribute name is derived from *the name this helper is assigned to*. This helper also works for deprecating methods.

matplotlib._api.deprecation.**deprecated**(*since*, *, *message=''*, *name=''*, *alternative=''*, *pending=False*, *obj_type=None*, *addendum=''*, *removal=''*)

Decorator to mark a function, a class, or a property as deprecated.

When deprecating a classmethod, a staticmethod, or a property, the `@deprecated` decorator should go *under* `@classmethod` and `@staticmethod` (i.e., *deprecated* should directly decorate the underlying callable), but *over* `@property`.

When deprecating a class `C` intended to be used as a base class in a multiple inheritance hierarchy, `C` *must* define an `__init__` method (if `C` instead inherited its `__init__` from its own base class, then `@deprecated` would mess up `__init__` inheritance when installing its own (deprecation-emitting) `C.__init__`).

Parameters are the same as for *warn_deprecated*, except that *obj_type* defaults to 'class' if decorating a class, 'attribute' if decorating a property, and 'function' otherwise.

Examples

```
@deprecated('1.4.0')
def the_function_to_deprecate():
    pass
```

matplotlib._api.deprecation.**make_keyword_only**(*since*, *name*, *func=None*)

Decorator indicating that passing parameter *name* (or any of the following ones) positionally to *func* is being deprecated.

When used on a method that has a pyplot wrapper, this should be the outermost decorator, so that `boilerplate.py` can access the original signature.

matplotlib._api.deprecation.**rename_parameter**(*since*, *old*, *new*, *func=None*)

Decorator indicating that parameter *old* of *func* is renamed to *new*.

The actual implementation of *func* should use *new*, not *old*. If *old* is passed to *func*, a DeprecationWarning is emitted, and its value is used, even if *new* is also passed by keyword (this is to simplify pyplot wrapper functions, which always pass *new* explicitly to the Axes method). If *new* is also passed but positionally, a TypeError will be raised by the underlying function during argument binding.

Examples

```
@_api.rename_parameter("3.1", "bad_name", "good_name")
def func(good_name): ...
```

matplotlib._api.deprecation.**suppress_matplotlib_deprecation_warning**()

matplotlib._api.deprecation.**warn_deprecated**(*since*, *, *message=''*, *name=''*, *alternative=''*, *pending=False*, *obj_type=''*, *addendum=''*, *removal=''*)

Display a standardized deprecation.

Parameters

since

[str] The release at which this API became deprecated.

message

[str, optional] Override the default deprecation message. The `%(since)s`, `%(name)s`, `%(alternative)s`, `%(obj_type)s`, `%(addendum)s`, and `%(removal)s` format specifiers will be replaced by the values of the respective arguments passed to this function.

name

[str, optional] The name of the deprecated object.

alternative

[str, optional] An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.

pending

[bool, optional] If True, uses a PendingDeprecationWarning instead of a DeprecationWarning. Cannot be used together with *removal*.

obj_type

[str, optional] The object type being deprecated.

addendum

[str, optional] Additional text appended directly to the final message.

removal

[str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from *since*. Set to other Falsy values to not schedule a removal date. Cannot be used together with *pending*.

Examples

```
# To warn of the deprecation of "matplotlib.name_of_module"
warn_deprecated('1.4.0', name='matplotlib.name_of_module',
                obj_type='module')
```

7.2.64 matplotlib._docstring

class matplotlib._docstring.**Substitution**(**args*, ***kwargs*)

Bases: object

A decorator that performs %-substitution on an object's docstring.

This decorator should be robust even if `obj.__doc__` is None (for example, if -OO was passed to the interpreter).

Usage: construct a docstring.Substitution with a sequence or dictionary suitable for performing substitution; then decorate a suitable function with the constructed object, e.g.:

```
sub_author_name = Substitution(author='Jason')

@sub_author_name
def some_function(x):
    "%(author)s wrote this function"

# note that some_function.__doc__ is now "Jason wrote this function
 ↪"
```

One can also use positional arguments:

```
sub_first_last_names = Substitution('Edgar Allen', 'Poe')

@sub_first_last_names
def some_function(x):
    "%s %s wrote the Raven"
```

matplotlib._docstring.**copy**(*source*)

Copy a docstring from another source function (if present).

matplotlib._docstring.**kwarg_doc**(*text*)

Decorator for defining the kwdoc documentation of artist properties.

This decorator can be applied to artist property setter methods. The given text is stored in a private attribute `_kwarg_doc` on the method. It is used to overwrite auto-generated documentation in the

kwdoc list for artists. The kwdoc list is used to document `**kwargs` when they are properties of an artist. See e.g. the `**kwargs` section in *Axes.text*.

The text should contain the supported types, as well as the default value if applicable, e.g.:

@_docstring.kwarg_doc("bool, default: *rcParams["text.usetex"]* (default: `False`)") def set_usetex(self, usetex):

See also

matplotlib.artist.kwdoc

7.2.65 matplotlib._enums

Enums representing sets of strings that Matplotlib uses as input parameters.

Matplotlib often uses simple data types like strings or tuples to define a concept; e.g. the line capstyle can be specified as one of 'butt', 'round', or 'projecting'. The classes in this module are used internally and serve to document these concepts formally.

As an end-user you will not use these classes directly, but only the values they define.

class matplotlib._enums.**JoinStyle**(**values*)

Define how the connection between two line segments is drawn.

For a visual impression of each *JoinStyle*, *view these docs online*, or run *JoinStyle.demo*.

Lines in Matplotlib are typically defined by a 1D *Path* and a finite `linewidth`, where the underlying 1D *Path* represents the center of the stroked line.

By default, *GraphicsContextBase* defines the boundaries of a stroked line to simply be every point within some radius, `linewidth/2`, away from any point of the center line. However, this results in corners appearing "rounded", which may not be the desired behavior if you are drawing, for example, a polygon or pointed star.

Supported values:

'miter'

the "arrow-tip" style. Each boundary of the filled-in area will extend in a straight line parallel to the tangent vector of the centerline at the point it meets the corner, until they meet in a sharp point.

'round'

stokes every point within a radius of `linewidth/2` of the center lines.

'bevel'

the "squared-off" style. It can be thought of as a rounded corner where the "circular" part of the corner has been cut off.

> **Note**
>
> Very long miter tips are cut off (to form a *bevel*) after a backend-dependent limit called the "miter limit", which specifies the maximum allowed ratio of miter length to line width. For example, the PDF backend uses the default value of 10 specified by the PDF standard, while the SVG backend does not even specify the miter limit, resulting in a default value of 4 per the SVG specification. Matplotlib does not currently allow the user to adjust this parameter.
>
> A more detailed description of the effect of a miter limit can be found in the Mozilla Developer Docs

static demo()

Demonstrate how each JoinStyle looks for various join angles.

class matplotlib._enums.**CapStyle**(**values*)

Define how the two endpoints (caps) of an unclosed line are drawn.

How to draw the start and end points of lines that represent a closed curve (i.e. that end in a *CLOSEPOLY*) is controlled by the line's *JoinStyle*. For all other lines, how the start and end points are drawn is controlled by the *CapStyle*.

For a visual impression of each *CapStyle*, *view these docs online* or run *CapStyle.demo*.

By default, *GraphicsContextBase* draws a stroked line as squared off at its endpoints.

Supported values:

'butt'

the line is squared off at its endpoint.

'projecting'

the line is squared off as in *butt*, but the filled in area extends beyond the endpoint a distance of `linewidth/2`.

'round'

like *butt*, but a semicircular cap is added to the end of the line, of radius `linewidth/2`.

static demo()

Demonstrate how each CapStyle looks for a thick line segment.

7.2.66 matplotlib._type1font

A class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

Usage:

```
font = Type1Font(filename)
clear_part, encrypted_part, finale = font.parts
slanted_font = font.transform({'slant': 0.167})
extended_font = font.transform({'extend': 1.2})
```

Sources:

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.
- Adobe Type 1 Font Format, Adobe Systems Incorporated, third printing, v1.1, 1993. ISBN 0-201-57044-0.

class matplotlib._type1font.**Type1Font**(*input*)

Bases: object

A class representing a Type-1 font, for use by backends.

Attributes

parts

[tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

decrypted

[bytes] The decrypted form of `parts[1]`.

prop

[dict[str, Any]] A dictionary of font properties. Noteworthy keys include:

- FontName: PostScript name of the font
- Encoding: dict from numeric codes to glyph names
- FontMatrix: bytes object encoding a matrix
- UniqueID: optional font identifier, dropped when modifying the font
- CharStrings: dict from glyph names to byte code
- Subrs: array of byte code subroutines
- OtherSubrs: bytes object encoding some PostScript code

Initialize a Type-1 font.

Parameters

input

[str or 3-tuple] Either a pfb file name, or a 3-tuple of already-decoded Type-1 font *parts*.

decrypted

parts

prop

transform(*effects*)

Return a new font that is slanted and/or extended.

Parameters

effects

[dict] A dict with optional entries:

- **'slant'**

  [float, default: 0] Tangent of the angle that the font is to be slanted to the right. Negative values slant to the left.

- **'extend'**

  [float, default: 1] Scaling factor for the font width. Values less than 1 condense the glyphs.

Returns

Type1Font

7.2.67 matplotlib._tight_bbox

Helper module for the *bbox_inches* parameter in *Figure.savefig*.

matplotlib._tight_bbox.**adjust_bbox**(*fig*, *bbox_inches*, *fixed_dpi=None*)

Temporarily adjust the figure so that only the specified area (bbox_inches) is saved.

It modifies fig.bbox, fig.bbox_inches, fig.transFigure._boxout, and fig.patch. While the figure size changes, the scale of the original figure is conserved. A function which restores the original values are returned.

matplotlib._tight_bbox.**process_figure_for_rasterizing**(*fig*, *bbox_inches_restore*, *fixed_dpi=None*)

A function that needs to be called when figure dpi changes during the drawing (e.g., rasterizing). It recovers the bbox and re-adjust it with the new dpi.

7.2.68 matplotlib._tight_layout

Routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, Axes titles and offsetboxes that are anchored to Axes are currently considered.

Internally, this module assumes that the margins (left margin, etc.) which are differences between `Axes.get_tightbbox` and `Axes.bbox` are independent of Axes position. This may fail if `Axes.adjustable` is `datalim` as well as such cases as when left or right margin are affected by xlabel.

matplotlib._tight_layout.**get_subplotspec_list**(*axes_list*, *grid_spec=None*)

Return a list of subplotspec from the given list of Axes.

For an instance of Axes that does not support subplotspec, None is inserted in the list.

If grid_spec is given, None is inserted for those not from the given grid_spec.

matplotlib._tight_layout.**get_tight_layout_figure**(*fig*, *axes_list*, *subplotspec_list*, *renderer*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Return subplot parameters for tight-layouted-figure with specified padding.

Parameters

fig

[Figure]

axes_list

[list of Axes]

subplotspec_list

[list of *SubplotSpec*] The subplotspecs of each Axes.

renderer

[renderer]

pad

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

rect

[tuple (left, bottom, right, top), default: None.] rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

Returns

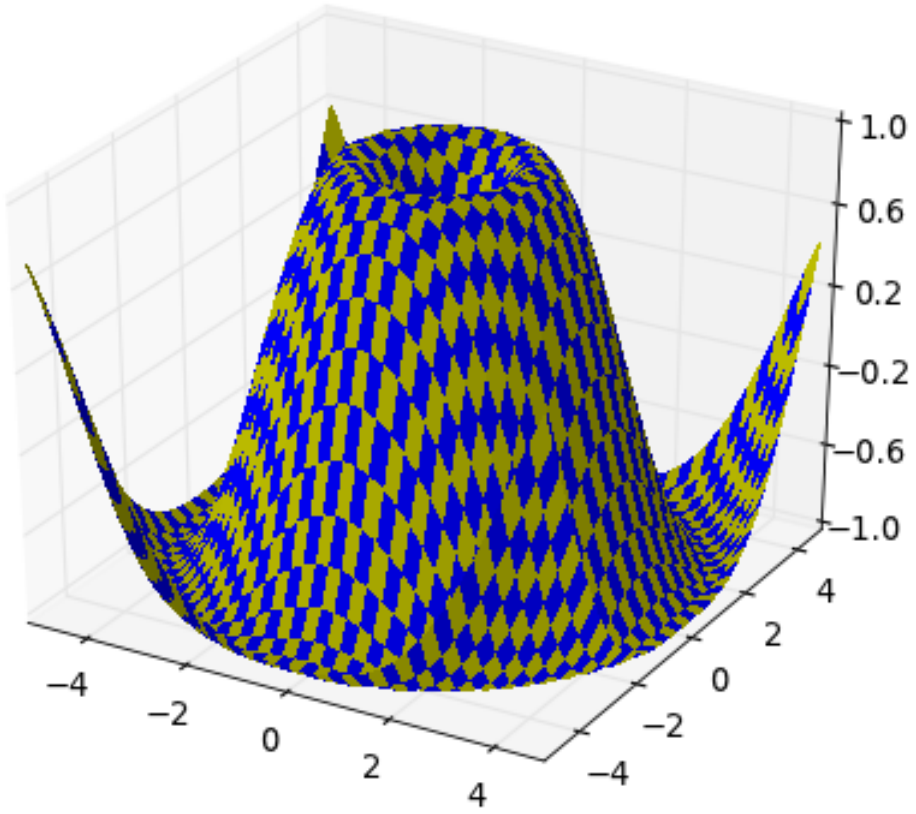
subplotspec or None

subplotspec kwargs to be passed to *Figure.subplots_adjust* or None if tight_layout could not be accomplished.

7.2.69 `mpl_toolkits.mplot3d`

The mplot3d toolkit adds simple 3D plotting capabilities (scatter, surface, line, mesh, etc.) to Matplotlib by supplying an Axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases.

See the *mplot3d tutorial* for more information.



The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Panning is done by clicking the middle mouse button, and zooming is done by right-clicking the scene and dragging the mouse up and down. Unlike 2D plots, the toolbar pan and zoom buttons are not used.

mplot3d FAQ

How is mplot3d different from Mayavi?

Mayavi is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use Mayavi.

mplot3d was intended to allow users to create simple 3D graphs with the same "look-and-feel" as matplotlib's 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.

My 3D plot doesn't look right at certain viewing angles

This is probably the most commonly reported issue with mplot3d. The problem is that -- from some viewing angles -- a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look "physically correct."

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and cannot be fully solved until matplotlib supports 3D graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) cannot be rendered properly in matplotlib's 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using MayaVi.

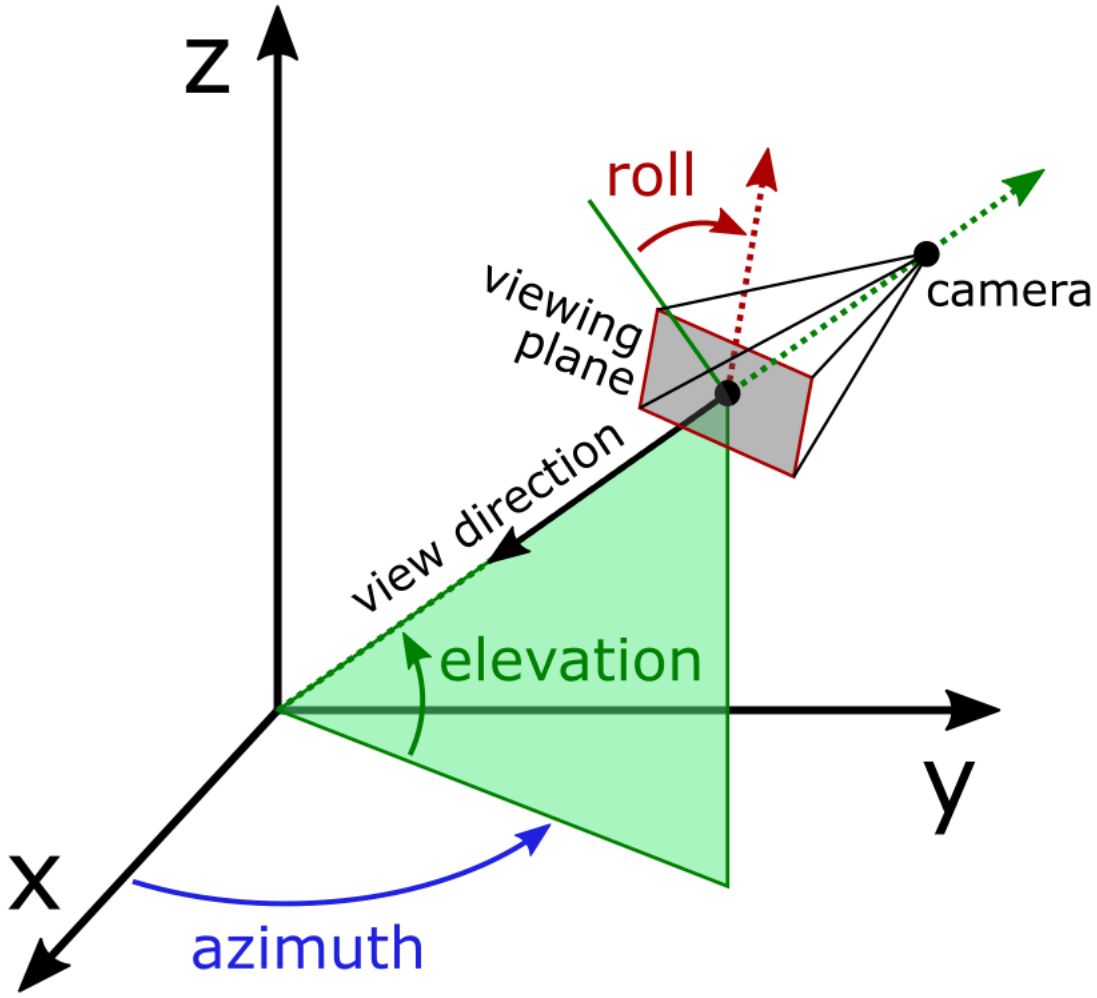
I don't like how the 3D plot is laid out, how do I change that?

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the `mplot3d.axis3d` section of the mplot3d API documentation for more information.

mplot3d View Angles

How to define the view angle

The position of the viewport "camera" in a 3D plot is defined by three angles: *elevation*, *azimuth*, and *roll*. From the resulting position, it always points towards the center of the plot box volume. The angle direction is a common convention, and is shared with PyVista and MATLAB. Note that a positive roll angle rotates the viewing plane clockwise, so the 3d axes will appear to rotate counter-clockwise.



Rotating the plot using the mouse will control azimuth, elevation, as well as roll, and all three angles can be set programmatically:

```
import matplotlib.pyplot as plt
ax = plt.figure().add_subplot(projection='3d')
ax.view_init(elev=30, azim=45, roll=15)
```

Primary view planes

To look directly at the primary view planes, the required elevation, azimuth, and roll angles are shown in the diagram of an "unfolded" plot below. These are further documented in the *mplot3d.axes3d.Axes3D.view_init* API.

Rotation with mouse

3D plots can be reoriented by dragging the mouse. There are various ways to accomplish this; the style of mouse rotation can be specified by setting `rcParams["axes3d.mouserotationstyle"]` (default: `'arcball'`), see *Customizing Matplotlib with style sheets and rcParams*.

Prior to v3.10, the 2D mouse position corresponded directly to azimuth and elevation; this is also how it is done in MATLAB. To keep it this way, set `mouserotationstyle: azel`. This approach works fine for spherical coordinate plots, where the z axis is special; however, it leads to a kind of 'gimbal lock' when looking down the z axis: the plot reacts differently to mouse movement, dependent on the particular orientation at hand. Also, 'roll' cannot be controlled.

As an alternative, there are various mouse rotation styles where the mouse manipulates a virtual 'trackball'. In its simplest form (`mouserotationstyle: trackball`), the trackball rotates around an in-plane axis perpendicular to the mouse motion (it is as if there is a plate laying on the trackball; the plate itself is fixed in orientation, but you can drag the plate with the mouse, thus rotating the ball). This is more natural to work with than the `azel` style; however, the plot cannot be easily rotated around the viewing direction - one has to move the mouse in circles with a handedness opposite to the desired rotation, counterintuitively.

A different variety of trackball rotates along the shortest arc on the virtual sphere (`mouserotationstyle: sphere`). Rotating around the viewing direction is straightforward with it: grab the ball near its edge instead of near the center.

Ken Shoemake's ARCBALL [Shoemake1992] is also available (`mouserotationstyle: Shoemake`); it resembles the `sphere` style, but is free of hysteresis, i.e., returning mouse to the original position returns the figure to its original orientation; the rotation is independent of the details of the path the mouse took, which could be desirable. However, Shoemake's arcball rotates at twice the angular rate of the mouse movement (it is quite noticeable, especially when adjusting roll), and it lacks an obvious mechanical equivalent; arguably, the path-independent rotation is not natural (however convenient), it could take some getting used to. So it is a trade-off.

Henriksen et al. [Henriksen2002] provide an overview. In summary:

Style	traditional[1]	incl. roll[2]	uniform[3]	path independent[4]	mechanical counterpart[5]
azel	✓	□	□	✓	✓
trackball	□	✓[6]	✓	□	✓
sphere	□	✓	✓	□	✓
arcball	□	✓	✓	✓	□

You can try out one of the various mouse rotation styles using:

[1] The way it was prior to v3.10; this is also MATLAB's style

[2] Mouse controls roll too (not only azimuth and elevation)

[3] Figure reacts the same way to mouse movements, regardless of orientation (no difference between 'poles' and 'equator')

[4] Returning mouse to original position returns figure to original orientation (rotation is independent of the details of the path the mouse took)

[5] The style has a corresponding natural implementation as a mechanical device

[6] While it is possible to control roll with the `trackball` style, this is not immediately obvious (it requires moving the mouse in large circles) and a bit counterintuitive (the resulting roll is in the opposite direction)

```
import matplotlib as mpl
mpl.rcParams['axes3d.mouserotationstyle'] = 'trackball'  # 'azel',
 ↪'trackball', 'sphere', or 'arcball'

import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cm

ax = plt.figure().add_subplot(projection='3d')

X = np.arange(-5, 5, 0.25)
Y = np.arange(-5, 5, 0.25)
X, Y = np.meshgrid(X, Y)
R = np.sqrt(X**2 + Y**2)
Z = np.sin(R)

surf = ax.plot_surface(X, Y, Z, cmap=cm.coolwarm,
                       linewidth=0, antialiased=False)

plt.show()
```

Alternatively, create a file `matplotlibrc`, with contents:

```
axes3d.mouserotationstyle: trackball
```

(or any of the other styles, instead of `trackball`), and then run any of the *3D plotting* examples.

The size of the virtual trackball, sphere, or arcball can be adjusted by setting *`rcParams["axes3d.trackballsize"]`* (default: `0.667`). This specifies how much mouse motion is needed to obtain a given rotation angle (when near the center), and it controls where the edge of the sphere or arcball is (how far from the center, hence how close to the plot edge). The size is specified in units of the Axes bounding box, i.e., to make the arcball span the whole bounding box, set it to 1. A size of about 2/3 appears to work reasonably well; this is the default.

Both arcballs (`mouserotationstyle: sphere` and `mouserotationstyle: arcball`) have a noticeable edge; the edge can be made less abrupt by specifying a border width, *`rcParams["axes3d.trackballborder"]`* (default: `0.2`). This works somewhat like Gavin Bell's arcball, which was originally written for OpenGL [Bell1988], and is used in Blender and Meshlab. Bell's arcball extends the arcball's spherical control surface with a hyperbola; the two are smoothly joined. However, the hyperbola extends all the way beyond the edge of the plot. In the mplot3d sphere and arcball style, the border extends to a radius `trackballsize/2 + trackballborder`. Beyond the border, the style works like the original: it controls roll only. A border width of about 0.2 appears to work well; this is the default. To obtain the original Shoemake's arcball with a sharp border, set the border width to 0. For an extended border similar to Bell's arcball, where the transition from the arcball to the border occurs at 45°, set the border width to $\sqrt{2} \approx 1.414$. The border is a circular arc, wrapped around the arcball sphere cylindrically (like a doughnut), joined smoothly to the sphere, much like Bell's hyperbola.

mpl_toolkits.mplot3d.axes3d.Axes3D

class mpl_toolkits.mplot3d.axes3d.**Axes3D**(*fig*, *rect=None*, **args*, *elev=30*, *azim=-60*, *roll=0*, *shareview=None*, *sharez=None*, *proj_type='persp'*, *focal_length=None*, *box_aspect=None*, *computed_zorder=True*, ***kwargs*)

Bases: *Axes*

3D Axes object.

Note

As a user, you do not instantiate Axes directly, but use Axes creation methods instead; e.g. from *pyplot* or *Figure*: *subplots*, *subplot_mosaic* or *Figure.add_axes*.

Parameters

fig

[Figure] The parent figure.

rect

[tuple (left, bottom, width, height), default: None.] The `(left, bottom, width, height)` Axes position.

elev

[float, default: 30] The elevation angle in degrees rotates the camera above and below the x-y plane, with a positive angle corresponding to a location above the plane.

azim

[float, default: -60] The azimuthal angle in degrees rotates the camera about the z axis, with a positive angle corresponding to a right-handed rotation. In other words, a positive azimuth rotates the camera about the origin from its location along the +x axis towards the +y axis.

roll

[float, default: 0] The roll angle in degrees rotates the camera about the viewing axis. A positive angle spins the camera clockwise, causing the scene to rotate counter-clockwise.

shareview

[Axes3D, optional] Other Axes to share view angles with. Note that it is not possible to unshare axes.

sharez

[Axes3D, optional] Other Axes to share z-limits with. Note that it is not possible to unshare axes.

proj_type

[{'persp', 'ortho'}] The projection type, default 'persp'.

focal_length

[float, default: None] For a projection type of 'persp', the focal length of the virtual camera. Must be > 0. If None, defaults to 1. For a projection type of 'ortho', must be set to either None or infinity (numpy.inf). If None, defaults to infinity. The focal length can be computed from a desired Field Of View via the equation: focal_length = 1/tan(FOV/2)

box_aspect

[3-tuple of floats, default: None] Changes the physical dimensions of the Axes3D, such that the ratio of the axis lengths in display units is x:y:z. If None, defaults to 4:4:3

computed_zorder

[bool, default: True] If True, the draw order is computed based on the average position of the *Artist*s along the view direction. Set to False if you want to manually control the order in which Artists are drawn on top of each other using their *zorder* attribute. This can be used for fine-tuning if the automatic order does not produce the desired result. Note however, that a manual zorder will only be correct for a limited view angle. If the figure is rotated by the user, it will look wrong from certain angles.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal', 'equalxy', 'equalxz', 'equalyz'}
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
autoscalez_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	3-tuple of floats or None
clip_box	*BboxBase* or None
clip_on	bool

Table 305 – continued fro

Property	Description
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	Figure or SubFigure
forward_navigation_events	bool or "auto"
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	[left, bottom, width, height] or Bbox
proj_type	{'persp', 'ortho'}
prop_cycle	Cycler
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	unknown
transform	Transform
url	str
visible	bool
xbound	unknown
xlabel	str
xlim or xlim3d	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim or ylim3d	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zbound	unknown
zlabel	unknown
zlim or zlim3d	(bottom: float, top: float)
zmargin	float greater than -0.5
zorder	float
zscale	unknown

Table 305 – continued fro

Property	Description
zticklabels	unknown
zticks	unknown

Plotting

plot	Plot 2D or 3D data.
scatter	Create a scatter plot.
bar	Add 2D bar(s).
bar3d	Generate a 3D barplot.
plot_surface	Create a surface plot.
plot_wireframe	Plot a 3D wireframe.
plot_trisurf	Plot a triangulated surface.
fill_between	Fill the area between two 3D curves.
clabel	Currently not implemented for 3D Axes, and returns *None*.
contour	Create a 3D contour plot.
tricontour	Create a 3D contour plot.
contourf	Create a 3D filled contour plot.
tricontourf	Create a 3D filled contour plot.
quiver	Plot a 3D field of arrows.
voxels	Plot a set of filled voxels
errorbar	Plot lines and/or markers with errorbars around them.
stem	Create a 3D stem plot.

mpl_toolkits.mplot3d.axes3d.Axes3D.plot

Axes3D.**plot**(*xs*, *ys*, **args*, *zdir='z'*, *axlim_clip=False*, ***kwargs*)

Plot 2D or 3D data.

Parameters

xs

[1D array-like] x coordinates of vertices.

ys

[1D array-like] y coordinates of vertices.

zs

[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z.

axlim_clip

[bool, default: False] Whether to hide data that is outside the axes view limits.

Added in version 3.10.

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.plot*.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.plot`

mpl_toolkits.mplot3d.axes3d.Axes3D.scatter

Axes3D.**scatter**(*xs*, *ys*, *zs=0*, *zdir='z'*, *s=20*, *c=None*, *depthshade=True*, **args*, *axlim_clip=False*, *data=None*, ***kwargs*)

Create a scatter plot.

Parameters

xs, ys

[array-like] The data positions.

zs

[float or array-like, default: 0] The z-positions. Either an array of the same length as *xs* and *ys* or a single value to place all points in the same plane.

zdir

[{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the *zs*. This is useful when plotting 2D data on a 3D Axes. The data must be passed as *xs*, *ys*. Setting *zdir* to 'y' then plots the data to the x-z-plane.

See also *Plot 2D data on 3D plot*.

s

[float or array-like, default: 20] The marker size in points**2. Either an array of the same length as *xs* and *ys* or a single value to make all markers the same size.

c

[*color*, sequence, or sequence of colors, optional] The marker color. Possible values:

- A single color format string.
- A sequence of colors of length n.
- A sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2D array in which the rows are RGB or RGBA.

For more details see the *c* argument of *scatter*.

depthshade

[bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

axlim_clip

[bool, default: False] Whether to hide the scatter points outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

xs, *ys*, *zs*, *s*, *edgecolors*, *c*, *facecolor*, *facecolors*, *color*

****kwargs**

All other keyword arguments are passed on to *scatter*.

Returns

paths

[*PathCollection*]

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.scatter`

mpl_toolkits.mplot3d.axes3d.Axes3D.bar

Axes3D.**bar**(*left*, *height*, *zs=0*, *zdir='z'*, **args*, *axlim_clip=False*, *data=None*, ***kwargs*)

Add 2D bar(s).

Parameters

left

[1D array-like] The x coordinates of the left sides of the bars.

height

[1D array-like] The height of the bars.

zs

[float or 1D array-like, default: 0] Z coordinate of bars; if a single value is specified, it will be used for all bars.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

axlim_clip

[bool, default: False] Whether to hide bars with points outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

Other keyword arguments are forwarded to *matplotlib.axes.Axes.bar*.

Returns

mpl_toolkits.mplot3d.art3d.Patch3DCollection

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.bar`

mpl_toolkits.mplot3d.axes3d.Axes3D.bar3d

Axes3D.**bar3d**(*x*, *y*, *z*, *dx*, *dy*, *dz*, *color=None*, *zsort='average'*, *shade=True*, *lightsource=None*, **args*, *axlim_clip=False*, *data=None*, ***kwargs*)

Generate a 3D barplot.

This method creates three-dimensional barplot where the width, depth, height, and color of the bars can all be uniquely set.

Parameters

x, y, z

[array-like] The coordinates of the anchor point of the bars.

dx, dy, dz

[float or array-like] The width, depth, and height of the bars, respectively.

color

[sequence of colors, optional] The color of the bars can be specified globally or individually. This parameter can be:

- A single color, to color all bars the same color.
- An array of colors of length N bars, to color each bar independently.
- An array of colors of length 6, to color the faces of the bars similarly.
- An array of colors of length 6 * N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:

1. -Z (bottom of box)

2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X

zsort

[{'average', 'min', 'max'}, default: 'average'] The z-axis sorting scheme passed onto *Poly3DCollection*

shade

[bool, default: True] When true, this shades the dark sides of the bars (relative to the plot's source of light).

lightsource

[*LightSource*, optional] The lightsource to use when *shade* is True.

axlim_clip

[bool, default: False] Whether to hide the bars with points outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

Any additional keyword arguments are passed onto *Poly3DCollection*.

Returns

collection

[*Poly3DCollection*] A collection of three-dimensional polygons representing the bars.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.bar3d`

mpl_toolkits.mplot3d.axes3d.Axes3D.plot_surface

`Axes3D.`**`plot_surface`**(*X*, *Y*, *Z*, *, *norm=None*, *vmin=None*, *vmax=None*, *lightsource=None*, *axlim_clip=False*, ***kwargs*)

Create a surface plot.

By default, it will be colored in shades of a solid color, but it also supports colormapping by supplying the *cmap* argument.

Note

The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Note

To maximize rendering speed consider setting *rstride* and *cstride* to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows rstride can be any of the divisors of 50.

Similarly, a setting of *rstride* and *cstride* equal to 1 (or *rcount* and *ccount* equal the number of rows and columns) can use the optimized path.

Parameters

X, Y, Z

[2D arrays] Data values.

rcount, ccount

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.

rstride, cstride

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 10.

'classic' mode uses a default of `rstride = cstride = 10` instead of the new default of `rcount = ccount = 50`.

color

[*color*] Color of the surface patches.

cmap

[Colormap, optional] Colormap of the surface patches.

facecolors

[list of *color*] Colors of each individual patch.

norm

[`Normalize`, optional] Normalization for the colormap.

vmin, vmax

[float, optional] Bounds for the normalization.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

lightsource

[*LightSource*, optional] The lightsource to use when *shade* is True.

axlim_clip

[bool, default: False] Whether to hide patches with a vertex outside the axes view limits.

Added in version 3.10.

****kwargs**

Other keyword arguments are forwarded to *Poly3DCollection*.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.plot_surface`

mpl_toolkits.mplot3d.axes3d.Axes3D.plot_wireframe

Axes3D.**plot_wireframe**(*X*, *Y*, *Z*, *, *axlim_clip=False*, ***kwargs*)

Plot a 3D wireframe.

Note

The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Parameters

X, Y, Z

[2D arrays] Data values.

axlim_clip

[bool, default: False] Whether to hide lines and patches with vertices outside the axes view limits.

Added in version 3.10.

rcount, ccount

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

rstride, cstride

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of `rstride = cstride = 1` instead of the new default of `rcount = ccount = 50`.

****kwargs**

Other keyword arguments are forwarded to *Line3DCollection*.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.plot_wireframe`

mpl_toolkits.mplot3d.axes3d.Axes3D.plot_trisurf

Axes3D.**plot_trisurf**(**args*, *color=None*, *norm=None*, *vmin=None*, *vmax=None*, *lightsource=None*, *axlim_clip=False*, ***kwargs*)

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where triangulation is a *Triangulation* object, or:

```
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for an explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation.

Parameters

X, Y, Z

[array-like] Data values as 1D arrays.

color

Color of the surface patches.

cmap

A colormap for the surface patches.

norm

[*Normalize*, optional] An instance of Normalize to map values to colors.

vmin, vmax

[float, optional] Minimum and maximum value to map.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

lightsource

[*LightSource*, optional] The lightsource to use when *shade* is True.

axlim_clip

[bool, default: False] Whether to hide patches with a vertex outside the axes view limits.

Added in version 3.10.

****kwargs**

All other keyword arguments are passed on to *Poly3DCollection*

Examples

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.plot_trisurf`

mpl_toolkits.mplot3d.axes3d.Axes3D.fill_between

Axes3D.**fill_between**(*x1*, *y1*, *z1*, *x2*, *y2*, *z2*, *, *where=None*, *mode='auto'*, *facecolors=None*, *shade=None*, *axlim_clip=False*, ***kwargs*)

Fill the area between two 3D curves.

The curves are defined by the points (*x1*, *y1*, *z1*) and (*x2*, *y2*, *z2*). This creates one or multiple quadrangle polygons that are filled. All points must be the same length N, or a single value to be used for all points.

Parameters

x1, y1, z1

[float or 1D array-like] x, y, and z coordinates of vertices for 1st line.

x2, y2, z2

[float or 1D array-like] x, y, and z coordinates of vertices for 2nd line.

where

[array of bool (length N), optional] Define *where* to exclude some regions from being filled. The filled regions are defined by the coordinates `pts[where]`, for all x, y, and z pts. More precisely, fill between `pts[i]` and `pts[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

mode

[{'quad', 'polygon', 'auto'}, default: 'auto'] The fill mode. One of:

- 'quad': A separate quadrilateral polygon is created for each pair of subsequent points in the two lines.
- 'polygon': The two lines are connected to form a single polygon. This is faster and can render more cleanly for simple shapes (e.g. for filling between two lines that lie within a plane).
- 'auto': If the points all lie on the same 3D plane, 'polygon' is used. Otherwise, 'quad' is used.

facecolors

[list of *color*, default: None] Colors of each individual patch, or a single color to be used for all patches.

shade

[bool, default: None] Whether to shade the facecolors. If *None*, then defaults to *True* for 'quad' mode and *False* for 'polygon' mode.

axlim_clip

[bool, default: False] Whether to hide data that is outside the axes view limits.

Added in version 3.10.

****kwargs**

All other keyword arguments are passed on to *Poly3DCollection*.

Returns

Poly3DCollection

A *Poly3DCollection* containing the plotted polygons.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.fill_between`

mpl_toolkits.mplot3d.axes3d.Axes3D.clabel

Axes3D.**clabel**(**args*, ***kwargs*)

Currently not implemented for 3D Axes, and returns *None*.

mpl_toolkits.mplot3d.axes3d.Axes3D.contour

Axes3D.**contour**(*X*, *Y*, *Z*, **args*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, *axlim_clip=False*, *data=None*, ***kwargs*)

Create a 3D contour plot.

Parameters

X, Y, Z

[array-like,] Input data. See *Axes.contour* for supported data shapes.

extend3d

[bool, default: False] Whether to extend contour in 3D.

stride

[int, default: 5] Step size for extending contour.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to *zdir*.

axlim_clip

[bool, default: False] Whether to hide lines with a vertex outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contour*.

Returns

matplotlib.contour.QuadContourSet

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.contour`

mpl_toolkits.mplot3d.axes3d.Axes3D.tricontour

Axes3D.**tricontour**(**args*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, *axlim_clip=False*, *data=None*, ***kwargs*)

Create a 3D contour plot.

> **Note**
>
> This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

Parameters

X, Y, Z

[array-like] Input data. See *Axes.tricontour* for supported data shapes.

extend3d

[bool, default: False] Whether to extend contour in 3D.

stride

[int, default: 5] Step size for extending contour.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to *zdir*.

axlim_clip

[bool, default: False] Whether to hide lines with a vertex outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.tricontour*.

Returns

matplotlib.tri._tricontour.TriContourSet

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.tricontour`

mpl_toolkits.mplot3d.axes3d.Axes3D.contourf

`Axes3D.`**`contourf`**(*X*, *Y*, *Z*, **args*, *zdir='z'*, *offset=None*, *axlim_clip=False*, *data=None*, ***kwargs*)

Create a 3D filled contour plot.

Parameters

X, Y, Z

[array-like] Input data. See *`Axes.contourf`* for supported data shapes.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to *zdir*.

axlim_clip

[bool, default: False] Whether to hide lines with a vertex outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

***args, **kwargs**

Other arguments are forwarded to *`matplotlib.axes.Axes.contourf`*.

Returns

matplotlib.contour.QuadContourSet

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.contourf`

mpl_toolkits.mplot3d.axes3d.Axes3D.tricontourf

`Axes3D.`**`tricontourf`**(**args*, *zdir='z'*, *offset=None*, *axlim_clip=False*, *data=None*, ***kwargs*)

Create a 3D filled contour plot.

> **Note**
>
> This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

Parameters

X, Y, Z

[array-like] Input data. See *Axes.tricontourf* for supported data shapes.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

axlim_clip

[bool, default: False] Whether to hide lines with a vertex outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.tricontourf*.

Returns

matplotlib.tri._tricontour.TriContourSet

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.tricontourf`

mpl_toolkits.mplot3d.axes3d.Axes3D.quiver

`Axes3D.`**`quiver`**(*X*, *Y*, *Z*, *U*, *V*, *W*, *, *length=1*, *arrow_length_ratio=0.3*, *pivot='tail'*, *normalize=False*, *axlim_clip=False*, *data=None*, ***kwargs*)

Plot a 3D field of arrows.

The arguments can be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Parameters

X, Y, Z

[array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

U, V, W

[array-like] The x, y and z components of the arrow vectors.

length

[float, default: 1] The length of each quiver.

arrow_length_ratio

[float, default: 0.3] The ratio of the arrow head with respect to the quiver.

pivot

[{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

normalize

[bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by *u*, *v*, and *w*.

axlim_clip

[bool, default: False] Whether to hide arrows with points outside the axes view limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

****kwargs**

Any additional keyword arguments are delegated to *Line3DCollection*

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.quiver`

mpl_toolkits.mplot3d.axes3d.Axes3D.voxels

`Axes3D.`**`voxels`**`(`[*x*, *y*, *z*,]/, *filled*, *facecolors=None*, *edgecolors=None*, ***kwargs*`)`

Plot a set of filled voxels

All voxels are plotted as 1x1x1 cubes on the axis, with `filled[0, 0, 0]` placed with its lower corner at the origin. Occluded faces are not plotted.

Parameters

filled

[3D np.array of bool] A 3D array of values, with truthy values indicating which voxels to fill

x, y, z

[3D np.array, optional] The coordinates of the corners of the voxels. This should broadcast to a shape one larger in every dimension than the shape of *filled*. These can be used to plot non-cubic voxels.

If not specified, defaults to increasing integers along each axis, like those returned by `indices()`. As indicated by the `/` in the function signature, these arguments can only be passed positionally.

facecolors, edgecolors

[array-like, optional] The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. These parameters can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D RGB/RGBA array
- `None`, the default, to use a single color for the faces, and the style default for the edges.
- A 3D `ndarray` of color names, with each item the color for the corresponding voxel. The size must match the voxels.
- A 4D `ndarray` of RGB/RGBA data, with the components along the last axis.

shade

[bool, default: True] Whether to shade the facecolors.

lightsource

[*`LightSource`*, optional] The lightsource to use when *shade* is True.

axlim_clip

[bool, default: False] Whether to hide voxels with points outside the axes view limits.

Added in version 3.10.

****kwargs**

Additional keyword arguments to pass onto *`Poly3DCollection`*.

Returns

faces

[dict] A dictionary indexed by coordinate, where `faces[i, j, k]` is a *`Poly3DCollection`* of the faces drawn for the voxel `filled[i, j, k]`. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then `(i, j, k) not in faces`.

Examples

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.voxels`

mpl_toolkits.mplot3d.axes3d.Axes3D.errorbar

Axes3D.**errorbar**(*x*, *y*, *z*, *zerr=None*, *yerr=None*, *xerr=None*, *fmt=''*, *barsabove=False*, *errorevery=1*, *ecolor=None*, *elinewidth=None*, *capsize=None*, *capthick=None*, *xlolims=False*, *xuplims=False*, *ylolims=False*, *yuplims=False*, *zlolims=False*, *zuplims=False*, *axlim_clip=False*, ***, *data=None*, ***kwargs*)

Plot lines and/or markers with errorbars around them.

x/*y*/*z* define the data locations, and *xerr*/*yerr*/*zerr* define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use fmt='none' to draw errorbars only.

Parameters

x, y, z

[float or array-like] The data positions.

xerr, yerr, zerr

[float or array-like, shape (N,) or (2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

Note that all error arrays should have *positive* values.

fmt

[str, default: ''] The format for the data points / data lines. See `plot` for details.

Use 'none' (case-insensitive) to plot errorbars without any data markers.

ecolor

[*color*, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth

[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize

[float, default: *rcParams["errorbar.capsize"]* (default: 0.0)] The length of the error bar caps in points.

capthick

[float, default: None] An alias to the keyword argument *markeredgewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markeredgewidth* are given, then they will over-ride *capthick*. This may change in future releases.

barsabove

[bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

xlolims, ylolims, zlolims

[bool, default: False] These arguments can be used to indicate that a value gives only lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as the errors. To use limits with inverted axes, *set_xlim*, *set_ylim*, or *set_zlim* must be called before *errorbar*. Note the tricky parameter names: setting e.g. *ylolims* to True means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

xuplims, yuplims, zuplims

[bool, default: False] Same as above, but for controlling the upper limits.

errorevery

[int or (int, int), default: 1] draws error bars on a subset of the data. *errorevery* =N draws error bars on the points (x[::N], y[::N], z[::N]). *errorevery* =(start, N) draws error bars on the points (x[start::N], y[start::N], z[start::N]). e.g. *errorevery* =(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

axlim_clip

[bool, default: False] Whether to hide error bars that are outside the axes limits.

Added in version 3.10.

Returns

errlines

[list] List of *Line3DCollection* instances each containing an errorbar line.

caplines

[list] List of *Line3D* instances each containing a capline object.

limmarks

[list] List of *Line3D* instances each containing a marker with an upper or lower limit.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`:

x, *y*, *z*, *xerr*, *yerr*, *zerr*

****kwargs**

All other keyword arguments for styling errorbar lines are passed *Line3DCollection*.

Examples

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.errorbar`

mpl_toolkits.mplot3d.axes3d.Axes3D.stem

Axes3D.**stem**(*x*, *y*, *z*, *, *linefmt='C0-'*, *markerfmt='C0o'*, *basefmt='C3-'*, *bottom=0*, *label=None*, *orientation='z'*, *axlim_clip=False*, *data=None*)

Create a 3D stem plot.

A stem plot draws lines perpendicular to a baseline, and places markers at the heads. By default, the baseline is defined by *x* and *y*, and stems are drawn vertically from *bottom* to *z*.

Parameters

x, y, z

[array-like] The positions of the heads of the stems. The stems are drawn along the *orientation*-direction from the baseline at *bottom* (in the *orientation*-coordinate) to the heads. By default, the *x* and *y* positions are used for the baseline and *z* for the head position, but this can be changed by *orientation*.

linefmt

[str, default: 'C0-'] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

Character	Line Style
`'-'`	solid line
`'--'`	dashed line
`'-.'`	dash-dot line
`':'`	dotted line

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

markerfmt

[str, default: 'C0o'] A string defining the properties of the markers at the stem heads.

basefmt

[str, default: 'C3-'] A format string defining the properties of the baseline.

bottom

[float, default: 0] The position of the baseline, in *orientation*-coordinates.

label

[str, optional] The label to use for the stems in legends.

orientation

[{'x', 'y', 'z'}, default: 'z'] The direction along which stems are drawn.

axlim_clip

[bool, default: False] Whether to hide stems that are outside the axes limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

Returns

StemContainer

The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

Examples

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.stem`

Text and annotations

text	Add the text *s* to the 3D Axes at location *x*, *y*, *z* in data coordinates.
text2D	Add text to the Axes.

mpl_toolkits.mplot3d.axes3d.Axes3D.text

Axes3D.**text**(*x*, *y*, *z*, *s*, *zdir=None*, *, *axlim_clip=False*, ***kwargs*)

Add the text *s* to the 3D Axes at location *x*, *y*, *z* in data coordinates.

Parameters

x, y, z

[float] The position to place the text.

s

[str] The text.

zdir

[{'x', 'y', 'z', 3-tuple}, optional] The direction to be used as the z-direction. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide text that is outside the axes view limits.

Added in version 3.10.

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.text*.

Returns

Text3D

The created *Text3D* instance.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.text`

mpl_toolkits.mplot3d.axes3d.Axes3D.text2D

Axes3D.**text2D**(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to the Axes.

Add the text *s* to the Axes at location *x*, *y* in data coordinates, with a default `horizontalalignment` on the `left` and `verticalalignment` at the `baseline`. See *Text alignment*.

Parameters

x, y

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

s

[str] The text.

fontdict

[dict, default: None]

> **Discouraged**
>
> The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `text(..., **fontdict)`.

A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

Returns

Text

The created *Text* instance.

Other Parameters

****kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) flo
alpha	float or None
animated	bool
antialiased	bool
backgroundcolor	*color*
bbox	dict with properties for *patches.Fancy*
clip_box	unknown
clip_on	unknown
clip_path	unknown
color or *c*	*color*
figure	*Figure* or *SubFigure*
fontfamily or *family* or *fontname*	{FONTNAME, 'serif', 'sans-serif', 'cursive'

Table 3

Property	Description
fontproperties or *font* or *font_properties*	*font_manager.FontProperties* or
fontsize or *size*	float or {'xx-small', 'x-small', 'small', 'medi
fontstretch or *stretch*	{a numeric value in range 0-1000, 'ultra-co
fontstyle or *style*	{'normal', 'italic', 'oblique'}
fontvariant or *variant*	{'normal', 'small-caps'}
fontweight or *weight*	{a numeric value in range 0-1000, 'ultralig
gid	str
horizontalalignment or *ha*	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or *ma*	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: flo
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool, default: *rcParams["text.uset*
verticalalignment or *va*	{'baseline', 'bottom', 'center', 'center_baseli
visible	bool
wrap	bool
x	float
y	float
zorder	float

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the Axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.text2D`

Clearing

clear	Clear the Axes.

mpl_toolkits.mplot3d.axes3d.Axes3D.clear

Axes3D.**clear**()

Clear the Axes.

Appearance

set_axis_off	Hide all visual components of the x- and y-axis.
set_axis_on	Do not hide all visual components of the x- and y-axis.
grid	Set / unset 3D grid.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_axis_off

Axes3D.**set_axis_off**()

Hide all visual components of the x- and y-axis.

This sets a flag to suppress drawing of all axis decorations, i.e. axis labels, axis spines, and the axis tick component (tick markers, tick labels, and grid lines). Individual visibility settings of these components are ignored as long as *set_axis_off()* is in effect.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_axis_on

Axes3D.**set_axis_on**()

Do not hide all visual components of the x- and y-axis.

This reverts the effect of a prior *set_axis_off()* call. Whether the individual axis decorations are drawn is controlled by their respective visibility settings.

This is on by default.

mpl_toolkits.mplot3d.axes3d.Axes3D.grid

Axes3D.**grid**(*visible=True*, ***kwargs*)

Set / unset 3D grid.

> **Note**
>
> Currently, this function does not behave the same as *axes.Axes.grid*, but it is intended to eventually support that behavior.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.grid`

Axis

Axis limits and direction

get_zaxis	Return the ZAxis (*Axis*) instance.
get_xlim	Return the x-axis view limits.
set_xlim	Set the 3D x-axis view limits.
get_ylim	Return the y-axis view limits.
set_ylim	Set the 3D y-axis view limits.
get_zlim	Return the 3D z-axis view limits.
set_zlim	Set the 3D z-axis view limits.
get_w_lims	Get 3D world limits.
invert_xaxis	Invert the x-axis.
xaxis_inverted	Return whether the xaxis is oriented in the "inverse" direction.
invert_yaxis	Invert the y-axis.
yaxis_inverted	Return whether the yaxis is oriented in the "inverse" direction.
invert_zaxis	Invert the z-axis.
zaxis_inverted	Return whether the zaxis is oriented in the "inverse" direction.
get_xbound	Return the lower and upper x-axis bounds, in increasing order.
set_xbound	Set the lower and upper numerical bounds of the x-axis.
get_ybound	Return the lower and upper y-axis bounds, in increasing order.
set_ybound	Set the lower and upper numerical bounds of the y-axis.
get_zbound	Return the lower and upper z-axis bounds, in increasing order.
set_zbound	Set the lower and upper numerical bounds of the z-axis.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zaxis

Axes3D.**get_zaxis**()

Return the ZAxis (*Axis*) instance.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_xlim

Axes3D.**get_xlim**()

Return the x-axis view limits.

Returns

left, right

[(float, float)] The current x-axis limits in data coordinates.

See also

Axes.set_xlim
Axes.set_xbound, ***Axes.get_xbound***
Axes.invert_xaxis, ***Axes.xaxis_inverted***

Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_xlim

Axes3D.**set_xlim**(*left=None*, *right=None*, *, *emit=True*, *auto=False*, *view_margin=None*, *xmin=None*, *xmax=None*)

Set the 3D x-axis view limits.

Parameters

left

[float, optional] The left xlim in data coordinates. Passing *None* leaves the limit unchanged.

The left and right xlims may also be passed as the tuple (*left*, *right*) as the first positional argument (or as the *left* keyword argument).

right

[float, optional] The right xlim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the x-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

view_margin

[float, optional] The additional margin to apply to the limits.

xmin, xmax

[float, optional] They are equivalent to left and right respectively, and it is an error to pass both *xmin* and *left* or *xmax* and *right*.

Returns

left, right

[(float, float)] The new x-axis limits in data coordinates.

See also

get_xlim
set_xbound, ***get_xbound***
invert_xaxis, ***xaxis_inverted***

Notes

The *left* value may be greater than the *right* value, in which case the x-axis values will decrease from *left* to *right*.

Examples

```
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose `x` represents depth of the ocean in m. The x-axis limits might be set like the following so 5000 m depth is at the left of the plot and the surface, 0 m, is at the right.

```
>>> set_xlim(5000, 0)
```

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.set_xlim`

mpl_toolkits.mplot3d.axes3d.Axes3D.get_ylim

Axes3D.**get_ylim**()

Return the y-axis view limits.

Returns

bottom, top

[(float, float)] The current y-axis limits in data coordinates.

See also

Axes.set_ylim
Axes.set_ybound*, *Axes.get_ybound
Axes.invert_yaxis*, *Axes.yaxis_inverted

Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_ylim

Axes3D.**set_ylim**(*bottom=None*, *top=None*, *, *emit=True*, *auto=False*, *view_margin=None*, *ymin=None*, *ymax=None*)

Set the 3D y-axis view limits.

Parameters

bottom

[float, optional] The bottom ylim in data coordinates. Passing *None* leaves the limit unchanged.

The bottom and top ylims may also be passed as the tuple (*bottom*, *top*) as the first positional argument (or as the *bottom* keyword argument).

top

[float, optional] The top ylim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the y-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

view_margin

[float, optional] The additional margin to apply to the limits.

ymin, ymax

[float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

Returns

bottom, top

[(float, float)] The new y-axis limits in data coordinates.

See also

get_ylim
set_ybound*, *get_ybound
invert_yaxis*, *yaxis_inverted

Notes

The *bottom* value may be greater than the *top* value, in which case the y-axis values will decrease from *bottom* to *top*.

Examples

```
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose `y` represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_ylim(5000, 0)
```

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.set_ylim`

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zlim

Axes3D.**get_zlim**()

Return the 3D z-axis view limits.

Returns

left, right

[(float, float)] The current z-axis limits in data coordinates.

See also

set_zlim
set_zbound, *get_zbound*
invert_zaxis, *zaxis_inverted*

Notes

The z-axis may be inverted, in which case the *left* value will be greater than the *right* value.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zlim

Axes3D.**set_zlim**(*bottom=None*, *top=None*, *, *emit=True*, *auto=False*, *view_margin=None*, *zmin=None*, *zmax=None*)

Set the 3D z-axis view limits.

Parameters

bottom

[float, optional] The bottom zlim in data coordinates. Passing *None* leaves the limit unchanged.

The bottom and top zlims may also be passed as the tuple (*bottom*, *top*) as the first positional argument (or as the *bottom* keyword argument).

top

[float, optional] The top zlim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the z-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

view_margin

[float, optional] The additional margin to apply to the limits.

zmin, zmax

[float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both *zmin* and *bottom* or *zmax* and *top*.

Returns

bottom, top

[(float, float)] The new z-axis limits in data coordinates.

See also

get_zlim
set_zbound, ***get_zbound***
invert_zaxis, ***zaxis_inverted***

Notes

The *bottom* value may be greater than the *top* value, in which case the z-axis values will decrease from *bottom* to *top*.

Examples

```
>>> set_zlim(bottom, top)
>>> set_zlim((bottom, top))
>>> bottom, top = set_zlim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_zlim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the z-axis. For example, suppose `z` represents depth of the ocean in m. The z-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_zlim(5000, 0)
```

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.set_zlim`

mpl_toolkits.mplot3d.axes3d.Axes3D.get_w_lims

`Axes3D.`**`get_w_lims`**`()`

Get 3D world limits.

mpl_toolkits.mplot3d.axes3d.Axes3D.invert_xaxis

`Axes3D.`**`invert_xaxis`**`()`

Invert the x-axis.

See also

xaxis_inverted
get_xlim, *set_xlim*
get_xbound, *set_xbound*

mpl_toolkits.mplot3d.axes3d.Axes3D.xaxis_inverted

`Axes3D.`**`xaxis_inverted`**`()`

Return whether the xaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

mpl_toolkits.mplot3d.axes3d.Axes3D.invert_yaxis

`Axes3D.`**`invert_yaxis`**`()`

Invert the y-axis.

See also

yaxis_inverted
get_ylim, *set_ylim*
get_ybound, *set_ybound*

mpl_toolkits.mplot3d.axes3d.Axes3D.yaxis_inverted

`Axes3D.`**`yaxis_inverted`**`()`

Return whether the yaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

mpl_toolkits.mplot3d.axes3d.Axes3D.invert_zaxis

Axes3D.**invert_zaxis**()

Invert the z-axis.

See also

zaxis_inverted
get_zlim, *set_zlim*
get_zbound, *set_zbound*

mpl_toolkits.mplot3d.axes3d.Axes3D.zaxis_inverted

Axes3D.**zaxis_inverted**()

Return whether the zaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_xbound

Axes3D.**get_xbound**()

Return the lower and upper x-axis bounds, in increasing order.

See also

set_xbound
get_xlim, *set_xlim*
invert_xaxis, *xaxis_inverted*

mpl_toolkits.mplot3d.axes3d.Axes3D.set_xbound

Axes3D.**set_xbound**(*lower=None*, *upper=None*, *view_margin=None*)

Set the lower and upper numerical bounds of the x-axis.

This method will honor axis inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscalex_on()*).

Parameters

lower, upper

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

view_margin

[float or None] The margin to apply to the bounds. If *None*, the margin is handled by `set_xlim`.

See also

get_xbound
get_xlim*, *set_xlim
invert_xaxis*, *xaxis_inverted

mpl_toolkits.mplot3d.axes3d.Axes3D.get_ybound

`Axes3D.`**`get_ybound`**`()`

Return the lower and upper y-axis bounds, in increasing order.

See also

set_ybound
get_ylim*, *set_ylim
invert_yaxis*, *yaxis_inverted

mpl_toolkits.mplot3d.axes3d.Axes3D.set_ybound

`Axes3D.`**`set_ybound`**`(`*lower=None*, *upper=None*, *view_margin=None*`)`

Set the lower and upper numerical bounds of the y-axis.

This method will honor axis inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscaley_on()`).

Parameters

lower, upper

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

view_margin

[float or None] The margin to apply to the bounds. If *None*, the margin is handled by `set_ylim`.

See also

get_ybound
get_ylim*, *set_ylim
invert_yaxis*, *yaxis_inverted

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zbound

Axes3D.**get_zbound**()

Return the lower and upper z-axis bounds, in increasing order.

See also

set_zbound
get_zlim, *set_zlim*
invert_zaxis, *zaxis_inverted*

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zbound

Axes3D.**set_zbound**(*lower=None*, *upper=None*, *view_margin=None*)

Set the lower and upper numerical bounds of the z-axis. This method will honor axis inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscaley_on()*).

Parameters

lower, upper

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

view_margin

[float or None] The margin to apply to the bounds. If *None*, the margin is handled by *set_zlim*.

See also

get_zbound
get_zlim, *set_zlim*
invert_zaxis, *zaxis_inverted*

Axis labels and title

set_zlabel	Set zlabel.
get_zlabel	Get the z-label text string.
set_title	Set a title for the Axes.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zlabel

Axes3D.**set_zlabel**(*zlabel*, *fontdict=None*, *labelpad=None*, ***kwargs*)

Set zlabel. See doc for *set_ylabel* for description.

Examples using mpl_toolkits.mplot3d.axes3d.Axes3D.set_zlabel

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zlabel

Axes3D.**get_zlabel**()

Get the z-label text string.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_title

Axes3D.**set_title**(*label*, *fontdict=None*, *loc='center'*, ***kwargs*)

Set a title for the Axes.

Set one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[str] Text to use for the title

fontdict

[dict]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_title(..., **fontdict)`.

A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[{'center', 'left', 'right'}, default: *rcParams["axes.titlelocation"]* (default: `'center'`)] Which title to set.

y

[float, default: *rcParams["axes.titley"]* (default: None)] Vertical Axes location for the title (1.0 is the top). If None (the default) and *rcParams["axes.titley"]* (default: None) is also None, y is determined automatically to avoid decorators on the Axes.

pad

[float, default: *rcParams["axes.titlepad"]* (default: 6.0)] The offset of the title from the top of the Axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

****kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.set_title`

Axis scales

set_xscale	Set the x-axis scale.
set_yscale	Set the y-axis scale.
set_zscale	Set the z-axis scale.
get_zscale	Return the zaxis' scale (as a str).

mpl_toolkits.mplot3d.axes3d.Axes3D.set_xscale

Axes3D.**set_xscale**(*value*, ***kwargs*)

Set the x-axis scale.

Parameters

value

[{"linear"}] The axis scale type to apply. 3D Axes currently only support linear scales; other scales yield nonsensical results.

****kwargs**

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_yscale

Axes3D.**set_yscale**(*value*, ***kwargs*)

Set the y-axis scale.

Parameters

value

[{"linear"}] The axis scale type to apply. 3D Axes currently only support linear scales; other scales yield nonsensical results.

****kwargs**

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zscale

Axes3D.**set_zscale**(*value*, ***kwargs*)

Set the z-axis scale.

Parameters

value

[{"linear"}] The axis scale type to apply. 3D Axes currently only support linear scales; other scales yield nonsensical results.

****kwargs**

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zscale

Axes3D.**get_zscale**()

Return the zaxis' scale (as a str).

Autoscaling and margins

get_zmargin	Retrieve autoscaling margin of the z-axis.
set_zmargin	Set padding of Z data limits prior to autoscaling.
margins	Set or retrieve autoscaling margins.
autoscale	Convenience method for simple axis view autoscaling.
autoscale_view	Autoscale the view limits using the data limits.
set_autoscalez_on	Set whether the zaxis is autoscaled when drawing or by *Axes.autoscale_view*.

continues on next page

Table 314 – continued from previous page

get_autoscalez_on	Return whether the zaxis is autoscaled.
auto_scale_xyz	

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zmargin

Axes3D.**get_zmargin**()

Retrieve autoscaling margin of the z-axis.

Added in version 3.9.

Returns

zmargin

[float]

See also

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zmargin

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zmargin

Axes3D.**set_zmargin**(*m*)

Set padding of Z data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling. If *m* is negative, this will clip the data range instead of expanding it.

For example, if your data is in the range [0, 2], a margin of 0.1 will result in a range [-0.2, 2.2]; a margin of -0.1 will result in a range of [0.2, 1.8].

Parameters

m

[float greater than -0.5]

mpl_toolkits.mplot3d.axes3d.Axes3D.margins

Axes3D.**margins**(**margins*, *x=None*, *y=None*, *z=None*, *tight=True*)

Set or retrieve autoscaling margins.

See *Axes.margins* for full documentation. Because this function applies to 3D Axes, it also takes a *z* argument, and returns `(xmargin, ymargin, zmargin)`.

mpl_toolkits.mplot3d.axes3d.Axes3D.autoscale

Axes3D.**autoscale**(*enable=True*, *axis='both'*, *tight=None*)

Convenience method for simple axis view autoscaling.

See *Axes.autoscale* for full documentation. Because this function applies to 3D Axes, *axis* can also be set to 'z', and setting *axis* to 'both' autoscales all three axes.

mpl_toolkits.mplot3d.axes3d.Axes3D.autoscale_view

Axes3D.**autoscale_view**(*tight=None*, *scalex=True*, *scaley=True*, *scalez=True*)

Autoscale the view limits using the data limits.

See *Axes.autoscale_view* for full documentation. Because this function applies to 3D Axes, it also takes a *scalez* argument.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_autoscalez_on

Axes3D.**set_autoscalez_on**(*b*)

Set whether the zaxis is autoscaled when drawing or by *Axes.autoscale_view*.

If b is None, then the value is not changed.

Parameters

b

[bool]

mpl_toolkits.mplot3d.axes3d.Axes3D.get_autoscalez_on

Axes3D.**get_autoscalez_on**()

Return whether the zaxis is autoscaled.

mpl_toolkits.mplot3d.axes3d.Axes3D.auto_scale_xyz

Axes3D.**auto_scale_xyz**(*X*, *Y*, *Z=None*, *had_data=None*)

Aspect ratio

set_aspect	Set the aspect ratios.
set_box_aspect	Set the Axes box aspect.
apply_aspect	Adjust the Axes for a specified data aspect ratio.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_aspect

Axes3D.**set_aspect**(*aspect*, *adjustable=None*, *anchor=None*, *share=False*)

Set the aspect ratios.

Parameters

aspect

[{'auto', 'equal', 'equalxy', 'equalxz', 'equalyz'}] Possible values:

value	description
'auto'	automatic; fill the position rectangle with data.
'equal'	adapt all the axes to have equal aspect ratios.
'equalxy'	adapt the x and y axes to have equal aspect ratios.
'equalxz'	adapt the x and z axes to have equal aspect ratios.
'equalyz'	adapt the y and z axes to have equal aspect ratios.

adjustable

[None or {'box', 'datalim'}, optional] If not *None*, this defines which parameter will be adjusted to meet the required aspect. See *set_adjustable* for further details.

anchor

[None or str or 2-tuple of float, optional] If not *None*, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See *set_anchor* for further details.

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also

mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.set_aspect`

mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect

Axes3D.**set_box_aspect**(*aspect*, *, *zoom=1*)

Set the Axes box aspect.

The box aspect is the ratio of height to width in display units for each face of the box when viewed perpendicular to that face. This is not to be confused with the data aspect (see *set_aspect*). The default ratios are 4:4:3 (x:y:z).

To simulate having equal aspect in data space, set the box aspect to match your data range in each dimension.

zoom controls the overall size of the Axes3D in the figure.

Parameters

aspect

[3-tuple of floats or None] Changes the physical dimensions of the Axes3D, such that the ratio of the axis lengths in display units is x:y:z. If None, defaults to (4, 4, 3).

zoom

[float, default: 1] Control overall size of the Axes3D in the figure. Must be > 0.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect`

mpl_toolkits.mplot3d.axes3d.Axes3D.apply_aspect

Axes3D.**apply_aspect**(*position=None*)

Adjust the Axes for a specified data aspect ratio.

Depending on *get_adjustable* this will modify either the Axes box (position) or the view limits. In the former case, *get_anchor* will affect the position.

Parameters

position

[None or .Bbox]

Note

This parameter exists for historic reasons and is considered internal. End users should not use it.

If not `None`, this defines the position of the Axes within the figure as a Bbox. See *get_position* for further details.

See also

matplotlib.axes.Axes.set_aspect

For a description of aspect ratio handling.

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor

Set the position in case of extra space.

matplotlib.figure.Figure.draw_without_rendering

Update all stale components of a figure.

Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

An alternative with a broader scope is *Figure.draw_without_rendering*, which updates all stale components of a figure, not only the positioning / view limits of a single Axes.

Examples

A typical usage example would be the following. *imshow* sets the aspect to 1, but adapting the Axes position and extent to reflect this is deferred until rendering for performance reasons. If you want to know the Axes size before, you need to call *apply_aspect* to get the correct values.

```
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.zeros((3, 3)))
>>> ax.bbox.width, ax.bbox.height
(496.0, 369.59999999999997)
>>> ax.apply_aspect()
>>> ax.bbox.width, ax.bbox.height
(369.59999999999997, 369.59999999999997)
```

Ticks

tick_params	Convenience method for changing the appearance of ticks and tick labels.
set_zticks	Set the zaxis' tick locations and optionally tick labels.
get_zticks	Return the zaxis' tick locations in data coordinates.

continues on next page

Table 316 – continued from previous page

set_zticklabels	[*Discouraged*] Set the zaxis' tick labels with list of string labels.
get_zticklines	Return the zaxis' tick lines as a list of *Line2D*s.
get_zgridlines	Return the zaxis' grid lines as a list of *Line2D*s.
get_zminorticklabels	Return the zaxis' minor tick labels, as a list of *Text*.
get_zmajorticklabels	Return the zaxis' major tick labels, as a list of *Text*.
zaxis_date	Set up axis ticks and labels to treat data along the zaxis as dates.

mpl_toolkits.mplot3d.axes3d.Axes3D.tick_params

Axes3D.**tick_params**(*axis='both'*, ***kwargs*)

Convenience method for changing the appearance of ticks and tick labels.

See *Axes.tick_params* for full documentation. Because this function applies to 3D Axes, *axis* can also be set to 'z', and setting *axis* to 'both' autoscales all three axes.

Also, because of how Axes3D objects are drawn very differently from regular 2D Axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

Note

Axes3D currently ignores some of these settings.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zticks

Axes3D.**set_zticks**(*ticks*, *labels=None*, ***, *minor=False*, ***kwargs*)

Set the zaxis' tick locations and optionally tick labels.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

Parameters

ticks

[1D array-like] Array of tick locations (either floats or in axis units). The axis *Locator* is replaced by a *FixedLocator*.

Pass an empty list (`set_ticks([])`) to remove all ticks.

Some tick formatters will not label arbitrary tick positions; e.g. log formatters only label decade ticks by default. In such a case you can set a formatter explicitly on the axis using *Axis.set_major_formatter* or provide formatted *labels* yourself.

labels

[list of str, optional] Tick labels for each location in *ticks*; must have the same length as *ticks*. If set, the labels are used as is, via a *FixedFormatter*. If not set, the labels are generated using the axis tick *Formatter*.

minor

[bool, default: False] If `False`, set only the major ticks; if `True`, only the minor ticks.

****kwargs**

Text properties for the labels. Using these is only allowed if you pass *labels*. In other cases, please use *tick_params*.

Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zticks

`Axes3D.`**`get_zticks`**(*, *minor=False*)

Return the zaxis' tick locations in data coordinates.

The locations are not clipped to the current axis limits and hence may contain locations that are not visible in the output.

Parameters

minor

[bool, default: False] True to return the minor tick directions, False to return the major tick directions.

Returns

array of tick locations

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zticklabels

`Axes3D.`**`set_zticklabels`**(*labels*, *, *minor=False*, *fontdict=None*, ***kwargs*)

[*Discouraged*] Set the zaxis' tick labels with list of string labels.

Discouraged

The use of this method is discouraged, because of the dependency on tick positions. In most cases, you'll want to use `Axes.set_[x/y/z]ticks(positions, labels)` or `Axes3D.set_zticks` instead.

If you are using this method, you should always fix the tick positions before, e.g. by using *Axes3D.set_zticks* or by explicitly setting a *FixedLocator*. Otherwise, ticks are free to move and the labels may end up in unexpected positions.

Parameters

labels

[sequence of str or of *Text*s] Texts for labeling each tick location in the sequence set by *Axes3D.set_zticks*; the number of labels must match the number of locations. The labels are used as is, via a *FixedFormatter* (without further formatting).

minor

[bool] If True, set minor ticks instead of major ticks.

fontdict

[dict, optional]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_ticklabels(..., **fontdict)`.

A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

****kwargs**

Text properties.

Warning

This only sets the properties of the current ticks, which is only sufficient for static plots.

Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).

Use *set_tick_params* instead if possible.

Returns

list of *Text*s

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zticklines

`Axes3D.`**`get_zticklines`**(*minor=False*)

Return the zaxis' tick lines as a list of *Line2D*s.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zgridlines

`Axes3D.`**`get_zgridlines`**()

Return the zaxis' grid lines as a list of *Line2D*s.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zminorticklabels

`Axes3D.`**`get_zminorticklabels`**()

Return the zaxis' minor tick labels, as a list of *Text*.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_zmajorticklabels

`Axes3D.`**`get_zmajorticklabels`**()

Return the zaxis' major tick labels, as a list of *Text*.

mpl_toolkits.mplot3d.axes3d.Axes3D.zaxis_date

`Axes3D.`**`zaxis_date`**(*tz=None*)

Set up axis ticks and labels to treat data along the zaxis as dates.

Parameters

tz

[str or `datetime.tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] The timezone used to create date labels.

Notes

This function is merely provided for completeness, but 3D Axes do not support dates for ticks, and so this may not work as expected.

Units

convert_zunits	For artists in an Axes, if the zaxis has units support, convert z using zaxis unit type

mpl_toolkits.mplot3d.axes3d.Axes3D.convert_zunits

Axes3D.**convert_zunits**(*z*)

For artists in an Axes, if the zaxis has units support, convert z using zaxis unit type

Adding artists

add_collection3d	Add a 3D collection object to the plot.

mpl_toolkits.mplot3d.axes3d.Axes3D.add_collection3d

Axes3D.**add_collection3d**(*col*, *zs=0*, *zdir='z'*, *autolim=True*, *, *axlim_clip=False*)

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information, *zs* and *zdir*.

Supported 2D collection types are:

- *PolyCollection*
- *LineCollection*
- *PatchCollection* (currently not supporting *autolim*)

Parameters

col

[*Collection*] A 2D collection object.

zs

[float or array-like, default: 0] The z-positions to be used for the 2D objects.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use for the z-positions.

autolim

[bool, default: True] Whether to update the data limits.

axlim_clip

[bool, default: False] Whether to hide the scatter points outside the axes view limits.

Added in version 3.10.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.add_collection3d`

Sharing

sharez	Share the z-axis with *other*.
shareview	Share the view angles with *other*.

mpl_toolkits.mplot3d.axes3d.Axes3D.sharez

Axes3D.**sharez**(*other*)

Share the z-axis with *other*.

This is equivalent to passing `sharez=other` when constructing the Axes, and cannot be used if the z-axis is already being shared with another Axes. Note that it is not possible to unshare axes.

mpl_toolkits.mplot3d.axes3d.Axes3D.shareview

Axes3D.**shareview**(*other*)

Share the view angles with *other*.

This is equivalent to passing `shareview=other` when constructing the Axes, and cannot be used if the view angles are already being shared with another Axes. Note that it is not possible to unshare axes.

Interactive

can_zoom	Return whether this Axes supports the zoom box button functionality.
can_pan	Return whether this Axes supports any pan/zoom button functionality.
disable_mouse_rotation	Disable mouse buttons for 3D rotation, panning, and zooming.
mouse_init	Set the mouse buttons for 3D rotation and zooming.
drag_pan	Called when the mouse moves during a pan operation.
format_zdata	Return *z* string formatted.
format_coord	Return a string giving the current view rotation angles, or the x, y, z coordinates of the point on the nearest axis pane underneath the mouse cursor, depending on the mouse button pressed.

mpl_toolkits.mplot3d.axes3d.Axes3D.can_zoom

Axes3D.**can_zoom**()

Return whether this Axes supports the zoom box button functionality.

mpl_toolkits.mplot3d.axes3d.Axes3D.can_pan

Axes3D.**can_pan**()

Return whether this Axes supports any pan/zoom button functionality.

mpl_toolkits.mplot3d.axes3d.Axes3D.disable_mouse_rotation

Axes3D.**disable_mouse_rotation**()

Disable mouse buttons for 3D rotation, panning, and zooming.

mpl_toolkits.mplot3d.axes3d.Axes3D.mouse_init

Axes3D.**mouse_init**(*rotate_btn=1*, *pan_btn=2*, *zoom_btn=3*)

Set the mouse buttons for 3D rotation and zooming.

Parameters

rotate_btn

[int or list of int, default: 1] The mouse button or buttons to use for 3D rotation of the Axes.

pan_btn

[int or list of int, default: 2] The mouse button or buttons to use to pan the 3D Axes.

zoom_btn

[int or list of int, default: 3] The mouse button or buttons to use to zoom the 3D Axes.

mpl_toolkits.mplot3d.axes3d.Axes3D.drag_pan

Axes3D.**drag_pan**(*button*, *key*, *x*, *y*)

Called when the mouse moves during a pan operation.

Parameters

button

[*MouseButton*] The pressed mouse button.

key

[str or None] The pressed key, if any.

x, y

[float] The mouse coordinates in display coords.

Notes

This is intended to be overridden by new projection types.

mpl_toolkits.mplot3d.axes3d.Axes3D.format_zdata

Axes3D.**format_zdata**(*z*)

Return *z* string formatted. This function will use the `fmt_zdata` attribute if it is callable, else will fall back on the zaxis major formatter

mpl_toolkits.mplot3d.axes3d.Axes3D.format_coord

Axes3D.**format_coord**(*xv*, *yv*, *renderer=None*)

Return a string giving the current view rotation angles, or the x, y, z coordinates of the point on the nearest axis pane underneath the mouse cursor, depending on the mouse button pressed.

Projection and perspective

view_init	Set the elevation and azimuth of the Axes in degrees (not radians).
set_proj_type	Set the projection type.
get_proj	Create the projection matrix from the current viewing position.
set_top_view	

mpl_toolkits.mplot3d.axes3d.Axes3D.view_init

Axes3D.**view_init**(*elev=None*, *azim=None*, *roll=None*, *vertical_axis='z'*, *share=False*)

Set the elevation and azimuth of the Axes in degrees (not radians).

This can be used to rotate the Axes programmatically.

To look normal to the primary planes, the following elevation and azimuth angles can be used. A roll angle of 0, 90, 180, or 270 deg will rotate these views while keeping the axes at right angles.

view plane	elev	azim
XY	90	-90
XZ	0	-90
YZ	0	0
-XY	-90	90
-XZ	0	90
-YZ	0	180

Parameters

elev

[float, default: None] The elevation angle in degrees rotates the camera above the plane pierced by the vertical axis, with a positive angle corresponding to a location above that plane. For example, with the default vertical axis of 'z', the elevation defines the angle of the camera location above the x-y plane. If None, then the initial value as specified in the *Axes3D* constructor is used.

azim

[float, default: None] The azimuthal angle in degrees rotates the camera about the vertical axis, with a positive angle corresponding to a right-handed rotation. For example, with the default vertical axis of 'z', a positive azimuth rotates the camera about the origin from its location along the +x axis towards the +y axis. If None, then the initial value as specified in the *Axes3D* constructor is used.

roll

[float, default: None] The roll angle in degrees rotates the camera about the viewing axis. A positive angle spins the camera clockwise, causing the scene to rotate counter-clockwise. If None, then the initial value as specified in the *Axes3D* constructor is used.

vertical_axis

[{"z", "x", "y"}, default: "z"] The axis to align vertically. *azim* rotates about this axis.

share

[bool, default: False] If `True`, apply the settings to all Axes with shared views.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D.view_init`

mpl_toolkits.mplot3d.axes3d.Axes3D.set_proj_type

`Axes3D.`**`set_proj_type`**(*proj_type*, *focal_length=None*)

Set the projection type.

Parameters

proj_type

[{'persp', 'ortho'}] The projection type.

focal_length

[float, default: None] For a projection type of 'persp', the focal length of the virtual camera. Must be > 0. If None, defaults to 1. The focal length can be computed from a desired Field Of View via the equation: focal_length = 1/tan(FOV/2)

mpl_toolkits.mplot3d.axes3d.Axes3D.get_proj

Axes3D.**get_proj**()

Create the projection matrix from the current viewing position.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_top_view

Axes3D.**set_top_view**()

Drawing

draw	Draw the Artist (and its children) using the given renderer.
get_tightbbox	Return the tight bounding box of the Axes, including axis and their decorators (xlabel, title, etc).

mpl_toolkits.mplot3d.axes3d.Axes3D.draw

Axes3D.**draw**(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_tightbbox

Axes3D.**get_tightbbox**(*renderer=None*, ***, *call_axes_locator=True*, *bbox_extra_artists=None*, *for_layout_only=False*)

Return the tight bounding box of the Axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of the Axes are included in the tight bounding box.

call_axes_locator

[bool, default: True] If *call_axes_locator* is `False`, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box. `call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the Axes bbox.

for_layout_only

[default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

Returns

BboxBase

Bounding box in figure pixel coordinates.

matplotlib.axes.Axes.get_window_extent
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.Spine.get_window_extent

Aliases and deprecated methods

set_zlim3d	Alias for *set_zlim*.
stem3D	Create a 3D stem plot.
text3D	Add the text *s* to the 3D Axes at location *x*, *y*, *z* in data coordinates.

mpl_toolkits.mplot3d.axes3d.Axes3D.set_zlim3d

Axes3D.**set_zlim3d**(*bottom=None*, *top=None*, *, *emit=True*, *auto=False*, *view_margin=None*, *zmin=None*, *zmax=None*)

Alias for *set_zlim*.

mpl_toolkits.mplot3d.axes3d.Axes3D.stem3D

Axes3D.**stem3D**(*x*, *y*, *z*, *, *linefmt='C0-'*, *markerfmt='C0o'*, *basefmt='C3-'*, *bottom=0*, *label=None*, *orientation='z'*, *axlim_clip=False*, *data=None*)

Create a 3D stem plot.

A stem plot draws lines perpendicular to a baseline, and places markers at the heads. By default, the baseline is defined by *x* and *y*, and stems are drawn vertically from *bottom* to *z*.

Parameters

x, y, z

[array-like] The positions of the heads of the stems. The stems are drawn along the *orientation*-direction from the baseline at *bottom* (in the *orientation*-coordinate) to the heads. By default, the *x* and *y* positions are used for the baseline and *z* for the head position, but this can be changed by *orientation*.

linefmt

[str, default: 'C0-'] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

Character	Line Style
`'-'`	solid line
`'--'`	dashed line
`'-.'`	dash-dot line
`':'`	dotted line

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

markerfmt

[str, default: 'C0o'] A string defining the properties of the markers at the stem heads.

basefmt

[str, default: 'C3-'] A format string defining the properties of the baseline.

bottom

[float, default: 0] The position of the baseline, in *orientation*-coordinates.

label

[str, optional] The label to use for the stems in legends.

orientation

[{'x', 'y', 'z'}, default: 'z'] The direction along which stems are drawn.

axlim_clip

[bool, default: False] Whether to hide stems that are outside the axes limits.

Added in version 3.10.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` if `s` is a key in `data`.

Returns

StemContainer

The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

Examples

mpl_toolkits.mplot3d.axes3d.Axes3D.text3D

Axes3D.**text3D**(*x*, *y*, *z*, *s*, *zdir=None*, *, *axlim_clip=False*, ***kwargs*)

Add the text *s* to the 3D Axes at location *x*, *y*, *z* in data coordinates.

Parameters

x, y, z

[float] The position to place the text.

s

[str] The text.

zdir

[{'x', 'y', 'z', 3-tuple}, optional] The direction to be used as the z-direction. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide text that is outside the axes view limits.

Added in version 3.10.

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.text*.

Returns

Text3D

The created *Text3D* instance.

Other

get_axis_position	
add_contour_set	
add_contourf_set	
update_datalim	Not implemented in *Axes3D*.

mpl_toolkits.mplot3d.axes3d.Axes3D.get_axis_position

Axes3D.**get_axis_position**()

mpl_toolkits.mplot3d.axes3d.Axes3D.add_contour_set

Axes3D.**add_contour_set**(*cset*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, *axlim_clip=False*)

mpl_toolkits.mplot3d.axes3d.Axes3D.add_contourf_set

Axes3D.**add_contourf_set**(*cset*, *zdir='z'*, *offset=None*, ***, *axlim_clip=False*)

mpl_toolkits.mplot3d.axes3d.Axes3D.update_datalim

Axes3D.**update_datalim**(*xys*, ***kwargs*)

Not implemented in *Axes3D*.

Sample 3D data

axes3d.get_test_data	Return a tuple X, Y, Z with a test data set.

mpl_toolkits.mplot3d.axes3d.get_test_data

mpl_toolkits.mplot3d.axes3d.**get_test_data**(*delta=0.05*)

Return a tuple X, Y, Z with a test data set.

Examples using `mpl_toolkits.mplot3d.axes3d.get_test_data`

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D`

Note

pyplot cannot be used to add content to 3D plots, because its function signatures are strictly 2D and cannot handle the additional information needed for 3D. Instead, use the explicit API by calling the respective methods on the *Axes3D* object.

axes3d

Note

3D plotting in Matplotlib is still not as mature as the 2D case. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

axes3d.Axes3D (fig[, rect, elev, azim, roll, ...]) 3D Axes object.

axis3d

Note

See `mpl_toolkits.mplot3d.axis3d._axinfo` for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel colors). Historically, axis3d has suffered from having hard-coded constants that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

axis3d.Axis(axes, *[, rotate_label])	An Axis class for the 3D plots.

mpl_toolkits.mplot3d.axis3d.Axis

class mpl_toolkits.mplot3d.axis3d.**Axis**(*axes*, *, *rotate_label=None*, ***kwargs*)

Bases: *XAxis*

An Axis class for the 3D plots.

Parameters

axes

[*Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

clear

[bool, default: True] Whether to clear the Axis on creation. This is not required, e.g., when creating an Axis as part of an Axes, as `Axes.clear` will call `Axis.clear`. .. versionadded:: 3.8

active_pane()

property adir

[*Deprecated*]

Notes

Deprecated since version 3.6:

property d_interval

[*Deprecated*]

Notes

Deprecated since version 3.6: Use get_data_interval instead.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

draw_grid(*renderer*)

draw_pane(*renderer*)

Draw pane.

Parameters

renderer

[*RendererBase* subclass]

get_label_position()

Get the label position.

Returns

str

[{'lower', 'upper', 'both', 'default', 'none'}] The position of the axis label.

get_major_ticks(*numticks=None*)

Return the list of major *Tick*s.

> **Warning**
>
> Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that changes to individual ticks will not survive if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Working on the individual ticks is a method of last resort. Use *set_tick_params* instead if possible.

get_minor_ticks(*numticks=None*)

Return the list of minor *Tick*s.

> **Warning**
>
> Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that changes to individual ticks will not survive if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Working on the individual ticks is a method of last resort. Use *set_tick_params* instead if possible.

get_rotate_label(*text*)

get_ticks_position()

Get the ticks position.

Returns

str

[{'lower', 'upper', 'both', 'default', 'none'}] The position of the bolded axis lines, ticks, and tick labels.

get_tightbbox(*renderer=None*, *, *for_layout_only=False*)

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offset-Text.

If *for_layout_only* is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.

init3d()

[*Deprecated*]

Notes

Deprecated since version 3.6:

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *converter=<UNSET>*, *data_interval=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *inverted=<UNSET>*, *label=<UNSET>*, *label_coords=<UNSET>*, *label_position=<UNSET>*, *label_text=<UNSET>*, *major_formatter=<UNSET>*, *major_locator=<UNSET>*, *minor_formatter=<UNSET>*, *minor_locator=<UNSET>*, *mouseover=<UNSET>*, *pane_color=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *remove_overlapping_locs=<UNSET>*, *rotate_label=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *tick_params=<UNSET>*, *ticklabels=<UNSET>*, *ticks=<UNSET>*, *ticks_position=<UNSET>*, *transform=<UNSET>*, *units=<UNSET>*, *url=<UNSET>*, *view_interval=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

zorder	float

set_label_position(*position*)

Set the label position.

Parameters

position

[{'lower', 'upper', 'both', 'default', 'none'}] The position of the axis label.

set_pane_color(*color*, *alpha=None*)

Set pane color.

Parameters

color

[*color*] Color for axis pane.

alpha

[float, optional] Alpha value for axis pane. If None, base it on *color*.

set_rotate_label(*val*)

Whether to rotate the axis label: True, False or None. If set to None the label will be rotated if longer than 4 chars.

set_ticks_position(*position*)

Set the ticks position.

Parameters

position

[{'lower', 'upper', 'both', 'default', 'none'}] The position of the bolded axis lines, ticks, and tick labels.

property v_interval

[*Deprecated*]

Notes

Deprecated since version 3.6: Use get_view_interval instead.

art3d

art3d.Line3D(xs, ys, zs, *args[, axlim_clip])	3D line object.
art3d.Line3DCollection(lines[, axlim_clip])	A collection of 3D lines.
art3d.Patch3D(*args[, zs, zdir, axlim_clip])	3D patch object.
art3d.Patch3DCollection(*args[, zs, zdir, ...])	A collection of 3D patches.
art3d.Path3DCollection(*args[, zs, zdir, ...])	A collection of 3D paths.
art3d.PathPatch3D(path, *[, zs, zdir, ...])	3D PathPatch object.
art3d.Poly3DCollection(verts, *args[, ...])	A collection of 3D polygons.
art3d.Text3D([x, y, z, text, zdir, axlim_clip])	Text object with 3D position and direction.
art3d.get_dir_vector(zdir)	Return a direction vector.
art3d.juggle_axes(xs, ys, zs, zdir)	Reorder coordinates so that 2D *xs*, *ys* can be plotted in the plane orthogonal to *zdir*.
art3d.line_2d_to_3d(line[, zs, zdir, axlim_clip])	Convert a *Line2D* to a *Line3D* object.
art3d.line_collection_2d_to_3d(col[, zs, ...])	Convert a *LineCollection* to a *Line3DCollection* object.
art3d.patch_2d_to_3d(patch[, z, zdir, ...])	Convert a *Patch* to a *Patch3D* object.
art3d.patch_collection_2d_to_3d(col[, zs, ...])	Convert a *PatchCollection* into a *Patch3DCollection* object (or a *Path-Collection* into a *Path3DCollection* object).
art3d.pathpatch_2d_to_3d(pathpatch[, z, zdir])	Convert a *PathPatch* to a *PathPatch3D* object.
art3d.poly_collection_2d_to_3d(col[, zs, ...])	Convert a *PolyCollection* into a *Poly3DCollection* object.

continues on next page

Table 328 – continued from previous page

art3d.rotate_axes(xs, ys, zs, zdir)	Reorder coordinates so that the axes are rotated with *zdir* along the original z axis.
art3d.text_2d_to_3d(obj[, z, zdir, axlim_clip])	Convert a Text to a Text3D object.

mpl_toolkits.mplot3d.art3d.Line3D

class mpl_toolkits.mplot3d.art3d.**Line3D**(*xs*, *ys*, *zs*, **args*, *axlim_clip=False*, ***kwargs*)

Bases: Line2D

3D line object.

> **Note**
>
> Use get_data_3d to obtain the data associated with the line. get_data, get_xdata, and get_ydata return the x- and y-coordinates of the projected 2D-line, not the x- and y-data of the 3D-line. Similarly, use set_data_3d to set the data, not set_data, set_xdata, and set_ydata.

Parameters

xs

[array-like] The x-data to be plotted.

ys

[array-like] The y-data to be plotted.

zs

[array-like] The z-data to be plotted.

***args, **kwargs**

Additional arguments are passed to Line2D.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_data_3d()

Get the current data

Returns

verts3d

[length-3 tuple or array-like] The current data as a tuple or array-like.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *dash_capstyle=<UNSET>*, *dash_joinstyle=<UNSET>*, *dashes=<UNSET>*, *data=<UNSET>*, *data_3d=<UNSET>*, *drawstyle=<UNSET>*, *fillstyle=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *marker=<UNSET>*, *markeredgecolor=<UNSET>*, *markeredgewidth=<UNSET>*, *markerfacecolor=<UNSET>*, *markerfacecoloralt=<UNSET>*, *markersize=<UNSET>*, *markevery=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *solid_capstyle=<UNSET>*, *solid_joinstyle=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xdata=<UNSET>*, *ydata=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

xdata	1D array
ydata	1D array
zorder	float

set_3d_properties(*zs=0*, *zdir='z'*, *axlim_clip=False*)

Set the *z* position and direction of the line.

Parameters

zs

[float or array of floats] The location along the *zdir* axis in 3D space to position the line.

zdir

[{'x', 'y', 'z'}] Plane to plot line orthogonal to. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide lines with an endpoint outside the axes view limits.

set_data_3d(**args*)

Set the x, y and z data

Parameters

x

[array-like] The x-data to be plotted.

y

[array-like] The y-data to be plotted.

z

[array-like] The z-data to be plotted.

Notes

Accepts x, y, z arguments or a single array-like (x, y, z)

Examples using `mpl_toolkits.mplot3d.art3d.Line3D`

mpl_toolkits.mplot3d.art3d.Line3DCollection

class mpl_toolkits.mplot3d.art3d.**Line3DCollection**(*lines*, *axlim_clip=False*, ***kwargs*)

Bases: *LineCollection*

A collection of 3D lines.

Parameters

segments

[list of (N, 2) array-like] A sequence `[line0, line1, ...]` where each line is a (N, 2)-shape array-like containing points:

```
line0 = [(x0, y0), (x1, y1), ...]
```

Each line can contain a different number of points.

linewidths

[float or list of float, default: *rcParams["lines.linewidth"]* (default: `1.5`)] The width of each line in points.

colors

[*color* or list of color, default: *rcParams["lines.color"]* (default: `'C0'`)] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds

[bool or list of bool, default: *rcParams["lines.antialiased"]* (default: `True`)] Whether to use antialiasing for each line.

zorder

[float, default: 2] zorder of the lines once drawn.

facecolors

[*color* or list of *color*, default: 'none'] When setting *facecolors*, each line is interpreted as a boundary for an area, implicitly closing the path from the last point to the first point. The enclosed area is filled with *facecolor*. In order to manually specify what should count as the "interior" of each line, please use *PathCollection* instead, where the "interior" can be specified by appropriate usage of *CLOSEPOLY*.

****kwargs**

Forwarded to *Collection*.

do_3d_projection()

Project the points according to renderer matrix.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *colors=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *segments=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *sort_zpos=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

zorder	float

set_segments(*segments*)

Set 3D segments.

set_sort_zpos(*val*)

Set the position to use for z-sorting.

Examples using `mpl_toolkits.mplot3d.art3d.Line3DCollection`

mpl_toolkits.mplot3d.art3d.Patch3D

class mpl_toolkits.mplot3d.art3d.**Patch3D**(**args*, *zs=()*, *zdir='z'*, *axlim_clip=False*, ***kwargs*)

Bases: *Patch*

3D patch object.

Parameters

verts

zs

[float] The location along the *zdir* axis in 3D space to position the patch.

zdir

[{'x', 'y', 'z'}] Plane to plot patch orthogonal to. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide patches with a vertex outside the axes view limits.

do_3d_projection()

get_path()

Return the path of this patch.

set(***, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

zorder	float

set_3d_properties(*verts*, *zs=0*, *zdir='z'*, *axlim_clip=False*)

Set the *z* position and direction of the patch.

Parameters

verts

zs

[float] The location along the *zdir* axis in 3D space to position the patch.

zdir

[{'x', 'y', 'z'}] Plane to plot patch orthogonal to. Default: 'z'. See get_dir_vector for a description of the values.

axlim_clip

[bool, default: False] Whether to hide patches with a vertex outside the axes view limits.

mpl_toolkits.mplot3d.art3d.Patch3DCollection

class mpl_toolkits.mplot3d.art3d.**Patch3DCollection**(**args*, *zs=0*, *zdir='z'*, *depthshade=True*, *axlim_clip=False*, ***kwargs*)

Bases: *PatchCollection*

A collection of 3D patches.

Create a collection of flat 3D patches with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for *PatchCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument *depthshade* is available to indicate whether to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

do_3d_projection()

get_depthshade()

get_edgecolor()

get_facecolor()

set(***, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *depthshade=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *sort_zpos=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

zorder	float

set_3d_properties(*zs*, *zdir*, *axlim_clip=False*)

Set the *z* positions and direction of the patches.

Parameters

zs

[float or array of floats] The location or locations to place the patches in the collection along the *zdir* axis.

zdir

[{'x', 'y', 'z'}] Plane to plot patches orthogonal to. All patches must have the same direction. See `get_dir_vector` for a description of the values.

axlim_clip

[bool, default: False] Whether to hide patches with a vertex outside the axes view limits.

set_depthshade(*depthshade*)

Set whether depth shading is performed on collection members.

Parameters

depthshade

[bool] Whether to shade the patches in order to give the appearance of depth.

set_sort_zpos(*val*)

Set the position to use for z-sorting.

mpl_toolkits.mplot3d.art3d.Path3DCollection

class mpl_toolkits.mplot3d.art3d.**Path3DCollection**(**args*, *zs=0*, *zdir='z'*, *depthshade=True*, *axlim_clip=False*, ***kwargs*)

Bases: `PathCollection`

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for `PathCollection`. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument *depthshade* is available to indicate whether to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

do_3d_projection()

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_depthshade()

get_edgecolor()

get_facecolor()

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *depthshade=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *sort_zpos=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
3d_properties	float or array of floats
agg_filter	a filter function, which takes a (m, n, 3) float array ar
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools

zorder	float

set_3d_properties(*zs*, *zdir*, *axlim_clip=False*)

Set the *z* positions and direction of the paths.

Parameters

zs

[float or array of floats] The location or locations to place the paths in the collection along the *zdir* axis.

zdir

[{'x', 'y', 'z'}] Plane to plot paths orthogonal to. All paths must have the same direction. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide paths with a vertex outside the axes view limits.

set_depthshade(*depthshade*)

Set whether depth shading is performed on collection members.

Parameters

depthshade

[bool] Whether to shade the patches in order to give the appearance of depth.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[numpy.ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sort_zpos(*val*)

Set the position to use for z-sorting.

mpl_toolkits.mplot3d.art3d.PathPatch3D

class mpl_toolkits.mplot3d.art3d.**PathPatch3D**(*path*, ***, *zs=()*, *zdir='z'*, *axlim_clip=False*, ***kwargs*)

Bases: *Patch3D*

3D PathPatch object.

Parameters

path

zs

[float] The location along the *zdir* axis in 3D space to position the path patch.

zdir

[{'x', 'y', 'z', 3-tuple}] Plane to plot path patch orthogonal to. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide path patches with a point outside the axes view limits.

do_3d_projection()

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
3d_properties	unknown
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	float or None
animated	bool
antialiased or *aa*	bool or None

snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

set_3d_properties(*path*, *zs=0*, *zdir='z'*, *axlim_clip=False*)

Set the *z* position and direction of the path patch.

Parameters

path

zs

[float] The location along the *zdir* axis in 3D space to position the path patch.

zdir

[{'x', 'y', 'z', 3-tuple}] Plane to plot path patch orthogonal to. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide path patches with a point outside the axes view limits.

Examples using `mpl_toolkits.mplot3d.art3d.PathPatch3D`

mpl_toolkits.mplot3d.art3d.Poly3DCollection

class mpl_toolkits.mplot3d.art3d.**Poly3DCollection**(*verts*, **args*, *zsort='average'*, *shade=False*, *lightsource=None*, *axlim_clip=False*, ***kwargs*)

Bases: *PolyCollection*

A collection of 3D polygons.

Note

Filling of 3D polygons

There is no simple definition of the enclosed surface of a 3D polygon unless the polygon is planar.

In practice, Matplotlib fills the 2D projection of the polygon. This gives a correct filling appearance only for planar polygons. For all other polygons, you'll find orientations in which the edges of the polygon intersect in the projection. This will lead to an incorrect visualization of the 3D area.

If you need filled areas, it is recommended to create them via `plot_trisurf`, which creates a triangulation and thus generates consistent surfaces.

Parameters

verts

[list of (N, 3) array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (N, 3).

zsort

[{'average', 'min', 'max'}, default: 'average'] The calculation method for the z-order. See `set_zsort` for details.

shade

[bool, default: False] Whether to shade *facecolors* and *edgecolors*. When activating *shade*, *facecolors* and/or *edgecolors* must be provided.

Added in version 3.7.

lightsource

[`LightSource`, optional] The lightsource to use when *shade* is True.

Added in version 3.7.

axlim_clip

[bool, default: False] Whether to hide polygons with a vertex outside the view limits.

***args, **kwargs**

All other parameters are forwarded to `PolyCollection`.

Notes

Note that this class does a bit of magic with the _facecolors and _edgecolors properties.

do_3d_projection()
Perform the 3D projection for this object.

get_edgecolor()

get_facecolor()

get_vector(*segments3d*)
[*Deprecated*]

Notes

Deprecated since version 3.10:

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *sort_zpos=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *verts_and_codes=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*, *zsort=<UNSET>*)

set_3d_properties(*axlim_clip=False*)

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or float or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_edgecolor(*colors*)

Set the edgecolor(s) of the collection.

Parameters

c

[*color* or list of *color* or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_facecolor(*colors*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[*color* or list of *color*]

set_sort_zpos(*val*)

Set the position to use for z-sorting.

set_verts(*verts*, *closed=True*)

Set 3D vertices.

Parameters

verts

[list of (N, 3) array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (N, 3).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_verts_and_codes(*verts*, *codes*)

Set 3D vertices with path codes.

set_zsort(*zsort*)

Set the calculation method for the z-order.

Parameters

zsort

[{'average', 'min', 'max'}] The function applied on the z-coordinates of the vertices in the viewer's coordinate system, to determine the z-order.

Examples using `mpl_toolkits.mplot3d.art3d.Poly3DCollection`

mpl_toolkits.mplot3d.art3d.Text3D

class mpl_toolkits.mplot3d.art3d.**Text3D**(*x=0*, *y=0*, *z=0*, *text=''*, *zdir='z'*, *axlim_clip=False*, ***kwargs*)

Bases: *Text*

Text object with 3D position and direction.

Parameters

x, y, z

[float] The position of the text.

text

[str] The text string to display.

zdir

[{'x', 'y', 'z', None, 3-tuple}] The direction of the text. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide text outside the axes view limits.

Other Parameters

****kwargs**

All other parameters are passed on to *Text*.

Create a *Text* instance at *x*, *y* with string *text*.

The text is aligned relative to the anchor point (*x*, *y*) according to `horizontalalignment` (default: 'left') and `verticalalignment` (default: 'baseline'). See also *Text alignment*.

While Text accepts the 'label' keyword argument, by default it is not added to the handles of a legend.

Valid keyword arguments are:

zorder	float

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_position_3d()

Return the (x, y, z) position of the text.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

set(**, agg_filter=<UNSET>, alpha=<UNSET>, animated=<UNSET>, antialiased=<UNSET>, backgroundcolor=<UNSET>, bbox=<UNSET>, clip_box=<UNSET>, clip_on=<UNSET>, clip_path=<UNSET>, color=<UNSET>, fontfamily=<UNSET>, fontproperties=<UNSET>, fontsize=<UNSET>, fontstretch=<UNSET>, fontstyle=<UNSET>, fontvariant=<UNSET>, fontweight=<UNSET>, gid=<UNSET>, horizontalalignment=<UNSET>, in_layout=<UNSET>, label=<UNSET>, linespacing=<UNSET>, math_fontfamily=<UNSET>, mouseover=<UNSET>, multialignment=<UNSET>, parse_math=<UNSET>, path_effects=<UNSET>, picker=<UNSET>, position=<UNSET>, position_3d=<UNSET>, rasterized=<UNSET>, rotation=<UNSET>, rotation_mode=<UNSET>, sketch_params=<UNSET>, snap=<UNSET>, text=<UNSET>, transform=<UNSET>, transform_rotates_text=<UNSET>, url=<UNSET>, usetex=<UNSET>, verticalalignment=<UNSET>, visible=<UNSET>, wrap=<UNSET>, x=<UNSET>, y=<UNSET>, z=<UNSET>, zorder=<UNSET>*)

Set multiple properties at once.

clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
figure	Figure or SubFigure
fontfamily or family or fontname	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fan
fontproperties or font or font_properties	font_manager.FontProperties or st
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-conde
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'l
gid	str
horizontalalignment or ha	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or ma	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	(float, float)
position_3d	(float, float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	Transform
transform_rotates_text	bool
url	str
usetex	bool, default: rcParams["text.usetex"
verticalalignment or va	{'baseline', 'bottom', 'center', 'center_baseline', '
visible	bool
wrap	bool
x	float
y	float
z	float
zorder	float

set_3d_properties(*z=0*, *zdir='z'*, *axlim_clip=False*)

Set the *z* position and direction of the text.

Parameters

z

[float] The z-position in 3D space.

zdir

[{'x', 'y', 'z', 3-tuple}] The direction of the text. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide text outside the axes view limits.

set_position_3d(*xyz*, *zdir=None*)

Set the (*x*, *y*, *z*) position of the text.

Parameters

xyz

[(float, float, float)] The position in 3D space.

zdir

[{'x', 'y', 'z', None, 3-tuple}] The direction of the text. If unspecified, the *zdir* will not be changed. See *get_dir_vector* for a description of the values.

set_z(*z*)

Set the *z* position of the text.

Parameters

z

[float]

mpl_toolkits.mplot3d.art3d.get_dir_vector

mpl_toolkits.mplot3d.art3d.**get_dir_vector**(*zdir*)

Return a direction vector.

Parameters

zdir

[{'x', 'y', 'z', None, 3-tuple}] The direction. Possible values are:

- 'x': equivalent to (1, 0, 0)
- 'y': equivalent to (0, 1, 0)

- 'z': equivalent to (0, 0, 1)
- *None*: equivalent to (0, 0, 0)
- an iterable (x, y, z) is converted to an array

Returns

x, y, z

[array] The direction vector.

mpl_toolkits.mplot3d.art3d.juggle_axes

mpl_toolkits.mplot3d.art3d.**juggle_axes**(*xs*, *ys*, *zs*, *zdir*)

Reorder coordinates so that 2D *xs*, *ys* can be plotted in the plane orthogonal to *zdir*. *zdir* is normally 'x', 'y' or 'z'. However, if *zdir* starts with a '-' it is interpreted as a compensation for *rotate_axes*.

mpl_toolkits.mplot3d.art3d.line_2d_to_3d

mpl_toolkits.mplot3d.art3d.**line_2d_to_3d**(*line*, *zs=0*, *zdir='z'*, *axlim_clip=False*)

Convert a *Line2D* to a *Line3D* object.

Parameters

zs

[float] The location along the *zdir* axis in 3D space to position the line.

zdir

[{'x', 'y', 'z'}] Plane to plot line orthogonal to. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide lines with an endpoint outside the axes view limits.

mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d

mpl_toolkits.mplot3d.art3d.**line_collection_2d_to_3d**(*col*, *zs=0*, *zdir='z'*, *axlim_clip=False*)

Convert a *LineCollection* to a *Line3DCollection* object.

mpl_toolkits.mplot3d.art3d.patch_2d_to_3d

mpl_toolkits.mplot3d.art3d.**patch_2d_to_3d**(*patch*, *z=0*, *zdir='z'*, *axlim_clip=False*)

Convert a *Patch* to a *Patch3D* object.

mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d

mpl_toolkits.mplot3d.art3d.**patch_collection_2d_to_3d**(*col*, *zs=0*, *zdir='z'*, *depthshade=True*, *axlim_clip=False*)

Convert a *PatchCollection* into a *Patch3DCollection* object (or a *PathCollection* into a *Path3DCollection* object).

Parameters

col

[*PatchCollection* or *PathCollection*] The collection to convert.

zs

[float or array of floats] The location or locations to place the patches in the collection along the *zdir* axis. Default: 0.

zdir

[{'x', 'y', 'z'}] The axis in which to place the patches. Default: "z". See *get_dir_vector* for a description of the values.

depthshade

[bool, default: True] Whether to shade the patches to give a sense of depth.

axlim_clip

[bool, default: False] Whether to hide patches with a vertex outside the axes view limits.

mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d

mpl_toolkits.mplot3d.art3d.**pathpatch_2d_to_3d**(*pathpatch*, *z=0*, *zdir='z'*)

Convert a *PathPatch* to a *PathPatch3D* object.

Examples using `mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d

mpl_toolkits.mplot3d.art3d.**poly_collection_2d_to_3d**(*col*, *zs=0*, *zdir='z'*, *axlim_clip=False*)

Convert a *PolyCollection* into a *Poly3DCollection* object.

Parameters

col

[*PolyCollection*] The collection to convert.

zs

[float or array of floats] The location or locations to place the polygons in the collection along the *zdir* axis. Default: 0.

zdir

[{'x', 'y', 'z'}] The axis in which to place the patches. Default: 'z'. See *get_dir_vector* for a description of the values.

mpl_toolkits.mplot3d.art3d.rotate_axes

mpl_toolkits.mplot3d.art3d.**rotate_axes**(*xs*, *ys*, *zs*, *zdir*)

Reorder coordinates so that the axes are rotated with *zdir* along the original z axis. Prepending the axis with a '-' does the inverse transform, so *zdir* can be 'x', '-x', 'y', '-y', 'z' or '-z'.

mpl_toolkits.mplot3d.art3d.text_2d_to_3d

mpl_toolkits.mplot3d.art3d.**text_2d_to_3d**(*obj*, *z=0*, *zdir='z'*, *axlim_clip=False*)

Convert a *Text* to a *Text3D* object.

Parameters

z

[float] The z-position in 3D space.

zdir

[{'x', 'y', 'z', 3-tuple}] The direction of the text. Default: 'z'. See *get_dir_vector* for a description of the values.

axlim_clip

[bool, default: False] Whether to hide text outside the axes view limits.

proj3d

proj3d.inv_transform(xs, ys, zs, invM)	Transform the points by the inverse of the projection matrix, *invM*.
proj3d.proj_transform(xs, ys, zs, M)	Transform the points by the projection matrix *M*.
proj3d.proj_transform_clip(xs, ys, zs, M)	[*Deprecated*]
proj3d.world_transformation(xmin, xmax, ...)	Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

mpl_toolkits.mplot3d.proj3d.inv_transform

mpl_toolkits.mplot3d.proj3d.**inv_transform**(*xs*, *ys*, *zs*, *invM*)

Transform the points by the inverse of the projection matrix, *invM*.

mpl_toolkits.mplot3d.proj3d.proj_transform

mpl_toolkits.mplot3d.proj3d.**proj_transform**(*xs*, *ys*, *zs*, *M*)

Transform the points by the projection matrix *M*.

mpl_toolkits.mplot3d.proj3d.proj_transform_clip

mpl_toolkits.mplot3d.proj3d.**proj_transform_clip**(*xs*, *ys*, *zs*, *M*)

[*Deprecated*]

Notes

Deprecated since version 3.10:

mpl_toolkits.mplot3d.proj3d.world_transformation

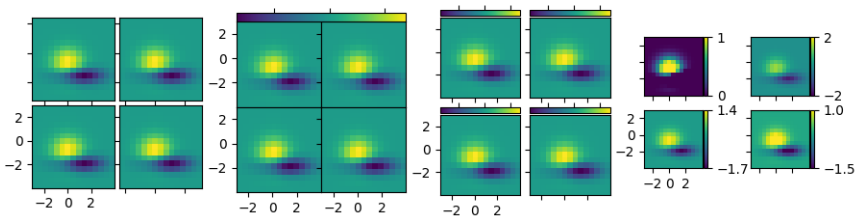
mpl_toolkits.mplot3d.proj3d.**world_transformation**(*xmin*, *xmax*, *ymin*, *ymax*, *zmin*, *zmax*, *pb_aspect=None*)

Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

7.2.70 mpl_toolkits.axes_grid1

mpl_toolkits.axes_grid1 provides a framework of helper classes to adjust the positioning of multiple fixed-aspect Axes (e.g., displaying images). It can be contrasted with the `aspect` property of Matplotlib Axes, which adjusts the position of a single Axes.

See *The axes_grid1 toolkit* for a guide on the usage of axes_grid1.



Note

This module contains classes and function that were formerly part of the `mpl_toolkits.axes_grid` module that was removed in 3.6. Additional classes from that older module may also be found in *mpl_toolkits.axisartist*.

The submodules of the axes_grid1 API are:

axes_grid1.anchored_artists	
axes_grid1.axes_divider	Helper classes to adjust the positions of multiple axes at drawing time.
axes_grid1.axes_grid	
axes_grid1.axes_rgb	
axes_grid1.axes_size	Provides classes of simple units that will be used with *AxesDivider* class (or others) to determine the size of each Axes.
axes_grid1.inset_locator	A collection of functions and objects for creating or placing inset axes.
axes_grid1.mpl_axes	
axes_grid1.parasite_axes	

mpl_toolkits.axes_grid1.anchored_artists

Classes

AnchoredAuxTransformBox(transform, loc[, ...])	An anchored container with transformed coordinates.
AnchoredDirectionArrows(transform, label_x, ...)	Draw two perpendicular arrows to indicate directions.
AnchoredDrawingArea(width, height, xdescent, ...)	An anchored container with a fixed size and fillable *DrawingArea*.
AnchoredSizeBar(transform, size, label, loc)	Draw a horizontal scale bar with a center-aligned label underneath.

mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredAuxTransformBox**(*transform*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, *frameon=True*, ***kwargs*)

Bases: *AnchoredOffsetbox*

An anchored container with transformed coordinates.

Artists added to the *drawing_area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

Parameters

transform

[*Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

loc

[str] Location of this artist. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

[*FontProperties*, optional] Font property used as a reference for paddings.

frameon

[bool, default: True] If True, draw a box around this artist.

****kwargs**

Keyword arguments forwarded to *AnchoredOffsetbox*.

Attributes

drawing_area

[*AuxTransformBox*] A container for artists to display.

Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
bbox_to_	unknown
child	unknown
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layout	bool
label	object
mouseover	bool
offset	(float, float) or callable
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox`

mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredDirectionArrows**(*transform*, *label_x*, *label_y*, *length=0.15*, *fontsize=0.08*, *loc='upper left'*, *angle=0*, *aspect_ratio=1*, *pad=0.4*, *borderpad=0.4*, *frameon=False*, *color='w'*, *alpha=1*, *sep_x=0.01*, *sep_y=0*, *fontproperties=None*, *back_length=0.1*, *head_width=10*, *head_length=15*, *tail_width=2*, *text_props=None*, *arrow_props=None*, ***kwargs*)

Bases: *AnchoredOffsetbox*

Draw two perpendicular arrows to indicate directions.

Parameters

transform

[*Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transAxes`.

label_x, label_y

[str] Label text for the x and y arrows

length

[float, default: 0.15] Length of the arrow, given in coordinates of *transform*.

fontsize

[float, default: 0.08] Size of label strings, given in coordinates of *transform*.

loc

[str, default: 'upper left'] Location of the arrow. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

angle

[float, default: 0] The angle of the arrows in degrees.

aspect_ratio

[float, default: 1] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

pad

[float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

borderpad

[float, default: 0.4] Border padding, in fraction of the font size.

frameon

[bool, default: False] If True, draw a box around the arrows and labels.

color

[str, default: 'white'] Color for the arrows and labels.

alpha

[float, default: 1] Alpha values of the arrows and labels

sep_x, sep_y

[float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.

fontproperties

[*FontProperties*, optional] Font properties for the label text.

back_length

[float, default: 0.15] Fraction of the arrow behind the arrow crossing.

head_width

[float, default: 10] Width of arrow head, sent to *ArrowStyle*.

head_length

[float, default: 15] Length of arrow head, sent to *ArrowStyle*.

tail_width

[float, default: 2] Width of arrow tail, sent to *ArrowStyle*.

text_props, arrow_props

[dict] Properties of the text and arrows, passed to *TextPath* and *FancyArrowPatch*.

****kwargs**

Keyword arguments forwarded to *AnchoredOffsetbox*.

Attributes

arrow_x, arrow_y

[*FancyArrowPatch*] Arrow x and y

text_path_x, text_path_y

[*TextPath*] Path for arrow labels

p_x, p_y

[*PathPatch*] Patch for arrow labels

box

[*AuxTransformBox*] Container for the arrows and labels.

Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
```

(continues on next page)

(continued from previous page)

```
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                  loc='lower left', color='k',
...                                  aspect_ratio=-1, sep_x=0.02,
...                                  sep_y=-0.01,
...                                  text_props={'ec':'w', 'fc':'k
 ↪'},
...                                  fontproperties=fontprops)
```

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool

clip_on	bool
clip_pat	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layou	bool
label	object
mouseove	bool
offset	(float, float) or callable
path_eff	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows`

mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredDrawingArea**(*width*, *height*, *xdescent*, *ydescent*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, *frameon=True*, ***kwargs*)

Bases: *AnchoredOffsetbox*

An anchored container with a fixed size and fillable *DrawingArea*.

Artists added to the *drawing_area* will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters

width, height

[float] Width and height of the container, in pixels.

xdescent, ydescent

[float] Descent of the container in the x- and y- direction, in pixels.

loc

[str] Location of this artist. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

[*FontProperties*, optional] Font property used as a reference for paddings.

frameon

[bool, default: True] If True, draw a box around this artist.

****kwargs**

Keyword arguments forwarded to *AnchoredOffsetbox*.

Attributes

drawing_area

[*DrawingArea*] A container for artists to display.

Examples

To display blue and red circles of different sizes in the upper right of an Axes *ax*:

```
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                           loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
bbox_to_	unknown
child	unknown
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layou	bool
label	object
mouseove	bool
offset	(float, float) or callable
path_eff	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea`

mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredSizeBar**(*transform*, *size*, *label*, *loc*, *pad=0.1*, *borderpad=0.1*, *sep=2*, *frameon=True*, *size_vertical=0*, *color='black'*, *label_top=False*, *fontproperties=None*, *fill_bar=None*, ***kwargs*)

Bases: *AnchoredOffsetbox*

Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

transform

[*Transform*] The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transData.

size

[float] Horizontal length of the size bar, given in coordinates of *transform*.

label

[str] Label to display.

loc

[str] Location of the size bar. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

sep

[float, default: 2] Separation between the label and the size bar, in points.

frameon

[bool, default: True] If True, draw a box around the horizontal bar and label.

size_vertical

[float, default: 0] Vertical length of the size bar, given in coordinates of *transform*.

color

[str, default: 'black'] Color for the size bar and label.

label_top

[bool, default: False] If True, the label will be over the size bar.

fontproperties

[*FontProperties*, optional] Font properties for the label text.

fill_bar

[bool, optional] If True and if *size_vertical* is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if *size_vertical* is greater than zero and False otherwise.

****kwargs**

Keyword arguments forwarded to *AnchoredOffsetbox*.

Attributes

size_bar

[*AuxTransformBox*] Container for the size bar.

txt_label

[*TextArea*] Container for the label of the size bar.

Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
```

(continues on next page)

(continued from previous page)

```
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
...                       sep=5, borderpad=0.5, frameon=False,
...                       size_vertical=0.5, color='white',
...                       fontproperties=fontprops)
```

set (*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
bbox_to_	unknown
child	unknown
clip_box	BboxBase or None
clip_on	bool
clip_pat	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layou	bool
label	object
mouseove	bool
offset	(float, float) or callable
path_eff	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

mpl_toolkits.axes_grid1.axes_divider

Helper classes to adjust the positions of multiple axes at drawing time.

Classes

AxesDivider(axes[, xref, yref])	Divider based on the preexisting axes.
Divider(fig, pos, horizontal, vertical[, ...])	An Axes positioning class.

continues on next page

Table 341 – continued from previous page

HBoxDivider(fig, *args[, horizontal, ...])	A *SubplotDivider* for laying out axes horizontally, while ensuring that they have equal heights.
SubplotDivider(fig, *args[, horizontal, ...])	The Divider class whose rectangle area is specified as a subplot geometry.
VBoxDivider(fig, *args[, horizontal, ...])	A *SubplotDivider* for laying out axes vertically, while ensuring that they have equal widths.

mpl_toolkits.axes_grid1.axes_divider.AxesDivider

class mpl_toolkits.axes_grid1.axes_divider.**AxesDivider**(*axes*, *xref=None*, *yref=None*)

Bases: *Divider*

Divider based on the preexisting axes.

Parameters

axes

[*Axes*]

xref
yref

append_axes(*position*, *size*, *pad=None*, *, *axes_class=None*, ***kwargs*)

Add a new axes on a given side of the main axes.

Parameters

position

[{"left", "right", "bottom", "top"}] Where the new axes is positioned relative to the main axes.

size

[*axes_size* or float or str] The axes width or height. float or str arguments are interpreted as `axes_size.from_any(size, AxesX(<main_axes>))` for left or right axes, and likewise with `AxesY` for bottom or top axes.

pad

[*axes_size* or float or str] Padding between the axes. float or str arguments are interpreted as for *size*. Defaults to *rcParams["figure.subplot.wspace"]* (default: `0.2`) times the main Axes width (left or right axes) or *rcParams["figure.subplot.hspace"]* (default: `0.2`) times the main Axes height (bottom or top axes).

axes_class

[subclass type of *Axes*, optional] The type of the new axes. Defaults to the type of the main axes.

****kwargs**

All extra keywords arguments are passed to the created axes.

get_anchor()

Return the anchor.

get_aspect()

Return aspect.

get_position()

Return the position of the rectangle.

get_subplotspec()

Examples using `mpl_toolkits.axes_grid1.axes_divider.AxesDivider`

mpl_toolkits.axes_grid1.axes_divider.Divider

class mpl_toolkits.axes_grid1.axes_divider.**Divider**(*fig*, *pos*, *horizontal*, *vertical*, *aspect=None*, *anchor='C'*)

Bases: object

An Axes positioning class.

The divider is initialized with lists of horizontal and vertical sizes (*mpl_toolkits.axes_grid1.axes_size*) based on which a given rectangular area will be divided.

The *new_locator* method then creates a callable object that can be used as the *axes_locator* of the axes.

Parameters

fig

[Figure]

pos

[tuple of 4 floats] Position of the rectangle that will be divided.

horizontal

[list of *axes_size*] Sizes for horizontal division.

vertical

[list of *axes_size*] Sizes for vertical division.

aspect

[bool, optional] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}, default: 'C'] Placement of the reduced rectangle, when *aspect* is True.

add_auto_adjustable_area(*use_axes*, *pad=0.1*, *adjust_dirs=None*)

Add auto-adjustable padding around *use_axes* to take their decorations (title, labels, ticks, ticklabels) into account during layout.

Parameters

use_axes

[*Axes* or list of *Axes*] The Axes whose decorations are taken into account.

pad

[float, default: 0.1] Additional padding in inches.

adjust_dirs

[list of {"left", "right", "bottom", "top"}, optional] The sides where padding is added; defaults to all four sides.

append_size(*position*, *size*)

get_anchor()

Return the anchor.

get_aspect()

Return aspect.

get_horizontal()

Return horizontal sizes.

get_horizontal_sizes(*renderer*)

get_locator()

get_position()

Return the position of the rectangle.

get_position_runtime(*ax*, *renderer*)

get_subplotspec()

get_vertical()

Return vertical sizes.

get_vertical_sizes(*renderer*)

new_locator(*nx*, *ny*, *nx1=None*, *ny1=None*)

Return an axes locator callable for the specified cell.

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise, location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

set_anchor(*anchor*)

Parameters

anchor

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] Either an (*x*, *y*) pair of relative coordinates (0 is left or bottom, 1 is right or top), 'C' (center), or a cardinal direction ('SW', southwest, is bottom left, etc.).

See also

Axes.set_anchor

set_aspect(*aspect=False*)

Parameters

aspect

[bool]

set_horizontal(*h*)

Parameters

h

[list of *axes_size*] sizes for horizontal division

set_locator(*_locator*)

set_position(*pos*)

Set the position of the rectangle.

Parameters

pos

[tuple of 4 floats] position of the rectangle that will be divided

set_vertical(*v*)

Parameters

v

[list of *axes_size*] sizes for vertical division

Examples using `mpl_toolkits.axes_grid1.axes_divider.Divider`

mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

class mpl_toolkits.axes_grid1.axes_divider.**HBoxDivider**(*fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*)

Bases: *SubplotDivider*

A *SubplotDivider* for laying out axes horizontally, while ensuring that they have equal heights.

Examples

Parameters

fig

[*Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

horizontal

[list of *axes_size*, optional] Sizes for horizontal division.

vertical

[list of *axes_size*, optional] Sizes for vertical division.

aspect

[bool, optional] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}, default: 'C'] Placement of the reduced rectangle, when *aspect* is True.

new_locator(*nx*, *nx1=None*)

Create an axes locator callable for the specified cell.

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise, location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

Examples using `mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`

mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

class mpl_toolkits.axes_grid1.axes_divider.**SubplotDivider**(*fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*)

Bases: *Divider*

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig

[*Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

horizontal

[list of *axes_size*, optional] Sizes for horizontal division.

vertical

[list of *axes_size*, optional] Sizes for vertical division.

aspect

[bool, optional] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}, default: 'C'] Placement of the reduced rectangle, when *aspect* is True.

get_position()

Return the bounds of the subplot box.

get_subplotspec()

Get the SubplotSpec instance.

set_subplotspec(*subplotspec*)

Set the SubplotSpec instance.

Examples using `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`

mpl_toolkits.axes_grid1.axes_divider.VBoxDivider

class mpl_toolkits.axes_grid1.axes_divider.**VBoxDivider**(*fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*)

Bases: *SubplotDivider*

A *SubplotDivider* for laying out axes vertically, while ensuring that they have equal widths.

Parameters

fig

[*Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

horizontal

[list of *axes_size*, optional] Sizes for horizontal division.

vertical

[list of *axes_size*, optional] Sizes for vertical division.

aspect

[bool, optional] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}, default: 'C'] Placement of the reduced rectangle, when *aspect* is True.

new_locator(*ny*, *ny1=None*)

Create an axes locator callable for the specified cell.

Parameters

ny, ny1

[int] Integers specifying the row-position of the cell. When *ny1* is None, a single *ny*-th row is specified. Otherwise, location of rows spanning between *ny* to *ny1* (but excluding *ny1*-th row) is specified.

Examples using `mpl_toolkits.axes_grid1.axes_divider.VBoxDivider`

Functions

make_axes_area_auto_adjustable(ax[, ...])	Add auto-adjustable padding around *ax* to take its decorations (title, labels, ticks, ticklabels) into account during layout, using *Divider.add_auto_adjustable_area*.
make_axes_locatable(axes)	

mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable

mpl_toolkits.axes_grid1.axes_divider.**make_axes_area_auto_adjustable**(*ax*, *use_axes=None*, *pad=0.1*, *adjust_dirs=None*)

Add auto-adjustable padding around *ax* to take its decorations (title, labels, ticks, ticklabels) into account during layout, using *Divider.add_auto_adjustable_area*.

By default, padding is determined from the decorations of *ax*. Pass *use_axes* to consider the decorations of other Axes instead.

Examples using `mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable`

mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable

mpl_toolkits.axes_grid1.axes_divider.**make_axes_locatable**(*axes*)

Examples using `mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable`

mpl_toolkits.axes_grid1.axes_grid

Classes

AxesGrid	alias of *ImageGrid*
CbarAxesBase(*args, orientation, **kwargs)	
Grid(fig, rect, nrows_ncols[, ngrids, ...])	A grid of Axes.
ImageGrid(fig, rect, nrows_ncols[, ngrids, ...])	A grid of Axes for Image display.

mpl_toolkits.axes_grid1.axes_grid.AxesGrid

mpl_toolkits.axes_grid1.axes_grid.**AxesGrid**

alias of *ImageGrid*

mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase

class mpl_toolkits.axes_grid1.axes_grid.**CbarAxesBase**(**args*, *orientation*, ***kwargs*)

Bases: object

colorbar(*mappable*, ***kwargs*)

mpl_toolkits.axes_grid1.axes_grid.Grid

class mpl_toolkits.axes_grid1.axes_grid.**Grid**(*fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, ***, *share_all=False*, *share_x=True*, *share_y=True*, *label_mode='L'*, *axes_class=None*, *aspect=False*)

Bases: object

A grid of Axes.

In Matplotlib, the Axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to

display multiple images of a same size with some fixed padding between them. AxesGrid can be used in such case.

Attributes

axes_all

[list of Axes] A flat list of Axes. Note that you can also access this directly from the grid. The following is equivalent

```
grid[i] == grid.axes_all[i]
len(grid) == len(grid.axes_all)
```

axes_column

[list of list of Axes] A 2D list of Axes where the first index is the column. This results in the usage pattern `grid.axes_column[col][row]`.

axes_row

[list of list of Axes] A 2D list of Axes where the first index is the row. This results in the usage pattern `grid.axes_row[row][col]`.

axes_llc

[Axes] The Axes in the lower left corner.

ngrids

[int] Number of Axes in the grid.

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float), (int, int, int), int, or *SubplotSpec*] The axes position, as a `(left, bottom, width, height)` tuple, as a three-digit subplot position code (e.g., `(1, 2, 1)` or `121`), or as a *SubplotSpec*.

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

axes_pad

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

share_all

[bool, default: False] Whether all axes share their x- and y-axis. Overrides *share_x* and *share_y*.

share_x

[bool, default: True] Whether all axes of a column share their x-axis.

share_y

[bool, default: True] Whether all axes of a row share their y-axis.

label_mode

[{"L", "1", "all", "keep"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": All axes are labelled.
- "keep": Do not do anything.

axes_class

[subclass of *matplotlib.axes.Axes*, default: *mpl_axes.Axes*] The type of Axes to create.

aspect

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

get_aspect()

Return the aspect of the SubplotDivider.

get_axes_locator()

get_axes_pad()

Return the axes padding.

Returns

hpad, vpad

Padding (horizontal pad, vertical pad) in inches.

get_divider()

get_geometry()

Return the number of rows and columns of the grid as (nrows, ncols).

set_aspect(*aspect*)

Set the aspect of the SubplotDivider.

set_axes_locator(*locator*)

set_axes_pad(*axes_pad*)

Set the padding between the axes.

Parameters

axes_pad

[(float, float)] The padding (horizontal pad, vertical pad) in inches.

set_label_mode(*mode*)

Define which axes have tick labels.

Parameters

mode

[{"L", "1", "all", "keep"}] The label mode:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": All axes are labelled.
- "keep": Do not do anything.

Examples using `mpl_toolkits.axes_grid1.axes_grid.Grid`

mpl_toolkits.axes_grid1.axes_grid.ImageGrid

class mpl_toolkits.axes_grid1.axes_grid.**ImageGrid**(*fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, ***, *share_all=False*, *aspect=True*, *label_mode='L'*, *cbar_mode=None*, *cbar_location='right'*, *cbar_pad=None*, *cbar_size='5%'*, *cbar_set_cax=True*, *axes_class=None*)

Bases: *Grid*

A grid of Axes for Image display.

This class is a specialization of *Grid* for displaying a grid of images. In particular, it forces all axes in a column to share their x-axis and all axes in a row to share their y-axis. It further provides helpers to add colorbars to some or all axes.

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

axes_pad

[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

share_all

[bool, default: False] Whether all axes share their x- and y-axis. Note that in any case, all axes in a column share their x-axis and all axes in a row share their y-axis.

aspect

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

cbar_mode

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar_location*, or no colorbars. The colorbars are stored in the `cbar_axes` attribute.

cbar_location

[{"left", "right", "bottom", "top"}, default: "right"]

cbar_pad

[float, default: None] Padding between the image axes and the colorbar axes.

Changed in version 3.10: `cbar_mode="single"` no longer adds *axes_pad* between the axes and the colorbar if the *cbar_location* is "left" or "bottom".

cbar_size

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

cbar_set_cax

[bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar_axes*.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

Examples using `mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

mpl_toolkits.axes_grid1.axes_rgb

Classes

RGBAxes(*args[, pad])	4-panel *imshow* (RGB, R, G, B).

mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

class mpl_toolkits.axes_grid1.axes_rgb.**RGBAxes**(**args*, *pad=0*, ***kwargs*)

Bases: `object`

4-panel *imshow* (RGB, R, G, B).

Layout:

Subclasses can override the `_defaultAxesClass` attribute. By default RGBAxes uses *mpl_axes.Axes*.

Attributes

RGB

[`_defaultAxesClass`] The Axes object for the three-channel *imshow*.

R

[`_defaultAxesClass`] The Axes object for the red channel *imshow*.

G

[`_defaultAxesClass`] The Axes object for the green channel *imshow*.

B

[`_defaultAxesClass`] The Axes object for the blue channel *imshow*.

Parameters

pad

[float, default: 0] Fraction of the Axes height to put as padding.

axes_class

[*Axes*] Axes class to use. If not provided, `_defaultAxesClass` is used.

***args**

Forwarded to *axes_class* init for the RGB Axes

****kwargs**

Forwarded to *axes_class* init for the RGB, R, G, and B Axes

imshow_rgb(*r*, *g*, *b*, ***kwargs*)

Create the four images {rgb, r, g, b}.

Parameters

r, g, b

[array-like] The red, green, and blue arrays.

****kwargs**

Forwarded to *imshow* calls for the four images.

Returns

rgb

[*AxesImage*]

r

[*AxesImage*]

g

[*AxesImage*]

b

[*AxesImage*]

Examples using `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

Functions

make_rgb_axes(ax[, pad, axes_class])

mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes

mpl_toolkits.axes_grid1.axes_rgb.**make_rgb_axes**(*ax*, *pad=0.01*, *axes_class=None*, ***kwargs*)

Parameters

ax

[*Axes*] Axes instance to create the RGB Axes in.

pad

[float, optional] Fraction of the Axes height to pad.

axes_class

[*matplotlib.axes.Axes* or None, optional] Axes class to use for the R, G, and B Axes. If None, use the same class as *ax*.

****kwargs**

Forwarded to *axes_class* init for the R, G, and B Axes.

Examples using `mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

mpl_toolkits.axes_grid1.axes_size

Provides classes of simple units that will be used with *AxesDivider* class (or others) to determine the size of each Axes. The unit classes define `get_size` method that returns a tuple of two floats, meaning relative and absolute sizes, respectively.

Note that this class is nothing more than a simple tuple of two floats. Take a look at the Divider class to see how these two values are used.

Once created, the unit classes can be modified by simple arithmetic operations: addition /subtraction with another unit type or a real number and scaling (multiplication or division) by a real number.

Classes

Add(a, b)	Sum of two sizes.
AxesX(axes[, aspect, ref_ax])	Scaled size whose relative part corresponds to the data width of the *axes* multiplied by the *aspect*.
AxesY(axes[, aspect, ref_ax])	Scaled size whose relative part corresponds to the data height of the *axes* multiplied by the *aspect*.
Fixed(fixed_size)	Simple fixed size with absolute part = *fixed_size* and relative part = 0.
Fraction(fraction, ref_size)	An instance whose size is a *fraction* of the *ref_size*.
MaxExtent(artist_list, w_or_h)	Size whose absolute part is either the largest width or the largest height of the given *artist_list*.
MaxHeight(artist_list)	Size whose absolute part is the largest height of the given *artist_list*.
MaxWidth(artist_list)	Size whose absolute part is the largest width of the given *artist_list*.
Scalable	alias of *Scaled*
Scaled(scalable_size)	Simple scaled(?) size with absolute part = 0 and relative part = *scalable_size*.

mpl_toolkits.axes_grid1.axes_size.Add

class mpl_toolkits.axes_grid1.axes_size.**Add**(*a*, *b*)

Bases: _Base

Sum of two sizes.

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

mpl_toolkits.axes_grid1.axes_size.AxesX

class mpl_toolkits.axes_grid1.axes_size.**AxesX**(*axes*, *aspect=1.0*, *ref_ax=None*)

Bases: _Base

Scaled size whose relative part corresponds to the data width of the *axes* multiplied by the *aspect*.

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

Examples using `mpl_toolkits.axes_grid1.axes_size.AxesX`

mpl_toolkits.axes_grid1.axes_size.AxesY

class mpl_toolkits.axes_grid1.axes_size.**AxesY**(*axes*, *aspect=1.0*, *ref_ax=None*)

Bases: _Base

Scaled size whose relative part corresponds to the data height of the *axes* multiplied by the *aspect*.

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

Examples using `mpl_toolkits.axes_grid1.axes_size.AxesY`

mpl_toolkits.axes_grid1.axes_size.Fixed

class mpl_toolkits.axes_grid1.axes_size.**Fixed**(*fixed_size*)

Bases: _Base

Simple fixed size with absolute part = *fixed_size* and relative part = 0.

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

Examples using `mpl_toolkits.axes_grid1.axes_size.Fixed`

mpl_toolkits.axes_grid1.axes_size.Fraction

class mpl_toolkits.axes_grid1.axes_size.**Fraction**(*fraction*, *ref_size*)

Bases: _Base

An instance whose size is a *fraction* of the *ref_size*.

```
>>> s = Fraction(0.3, AxesX(ax))
```

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

mpl_toolkits.axes_grid1.axes_size.MaxExtent

class mpl_toolkits.axes_grid1.axes_size.**MaxExtent**(*artist_list*, *w_or_h*)

Bases: _Base

Size whose absolute part is either the largest width or the largest height of the given *artist_list*.

add_artist(*a*)

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

mpl_toolkits.axes_grid1.axes_size.MaxHeight

class mpl_toolkits.axes_grid1.axes_size.**MaxHeight**(*artist_list*)

Bases: *MaxExtent*

Size whose absolute part is the largest height of the given *artist_list*.

mpl_toolkits.axes_grid1.axes_size.MaxWidth

class mpl_toolkits.axes_grid1.axes_size.**MaxWidth**(*artist_list*)

Bases: *MaxExtent*

Size whose absolute part is the largest width of the given *artist_list*.

mpl_toolkits.axes_grid1.axes_size.Scalable

mpl_toolkits.axes_grid1.axes_size.**Scalable**

alias of *Scaled*

mpl_toolkits.axes_grid1.axes_size.Scaled

class mpl_toolkits.axes_grid1.axes_size.**Scaled**(*scalable_size*)

Bases: _Base

Simple scaled(?) size with absolute part = 0 and relative part = *scalable_size*.

get_size(*renderer*)

Return two-float tuple with relative and absolute sizes.

Examples using `mpl_toolkits.axes_grid1.axes_size.Scaled`

Functions

from_any(size[, fraction_ref])	Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %.

mpl_toolkits.axes_grid1.axes_size.from_any

mpl_toolkits.axes_grid1.axes_size.**from_any**(*size*, *fraction_ref=None*)

Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. The second argument is only meaningful when Fraction unit is created.

```
>>> from mpl_toolkits.axes_grid1.axes_size import from_any
>>> a = from_any(1.2) # => Fixed(1.2)
>>> from_any("50%", a) # => Fraction(0.5, a)
```

mpl_toolkits.axes_grid1.inset_locator

A collection of functions and objects for creating or placing inset axes.

Classes

AnchoredLocatorBase(bbox_to_anchor, ...[, ...])	
AnchoredSizeLocator(bbox_to_anchor, x_size, ...)	
AnchoredZoomLocator(parent_axes, zoom, loc)	
BboxConnector(bbox1, bbox2, loc1[, loc2])	Connect two bboxes with a straight line.
BboxConnectorPatch(bbox1, bbox2, loc1a, ...)	Connect two bboxes with a quadrilateral.
BboxPatch(bbox, **kwargs)	Patch showing the shape bounded by a Bbox.

mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase

class mpl_toolkits.axes_grid1.inset_locator.**AnchoredLocatorBase**(*bbox_to_anchor*, *offsetbox*, *loc*, *borderpad=0.5*, *bbox_transform=None*)

Bases: *AnchoredOffsetbox*

Parameters

loc

[str] The box location. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, *rcParams["legend.fontsize"]* (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

__call__(*ax*, *renderer*)

Call self as a function.

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
bbox_to_	unknown
child	unknown
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layout	bool
label	object
mouseover	bool
offset	(float, float) or callable
path_eff	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator

class mpl_toolkits.axes_grid1.inset_locator.**AnchoredSizeLocator**(*bbox_to_anchor*, *x_size*, *y_size*, *loc*, *borderpad=0.5*, *bbox_transform=None*)

Bases: AnchoredLocatorBase

Parameters

loc

[str] The box location. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of `Legend` for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[`OffsetBox`] The box that will be anchored.

prop

[`FontProperties`] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to `OffsetBox`.

Notes

See `Legend` for a detailed description of the anchoring mechanism.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
bbox_to_	unknown
child	unknown
clip_box	BboxBase or None
clip_on	bool
clip_pat	Patch or (Path, Transform) or None
figure	Figure
gid	str

mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

class mpl_toolkits.axes_grid1.inset_locator.**AnchoredZoomLocator**(*parent_axes*, *zoom*, *loc*, *borderpad=0.5*, *bbox_to_anchor=None*, *bbox_transform=None*)

Bases: *AnchoredLocatorBase*

Parameters

loc

[str] The box location. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, *rcParams["legend.fontsize"]* (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None

mpl_toolkits.axes_grid1.inset_locator.BboxConnector

class mpl_toolkits.axes_grid1.inset_locator.**BboxConnector**(*bbox1*, *bbox2*, *loc1*, *loc2=None*, ***kwargs*)

Bases: Patch

Connect two bboxes with a straight line.

Parameters

bbox1, bbox2

[*Bbox*] Bounding boxes to connect.

loc1, loc2

[{1, 2, 3, 4}] Corner of *bbox1* and *bbox2* to draw the line. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

loc2 is optional and defaults to *loc1*.

****kwargs**

Patch properties for the line drawn. Valid arguments include:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or *aa*	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	*color*
edgecolor or *ec*	*color* or None

Table 349 – continued from previ

Property	Description
zorder	float

static connect_bbox(*bbox1*, *bbox2*, *loc1*, *loc2=None*)

Construct a *Path* connecting corner *loc1* of *bbox1* to corner *loc2* of *bbox2*, where parameters behave as documented as for the *BboxConnector* constructor.

static get_bbox_edge_pos(*bbox*, *loc*)

Return the `(x, y)` coordinates of corner *loc* of *bbox*; parameters behave as documented for the *BboxConnector* constructor.

get_path()

Return the path of this patch.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch

class mpl_toolkits.axes_grid1.inset_locator.**BboxConnectorPatch**(*bbox1*, *bbox2*, *loc1a*, *loc2a*, *loc1b*, *loc2b*, ***kwargs*)

Bases: *BboxConnector*

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in *bbox1* and the line between the two corners specified in *bbox2*.

Parameters

bbox1, bbox2

[*Bbox*] Bounding boxes to connect.

loc1a, loc2a, loc1b, loc2b

[{1, 2, 3, 4}] The first line connects corners *loc1a* of *bbox1* and *loc2a* of *bbox2*; the second line connects corners *loc1b* of *bbox1* and *loc2b* of *bbox2*. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

****kwargs**

Patch properties for the line drawn:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch`

mpl_toolkits.axes_grid1.inset_locator.BboxPatch

class mpl_toolkits.axes_grid1.inset_locator.**BboxPatch**(*bbox*, ***kwargs*)

Bases: *Patch*

Patch showing the shape bounded by a Bbox.

Parameters

bbox

[*Bbox*] Bbox to use for the extents of this patch.

****kwargs**

Patch properties. Valid arguments include:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or *aa*	bool or None

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

Functions

inset_axes(parent_axes, width, height[, ...])	Create an inset axes with a given width and height.
mark_inset(parent_axes, inset_axes, loc1, ...)	Draw a box to mark the location of an area represented by an inset axes.
zoomed_inset_axes(parent_axes, zoom[, loc, ...])	Create an anchored inset axes by scaling a parent axes.

mpl_toolkits.axes_grid1.inset_locator.inset_axes

mpl_toolkits.axes_grid1.inset_locator.**inset_axes**(*parent_axes*, *width*, *height*, *loc='upper right'*, *bbox_to_anchor=None*, *bbox_transform=None*, *axes_class=None*, *axes_kwargs=None*, *borderpad=0.5*)

Create an inset axes with a given width and height.

Both sizes used can be specified either in inches or percentage. For example,:

```
inset_axes(parent_axes, width='40%', height='30%', loc='lower left
↪')
```

creates in inset axes in the lower left corner of *parent_axes* which spans over 30% in height and 40% in width of the *parent_axes*. Since the usage of *inset_axes* may become slightly tricky when exceeding such standard cases, it is recommended to read *the examples*.

Parameters

parent_axes

[*matplotlib.axes.Axes*] Axes to place the inset axes.

width, height

[float or str] Size of the inset axes to create. If a float is provided, it is the size in inches, e.g. *width=1.3*. If a string is provided, it is the size in relative units, e.g. *width='40%'*. By default, i.e. if neither *bbox_to_anchor* nor *bbox_transform* are specified, those are relative to the parent_axes. Otherwise, they are to be understood relative to the bounding box provided via *bbox_to_anchor*.

loc

[str, default: 'upper right'] Location to place the inset axes. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

bbox_to_anchor

[tuple or *BboxBase*, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if *bbox_transform* is set to *parent_axes.transAxes* or *parent_axes.figure.transFigure*. Otherwise, *parent_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless *bbox_transform* is set, the units of the bounding box are interpreted in the pixel coordinate. When using *bbox_to_anchor* with tuple, it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes.transAxes*.

bbox_transform

[*Transform*, optional] Transformation for the bbox that contains the inset axes. If None, a *transforms.IdentityTransform* is used. The value of *bbox_to_anchor* (or the return value of its get_points method) is transformed by the *bbox_transform* and then interpreted as points in the pixel coordinate (which is dpi dependent). You may provide *bbox_to_anchor* in some normalized coordinate, and give an appropriate transform (e.g., *parent_axes.transAxes*).

axes_class

[*Axes* type, default: *HostAxes*] The type of the newly created inset axes.

axes_kwargs

[dict, optional] Keyword arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}

ylabel	str
ylim	(bottom: float, top: float)

Table 356 – continued fro

Property	Description
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

borderpad

[float, default: 0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points *borderpad = 0.5* is equivalent to a padding of 5 points.

Returns

inset_axes

[*axes_class*] Inset axes object created.

Notes

The meaning of *bbox_to_anchor* and *bbox_to_transform* is interpreted differently from that of legend. The value of bbox_to_anchor (or the return value of its get_points method; the default is *parent_axes.bbox*) is transformed by the bbox_transform (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the *parent_axes*:

```
axins = inset_axes(parent_axes, "30%", "40%")
axins = inset_axes(parent_axes, "30%", "40%",
                   bbox_to_anchor=parent_axes.bbox)
axins = inset_axes(parent_axes, "30%", "40%",
                   bbox_to_anchor=(0, 0, 1, 1),
                   bbox_transform=parent_axes.transAxes)
```

Examples using `mpl_toolkits.axes_grid1.inset_locator.inset_axes`

mpl_toolkits.axes_grid1.inset_locator.mark_inset

mpl_toolkits.axes_grid1.inset_locator.**mark_inset**(*parent_axes*, *inset_axes*, *loc1*, *loc2*, ***kwargs*)

Draw a box to mark the location of an area represented by an inset axes.

This function draws a box in *parent_axes* at the bounding box of *inset_axes*, and shows a connection with the inset axes by drawing lines at the corners, giving a "zoomed in" effect.

Parameters

parent_axes

[*Axes*] Axes which contains the area of the inset axes.

inset_axes

[*Axes*] The inset axes.

loc1, loc2

[{1, 2, 3, 4}] Corners to use for connecting the inset axes and the area in the parent axes.

****kwargs**

Patch properties for the lines and box drawn:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or *aa*	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	*color*
edgecolor or *ec*	*color* or None
facecolor or *fc*	*color* or None
figure	*Figure* or *SubFigure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
hatch_linewidth	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or *ls*	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or *lw*	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Returns

pp

[*Patch*] The patch drawn to represent the area of the inset axes.

p1, p2

[*Patch*] The patches connecting two corners of the inset axes and its area.

Examples using `mpl_toolkits.axes_grid1.inset_locator.mark_inset`

mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes

mpl_toolkits.axes_grid1.inset_locator.**zoomed_inset_axes**(*parent_axes*, *zoom*, *loc='upper right'*, *bbox_to_anchor=None*, *bbox_transform=None*, *axes_class=None*, *axes_kwargs=None*, *borderpad=0.5*)

Create an anchored inset axes by scaling a parent axes. For usage, also see *the examples*.

Parameters

parent_axes

[*Axes*] Axes to place the inset axes.

zoom

[float] Scaling factor of the data axes. *zoom* > 1 will enlarge the coordinates (i.e., "zoomed in"), while *zoom* < 1 will shrink the coordinates (i.e., "zoomed out").

loc

[str, default: 'upper right'] Location to place the inset axes. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

bbox_to_anchor

[tuple or *BboxBase*, optional] Bbox that the inset axes will be anchored to. If None, *parent_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that the units of the bounding box are determined through the transform in use. When using *bbox_to_anchor* it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes.transAxes*.

bbox_transform

[*Transform*, optional] Transformation for the bbox that contains the inset axes. If None, a *transforms.IdentityTransform* is used (i.e. pixel coordinates). This is useful when not providing any argument to *bbox_to_anchor*. When using *bbox_to_anchor* it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes.transAxes*. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying *bbox_to_anchor* will use *parent_axes.bbox*, the units of which are in display (pixel) coordinates.

axes_class

[*Axes* type, default: *HostAxes*] The type of the newly created inset axes.

axes_kwargs

[dict, optional] Keyword arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or *fc*	*color*
figure	*Figure* or *SubFigure*
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable

Table 358 – continued fro

Property	Description
position	[left, bottom, width, height] or Bbox
prop_cycle	Cycler
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	Transform
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str

borderpad

[float, default: 0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points *borderpad = 0.5* is equivalent to a padding of 5 points.

Returns

inset_axes

[*axes_class*] Inset axes object created.

Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

mpl_toolkits.axes_grid1.mpl_axes

Classes

Axes(fig, *args[, facecolor, frameon, ...])	Build an Axes in a figure.
SimpleAxisArtist(axis, axisnum, spine)	
SimpleChainedObjects(objects)	

mpl_toolkits.axes_grid1.mpl_axes.Axes

class mpl_toolkits.axes_grid1.mpl_axes.**Axes**(*fig*, **args*, *facecolor=None*, *frameon=True*, *sharex=None*, *sharey=None*, *label=''*, *xscale=None*, *yscale=None*, *box_aspect=None*, *forward_navigation_events='auto'*, ***kwargs*)

Bases: *Axes*

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or *fc*	*color*
figure	*Figure* or *SubFigure*
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	*Transform*
url	str
visible	bool

Table 360 – continued fro

Property	Description
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

class AxisDict(*axes*)

Bases: dict

__call__(**v*, ***kwargs*)

Call self as a function.

property axis

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'off' or Fals	Hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_off()*.
'on' or True	Do not hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_on()*.
'equal	Set equal scaling (i.e., make circles circular) by changing the axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scale	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'squar	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

Notes

For 3D Axes, this method additionally takes *zmin*, *zmax* as parameters and likewise returns them.

clear()

Clear the Axes.

Examples using `mpl_toolkits.axes_grid1.mpl_axes.Axes`

mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist

class mpl_toolkits.axes_grid1.mpl_axes.**SimpleAxisArtist**(*axis*, *axisnum*, *spine*)

Bases: *Artist*

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

property label

property major_ticklabels

property major_ticks

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None

snap	bool or None
transform	Transform
url	str
visible	unknown
zorder	float

set_label(*txt*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

toggle(*all=None*, *ticks=None*, *ticklabels=None*, *label=None*)

mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects

class mpl_toolkits.axes_grid1.mpl_axes.**SimpleChainedObjects**(*objects*)

Bases: object

__call__(**args*, ***kwargs*)

Call self as a function.

mpl_toolkits.axes_grid1.parasite_axes

Classes

HostAxes	alias of AxesHostAxes
HostAxesBase(*args, **kwargs)	
ParasiteAxes	alias of AxesParasite
ParasiteAxesBase(parent_axes[, ...])	
SubplotHost	alias of AxesHostAxes

mpl_toolkits.axes_grid1.parasite_axes.HostAxes

mpl_toolkits.axes_grid1.parasite_axes.**HostAxes**

alias of AxesHostAxes

mpl_toolkits.axes_grid1.parasite_axes.HostAxesBase

class mpl_toolkits.axes_grid1.parasite_axes.**HostAxesBase**(**args*, ***kwargs*)

Bases: object

clear()

draw(*renderer*)

get_aux_axes(*tr=None*, *viewlim_mode='equal'*, *axes_class=None*, ***kwargs*)

Add a parasite axes to this host.

Despite this method's name, this should actually be thought of as an add_parasite_axes method.

Changed in version 3.7: Defaults to same base axes class as host axes.

Parameters

tr

[*Transform* or None, default: None] If a *Transform*, the following relation will hold: `parasite.transData = tr + host.transData`. If None, the parasite's and the host's `transData` are unrelated.

viewlim_mode

[{"equal", "transform", None}, default: "equal"] How the parasite's view limits are set: directly equal to the parent axes ("equal"), equal after application of *tr* ("transform"), or independently (None).

axes_class

[subclass type of *Axes*, optional] The *Axes* subclass that is instantiated. If None, the base class of the host axes is used.

****kwargs**

Other parameters are forwarded to the parasite axes constructor.

get_tightbbox(*renderer=None*, *, *call_axes_locator=True*, *bbox_extra_artists=None*)

pick(*mouseevent*)

twin(*aux_trans=None*, *axes_class=None*)

Create a twin of Axes with no shared axis.

While self will have ticks on the left and bottom axis, the returned axes will have ticks on the top and right axis.

twinx(*axes_class=None*)

Create a twin of Axes with a shared x-axis but independent y-axis.

The y-axis of self will have ticks on the left and the returned axes will have ticks on the right.

twiny(*axes_class=None*)

Create a twin of Axes with a shared y-axis but independent x-axis.

The x-axis of self will have ticks on the bottom and the returned axes will have ticks on the top.

Examples using `mpl_toolkits.axes_grid1.parasite_axes.HostAxesBase`

mpl_toolkits.axes_grid1.parasite_axes.ParasiteAxes

mpl_toolkits.axes_grid1.parasite_axes.**ParasiteAxes**

alias of `AxesParasite`

mpl_toolkits.axes_grid1.parasite_axes.ParasiteAxesBase

class mpl_toolkits.axes_grid1.parasite_axes.**ParasiteAxesBase**(*parent_axes*, *aux_transform=None*, *, *viewlim_mode=None*, ***kwargs*)

Bases: object

clear()

get_viewlim_mode()

pick(*mouseevent*)

set_viewlim_mode(*mode*)

mpl_toolkits.axes_grid1.parasite_axes.SubplotHost

mpl_toolkits.axes_grid1.parasite_axes.**SubplotHost**

alias of AxesHostAxes

Functions

host_axes(*args[, axes_class, figure])	Create axes that can act as a hosts to parasitic axes.
host_axes_class_factory(axes_class)	
host_subplot(*args[, axes_class, figure])	Create axes that can act as a hosts to parasitic axes.
host_subplot_class_factory(axes_class)	
parasite_axes_class_factory(axes_class)	

mpl_toolkits.axes_grid1.parasite_axes.host_axes

mpl_toolkits.axes_grid1.parasite_axes.**host_axes**(**args*, *axes_class=<class 'mpl_toolkits.axes_grid1.mpl_axes.Axes'>*, *figure=None*, ***kwargs*)

Create axes that can act as a hosts to parasitic axes.

Parameters

figure

[*Figure*] Figure to which the axes will be added. Defaults to the current figure *pyplot.gcf()*.

***args, **kwargs**

Will be passed on to the underlying *Axes* object creation.

mpl_toolkits.axes_grid1.parasite_axes.host_axes_class_factory

mpl_toolkits.axes_grid1.parasite_axes.**host_axes_class_factory**(*axes_class*)

mpl_toolkits.axes_grid1.parasite_axes.host_subplot

mpl_toolkits.axes_grid1.parasite_axes.**host_subplot**(**args*, *axes_class=<class 'mpl_toolkits.axes_grid1.mpl_axes.Axes'>*, *figure=None*, ***kwargs*)

Create axes that can act as a hosts to parasitic axes.

Parameters

figure

[*Figure*] Figure to which the axes will be added. Defaults to the current figure *pyplot.gcf()*.

***args, **kwargs**

Will be passed on to the underlying *Axes* object creation.

Examples using `mpl_toolkits.axes_grid1.parasite_axes.host_subplot`

mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory

mpl_toolkits.axes_grid1.parasite_axes.**host_subplot_class_factory**(*axes_class*)

mpl_toolkits.axes_grid1.parasite_axes.**parasite_axes_class_factory**(*axes_class*)

7.2.71 `mpl_toolkits.axisartist`

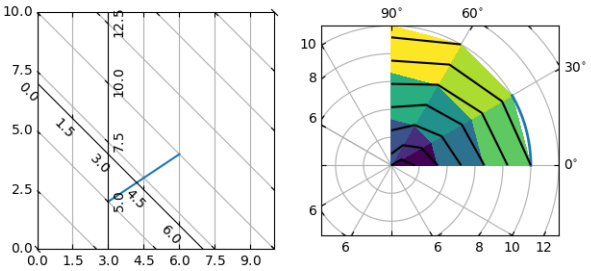
The *axisartist* namespace provides a derived Axes implementation (`mpl_toolkits.axisartist.Axes`), designed to support curvilinear grids. The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from Matplotlib's Axis class.

You can find a tutorial describing usage of axisartist at the *axisartist* user guide.

Note

This module contains classes and function that were formerly part of the `mpl_toolkits.axes_grid` module that was removed in 3.6. Additional classes from that older module may also be found in *mpl_toolkits.axes_grid1*.

The submodules of the axisartist API are:



axisartist.angle_helper	
axisartist.axes_divider	
axisartist.axis_artist	The *axis_artist* module implements custom artists to draw axis elements (axis lines and labels, tick lines and labels, grid lines).
axisartist.axisline_style	Provides classes to style the axis lines.
axisartist.axislines	Axislines includes modified implementation of the Axes class.
axisartist.floating_axes	An experimental support for curvilinear grid.
axisartist.grid_finder	
axisartist.grid_helper_curvelinear	An experimental support for curvilinear grid.
axisartist.parasite_axes	

mpl_toolkits.axisartist.angle_helper

Classes

ExtremeFinderCycle(nx, ny[, lon_cycle, ...])	This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.
FormatterDMS()	
FormatterHMS()	
LocatorBase(nbins[, include_last])	
LocatorD(nbins[, include_last])

Table 365 – continued from previous page

LocatorDM(nbins[, include_last])	
LocatorDMS(nbins[, include_last])	
LocatorH(nbins[, include_last])	
LocatorHM(nbins[, include_last])	
LocatorHMS(nbins[, include_last])	

mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle

class mpl_toolkits.axisartist.angle_helper.**ExtremeFinderCycle**(*nx*, *ny*, *lon_cycle=360.0*, *lat_cycle=None*, *lon_minmax=None*, *lat_minmax=(-90, 90)*)

Bases: *ExtremeFinderSimple*

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

Parameters

nx, ny

[int] The number of samples in each direction.

lon_cycle, lat_cycle

[360 or None] If not None, values in the corresponding direction are taken modulo *lon_cycle* or *lat_cycle*; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

__call__(*transform_xy*, *x1*, *y1*, *x2*, *y2*)

Compute an approximation of the bounding box obtained by applying *transform_xy* to the box delimited by `(x1, y1, x2, y2)`.

The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have *transform_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of *1/nx* or *1/ny*, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

Examples using `mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle`

mpl_toolkits.axisartist.angle_helper.FormatterDMS

class mpl_toolkits.axisartist.angle_helper.**FormatterDMS**

Bases: `object`

__call__(*direction*, *factor*, *values*)

Call self as a function.

deg_mark = '^{\\circ}'

fmt_d = '$%d^{\\circ}$'

fmt_d_m = '$%s%d^{\\circ}\\,%02d^{\\prime}$'

fmt_d_m_partial = '$%s%d^{\\circ}\\,%02d^{\\prime}\\,'

fmt_d_ms = '$%s%d^{\\circ}\\,%02d.%s^{\\prime}$'

fmt_ds = '$%d.%s^{\\circ}$'

fmt_s_partial = '%02d^{\\prime\\prime}$'

fmt_ss_partial = '%02d.%s^{\\prime\\prime}$'

min_mark = '^{\\prime}'

sec_mark = '^{\\prime\\prime}'

Examples using `mpl_toolkits.axisartist.angle_helper.FormatterDMS`

mpl_toolkits.axisartist.angle_helper.FormatterHMS

class mpl_toolkits.axisartist.angle_helper.**FormatterHMS**

Bases: *FormatterDMS*

__call__(*direction*, *factor*, *values*)

Call self as a function.

deg_mark = '^\\mathrm{h}'

fmt_d = '$%d^\\mathrm{h}$'

fmt_d_m = '$%s%d^\\mathrm{h}\\,%02d^\\mathrm{m}$'

fmt_d_m_partial = '$%s%d^\\mathrm{h}\\,%02d^\\mathrm{m}\\,'

fmt_d_ms = '$%s%d^\\mathrm{h}\\,%02d.%s^\\mathrm{m}$'

fmt_ds = '$%d.%s^\\mathrm{h}$'

fmt_s_partial = '%02d^\\mathrm{s}$'

fmt_ss_partial = '%02d.%s^\\mathrm{s}$'

min_mark = '^\\mathrm{m}'

sec_mark = '^\\mathrm{s}'

Examples using `mpl_toolkits.axisartist.angle_helper.FormatterHMS`

mpl_toolkits.axisartist.angle_helper.LocatorBase

class mpl_toolkits.axisartist.angle_helper.**LocatorBase**(*nbins*, *include_last=True*)

Bases: `object`

set_params(*nbins=None*)

Examples using `mpl_toolkits.axisartist.angle_helper.LocatorBase`

mpl_toolkits.axisartist.angle_helper.LocatorD

class mpl_toolkits.axisartist.angle_helper.**LocatorD**(*nbins*, *include_last=True*)

Bases: *LocatorBase*

__call__(*v1*, *v2*)

Call self as a function.

mpl_toolkits.axisartist.angle_helper.LocatorDM

class mpl_toolkits.axisartist.angle_helper.**LocatorDM**(*nbins*, *include_last=True*)

Bases: *LocatorBase*

__call__(*v1*, *v2*)

Call self as a function.

mpl_toolkits.axisartist.axes_divider

mpl_toolkits.axisartist.axis_artist

The *axis_artist* module implements custom artists to draw axis elements (axis lines and labels, tick lines and labels, grid lines).

Axis lines and labels and tick lines and labels are managed by the *AxisArtist* class; grid lines are managed by the *GridlinesCollection* class.

There is one *AxisArtist* per Axis; it can be accessed through the `axis` dictionary of the parent Axes (which should be a `mpl_toolkits.axislines.Axes`), e.g. `ax.axis["bottom"]`.

Children of the AxisArtist are accessed as attributes: `.line` and `.label` for the axis line and label, `.major_ticks`, `.major_ticklabels`, `.minor_ticks`, `.minor_ticklabels` for the tick lines and labels (e.g. `ax.axis["bottom"].line`).

Children properties (colors, fonts, line widths, etc.) can be set using setters, e.g.

```
# Make the major ticks of the bottom axis red.
ax.axis["bottom"].major_ticks.set_color("red")
```

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the grid_helper.

axis_direction

AxisArtist, *AxisLabel*, *TickLabels* have an *axis_direction* attribute, which adjusts the location, angle, etc. The *axis_direction* must be one of "left", "right", "bottom", "top", and follows the Matplotlib convention for rectangular axis.

For example, for the *bottom* axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
- ticklabels and axislabel have text angle of 0
- ticklabels are baseline, center-aligned
- axislabel is top, center-aligned

The text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

Property	left	bottom	right	top
ticklabel location	left	right	right	left
axislabel location	left	right	right	left
ticklabel angle	90	0	-90	180
axislabel angle	180	0	0	180
ticklabel va	center	baseline	center	baseline
axislabel va	center	top	center	bottom
ticklabel ha	right	center	right	center
axislabel ha	right	center	right	center

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```
ax.axis["bottom"].major_ticks.set_tick_out(True)
```

The following attributes can be customized (use the `set_xxx` methods):

- *Ticks*: ticksize, tick_out

- *TickLabels*: pad
- *AxisLabel*: pad

Classes

AttributeCopier()	
AxisArtist(axes, helper[, offset, ...])	An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, tick labels, and axis label.
AxisLabel(*args[, axis_direction, axis])	Axis label.
GridlinesCollection(*args[, which, axis])	Collection of grid lines.
LabelBase(*args, **kwargs)	A base class for *AxisLabel* and *TickLabels*.
TickLabels(*[, axis_direction])	Tick labels.
Ticks(ticksize[, tick_out, axis])	Ticks are derived from *Line2D*, and note that ticks themselves are markers.

mpl_toolkits.axisartist.axis_artist.AttributeCopier

class mpl_toolkits.axisartist.axis_artist.**AttributeCopier**

Bases: object

get_attribute_from_ref_artist(*attr_name*)

get_ref_artist()

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

mpl_toolkits.axisartist.axis_artist.AxisArtist

class mpl_toolkits.axisartist.axis_artist.**AxisArtist**(*axes*, *helper*, *offset=None*, *axis_direction='bottom'*, ***kwargs*)

Bases: *Artist*

An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, tick labels, and axis label.

Parameters

axes

[*mpl_toolkits.axisartist.axislines.Axes*]

helper

[*AxisArtistHelper*]

property LABELPAD

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_axisline_style()

Return the current axisline style.

get_helper()

Return axis artist helper instance.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transform()

Return the *Transform* instance used by this artist.

invert_ticklabel_direction()

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *axis_direction=<UNSET>*, *axislabel_direction=<UNSET>*, *axisline_style=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *ticklabel_direction=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filte	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	float or None
animated	bool
axis_direc	{"left", "bottom", "right", "top"}
axisla-bel_direc	{"+", "-"}
axis-line_style	str or None
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
figure	Figure or SubFigure
gid	str
in_layout	bool
label	unknown
mouseover	bool
path_effec	list of AbstractPathEffect
picker	None or bool or float or callable
raster-ized	bool
sketch_pa	(scale: float, length: float, randomness: float)
snap	bool or None
tickla-bel_direc	{"+", "-"}
trans-form	Transform
url	str
visible	bool
zorder	float

set_axis_direction(*axis_direction*)

Adjust the direction, text angle, and text alignment of tick labels and axis labels following the Matplotlib convention for the rectangle axes.

The *axis_direction* must be one of [left, right, bottom, top].

Property	left	bottom	right	top
ticklabel direction	"-"	"+"	"+"	"-"
axislabel direction	"-"	"+"	"+"	"-"
ticklabel angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the direction "+" and "-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

Parameters

axis_direction

[{"left", "bottom", "right", "top"}]

set_axislabel_direction(*label_direction*)

Adjust the direction of the axis label.

Note that the *label_direction*s '+' and '-' are relative to the direction of the increasing coordinate.

Parameters

label_direction

[{"+", "-"}]

set_axisline_style(*axisline_style=None*, ***kwargs*)

Set the axisline style.

The new style is completely defined by the passed attributes. Existing style attributes are forgotten.

Parameters

axisline_style

[str or None] The line style, e.g. '->', optionally followed by a comma-separated list of attributes. Alternatively, the attributes can be provided as keywords.

If *None* this returns a string containing the available styles.

Examples

The following two commands are equal:

```
>>> set_axisline_style("->,size=1.5")
>>> set_axisline_style("->", size=1.5)
```

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_ticklabel_direction(*tick_direction*)

Adjust the direction of the tick labels.

Note that the *tick_direction*s '+' and '-' are relative to the direction of the increasing coordinate.

Parameters

tick_direction

[{"+", "-"}]

toggle(*all=None*, *ticks=None*, *ticklabels=None*, *label=None*)

Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

```
axis.toggle(all=False)
```

To turn all off but ticks on

```
axis.toggle(all=False, ticks=True)
```

To turn all on but (axis) label off

```
axis.toggle(all=True, label=False)
```

zorder = 2.5

Examples using `mpl_toolkits.axisartist.axis_artist.AxisArtist`

mpl_toolkits.axisartist.axis_artist.AxisLabel

class mpl_toolkits.axisartist.axis_artist.**AxisLabel**(**args*, *axis_direction='bottom'*, *axis=None*, ***kwargs*)

Bases: *AttributeCopier*, *LabelBase*

Axis label. Derived from *Text*. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal *Text*.

To change the pad between tick labels and axis label, use *set_pad*.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_color()

Return the color of the text.

get_pad()

Return the internal pad in points.

See *set_pad* for more details.

get_ref_artist()

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_text()

Return the text string.

get_window_extent(*renderer=None*)

Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first draw. In practice, it is usually easier to trigger a draw first, e.g. by calling *draw_without_rendering* or `plt.show()`.

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.get_figure(root=True).dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

set (*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *axis_direction=<UNSET>*, *backgroundcolor=<UNSET>*, *bbox=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *default_alignment=<UNSET>*, *default_angle=<UNSET>*, *fontfamily=<UNSET>*, *fontproperties=<UNSET>*, *fontsize=<UNSET>*, *fontstretch=<UNSET>*, *fontstyle=<UNSET>*, *fontvariant=<UNSET>*, *fontweight=<UNSET>*, *gid=<UNSET>*, *horizontalalignment=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linespacing=<UNSET>*, *math_fontfamily=<UNSET>*, *mouseover=<UNSET>*, *multialignment=<UNSET>*, *pad=<UNSET>*, *parse_math=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *rasterized=<UNSET>*, *rotation=<UNSET>*, *rotation_mode=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text=<UNSET>*, *transform=<UNSET>*, *transform_rotates_text=<UNSET>*, *url=<UNSET>*, *usetex=<UNSET>*, *verticalalignment=<UNSET>*, *visible=<UNSET>*, *wrap=<UNSET>*, *x=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float ar
alpha	float or None
animated	bool
antialiased	bool
axis_direction	{"left", "bottom", "right", "top"}
backgroundcolor	*color*
bbox	dict with properties for *patches.FancyBbo*
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or *c*	*color*
default_alignment	{"left", "bottom", "right", "top"}
default_angle	{"left", "bottom", "right", "top"}
figure	*Figure* or *SubFigure*
fontfamily or *family* or *fontname*	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fan
fontproperties or *font* or *font_properties*	*font_manager.FontProperties* or *st*
fontsize or *size*	float or {'xx-small', 'x-small', 'small', 'medium',
fontstretch or *stretch*	{a numeric value in range 0-1000, 'ultra-conde
fontstyle or *style*	{'normal', 'italic', 'oblique'}
fontvariant or *variant*	{'normal', 'small-caps'}
fontweight or *weight*	{a numeric value in range 0-1000, 'ultralight', 'l
gid	str
horizontalalignment or *ha*	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)

Table 368

Property	Description
math_fontfamily	str
mouseover	bool
multialignment or *ma*	{'left', 'right', 'center'}
pad	float
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool, default: *rcParams["text.usetex"*

x	float
y	float
zorder	float

set_axis_direction(*d*)

Adjust the text angle and text alignment of axis label according to the matplotlib convention.

Property	left	bottom	right	top
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

Parameters

d

[{"left", "bottom", "right", "top"}]

set_default_alignment(*d*)

Set the default alignment. See *set_axis_direction* for details.

Parameters

d

[{"left", "bottom", "right", "top"}]

set_default_angle(*d*)

Set the default angle. See *set_axis_direction* for details.

Parameters

d

[{"left", "bottom", "right", "top"}]

set_pad(*pad*)

Set the internal pad in points.

The actual pad will be the sum of the internal pad and the external pad (the latter is set automatically by the *AxisArtist*).

Parameters

pad

[float] The internal pad in points.

mpl_toolkits.axisartist.axis_artist.GridlinesCollection

class mpl_toolkits.axisartist.axis_artist.**GridlinesCollection**(**args*, *which='major'*, *axis='both'*, ***kwargs*)

Bases: *LineCollection*

Collection of grid lines.

Parameters

which

[{"major", "minor"}] Which grid to consider.

axis

[{"both", "x", "y"}] Which axis to consider.

***args, **kwargs**

Passed to *LineCollection*.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *axis=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *colors=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *grid_helper=<UNSET>*, *hatch=<UNSET>*, *hatch_linewidth=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *segments=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *visible=<UNSET>*, *which=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array ar
alpha	array-like or float or None
animated	bool
antialiased or *aa* or *antialiaseds*	bool or list of bools
array	array-like or None
axis	{"both", "x", "y"}
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	*color* or list of *color*
colors	*color* or list of *color*

set_axis(*axis*)

Select axis.

Parameters

axis

[{"both", "x", "y"}]

set_grid_helper(*grid_helper*)

Set grid helper.

Parameters

grid_helper

[*GridHelperBase* subclass]

set_which(*which*)

Select major or minor grid lines.

Parameters

which

[{"major", "minor"}]

mpl_toolkits.axisartist.axis_artist.LabelBase

class mpl_toolkits.axisartist.axis_artist.**LabelBase**(**args*, ***kwargs*)

Bases: *Text*

A base class for *AxisLabel* and *TickLabels*. The position and angle of the text are calculated by the offset_ref_angle, text_ref_angle, and offset_radius attributes.

Create a *Text* instance at *x*, *y* with string *text*.

The text is aligned relative to the anchor point (*x*, *y*) according to `horizontalalignment` (default: 'left') and `verticalalignment` (default: 'baseline'). See also *Text alignment*.

While Text accepts the 'label' keyword argument, by default it is not added to the handles of a legend.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array a
alpha	float or None
animated	bool
antialiased	bool

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_window_extent(*renderer=None*)

Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first draw. In practice, it is usually easier to trigger a draw first, e.g. by calling *draw_without_rendering* or `plt.show()`.

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.get_figure(root=True).dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

set(**, agg_filter=<UNSET>, alpha=<UNSET>, animated=<UNSET>, antialiased=<UNSET>, backgroundcolor=<UNSET>, bbox=<UNSET>, clip_box=<UNSET>, clip_on=<UNSET>, clip_path=<UNSET>, color=<UNSET>, fontfamily=<UNSET>, fontproperties=<UNSET>, fontsize=<UNSET>, fontstretch=<UNSET>, fontstyle=<UNSET>, fontvariant=<UNSET>, fontweight=<UNSET>, gid=<UNSET>, horizontalalignment=<UNSET>, in_layout=<UNSET>, label=<UNSET>, linespacing=<UNSET>, math_fontfamily=<UNSET>, mouseover=<UNSET>, multialignment=<UNSET>, parse_math=<UNSET>, path_effects=<UNSET>, picker=<UNSET>, position=<UNSET>, rasterized=<UNSET>, rotation=<UNSET>, rotation_mode=<UNSET>, sketch_params=<UNSET>, snap=<UNSET>, text=<UNSET>, transform=<UNSET>, transform_rotates_text=<UNSET>, url=<UNSET>, usetex=<UNSET>, verticalalignment=<UNSET>, visible=<UNSET>, wrap=<UNSET>, x=<UNSET>, y=<UNSET>, zorder=<UNSET>*)

Set multiple properties at once.

mpl_toolkits.axisartist.axis_artist.TickLabels

class mpl_toolkits.axisartist.axis_artist.**TickLabels**(*, *axis_direction='bottom'*, ***kwargs*)

Bases: *AxisLabel*

Tick labels. While derived from *Text*, this single artist draws all ticklabels. As in *AxisLabel*, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal *Text*. Unlike the ticklabels of the mainline Matplotlib, properties of a single ticklabel alone cannot be modified.

To change the pad between ticks and ticklabels, use *set_pad*.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_ref_artist()

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_texts_widths_heights_descents(*renderer*)

Return a list of `(width, height, descent)` tuples for ticklabels.

Empty labels are left out.

get_window_extents(*renderer=None*)

invert_axis_direction()

set (*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *axis_direction=<UNSET>*, *backgroundcolor=<UNSET>*, *bbox=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *default_alignment=<UNSET>*, *default_angle=<UNSET>*, *fontfamily=<UNSET>*, *fontproperties=<UNSET>*, *fontsize=<UNSET>*, *fontstretch=<UNSET>*, *fontstyle=<UNSET>*, *fontvariant=<UNSET>*, *fontweight=<UNSET>*, *gid=<UNSET>*, *horizontalalignment=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linespacing=<UNSET>*, *locs_angles_labels=<UNSET>*, *math_fontfamily=<UNSET>*, *mouseover=<UNSET>*, *multialignment=<UNSET>*, *pad=<UNSET>*, *parse_math=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *rasterized=<UNSET>*, *rotation=<UNSET>*, *rotation_mode=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text=<UNSET>*, *transform=<UNSET>*, *transform_rotates_text=<UNSET>*, *url=<UNSET>*, *usetex=<UNSET>*, *verticalalignment=<UNSET>*, *visible=<UNSET>*, *wrap=<UNSET>*, *x=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

verticalalignment or *va*	{'baseline', 'bottom', 'center', 'center_baseline', '
visible	bool
wrap	bool
x	float
y	float
zorder	float

set_axis_direction(*label_direction*)

Adjust the text angle and text alignment of ticklabels according to the Matplotlib convention.

The *label_direction* must be one of [left, right, bottom, top].

Property	left	bottom	right	top
ticklabel angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

Parameters

label_direction

[{"left", "bottom", "right", "top"}]

set_locs_angles_labels(*locs_angles_labels*)

mpl_toolkits.axisartist.axis_artist.Ticks

class mpl_toolkits.axisartist.axis_artist.**Ticks**(*ticksize*, *tick_out=False*, *, *axis=None*, ***kwargs*)

Bases: *AttributeCopier*, *Line2D*

Ticks are derived from *Line2D*, and note that ticks themselves are markers. Thus, you should use set_mec, set_mew, etc.

To change the tick size (length), you need to use *set_ticksize*. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use `set_tick_out(False)`

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_color()

Return the line color.

See also *set_color*.

get_markeredgecolor()

Return the marker edge color.

See also *set_markeredgecolor*.

get_markeredgewidth()

Return the marker edge width in points.

See also *set_markeredgewidth*.

get_ref_artist()

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_tick_out()

Return whether ticks are drawn inside or outside the axes.

get_ticksize()

Return length of the ticks in points.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *dash_capstyle=<UNSET>*, *dash_joinstyle=<UNSET>*, *dashes=<UNSET>*, *data=<UNSET>*, *drawstyle=<UNSET>*, *fillstyle=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *locs_angles=<UNSET>*, *marker=<UNSET>*, *markeredgecolor=<UNSET>*, *markeredgewidth=<UNSET>*, *markerfacecolor=<UNSET>*, *markerfacecoloralt=<UNSET>*, *markersize=<UNSET>*, *markevery=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *solid_capstyle=<UNSET>*, *solid_joinstyle=<UNSET>*, *tick_out=<UNSET>*, *ticksize=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xdata=<UNSET>*, *ydata=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

xdata	1D array
ydata	1D array
zorder	float

set_color(*color*)

Set the color of the line.

Parameters

color

[*color*]

set_locs_angles(*locs_angles*)

set_tick_out(*b*)

Set whether ticks are drawn inside or outside the axes.

set_ticksize(*ticksize*)

Set length of the ticks in points.

mpl_toolkits.axisartist.axisline_style

Provides classes to style the axis lines.

Classes

AxislineStyle(stylename, **kwargs)	A container class which defines style classes for AxisArtists.

mpl_toolkits.axisartist.axisline_style.AxislineStyle

class mpl_toolkits.axisartist.axisline_style.**AxislineStyle**(*stylename*, ***kwargs*)

Bases: `_Style`

A container class which defines style classes for AxisArtists.

An instance of any axisline style class is a callable object, whose call signature is

```
__call__(self, axis_artist, path, transform)
```

When called, this should return an *Artist* with the following methods:

```
def set_path(self, path):
    # set the path for axisline.

def set_line_mutation_scale(self, scale):
    # set the scale

def draw(self, renderer):
    # draw
```

Return the instance of the subclass with the given style name.

class **FilledArrow**(*size=1*, *facecolor=None*)

Bases: *SimpleArrow*

An arrow with a filled head.

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

facecolor

[*color*, default: *rcParams["axes.edgecolor"]* (default: `'black'`)] Fill color.

Added in version 3.7.

ArrowAxisClass

alias of `FilledArrow`

new_line(*axis_artist*, *transform*)

class SimpleArrow(*size=1*)

Bases: `_Base`

A simple arrow.

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of `SimpleArrow`

new_line(*axis_artist*, *transform*)

mpl_toolkits.axisartist.axislines

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from Matplotlib's Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- "top" and "bottom" x-axis (or "left" and "right" y-axis) can have different ticks (tick locations and labels). This is not possible with the current Matplotlib, although some twin axes trick can help.
- Curvilinear grid.
- angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., ax.axis["left"] is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains "bottom", "left", "top" and "right".

AxisArtist can be considered as a container artist and has the following children artists which will draw ticks, labels, etc.

- line
- major_ticks, major_ticklabels
- minor_ticks, minor_ticklabels
- offsetText
- label

Note that these are separate artists from *matplotlib.axis.Axis*, thus most tick-related functions in Matplotlib won't work. For example, color and markerwidth of the `ax.axis["bottom"].major_ticks` will follow those of Axes.xaxis unless explicitly specified.

In addition to AxisArtist, the Axes will have *gridlines* attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.

Classes

Axes(*args[, grid_helper])	Build an Axes in a figure.
AxesZero(*args[, grid_helper])	Build an Axes in a figure.
AxisArtistHelper()	
AxisArtistHelperRectlinear()	
FixedAxisArtistHelperRectilinear(axes, loc)	nth_coord = along which coordinate value varies in 2D, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis
FloatingAxisArtistHelperRectilinear(axes, ...)	
GridHelperBase()	
GridHelperRectlinear(axes)	
Subplot	alias of *Axes*
SubplotZero	alias of *AxesZero*

mpl_toolkits.axisartist.axislines.Axes

class mpl_toolkits.axisartist.axislines.**Axes**(**args*, *grid_helper=None*, ***kwargs*)

Bases: *Axes*

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or *fc*	*color*
figure	*Figure* or *SubFigure*
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*

Table 376 – continued fro

Property	Description
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None

ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

property axis

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'off' or Fals	Hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_off()*.
'on' or True	Do not hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_on()*.
'equal	Set equal scaling (i.e., make circles circular) by changing the axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scale	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'squar	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

Notes

For 3D Axes, this method additionally takes *zmin*, *zmax* as parameters and likewise returns them.

clear()

Clear the Axes.

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_grid_helper()

grid(*visible=None*, *which='major'*, *axis='both'*, ***kwargs*)

Toggle the gridlines, and optionally set the properties of the lines.

new_fixed_axis(*loc*, *offset=None*)

new_floating_axis(*nth_coord*, *value*, *axis_direction='bottom'*)

set(***, *adjustable=<UNSET>*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *anchor=<UNSET>*, *animated=<UNSET>*, *aspect=<UNSET>*, *autoscale_on=<UNSET>*, *autoscalex_on=<UNSET>*, *autoscaley_on=<UNSET>*, *axes_locator=<UNSET>*, *axisbelow=<UNSET>*, *box_aspect=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *facecolor=<UNSET>*, *forward_navigation_events=<UNSET>*, *frame_on=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *navigate=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *prop_cycle=<UNSET>*, *rasterization_zorder=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *subplotspec=<UNSET>*, *title=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xbound=<UNSET>*, *xlabel=<UNSET>*, *xlim=<UNSET>*, *xmargin=<UNSET>*, *xscale=<UNSET>*, *xticklabels=<UNSET>*, *xticks=<UNSET>*, *ybound=<UNSET>*, *ylabel=<UNSET>*, *ylim=<UNSET>*, *ymargin=<UNSET>*, *yscale=<UNSET>*, *yticklabels=<UNSET>*, *yticks=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

toggle_axisline(*b=None*)

Examples using `mpl_toolkits.axisartist.axislines.Axes`

mpl_toolkits.axisartist.axislines.AxesZero

class mpl_toolkits.axisartist.axislines.**AxesZero**(**args*, *grid_helper=None*, ***kwargs*)

Bases: *Axes*

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*. Note that it is not possible to unshare axes.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

forward_navigation_events

[bool or "auto", default: "auto"] Control whether pan/zoom events are passed through to Axes below this one. "auto" is *True* for axes with an invisible patch and *False* otherwise.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or *fc*	*color*
figure	*Figure* or *SubFigure*
forward_navigation_events	bool or "auto"
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	*Transform*
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown

Table 378 – continued fro

Property	Description
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

clear()

Clear the Axes.

set(*, *adjustable=<UNSET>*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *anchor=<UNSET>*, *animated=<UNSET>*, *aspect=<UNSET>*, *autoscale_on=<UNSET>*, *autoscalex_on=<UNSET>*, *autoscaley_on=<UNSET>*, *axes_locator=<UNSET>*, *axisbelow=<UNSET>*, *box_aspect=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *facecolor=<UNSET>*, *forward_navigation_events=<UNSET>*, *frame_on=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *navigate=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *prop_cycle=<UNSET>*, *rasterization_zorder=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *subplotspec=<UNSET>*, *title=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xbound=<UNSET>*, *xlabel=<UNSET>*, *xlim=<UNSET>*, *xmargin=<UNSET>*, *xscale=<UNSET>*, *xticklabels=<UNSET>*, *xticks=<UNSET>*, *ybound=<UNSET>*, *ylabel=<UNSET>*, *ylim=<UNSET>*, *ymargin=<UNSET>*, *yscale=<UNSET>*, *yticklabels=<UNSET>*, *yticks=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool

Floating

alias of *FloatingAxisArtistHelperRectilinear*

mpl_toolkits.axisartist.axislines.FixedAxisArtistHelperRectilinear

class mpl_toolkits.axisartist.axislines.**FixedAxisArtistHelperRectilinear**(*axes*, *loc*, *nth_coord=<a parameter>*)

Bases: _FixedAxisArtistHelperBase

nth_coord = along which coordinate value varies in 2D, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

get_tick_iterators(*axes*)

tick_loc, tick_angle, tick_label

mpl_toolkits.axisartist.axislines.FloatingAxisArtistHelperRectilinear

class mpl_toolkits.axisartist.axislines.**FloatingAxisArtistHelperRectilinear**(*axes*, *nth_coord*, *passingth-rough_point*, *axis_direction*)

Bases: `_FloatingAxisArtistHelperBase`

get_axislabel_pos_angle(*axes*)

Return the label reference position in transAxes.

get_label_transform() returns a transform of (transAxes+offset)

get_axislabel_transform(*axes*)

get_line(*axes*)

get_line_transform(*axes*)

get_tick_iterators(*axes*)

tick_loc, tick_angle, tick_label

get_tick_transform(*axes*)

mpl_toolkits.axisartist.axislines.GridHelperBase

class mpl_toolkits.axisartist.axislines.**GridHelperBase**

Bases: `object`

get_gridlines(*which*, *axis*)

Return list of grid lines as a list of paths (list of points).

Parameters

which

[{"both", "major", "minor"}]

axis

[{"both", "x", "y"}]

update_lim(*axes*)

Examples using `mpl_toolkits.axisartist.axislines.GridHelperBase`

mpl_toolkits.axisartist.axislines.GridHelperRectlinear

class mpl_toolkits.axisartist.axislines.**GridHelperRectlinear**(*axes*)

Bases: *GridHelperBase*

get_gridlines(*which='major'*, *axis='both'*)

Return list of gridline coordinates in data coordinates.

Parameters

which

[{"both", "major", "minor"}]

axis

[{"both", "x", "y"}]

new_fixed_axis(*loc*, *nth_coord=<deprecated parameter>*, *axis_direction=None*, *offset=None*, *axes=None*)

new_floating_axis(*nth_coord*, *value*, *axis_direction='bottom'*, *axes=None*)

mpl_toolkits.axisartist.axislines.Subplot

mpl_toolkits.axisartist.axislines.**Subplot**

alias of *Axes*

mpl_toolkits.axisartist.axislines.SubplotZero

mpl_toolkits.axisartist.axislines.**SubplotZero**

alias of *AxesZero*

mpl_toolkits.axisartist.floating_axes

An experimental support for curvilinear grid.

Classes

ExtremeFinderFixed(extremes)	This subclass always returns the same bounding box.
FixedAxisArtistHelper(grid_helper, side[, ...])	nth_coord = along which coordinate value varies.
FloatingAxes	alias of `FloatingAxesHostAxes`
FloatingAxesBase(*args, grid_helper, **kwargs)	
FloatingAxisArtistHelper(grid_helper, ...[, ...])	nth_coord = along which coordinate value varies.
FloatingSubplot	alias of `FloatingAxesHostAxes`

Table 380 – continued from previous page

GridHelperCurveLinear(aux_trans, extremes[, ...])	

mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed

class mpl_toolkits.axisartist.floating_axes.**ExtremeFinderFixed**(*extremes*)

Bases: *ExtremeFinderSimple*

This subclass always returns the same bounding box.

Parameters

extremes

[(float, float, float, float)] The bounding box that this helper always returns.

__call__(*transform_xy*, *x1*, *y1*, *x2*, *y2*)

Compute an approximation of the bounding box obtained by applying *transform_xy* to the box delimited by `(x1, y1, x2, y2)`.

The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have *transform_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of *1/nx* or *1/ny*, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper

class mpl_toolkits.axisartist.floating_axes.**FixedAxisArtistHelper**(*grid_helper*, *side*, *nth_coord_ticks=None*)

Bases: *FloatingAxisArtistHelper*

nth_coord = along which coordinate value varies.

nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

get_line(*axes*)

get_tick_iterators(*axes*)

tick_loc, tick_angle, tick_label, (optionally) tick_label

update_lim(*axes*)

mpl_toolkits.axisartist.floating_axes.FloatingAxes

mpl_toolkits.axisartist.floating_axes.**FloatingAxes**

alias of FloatingAxesHostAxes

mpl_toolkits.axisartist.floating_axes.FloatingAxesBase

class mpl_toolkits.axisartist.floating_axes.**FloatingAxesBase**(**args*, *grid_helper*, ***kwargs*)

Bases: object

adjust_axes_lim()

clear()

Examples using mpl_toolkits.axisartist.floating_axes.FloatingAxesBase

mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper

class mpl_toolkits.axisartist.floating_axes.**FloatingAxisArtistHelper**(*grid_helper*, *nth_coord*, *value*, *axis_direction=Non*

Bases: *FloatingAxisArtistHelper*

nth_coord = along which coordinate value varies.

nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

mpl_toolkits.axisartist.floating_axes.FloatingSubplot

mpl_toolkits.axisartist.floating_axes.**FloatingSubplot**

alias of FloatingAxesHostAxes

mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear

class mpl_toolkits.axisartist.floating_axes.**GridHelperCurveLinear**(*aux_trans*, *extremes*, *grid_locator1=None*, *grid_locator2=None*, *tick_formatter1=None*, *tick_formatter2=None*)

Bases: *GridHelperCurveLinear*

Parameters

aux_trans

[*Transform* or tuple[Callable, Callable]] The transform from curved coordinates to rectilinear coordinate: either a *Transform* instance (which provides also its inverse), or a pair of callables `(trans, inv_trans)` that define the transform and its inverse. The callables should have signature:

```
x_rect, y_rect = trans(x_curved, y_curved)
x_curved, y_curved = inv_trans(x_rect, y_rect)
```

extreme_finder

grid_locator1, grid_locator2

Grid locators for each axis.

tick_formatter1, tick_formatter2

Tick formatters for each axis.

get_gridlines(*which='major'*, *axis='both'*)

Return list of grid lines as a list of paths (list of points).

Parameters

which

[{"both", "major", "minor"}]

axis

[{"both", "x", "y"}]

new_fixed_axis(*loc*, *nth_coord=None*, *axis_direction=None*, *offset=None*, *axes=None*)

mpl_toolkits.axisartist.grid_finder

Classes

DictFormatter(format_dict[, formatter])	format_dict : dictionary for format strings to be used.
ExtremeFinderSimple(nx, ny)	A helper class to figure out the range of grid lines that need to be drawn.
FixedLocator(locs)	
FormatterPrettyPrint([useMathText])	
GridFinder(transform[, extreme_finder, ...])	Internal helper for *GridHelperCurveLinear*, with the same constructor parameters; should not be directly instantiated.
MaxNLocator([nbins, steps, trim, integer, ...])	

mpl_toolkits.axisartist.grid_finder.DictFormatter

class mpl_toolkits.axisartist.grid_finder.**DictFormatter**(*format_dict*, *formatter=None*)

Bases: object

format_dict : dictionary for format strings to be used. formatter : fall-back formatter

__call__(*direction*, *factor*, *values*)

factor is ignored if value is found in the dictionary

Examples using mpl_toolkits.axisartist.grid_finder.DictFormatter

mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

class mpl_toolkits.axisartist.grid_finder.**ExtremeFinderSimple**(*nx*, *ny*)

Bases: object

A helper class to figure out the range of grid lines that need to be drawn.

Parameters

nx, ny

[int] The number of samples in each direction.

__call__(*transform_xy*, *x1*, *y1*, *x2*, *y2*)

Compute an approximation of the bounding box obtained by applying *transform_xy* to the box delimited by `(x1, y1, x2, y2)`.

The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have *transform_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of *1/nx* or *1/ny*, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

Examples using `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

mpl_toolkits.axisartist.grid_finder.FixedLocator

class mpl_toolkits.axisartist.grid_finder.**FixedLocator**(*locs*)

Bases: object

__call__(*v1*, *v2*)

Call self as a function.

Examples using `mpl_toolkits.axisartist.grid_finder.FixedLocator`

mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint

class mpl_toolkits.axisartist.grid_finder.**FormatterPrettyPrint**(*useMathText=True*)

Bases: object

__call__(*direction*, *factor*, *values*)

Call self as a function.

mpl_toolkits.axisartist.grid_finder.GridFinder

class mpl_toolkits.axisartist.grid_finder.**GridFinder**(*transform*, *extreme_finder=None*, *grid_locator1=None*, *grid_locator2=None*, *tick_formatter1=None*, *tick_formatter2=None*)

Bases: object

Internal helper for *GridHelperCurveLinear*, with the same constructor parameters; should not be directly instantiated.

get_grid_info(*x1*, *y1*, *x2*, *y2*)

lon_values, lat_values

[list of grid values. if integer is given,] rough number of grids in each direction.

get_transform()

inv_transform_xy(*x*, *y*)

set_transform(*aux_trans*)

transform_xy(*x*, *y*)

update(***kwargs*)

update_transform(*aux_trans*)

mpl_toolkits.axisartist.grid_finder.MaxNLocator

class mpl_toolkits.axisartist.grid_finder.**MaxNLocator**(*nbins=10*, *steps=None*, *trim=True*, *integer=False*, *symmetric=False*, *prune=None*)

Bases: *MaxNLocator*

Parameters

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps

[array-like, optional] Sequence of acceptable tick multiples, starting with 1 and ending with 10. For example, if `steps=[1, 2, 4, 5, 10]`, `20, 40, 60` or `0.4, 0.6, 0.8` would be possible sets of ticks because they are multiples of 2. `30, 60, 90` would not be generated because 3 does not appear in this example list of steps.

integer

[bool, default: False] If True, ticks will take only integer values, provided at least *min_n_ticks* integers are found within the view limits.

symmetric

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune

[{'lower', 'upper', 'both', None}, default: None] Remove the 'lower' tick, the 'upper' tick, or ticks on 'both' sides *if they fall exactly on an axis' edge* (this typically occurs when *rcParams["axes.autolimit_mode"]* (default: `'data'`) is 'round_numbers'). Removing such ticks is mostly useful for stacked or ganged plots, where the upper tick of an Axes overlaps with the lower tick of the axes above it.

min_n_ticks

[int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

__call__(*v1*, *v2*)

Return the locations of the ticks.

Examples using `mpl_toolkits.axisartist.grid_finder.MaxNLocator`

mpl_toolkits.axisartist.grid_helper_curvelinear

An experimental support for curvilinear grid.

Classes

FixedAxisArtistHelper(grid_helper, side[, ...])	Helper class for a fixed axis.
FloatingAxisArtistHelper(grid_helper, ...[, ...])	nth_coord = along which coordinate value varies.
GridHelperCurveLinear(aux_trans[, ...])	

mpl_toolkits.axisartist.grid_helper_curvelinear.FixedAxisArtistHelper

class mpl_toolkits.axisartist.grid_helper_curvelinear.**FixedAxisArtistHelper**(*grid_help*
side,

mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear

class mpl_toolkits.axisartist.grid_helper_curvelinear.**GridHelperCurveLinear**(*aux_trans*, *extreme_finder*, *grid_locator1*, *grid_locator2*, *tick_formatter1*, *tick_formatter2*)

Bases: *GridHelperBase*

Parameters

aux_trans

[*Transform* or tuple[Callable, Callable]] The transform from curved coordinates to rectilinear coordinate: either a *Transform* instance (which provides also its inverse), or a pair of callables `(trans, inv_trans)` that define the transform and its inverse. The callables should have signature:

```
x_rect, y_rect = trans(x_curved, y_curved)
x_curved, y_curved = inv_trans(x_rect, y_rect)
```

extreme_finder

grid_locator1, grid_locator2

Grid locators for each axis.

tick_formatter1, tick_formatter2

Tick formatters for each axis.

get_gridlines(*which='major'*, *axis='both'*)

Return list of grid lines as a list of paths (list of points).

Parameters

which

[{"both", "major", "minor"}]

axis

[{"both", "x", "y"}]

get_tick_iterator(*nth_coord*, *axis_side*, *minor=False*)

[*Deprecated*]

Notes

Deprecated since version 3.9:

new_fixed_axis(*loc*, *, *nth_coord=None*, *axis_direction=None*, *offset=None*, *axes=None*)

new_floating_axis(*nth_coord*, *value*, *axes=None*, *axis_direction='bottom'*)

Examples using `mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear`

mpl_toolkits.axisartist.parasite_axes

7.2.72 `pylab`

pylab is a historic interface and its use is strongly discouraged. The equivalent replacement is *matplotlib.pyplot*. See *Matplotlib Application Interfaces (APIs)* for a full overview of Matplotlib interfaces.

pylab was designed to support a MATLAB-like way of working with all plotting related functions directly available in the global namespace. This was achieved through a wildcard import (`from pylab import *`).

Warning

The use of *pylab* is discouraged for the following reasons:

`from pylab import *` imports all the functions from *matplotlib.pyplot*, `numpy`, `numpy.fft`, `numpy.linalg`, and `numpy.random`, and some additional functions into the global namespace.

Such a pattern is considered bad practice in modern python, as it clutters the global namespace. Even more severely, in the case of *pylab*, this will overwrite some builtin functions (e.g. the builtin `sum` will be replaced by `numpy.sum`), which can lead to unexpected behavior.

Top-level interfaces to create:

- figures: *pyplot.figure*
- subplots: *pyplot.subplots*, *pyplot.subplot_mosaic*

RELEASE NOTES

9.1 Version 3.10

9.1.1 What's new in Matplotlib 3.10.0 (December 13, 2024)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.10.0 (December 13, 2024)*
  - *New more-accessible color cycle*
  - *Dark-mode diverging colormaps*
    - *Plotting and Annotation improvements*
  - *Specifying a single color in `contour` and `contourf`*
  - *Vectorized `hist` style parameters*
  - *`InsetIndicator` artist*
  - *`matplotlib.ticker.EngFormatter` can computes offsets now*
  - *Fix padding of single colorbar for `ImageGrid`*
  - *`ax.table` will accept a pandas DataFrame*
  - *Subfigures are now added in row-major order*
  - *`boxplot` and `bxp` orientation parameter*
  - *`violinplot` and `violin` orientation parameter*
  - *`FillBetweenPolyCollection`*
  - *`matplotlib.colorizer.Colorizer` as container for `norm` and `cmap`*
    - *3D plotting improvements*
  - *Fill between 3D lines*

- *Rotating 3d plots with the mouse*
- *Data in 3D plots can now be dynamically clipped to the axes view limits*
  - *Preliminary support for free-threaded CPython 3.13*
  - *Other Improvements*
- `svg.id` *rcParam*
- *Exception handling control*
- *Increased Figure limits with Agg renderer*
- *Miscellaneous Changes*

New more-accessible color cycle

A new color cycle named 'petroff10' was added. This cycle was constructed using a combination of algorithmically-enforced accessibility constraints, including color-vision-deficiency modeling, and a machine-learning-based aesthetics model developed from a crowdsourced color-preference survey. It aims to be both generally pleasing aesthetically and colorblind accessible such that it could serve as a default in the aim of universal design. For more details see Petroff, M. A.: "Accessible Color Sequences for Data Visualization" and related SciPy talk. A demonstration is included in the style sheets reference. To load this color cycle in place of the default:

```
import matplotlib.pyplot as plt
plt.style.use('petroff10')
```

Dark-mode diverging colormaps

Three diverging colormaps have been added: "berlin", "managua", and "vanimo". They are dark-mode diverging colormaps, with minimum lightness at the center, and maximum at the extremes. These are taken from F. Crameri's Scientific colour maps version 8.0.1 (DOI: https://doi.org/10.5281/zenodo.1243862).

```
import numpy as np
import matplotlib.pyplot as plt

vals = np.linspace(-5, 5, 100)
x, y = np.meshgrid(vals, vals)
img = np.sin(x*y)

_, ax = plt.subplots(1, 3)
ax[0].imshow(img, cmap=plt.cm.berlin)
ax[1].imshow(img, cmap=plt.cm.managua)
ax[2].imshow(img, cmap=plt.cm.vanimo)
```

Plotting and Annotation improvements

Specifying a single color in `contour` and `contourf`

contour and *contourf* previously accepted a single color provided it was expressed as a string. This restriction has now been removed and a single color in any format described in the *Specifying colors* tutorial may be passed.

```
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(ncols=2, figsize=(6, 3))
z = [[0, 1], [1, 2]]

ax1.contour(z, colors=('r', 0.4))
ax2.contour(z, colors=(0.1, 0.2, 0.5))

plt.show()
```

Vectorized `hist` style parameters

The parameters *hatch*, *edgecolor*, *facecolor*, *linewidth* and *linestyle* of the *hist* method are now vectorized. This means that you can pass in individual parameters for each histogram when the input *x* has multiple datasets.

```
import matplotlib.pyplot as plt
import numpy as np
np.random.seed(19680801)

fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(2, 2, figsize=(9, 9))

data1 = np.random.poisson(5, 1000)
data2 = np.random.poisson(7, 1000)
data3 = np.random.poisson(10, 1000)

labels = ["Data 1", "Data 2", "Data 3"]

ax1.hist([data1, data2, data3], bins=range(17), histtype="step",␣
 ↪stacked=True,
         edgecolor=["red", "green", "blue"], linewidth=[1, 2, 3])
ax1.set_title("Different linewidths")
ax1.legend(labels)

ax2.hist([data1, data2, data3], bins=range(17), histtype="barstacked",
         hatch=["/", ".", "*"])
ax2.set_title("Different hatch patterns")
ax2.legend(labels)
```

(continues on next page)

(continued from previous page)

```
ax3.hist([data1, data2, data3], bins=range(17), histtype="bar",␣
 ↪fill=False,
         edgecolor=["red", "green", "blue"], linestyle=["--", "-.", ":
 ↪"])
ax3.set_title("Different linestyles")
ax3.legend(labels)

ax4.hist([data1, data2, data3], bins=range(17), histtype="barstacked",
         facecolor=["red", "green", "blue"])
ax4.set_title("Different facecolors")
ax4.legend(labels)

plt.show()
```

`InsetIndicator` artist

indicate_inset and *indicate_inset_zoom* now return an instance of *InsetIndicator* which contains the rectangle and connector patches. These patches now update automatically so that

```
ax.indicate_inset_zoom(ax_inset)
ax_inset.set_xlim(new_lim)
```

now gives the same result as

```
ax_inset.set_xlim(new_lim)
ax.indicate_inset_zoom(ax_inset)
```

`matplotlib.ticker.EngFormatter` can computes offsets now

matplotlib.ticker.EngFormatter has gained the ability to show an offset text near the axis. Using logic shared with *matplotlib.ticker.ScalarFormatter*, it is capable of deciding whether the data qualifies having an offset and show it with an appropriate SI quantity prefix, and with the supplied `unit`.

To enable this new behavior, simply pass `useOffset=True` when you instantiate *matplotlib.ticker.EngFormatter*. See example *SI prefixed offsets and natural order of magnitudes*.

Fix padding of single colorbar for `ImageGrid`

`ImageGrid` with `cbar_mode="single"` no longer adds the `axes_pad` between the axes and the colorbar for `cbar_location` "left" and "bottom". If desired, add additional spacing using `cbar_pad`.

`ax.table` will accept a pandas DataFrame

The *table* method can now accept a Pandas DataFrame for the `cellText` argument.

```
import matplotlib.pyplot as plt
import pandas as pd

data = {
    'Letter': ['A', 'B', 'C'],
    'Number': [100, 200, 300]
}

df = pd.DataFrame(data)
fig, ax = plt.subplots()
table = ax.table(df, loc='center')  # or table = ax.table(cellText=df,␣
↪loc='center')
ax.axis('off')
plt.show()
```

Subfigures are now added in row-major order

`Figure.subfigures` are now added in row-major order for API consistency.

```
import matplotlib.pyplot as plt

fig = plt.figure()
subfigs = fig.subfigures(3, 3)
x = np.linspace(0, 10, 100)

for i, sf in enumerate(fig.subfigs):
    ax = sf.subplots()
    ax.plot(x, np.sin(x + i), label=f'Subfigure {i+1}')
    sf.suptitle(f'Subfigure {i+1}')
    ax.set_xticks([])
    ax.set_yticks([])
plt.show()
```

`boxplot` and `bxp` orientation parameter

Boxplots have a new parameter *orientation: {"vertical", "horizontal"}* to change the orientation of the plot. This replaces the deprecated *vert: bool* parameter.

```
import matplotlib.pyplot as plt
import numpy as np

fig, ax = plt.subplots()
```

(continues on next page)

(continued from previous page)

```
np.random.seed(19680801)
all_data = [np.random.normal(0, std, 100) for std in range(6, 10)]

ax.boxplot(all_data, orientation='horizontal')
plt.show()
```

`violinplot` and `violin` orientation parameter

Violinplots have a new parameter *orientation: {"vertical", "horizontal"}* to change the orientation of the plot. This will replace the deprecated *vert: bool* parameter.

```
import matplotlib.pyplot as plt
import numpy as np

fig, ax = plt.subplots()
np.random.seed(19680801)
all_data = [np.random.normal(0, std, 100) for std in range(6, 10)]

ax.violinplot(all_data, orientation='horizontal')
plt.show()
```

`FillBetweenPolyCollection`

The new class *matplotlib.collections.FillBetweenPolyCollection* provides the `set_data` method, enabling e.g. resampling (`galleries/event_handling/resample.html`). *matplotlib.axes.Axes.fill_between()* and *matplotlib.axes.Axes.fill_betweenx()* now return this new class.

```
import numpy as np
from matplotlib import pyplot as plt

t = np.linspace(0, 1)

fig, ax = plt.subplots()
coll = ax.fill_between(t, -t**2, t**2)
fig.savefig("before.png")

coll.set_data(t, -t**4, t**4)
fig.savefig("after.png")
```

`matplotlib.colorizer.Colorizer` as container for `norm` and `cmap`

matplotlib.colorizer.Colorizer encapsulates the data-to-color pipeline. It makes reuse of colormapping easier, e.g. across multiple images. Plotting methods that support *norm* and *cmap* keyword arguments now also accept a *colorizer* keyword argument.

In the following example the norm and cmap are changed on multiple plots simultaneously:

```
import matplotlib.pyplot as plt
import matplotlib as mpl
import numpy as np

x = np.linspace(-2, 2, 50)[np.newaxis, :]
y = np.linspace(-2, 2, 50)[:, np.newaxis]
im_0 = 1 * np.exp( - (x**2 + y**2 - x * y))
im_1 = 2 * np.exp( - (x**2 + y**2 + x * y))

colorizer = mpl.colorizer.Colorizer()
fig, axes = plt.subplots(1, 2, figsize=(6, 2))
cim_0 = axes[0].imshow(im_0, colorizer=colorizer)
fig.colorbar(cim_0)
cim_1 = axes[1].imshow(im_1, colorizer=colorizer)
fig.colorbar(cim_1)

colorizer.vmin = 0.5
colorizer.vmax = 2
colorizer.cmap = 'RdBu'
```

All plotting methods that use a data-to-color pipeline now create a colorizer object if one is not provided. This can be re-used by subsequent artists such that they will share a single data-to-color pipeline:

```
import matplotlib.pyplot as plt
import matplotlib as mpl
import numpy as np

x = np.linspace(-2, 2, 50)[np.newaxis, :]
y = np.linspace(-2, 2, 50)[:, np.newaxis]
im_0 = 1 * np.exp( - (x**2 + y**2 - x * y))
im_1 = 2 * np.exp( - (x**2 + y**2 + x * y))

fig, axes = plt.subplots(1, 2, figsize=(6, 2))

cim_0 = axes[0].imshow(im_0, cmap='RdBu', vmin=0.5, vmax=2)
fig.colorbar(cim_0)
cim_1 = axes[1].imshow(im_1, colorizer=cim_0.colorizer)
fig.colorbar(cim_1)

cim_1.cmap = 'rainbow'
```

3D plotting improvements

Fill between 3D lines

The new method *Axes3D.fill_between* allows to fill the surface between two 3D lines with polygons.

```
N = 50
theta = np.linspace(0, 2*np.pi, N)

x1 = np.cos(theta)
y1 = np.sin(theta)
z1 = 0.1 * np.sin(6 * theta)

x2 = 0.6 * np.cos(theta)
y2 = 0.6 * np.sin(theta)
z2 = 2  # Note that scalar values work in addition to length N arrays

fig = plt.figure()
ax = fig.add_subplot(projection='3d')
ax.fill_between(x1, y1, z1, x2, y2, z2,
                alpha=0.5, edgecolor='k')
```

Rotating 3d plots with the mouse

Rotating three-dimensional plots with the mouse has been made more intuitive. The plot now reacts the same way to mouse movement, independent of the particular orientation at hand; and it is possible to control all 3 rotational degrees of freedom (azimuth, elevation, and roll). By default, it uses a variation on Ken Shoemake's ARCBALL[1]. The particular style of mouse rotation can be set via *rcParams["axes3d.mouserotationstyle"]* (default: `'arcball'`). See also *Rotation with mouse*.

To revert to the original mouse rotation style, create a file `matplotlibrc` with contents:

```
axes3d.mouserotationstyle: azel
```

To try out one of the various mouse rotation styles:

```
import matplotlib as mpl
mpl.rcParams['axes3d.mouserotationstyle'] = 'trackball'  # 'azel',
 ↪'trackball', 'sphere', or 'arcball'

import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cm
```

(continues on next page)

[1] Ken Shoemake, "ARCBALL: A user interface for specifying three-dimensional rotation using a mouse", in Proceedings of Graphics Interface '92, 1992, pp. 151-156, https://doi.org/10.20380/GI1992.18

(continued from previous page)

```
ax = plt.figure().add_subplot(projection='3d')

X = np.arange(-5, 5, 0.25)
Y = np.arange(-5, 5, 0.25)
X, Y = np.meshgrid(X, Y)
R = np.sqrt(X**2 + Y**2)
Z = np.sin(R)

surf = ax.plot_surface(X, Y, Z, cmap=cm.coolwarm,
                       linewidth=0, antialiased=False)

plt.show()
```

Data in 3D plots can now be dynamically clipped to the axes view limits

All 3D plotting functions now support the *axlim_clip* keyword argument, which will clip the data to the axes view limits, hiding all data outside those bounds. This clipping will be dynamically applied in real time while panning and zooming.

Please note that if one vertex of a line segment or 3D patch is clipped, then the entire segment or patch will be hidden. Not being able to show partial lines or patches such that they are "smoothly" cut off at the boundaries of the view box is a limitation of the current renderer.

```
import matplotlib.pyplot as plt
import numpy as np

fig, ax = plt.subplots(subplot_kw={"projection": "3d"})
x = np.arange(-5, 5, 0.5)
y = np.arange(-5, 5, 0.5)
X, Y = np.meshgrid(x, y)
R = np.sqrt(X**2 + Y**2)
Z = np.sin(R)

# Note that when a line has one vertex outside the view limits, the␣
 ↪entire
# line is hidden. The same is true for 3D patches (not shown).
# In this example, data where x < 0 or z > 0.5 is clipped.
ax.plot_wireframe(X, Y, Z, color='C0')
ax.plot_wireframe(X, Y, Z, color='C1', axlim_clip=True)
ax.set(xlim=(0, 10), ylim=(-5, 5), zlim=(-1, 0.5))
ax.legend(['axlim_clip=False (default)', 'axlim_clip=True'])
```

Preliminary support for free-threaded CPython 3.13

Matplotlib 3.10 has preliminary support for the free-threaded build of CPython 3.13. See https://py-free-threading.github.io, PEP 703 and the CPython 3.13 release notes for more detail about free-threaded Python.

Support for free-threaded Python does not mean that Matplotlib is wholly thread safe. We expect that use of a Figure within a single thread will work, and though input data is usually copied, modification of data objects used for a plot from another thread may cause inconsistencies in cases where it is not. Use of any global state (such as the `pyplot` module) is highly discouraged and unlikely to work consistently. Also note that most GUI toolkits expect to run on the main thread, so interactive usage may be limited or unsupported from other threads.

If you are interested in free-threaded Python, for example because you have a multiprocessing-based workflow that you are interested in running with Python threads, we encourage testing and experimentation. If you run into problems that you suspect are because of Matplotlib, please open an issue, checking first if the bug also occurs in the "regular" non-free-threaded CPython 3.13 build.

Other Improvements

`svg.id` rcParam

`rcParams["svg.id"]` (default: `None`) lets you insert an `id` attribute into the top-level `<svg>` tag.

e.g. `rcParams["svg.id"] = "svg1"` results in

```
<svg
    xmlns:xlink="http://www.w3.org/1999/xlink"
    width="50pt" height="50pt"
    viewBox="0 0 50 50"
    xmlns="http://www.w3.org/2000/svg"
    version="1.1"
    id="svg1"
></svg>
```

This is useful if you would like to link the entire matplotlib SVG file within another SVG file with the `<use>` tag.

```
<svg>
<use
    width="50" height="50"
    xlink:href="mpl.svg#svg1" id="use1"
    x="0" y="0"
/></svg>
```

Where the `#svg1` indicator will now refer to the top level `<svg>` tag, and will hence result in the inclusion of the entire file.

By default, no `id` tag is included.

Exception handling control

The exception raised when an invalid keyword parameter is passed now includes that parameter name as the exception's `name` property. This provides more control for exception handling:

```
import matplotlib.pyplot as plt

def wobbly_plot(args, **kwargs):
    w = kwargs.pop('wobble_factor', None)

    try:
        plt.plot(args, **kwargs)
    except AttributeError as e:
        raise AttributeError(f'wobbly_plot does not take parameter {e.
 ↪name}') from e

wobbly_plot([0, 1], wibble_factor=5)
```

```
AttributeError: wobbly_plot does not take parameter wibble_factor
```

Increased Figure limits with Agg renderer

Figures using the Agg renderer are now limited to 2**23 pixels in each direction, instead of 2**16. Additionally, bugs that caused artists to not render past 2**15 pixels horizontally have been fixed.

Note that if you are using a GUI backend, it may have its own smaller limits (which may themselves depend on screen size.)

Miscellaneous Changes

- The *matplotlib.ticker.ScalarFormatter* class has gained a new instantiating parameter `usetex`.
- Creating an Axes is now 20-25% faster due to internal optimizations.
- The API on *Figure.subfigures* and *SubFigure* are now considered stable.

9.1.2 API Changes for 3.10.7

Development

New minimum version of pyparsing

The minimum required version of `pyparsing` has been updated from 2.3.1 to 3.0.0.

9.1.3 API Changes for 3.10.1

Behaviour

alpha parameter handling on images

When passing and array to `imshow(..., alpha=...)`, the parameter was silently ignored if the image data was a RGB or RBGA image or if *`rcParams["interpolation_state"]`* resolved to "rbga".

This is now fixed, and the alpha array overwrites any previous transparency information.

9.1.4 API Changes for 3.10.0

- *Behavior Changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behavior Changes

onselect argument to selector widgets made optional

The *onselect* argument to *`EllipseSelector`*, *`LassoSelector`*, *`PolygonSelector`*, and *`RectangleSelector`* is no longer required.

`NavigationToolbar2.save_figure` now returns filepath of saved figure

`NavigationToolbar2.save_figure` function may return the filename of the saved figure.

If a backend implements this functionality it should return `None` in the case where no figure is actually saved (because the user closed the dialog without saving).

If the backend does not or can not implement this functionality (currently the Gtk4 backends and webagg backends do not) this method will return `NavigationToolbar2.UNKNOWN_SAVED_STATUS`.

SVG output: improved reproducibility

Some SVG-format plots produced different output on each render, even with a static `svg.hashsalt` value configured.

The problem was a non-deterministic ID-generation scheme for clip paths; the fix introduces a repeatable, monotonically increasing integer ID scheme as a replacement.

Provided that plots add clip paths themselves in deterministic order, this enables repeatable (a.k.a. reproducible, deterministic) SVG output.

ft2font classes are now final

The ft2font classes *ft2font.FT2Font*, and *ft2font.FT2Image* are now final and can no longer be subclassed.

`InsetIndicator` artist

indicate_inset and *indicate_inset_zoom* now return an instance of *InsetIndicator*. Use the *rectangle* and *connectors* properties of this artist to access the objects that were previously returned directly.

`imshow` *interpolation_stage* default changed to 'auto'

The *interpolation_stage* parameter of *imshow* has a new default value 'auto'. For images that are up-sampled less than a factor of three or down-sampled, image interpolation will occur in 'rgba' space. For images that are up-sampled by a factor of 3 or more, then image interpolation occurs in 'data' space.

The previous default was 'data', so down-sampled images may change subtly with the new default. However, the new default also avoids floating point artifacts at sharp boundaries in a colormap when down-sampling.

The previous behavior can achieved by setting the *interpolation_stage* parameter or *rcParams["image.interpolation_stage"]* (default: `'auto'`) to 'data'.

imshow default *interpolation* changed to 'auto'

The *interpolation* parameter of *imshow* has a new default value 'auto', changed from 'antialiased', for consistency with *interpolation_stage* and because the interpolation is only anti-aliasing during down-sampling. Passing 'antialiased' still works, and behaves exactly the same as 'auto', but is discouraged.

dark_background and fivethirtyeight styles no longer set `savefig.facecolor` and `savefig.edgecolor`

When using these styles, *rcParams["savefig.facecolor"]* (default: `'auto'`) and *rcParams["savefig.edgecolor"]* (default: `'auto'`) now inherit the global default value of "auto", which means that the actual figure colors will be used. Previously, these rcParams were set to the same values as *rcParams["figure.facecolor"]* (default: `'white'`) and *rcParams["figure.edgecolor"]* (default: `'white'`), i.e. a saved figure would always use the theme colors even if the user manually overrode them; this is no longer the case.

This change should have no impact for users that do not manually set the figure face and edge colors.

Add zorder option in QuiverKey

`zorder` can be used as a keyword argument to *QuiverKey*. Previously, that parameter did not have any effect because the zorder was hard coded.

Subfigures

Figure.subfigures are now added in row-major order to be consistent with *Figure.subplots*. The return value of *subfigures* is not changed, but the order of `fig.subfigs` is.

(Sub)Figure.get_figure

...in future will by default return the direct parent figure, which may be a SubFigure. This will make the default behavior consistent with the *get_figure* method of other artists. To control the behavior, use the newly introduced *root* parameter.

`transforms.AffineDeltaTransform` updates correctly on axis limit changes

Before this change, transform sub-graphs with `AffineDeltaTransform` did not update correctly. This PR ensures that changes to the child transform are passed through correctly.

The offset string associated with ConciseDateFormatter will now invert when the axis is inverted

Previously, when the axis was inverted, the offset string associated with ConciseDateFormatter would not change, so the offset string indicated the axis was oriented in the wrong direction. Now, when the axis is inverted, the offset string is oriented correctly.

`suptitle` in compressed layout

Compressed layout now automatically positions the *suptitle* just above the top row of axes. To keep this title in its previous position, either pass `in_layout=False` or explicitly set `y=0.98` in the *suptitle* call.

Deprecations

Positional parameters in plotting functions

Many plotting functions will restrict positional arguments to the first few parameters in the future. All further configuration parameters will have to be passed as keyword arguments. This is to enforce better code and and allow for future changes with reduced risk of breaking existing code.

Changing `Figure.number`

Changing `Figure.number` is deprecated. This value is used by *pyplot* to identify figures. It must stay in sync with the pyplot internal state and is not intended to be modified by the user.

`PdfFile.hatchPatterns`

... is deprecated.

(Sub)Figure.set_figure

...is deprecated and in future will always raise an exception. The parent and root figures of a (Sub)Figure are set at instantiation and cannot be changed.

`Poly3DCollection.get_vector`

... is deprecated with no replacement.

Deprecated `register` on `matplotlib.patches._Styles` and subclasses

This class method is never used internally. Due to the internal check in the method it only accepts subclasses of a private baseclass embedded in the host class which makes it unlikely that it has been used externally.

matplotlib.validate_backend

...is deprecated. Please use *matplotlib.rcsetup.validate_backend* instead.

matplotlib.sanitize_sequence

...is deprecated. Please use *matplotlib.cbook.sanitize_sequence* instead.

ft2font module-level constants replaced by enums

The *ft2font*-level constants have been converted to `enum` classes, and all API using them now take/return the new types.

The following constants are now part of *ft2font.Kerning* (without the `KERNING_` prefix):

- `KERNING_DEFAULT`
- `KERNING_UNFITTED`
- `KERNING_UNSCALED`

The following constants are now part of *ft2font.LoadFlags* (without the `LOAD_` prefix):

- `LOAD_DEFAULT`
- `LOAD_NO_SCALE`
- `LOAD_NO_HINTING`
- `LOAD_RENDER`
- `LOAD_NO_BITMAP`
- `LOAD_VERTICAL_LAYOUT`
- `LOAD_FORCE_AUTOHINT`
- `LOAD_CROP_BITMAP`
- `LOAD_PEDANTIC`

- LOAD_IGNORE_GLOBAL_ADVANCE_WIDTH
- LOAD_NO_RECURSE
- LOAD_IGNORE_TRANSFORM
- LOAD_MONOCHROME
- LOAD_LINEAR_DESIGN
- LOAD_NO_AUTOHINT
- LOAD_TARGET_NORMAL
- LOAD_TARGET_LIGHT
- LOAD_TARGET_MONO
- LOAD_TARGET_LCD
- LOAD_TARGET_LCD_V

The following constants are now part of *ft2font.FaceFlags*:

- EXTERNAL_STREAM
- FAST_GLYPHS
- FIXED_SIZES
- FIXED_WIDTH
- GLYPH_NAMES
- HORIZONTAL
- KERNING
- MULTIPLE_MASTERS
- SCALABLE
- SFNT
- VERTICAL

The following constants are now part of *ft2font.StyleFlags*:

- ITALIC
- BOLD

FontProperties initialization

FontProperties initialization is limited to the two call patterns:

- single positional parameter, interpreted as fontconfig pattern
- only keyword parameters for setting individual properties

All other previously supported call patterns are deprecated.

`AxLine` `xy1` and `xy2` setters

These setters now each take a single argument, `xy1` or `xy2` as a tuple. The old form, where `x` and `y` were passed as separate arguments, is deprecated.

Calling `pyplot.polar()` with an existing non-polar Axes

This currently plots the data into the non-polar Axes, ignoring the "polar" intention. This usage scenario is deprecated and will raise an error in the future.

Passing floating-point values to `RendererAgg.draw_text_image`

Any floating-point values passed to the *x* and *y* parameters were truncated to integers silently. This behaviour is now deprecated, and only `int` values should be used.

Passing floating-point values to `FT2Image`

Any floating-point values passed to the *FT2Image* constructor, or the *x0*, *y0*, *x1*, and *y1* parameters of *FT2Image.draw_rect_filled* were truncated to integers silently. This behaviour is now deprecated, and only `int` values should be used.

`boxplot` and `bxp` *vert* parameter, and `rcParams["boxplot.vertical"]`

The parameter *vert: bool* has been deprecated on *boxplot* and *bxp*. It is replaced by *orientation: {"vertical", "horizontal"}* for API consistency.

`rcParams["boxplot.vertical"]`, which controlled the orientation of `boxplot`, is deprecated without replacement.

This deprecation is currently marked as pending and will be fully deprecated in Matplotlib 3.11.

`violinplot` and `violin` *vert* parameter

The parameter *vert: bool* has been deprecated on *violinplot* and *violin*. It will be replaced by *orientation: {"vertical", "horizontal"}* for API consistency.

This deprecation is currently marked as pending and will be fully deprecated in Matplotlib 3.11.

`proj3d.proj_transform_clip`

... is deprecated with no replacement.

Removals

ttconv removed

The `matplotlib._ttconv` extension has been removed. Most of its functionaliy was already replaced by other code, and the only thing left was embedding TTF fonts in PostScript in Type 42 format. This is now done in the PS backend using the FontTools library.

Remove hard reference to `lastevent` in `LocationEvent`

This was previously used to detect exiting from axes, however the hard reference would keep closed *Figure* objects and their children alive longer than expected.

`ft2font.FT2Image.draw_rect` and `ft2font.FT2Font.get_xys`

... have been removed as they are unused.

`Tick.set_label`, `Tick.set_label1` and `Tick.set_label2`

... are removed. Calling these methods from third-party code usually had no effect, as the labels are overwritten at draw time by the tick formatter.

Functions in `mpl_toolkits.mplot3d.proj3d`

The function `transform` is just an alias for `proj_transform`, use the latter instead.

The following functions were either unused (so no longer required in Matplotlib) or considered private.

- `ortho_transformation`
- `persp_transformation`
- `proj_points`
- `proj_trans_points`
- `rot_x`
- `rotation_about_vector`
- `view_transformation`

Arguments other than `renderer` to `get_tightbbox`

... are keyword-only arguments. This is for consistency and that different classes have different additional arguments.

Method parameters renamed to match base classes

The only parameter of `transform_affine` and `transform_non_affine` in `Transform` subclasses is renamed to *values*.

The *points* parameter of `transforms.IdentityTransform.transform` is renamed to *values*.

The *trans* parameter of `table.Cell.set_transform` is renamed to *t* consistently with *Artist.set_transform*.

The *clippath* parameters of `axis.Axis.set_clip_path` and `axis.Tick.set_clip_path` are renamed to *path* consistently with *Artist.set_clip_path*.

The *s* parameter of `images.NonUniformImage.set_filternorm` is renamed to *filternorm* consistently with `_ImageBase.set_filternorm`.

The *s* parameter of `images.NonUniformImage.set_filterrad` is renamed to *filterrad* consistently with `_ImageBase.set_filterrad`.

The only parameter of `Annotation.contains` and `Legend.contains` is renamed to *mouseevent* consistently with *Artist.contains*.

Method parameters renamed

The *p* parameter of `BboxBase.padded` is renamed to *w_pad*, consistently with the other parameter, *h_pad*

numdecs parameter and attribute of `LogLocator`

... are removed without replacement, because they had no effect. The `PolyQuadMesh` class requires full 2D arrays of values ~~~~~~

Previously, if a masked array was input, the list of polygons within the collection would shrink to the size of valid polygons and users were required to keep track of which polygons were drawn and call `set_array()` with the smaller "compressed" array size. Passing the "compressed" and flattened array values will no longer work and the full 2D array of values (including the mask) should be passed to *PolyQuadMesh.set_array*. `ContourSet.collections` ~~~~~~~~~~~~~~~~~~~~~~~~~~~~

... has been removed. *ContourSet* is now implemented as a single *Collection* of paths, each path corresponding to a contour level, possibly including multiple unconnected components.

`ContourSet.antialiased`

... has been removed. Use *get_antialiased* or *set_antialiased* instead. Note that *get_antialiased* returns an array.

`tcolors` and `tlinewidths` attributes of `ContourSet`

... have been removed. Use *get_facecolor*, *get_edgecolor* or *get_linewidths* instead.

`calc_label_rot_and_inline` method of `ContourLabeler`

... has been removed without replacement.

`add_label_clabeltext` method of `ContourLabeler`

... has been removed. Use *add_label* instead. Passing extra positional arguments to `Figure.add_axes` ~~~~~~

Positional arguments passed to *Figure.add_axes* other than a rect or an existing `Axes` were previously ignored, and is now an error.

Artists explicitly passed in will no longer be filtered by legend() based on their label

Previously, artists explicitly passed to `legend(handles=[...])` are filtered out if their label starts with an underscore. This filter is no longer applied; explicitly filter out such artists (`[art for art in artists if not art.get_label().startswith('_')]`) if necessary.

Note that if no handles are specified at all, then the default still filters out labels starting with an underscore.

The parameter of `Annotation.contains` and `Legend.contains` is renamed to *mouseevent*

... consistently with *`Artist.contains`*.

Support for passing the "frac" key in `annotate(..., arrowprops={"frac": ...})`

... has been removed. This key has had no effect since Matplotlib 1.5.

Passing non-int or sequence of non-int to `Table.auto_set_column_width`

Column numbers are ints, and formerly passing any other type was effectively ignored. This has now become an error.

Widgets

The *visible* attribute getter of `*Selector` widgets has been removed; use `get_visible` instead.

Auto-closing of figures when switching backend

Allowable backend switches (i.e. those that do not swap a GUI event loop with another one) will not close existing figures. If necessary, call `plt.close("all")` before switching.

`FigureCanvasBase.switch_backends`

... has been removed with no replacement.

Accessing `event.guiEvent` after event handlers return

... is no longer supported, and `event.guiEvent` will be set to None once the event handlers return. For some GUI toolkits, it is unsafe to use the event, though you may separately stash the object at your own risk.

`PdfPages(keep_empty=True)`

A zero-page PDF is not valid, thus passing `keep_empty=True` to *`backend_pdf.PdfPages`* and *`backend_pgf.PdfPages`*, and the `keep_empty` attribute of these classes, is no longer allowed, and empty PDF files will not be created.

Furthermore, *`backend_pdf.PdfPages`* no longer immediately creates the target file upon instantiation, but only when the first figure is saved. To fully control file creation, directly pass an opened file object as argument (`with open(path, "wb") as file, PdfPages(file) as pdf: ...`).

`backend_ps.psDefs`

The `psDefs` module-level variable in `backend_ps` has been removed with no replacement.

Automatic papersize selection in PostScript

Setting *`rcParams["ps.papersize"]`* (default: `'letter'`) to `'auto'` or passing `papersize='auto'` to *`Figure.savefig`* is no longer supported. Either pass an explicit paper type name, or omit this parameter to use the default from the rcParam.

`RendererAgg.tostring_rgb` and `FigureCanvasAgg.tostring_rgb`

... have been remove with no direct replacement. Consider using `buffer_rgba` instead, which should cover most use cases.

`NavigationToolbar2QT.message` has been removed

... with no replacement.

`TexManager.texcache`

... is considered private and has been removed. The location of the cache directory is clarified in the docstring.

`cbook` API changes

`cbook.Stack` has been removed with no replacement.

`Grouper.clean()` has been removed with no replacement. The Grouper class now cleans itself up automatically.

The *np_load* parameter of `cbook.get_sample_data` has been removed; *`get_sample_data`* now auto-loads numpy arrays. Use `get_sample_data(..., asfileobj=False)` instead to get the filename of the data file, which can then be passed to `open`, if desired.

Calling `paths.get_path_collection_extents` with empty *offsets*

Calling *`get_path_collection_extents`* with an empty *offsets* parameter has an ambiguous interpretation and is no longer allowed.

`bbox.anchored()` with no explicit container

Not passing a *container* argument to *`BboxBase.anchored`* is no longer supported.

`INVALID_NON_AFFINE`, `INVALID_AFFINE`, `INVALID` attributes of `TransformNode`

These attributes have been removed.

`axes_grid1` API changes

`anchored_artists.AnchoredEllipse` has been removed. Instead, directly construct an *AnchoredOffsetbox*, an *AuxTransformBox*, and an *Ellipse*, as demonstrated in *Anchored Artists*.

The `axes_divider.AxesLocator` class has been removed. The `new_locator` method of divider instances now instead returns an opaque callable (which can still be passed to `ax.set_axes_locator`).

`axes_divider.Divider.locate` has been removed; use `Divider.new_locator(...)(ax, renderer)` instead.

`axes_grid.CbarAxesBase.toggle_label` has been removed. Instead, use standard methods for manipulating colorbar labels (*Colorbar.set_label*) and tick labels (*Axes.tick_params*).

`inset_location.InsetPosition` has been removed; use *inset_axes* instead.

`axisartist` API changes

The `axisartist.axes_grid` and `axisartist.axes_rgb` modules, which provide wrappers combining the functionality of *axes_grid1* and *axisartist*, have been removed; directly use e.g. `AxesGrid(..., axes_class=axislines.Axes)` instead.

Calling an axisartist Axes to mean *axis* has been removed; explicitly call the method instead.

`floating_axes.GridHelperCurveLinear.get_data_boundary` has been removed. Use `grid_finder.extreme_finder(*[None] * 5)` to get the extremes of the grid.

Development changes

Documentation-specific custom Sphinx roles are now semi-public

For third-party packages that derive types from Matplotlib, our use of custom roles may prevent Sphinx from building their docs. These custom Sphinx roles are now public solely for the purposes of use within projects that derive from Matplotlib types. See *matplotlib.sphinxext.roles* for details.

Increase to minimum supported versions of dependencies

For Matplotlib 3.10, the *minimum supported versions* are being bumped:

Dependency	min in mpl3.9	min in mpl3.10
Python	3.9	3.10

This is consistent with our *Dependency version policy* and SPEC0

9.2 Version 3.9

9.2.1 What's new in Matplotlib 3.9.0 (May 15, 2024)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.9.0 (May 15, 2024)*.

Table of Contents

- What's new in Matplotlib 3.9.0 (May 15, 2024)
  - Plotting and Annotation improvements
    - `Axes.inset_axes` is no longer experimental
    - Legend support for Boxplot
    - Percent sign in pie labels auto-escaped with `usetex=True`
    - `hatch` parameter for stackplot
    - Add option to plot only one half of violin plot
    - `axhline` and `axhspan` on polar axes
    - Subplot titles can now be automatically aligned
    - `axisartist` can now be used together with standard `Formatters`
    - Toggle minorticks on Axis
    - `StrMethodFormatter` now respects `axes.unicode_minus`
  - Figure, Axes, and Legend Layout
    - Subfigures now have controllable zorders
    - Getters for xmargin, ymargin and zmargin
  - Mathtext improvements
    - `mathtext` documentation improvements
    - `mathtext` spacing corrections
  - Widget Improvements
    - Check and Radio Button widgets support clearing
  - 3D plotting improvements
    - Setting 3D axis limits now set the limits exactly
  - Other improvements
    - BackendRegistry
    - Add `widths`, `heights` and `angles` setter to `EllipseCollection`
    - `image.interpolation_stage` rcParam
    - Arrow patch position is now modifiable
    - NonUniformImage now has mouseover support

Plotting and Annotation improvements

`Axes.inset_axes` is no longer experimental

Axes.inset_axes is considered stable for use.

Legend support for Boxplot

Boxplots now support a *label* parameter to create legend entries. Legend labels can be passed as a list of strings to label multiple boxes in a single *Axes.boxplot* call:

```
np.random.seed(19680801)
fruit_weights = [
    np.random.normal(130, 10, size=100),
    np.random.normal(125, 20, size=100),
    np.random.normal(120, 30, size=100),
]
labels = ['peaches', 'oranges', 'tomatoes']
colors = ['peachpuff', 'orange', 'tomato']

fig, ax = plt.subplots()
ax.set_ylabel('fruit weight (g)')

bplot = ax.boxplot(fruit_weights,
                   patch_artist=True,  # fill with color
                   label=labels)

# fill with colors
for patch, color in zip(bplot['boxes'], colors):
    patch.set_facecolor(color)

ax.set_xticks([])
ax.legend()
```

Or as a single string to each individual *Axes.boxplot*:

```
fig, ax = plt.subplots()

data_A = np.random.random((100, 3))
data_B = np.random.random((100, 3)) + 0.2
pos = np.arange(3)

ax.boxplot(data_A, positions=pos - 0.2, patch_artist=True, label='Box A
↪',
           boxprops={'facecolor': 'steelblue'})
ax.boxplot(data_B, positions=pos + 0.2, patch_artist=True, label='Box B
↪',
```

(continues on next page)

(continued from previous page)

```
            boxprops={'facecolor': 'lightblue'})

ax.legend()
```

Percent sign in pie labels auto-escaped with `usetex=True`

It is common, with *Axes.pie*, to specify labels that include a percent sign (`%`), which denotes a comment for LaTeX. When enabling LaTeX with *rcParams["text.usetex"]* (default: `False`) or passing `textprops={"usetex": True}`, this used to cause the percent sign to disappear.

Now, the percent sign is automatically escaped (by adding a preceding backslash) so that it appears regardless of the `usetex` setting. If you have pre-escaped the percent sign, this will be detected, and remain as is.

`hatch` parameter for stackplot

The *stackplot* *hatch* parameter now accepts a list of strings describing hatching styles that will be applied sequentially to the layers in the stack:

```
fig, (ax1, ax2) = plt.subplots(ncols=2, figsize=(10,5))

cols = 10
rows = 4
data = (
np.reshape(np.arange(0, cols, 1), (1, -1)) ** 2
+ np.reshape(np.arange(0, rows), (-1, 1))
+ np.random.random((rows, cols))*5
)
x = range(data.shape[1])
ax1.stackplot(x, data, hatch="x")
ax2.stackplot(x, data, hatch=["//","\\","x","o"])

ax1.set_title("hatch='x'")
ax2.set_title("hatch=['//','\\\\','x','o']")

plt.show()
```

Add option to plot only one half of violin plot

Setting the parameter *side* to 'low' or 'high' allows to only plot one half of the *Axes.violinplot*.

```
# Fake data with reproducible random state.
np.random.seed(19680801)
data = np.random.normal(0, 8, size=100)
```

(continues on next page)

(continued from previous page)

```
fig, ax = plt.subplots()

ax.violinplot(data, [0], showmeans=True, showextrema=True)
ax.violinplot(data, [1], showmeans=True, showextrema=True, side='low')
ax.violinplot(data, [2], showmeans=True, showextrema=True, side='high')

ax.set_title('Violin Sides Example')
ax.set_xticks([0, 1, 2], ['Default', 'side="low"', 'side="high"'])
ax.set_yticklabels([])
```

`axhline` and `axhspan` on polar axes

... now draw circles and circular arcs (*axhline*) or annuli and wedges (*axhspan*).

```
fig = plt.figure()
ax = fig.add_subplot(projection="polar")
ax.set_rlim(0, 1.2)

ax.axhline(1, c="C0", alpha=.5)
ax.axhspan(.8, .9, fc="C1", alpha=.5)
ax.axhspan(.6, .7, .8, .9, fc="C2", alpha=.5)
```

Subplot titles can now be automatically aligned

Subplot axes titles can be misaligned vertically if tick labels or xlabels are placed at the top of one subplot. The new *align_titles* method on the *Figure* class will now align the titles vertically.

```
fig, axs = plt.subplots(1, 2, layout='constrained')

axs[0].plot(np.arange(0, 1e6, 1000))
axs[0].set_title('Title 0')
axs[0].set_xlabel('XLabel 0')

axs[1].plot(np.arange(1, 0, -0.1) * 2000, np.arange(1, 0, -0.1))
axs[1].set_title('Title 1')
axs[1].set_xlabel('XLabel 1')
axs[1].xaxis.tick_top()
axs[1].tick_params(axis='x', rotation=55)
```

```
fig, axs = plt.subplots(1, 2, layout='constrained')

```

(continues on next page)

(continued from previous page)

```
axs[0].plot(np.arange(0, 1e6, 1000))
axs[0].set_title('Title 0')
axs[0].set_xlabel('XLabel 0')

axs[1].plot(np.arange(1, 0, -0.1) * 2000, np.arange(1, 0, -0.1))
axs[1].set_title('Title 1')
axs[1].set_xlabel('XLabel 1')
axs[1].xaxis.tick_top()
axs[1].tick_params(axis='x', rotation=55)

fig.align_labels()
fig.align_titles()
```

`axisartist` can now be used together with standard `Formatters`

... instead of being limited to axisartist-specific ones.

Toggle minorticks on Axis

Minor ticks on an *Axis* can be displayed or removed using *minorticks_on* and *minorticks_off*; e.g., `ax.xaxis.minorticks_on()`. See also *minorticks_on*.

`StrMethodFormatter` now respects `axes.unicode_minus`

When formatting negative values, *StrMethodFormatter* will now use unicode minus signs if *rcParams["axes.unicode_minus"]* (default: `True`) is set.

```
>>> from matplotlib.ticker import StrMethodFormatter
>>> with plt.rc_context({'axes.unicode_minus': False}):
...     formatter = StrMethodFormatter('{x}')
...     print(formatter.format_data(-10))
-10
```

```
>>> with plt.rc_context({'axes.unicode_minus': True}):
...     formatter = StrMethodFormatter('{x}')
...     print(formatter.format_data(-10))
-10
```

Figure, Axes, and Legend Layout

Subfigures now have controllable zorders

Previously, setting the zorder of a subfigure had no effect, and those were plotted on top of any figure-level artists (i.e for example on top of fig-level legends). Now, subfigures behave like any other artists, and their zorder can be controlled, with default a zorder of 0.

```
x = np.linspace(1, 10, 10)
y1, y2 = x, -x
fig = plt.figure(constrained_layout=True)
subfigs = fig.subfigures(nrows=1, ncols=2)
for subfig in subfigs:
    axarr = subfig.subplots(2, 1)
    for ax in axarr.flatten():
        (l1,) = ax.plot(x, y1, label="line1")
        (l2,) = ax.plot(x, y2, label="line2")
subfigs[0].set_zorder(6)
l = fig.legend(handles=[l1, l2], loc="upper center", ncol=2)
```

Getters for xmargin, ymargin and zmargin

Axes.get_xmargin, *Axes.get_ymargin* and *Axes3D.get_zmargin* methods have been added to return the margin values set by *Axes.set_xmargin*, *Axes.set_ymargin* and *Axes3D.set_zmargin*, respectively.

Mathtext improvements

`mathtext` documentation improvements

The documentation is updated to take information directly from the parser. This means that (almost) all supported symbols, operators, etc. are shown at *Writing mathematical expressions*.

`mathtext` spacing corrections

As consequence of the updated documentation, the spacing on a number of relational and operator symbols were correctly classified and therefore will be spaced properly.

Widget Improvements

Check and Radio Button widgets support clearing

The *CheckButtons* and *RadioButtons* widgets now support clearing their state by calling their `.clear` method. Note that it is not possible to have no selected radio buttons, so the selected option at construction time is selected.

3D plotting improvements

Setting 3D axis limits now set the limits exactly

Previously, setting the limits of a 3D axis would always add a small margin to the limits. Limits are now set exactly by default. The newly introduced rcparam `axes3d.automargin` can be used to revert to the old behavior where margin is automatically added.

```
fig, axs = plt.subplots(1, 2, subplot_kw={'projection': '3d'})

plt.rcParams['axes3d.automargin'] = True
axs[0].set(xlim=(0, 1), ylim=(0, 1), zlim=(0, 1), title='Old Behavior')

plt.rcParams['axes3d.automargin'] = False  # the default in 3.9.0
axs[1].set(xlim=(0, 1), ylim=(0, 1), zlim=(0, 1), title='New Behavior')
```

Other improvements

BackendRegistry

New *BackendRegistry* class is the single source of truth for available backends. The singleton instance is `matplotlib.backends.backend_registry`. It is used internally by Matplotlib, and also IPython (and therefore Jupyter) starting with IPython 8.24.0.

There are three sources of backends: built-in (source code is within the Matplotlib repository), explicit `module://some.backend` syntax (backend is obtained by loading the module), or via an entry point (self-registering backend in an external package).

To obtain a list of all registered backends use:

```
>>> from matplotlib.backends import backend_registry
>>> backend_registry.list_all()
```

Add `widths`, `heights` and `angles` setter to `EllipseCollection`

The `widths`, `heights` and `angles` values of the *EllipseCollection* can now be changed after the collection has been created.

```
from matplotlib.collections import EllipseCollection

rng = np.random.default_rng(0)

widths = (2, )
heights = (3, )
angles = (45, )
offsets = rng.random((10, 2)) * 10

fig, ax = plt.subplots()

ec = EllipseCollection(
    widths=widths,
    heights=heights,
    angles=angles,
    offsets=offsets,
```

(continues on next page)

(continued from previous page)

```
    units='x',
    offset_transform=ax.transData,
    )

ax.add_collection(ec)
ax.set_xlim(-2, 12)
ax.set_ylim(-2, 12)

new_widths = rng.random((10, 2)) * 2
new_heights = rng.random((10, 2)) * 3
new_angles = rng.random((10, 2)) * 180

ec.set(widths=new_widths, heights=new_heights, angles=new_angles)
```

`image.interpolation_stage` rcParam

This new rcParam controls whether image interpolation occurs in "data" space or in "rgba" space.

Arrow patch position is now modifiable

A setter method has been added that allows updating the position of the *patches.Arrow* object without requiring a full re-draw.

```
from matplotlib import animation
from matplotlib.patches import Arrow

fig, ax = plt.subplots()
ax.set_xlim(0, 10)
ax.set_ylim(0, 10)

a = Arrow(2, 0, 0, 10)
ax.add_patch(a)

# code for modifying the arrow
def update(i):
    a.set_data(x=.5, dx=i, dy=6, width=2)

ani = animation.FuncAnimation(fig, update, frames=15, interval=90,␣
 ↪blit=False)

plt.show()
```

NonUniformImage now has mouseover support

When mousing over a *NonUniformImage*, the data values are now displayed.

9.2.2 API Changes for 3.9.2

Development

Windows wheel runtime bundling made static

In 3.7.0, the MSVC runtime DLL was bundled in wheels to enable importing Matplotlib on systems that do not have it installed. However, this could cause inconsistencies with other wheels that did the same, and trigger random crashes depending on import order. See this issue for further details.

Since 3.9.2, wheels now bundle the MSVC runtime DLL statically to avoid such issues.

9.2.3 API Changes for 3.9.1

Development

Documentation-specific custom Sphinx roles are now semi-public

For third-party packages that derive types from Matplotlib, our use of custom roles may prevent Sphinx from building their docs. These custom Sphinx roles are now public solely for the purposes of use within projects that derive from Matplotlib types. See *matplotlib.sphinxext.roles* for details.

9.2.4 API Changes for 3.9.0

- *Behaviour Changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behaviour Changes

plot() shorthand format interprets "Cn" (n>9) as a color-cycle color

Previously, `plot(..., "-C11")` would be interpreted as requesting a plot using linestyle "-", color "C1" (color #1 of the color cycle), and marker "1" ("tri-down"). It is now interpreted as requesting linestyle "-" and color "C11" (color #11 of the color cycle).

It is recommended to pass ambiguous markers (such as "1") explicitly using the *marker* keyword argument. If the shorthand form is desired, such markers can also be unambiguously set by putting them *before* the color string.

Legend labels for `plot`

Previously if a sequence was passed to the *label* parameter of *plot* when plotting a single dataset, the sequence was automatically cast to string for the legend label. Now, if the sequence has only one element, that element will be the legend label. To keep the old behavior, cast the sequence to string before passing.

Boxplots now ignore masked data points

boxplot and *boxplot_stats* now ignore any masked points in the input data.

`axhspan` and `axvspan` now return `Rectangle`s, not `Polygon`s

This change allows using *axhspan* to draw an annulus on polar axes.

This change also affects other elements built via *axhspan* and *axvspan*, such as `Slider.poly`.

Improved handling of pan/zoom events of overlapping Axes

The forwarding of pan/zoom events is now determined by the visibility of the background-patch (e.g. `ax.patch.get_visible()`) and by the `zorder` of the axes.

- Axes with a visible patch capture the event and do not pass it on to axes below. Only the Axes with the highest `zorder` that contains the event is triggered (if there are multiple Axes with the same `zorder`, the last added Axes counts)
- Axes with an invisible patch are also invisible to events and they are passed on to the axes below.

To override the default behavior and explicitly set whether an Axes should forward navigation events, use *Axes.set_forward_navigation_events*.

`loc='best'` for `legend` now considers `Text` and `PolyCollections`

The location selection `legend` now considers the existence of `Text` and `PolyCollections` in the `badness` calculation.

Note: The `best` option can already be quite slow for plots with large amounts of data. For `PolyCollections`, it only considers the `Path` of `PolyCollections` and not the enclosed area when checking for overlap to reduce additional latency. However, it can still be quite slow when there are large amounts of `PolyCollections` in the plot to check for.

Exception when not passing a Bbox to BboxTransform*-classes

The exception when not passing a Bbox to BboxTransform*-classes that expect one, e.g., *BboxTransform* has changed from `ValueError` to `TypeError`.

loc parameter of `Cell` no longer accepts `None`

The default value of the *loc* parameter has been changed from `None` to `right`, which already was the default location. The behavior of *Cell* didn't change when called without an explicit *loc* parameter.

`ContourLabeler.add_label` now respects *use_clabeltext*

... and sets *`Text.set_transform_rotates_text`* accordingly.

`Line2D`

When creating a Line2D or using *`Line2D.set_xdata`* and *`Line2D.set_ydata`*, passing x/y data as non sequence is now an error.

`ScalarMappable`s auto-scale their norm when an array is set

Collections previously deferred auto-scaling of the norm until draw time. This has been changed to scale the norm whenever the first array is set to align with the docstring and reduce unexpected behavior when accessing the norm before drawing.

`SubplotParams` moved from `matplotlib.figure` to `matplotlib.gridspec`

It is still importable from `matplotlib.figure`, so does not require any changes to existing code.

`PowerNorm` no longer clips values below vmin

When `clip=False` is set (the default) on *`PowerNorm`*, values below `vmin` are now linearly normalised. Previously they were clipped to zero. This fixes issues with the display of colorbars associated with a power norm.

Image path semantics of toolmanager-based tools

Previously, MEP22 ("toolmanager-based") Tools would try to load their icon (`tool.image`) relative to the current working directory, or, as a fallback, from Matplotlib's own image directory. Because both approaches are problematic for third-party tools (the end-user may change the current working directory at any time, and third-parties cannot add new icons in Matplotlib's image directory), this behavior is deprecated; instead, `tool.image` is now interpreted relative to the directory containing the source file where the `Tool.image` class attribute is defined. (Defining `tool.image` as an absolute path also works and is compatible with both the old and the new semantics.)

Deprecations

`plot_date`

Use of *`plot_date`* has been discouraged since Matplotlib 3.5 and the function is now formally deprecated.

- `datetime`-like data should directly be plotted using *`plot`*.
- If you need to plot plain numeric data as *Matplotlib date format* or need to set a timezone, call `ax.xaxis.axis_date` / `ax.yaxis.axis_date` before *`plot`*. See *`Axis.axis_date`*.

Legend labels for `plot`

Previously if a sequence was passed to the *label* parameter of *plot* when plotting a single dataset, the sequence was automatically cast to string for the legend label. This behavior is now deprecated and in future will error if the sequence length is not one (consistent with multi-dataset behavior, where the number of elements must match the number of datasets). To keep the old behavior, cast the sequence to string before passing.

`boxplot` tick labels

The parameter *labels* has been renamed to *tick_labels* for clarity and consistency with *bar*.

Mixing positional and keyword arguments for `legend` handles and labels

This previously only raised a warning, but is now formally deprecated. If passing *handles* and *labels*, they must be passed either both positionally or both as keyword.

Applying theta transforms in `PolarTransform`

Applying theta transforms in *PolarTransform* and *InvertedPolarTransform* is deprecated, and will be removed in a future version of Matplotlib. This is currently the default behaviour when these transforms are used externally, but only takes affect when:

- An axis is associated with the transform.
- The axis has a non-zero theta offset or has theta values increasing in a clockwise direction.

To silence this warning and adopt future behaviour, set `apply_theta_transforms=False`. If you need to retain the behaviour where theta values are transformed, chain the `PolarTransform` with a *Affine2D* transform that performs the theta shift and/or sign shift.

interval parameter of `TimerBase.start`

Setting the timer *interval* while starting it is deprecated. The interval can be specified instead in the timer constructor, or by setting the `timer.interval` attribute.

nth_coord parameter to axisartist helpers for fixed axis

Helper APIs in *axisartist* for generating a "fixed" axis on rectilinear axes (*FixedAxisArtistHelperRectilinear*) no longer take a *nth_coord* parameter, as that parameter is entirely inferred from the (required) *loc* parameter and having inconsistent *nth_coord* and *loc* is an error.

For curvilinear axes, the *nth_coord* parameter remains supported (it affects the *ticks*, not the axis position itself), but that parameter will become keyword-only, for consistency with the rectilinear case.

rcsetup.interactive_bk, rcsetup.non_interactive_bk and rcsetup.all_backends

... are deprecated and replaced by `matplotlib.backends.backend_registry.list_builtin` with the following arguments

- `matplotlib.backends.BackendFilter.INTERACTIVE`
- `matplotlib.backends.BackendFilter.NON_INTERACTIVE`
- `None`

respectively.

Miscellaneous deprecations

- `backend_ps.get_bbox_header` is considered an internal helper
- `BboxTransformToMaxOnly`; if you rely on this, please make a copy of the code
- `ContourLabeler.add_label_clabeltext`
- `TransformNode.is_bbox`; instead check the object using `isinstance(..., BboxBase)`
- `GridHelperCurveLinear.get_tick_iterator`

Removals

Top-level cmap registration and access functions in mpl.cm

As part of the multi-step refactoring of colormap registration, the following functions have been removed:

- `matplotlib.cm.get_cmap`; use `matplotlib.colormaps[name]` instead if you have a `str`.

  Use *matplotlib.cm.ColormapRegistry.get_cmap* if you have a `str`, `None` or a *matplotlib.colors.Colormap* object that you want to convert to a *Colormap* object.
- `matplotlib.cm.register_cmap`; use *matplotlib.colormaps.register* instead.
- `matplotlib.cm.unregister_cmap`; use *matplotlib.colormaps.unregister* instead.
- `matplotlib.pyplot.register_cmap`; use *matplotlib.colormaps.register* instead.

The *matplotlib.pyplot.get_cmap* function will stay available for backward compatibility.

Contour labels

`contour.ClabelText` and `ContourLabeler.set_label_props` are removed. Use `Text(..., transform_rotates_text=True)` as a replacement for `contour.ClabelText(...)` and `text.set(text=text, color=color, fontproperties=labeler.labelFontProps, clip_box=labeler.axes.bbox)` as a replacement for the `ContourLabeler.set_label_props(label, text, color)`.

The `labelFontProps`, `labelFontSizeList`, and `labelTextsList` attributes of *ContourLabeler* have been removed. Use the `labelTexts` attribute and the font properties of the corresponding text objects instead.

`num2julian`, `julian2num` and `JULIAN_OFFSET`

... of the *dates* module are removed without replacements. These were undocumented and not exported.

Julian dates in Matplotlib were calculated from a Julian date epoch: `jdate = (date - np.datetime64(EPOCH)) / np.timedelta64(1, 'D')`. Conversely, a Julian date was converted to datetime as `date = np.timedelta64(int(jdate * 24 * 3600), 's') + np.datetime64(EPOCH)`. Matplotlib was using `EPOCH='-4713-11-24T12:00'` so that 2000-01-01 at 12:00 is 2_451_545.0 (see https://en.wikipedia.org/wiki/Julian_day).

`offsetbox` methods

`offsetbox.bbox_artist` is removed. This was just a wrapper to call *patches.bbox_artist* if a flag is set in the file, so use that directly if you need the behavior.

`OffsetBox.get_extent_offsets` and `OffsetBox.get_extent` are removed; these methods are also removed on all subclasses of *OffsetBox*. To get the offsetbox extents, instead of `get_extent`, use *OffsetBox.get_bbox*, which directly returns a *Bbox* instance. To also get the child offsets, instead of `get_extent_offsets`, separately call *get_offset* on each children after triggering a draw.

`parse_fontconfig_pattern` raises on unknown constant names

Previously, in a fontconfig pattern like `DejaVu Sans:foo`, the unknown `foo` constant name would be silently ignored. This now raises an error.

`tri` submodules

The `matplotlib.tri.*` submodules are removed. All functionality is available in `matplotlib.tri` directly and should be imported from there.

Widget API

- `CheckButtons.rectangles` and `CheckButtons.lines` are removed; *CheckButtons* now draws itself using *scatter*.
- `RadioButtons.circles` is removed; *RadioButtons* now draws itself using *scatter*.
- `MultiCursor.needclear` is removed with no replacement.
- The unused parameter *x* to `TextBox.begin_typing` was a required argument, and is now removed.

Most arguments to widgets have been made keyword-only

Passing all but the very few first arguments positionally in the constructors of Widgets is now keyword-only. In general, all optional arguments are keyword-only.

`Axes3D` API

- `Axes3D.unit_cube`, `Axes3D.tunit_cube`, and `Axes3D.tunit_edges` are removed without replacement.
- `axes3d.vvec`, `axes3d.eye`, `axes3d.sx`, and `axes3d.sy` are removed without replacement.

Inconsistent *nth_coord* and *loc* passed to `_FixedAxisArtistHelperBase`

The value of the *nth_coord* parameter of `_FixedAxisArtistHelperBase` and its subclasses is now inferred from the value of *loc*; passing inconsistent values (e.g., requesting a "top y axis" or a "left x axis") has no more effect.

Passing undefined *label_mode* to `Grid`

... is no longer allowed. This includes *mpl_toolkits.axes_grid1.axes_grid.Grid*, *mpl_toolkits.axes_grid1.axes_grid.AxesGrid*, and *mpl_toolkits.axes_grid1.axes_grid.ImageGrid* as well as the corresponding classes imported from `mpl_toolkits.axisartist.axes_grid`.

Pass `label_mode='keep'` instead to get the previous behavior of not modifying labels.

`draw_gouraud_triangle`

... is removed. Use *draw_gouraud_triangles* instead.

A `draw_gouraud_triangle` call in a custom *Artist* can readily be replaced as:

```
self.draw_gouraud_triangles(gc, points.reshape((1, 3, 2)),
                            colors.reshape((1, 3, 4)), trans)
```

A *draw_gouraud_triangles* method can be implemented from an existing `draw_gouraud_triangle` method as:

```
transform = transform.frozen()
for tri, col in zip(triangles_array, colors_array):
    self.draw_gouraud_triangle(gc, tri, col, transform)
```

Miscellaneous removals

The following items have previously been replaced, and are now removed:

- *ticklabels* parameter of `matplotlib.axis.Axis.set_ticklabels` has been renamed to *labels*.

- `Barbs.barbs_doc` and `Quiver.quiver_doc` are removed. These are the doc-strings and should not be accessible as a named class member, but as normal doc-strings would.
- `collections.PolyCollection.span_where` and `collections.BrokenBarHCollection`; use `fill_between` instead.
- `Legend.legendHandles` was undocumented and has been renamed to `legend_handles`.

The following items have been removed without replacements:

- The attributes `repeat` of *`TimedAnimation`* and subclasses and `save_count` of *`FuncAnimation`* are considered private and removed.
- `matplotlib.backend.backend_agg.BufferRegion.to_string`
- `matplotlib.backend.backend_agg.BufferRegion.to_string_argb`
- `matplotlib.backends.backend_ps.PsBackendHelper`
- `matplotlib.backends.backend_webagg.ServerThread`
- *raw* parameter of *`GridSpecBase.get_grid_positions`*
- `matplotlib.patches.ConnectionStyle._Base.SimpleEvent`
- `passthru_pt` attribute of `mpl_toolkits.axisartist.AxisArtistHelper`

Development changes

Build system ported to Meson

The build system of Matplotlib has been ported from setuptools to meson-python and Meson. Consequently, there have been a few changes for development and packaging purposes.

1. Installation by `pip` of packages with `pyproject.toml` use build isolation by default, which interferes with editable installation. Thus for developers using editable installs, it is now necessary to pass the `--no-build-isolation` flag to `pip install`. This means that all build-time requirements must be available in the environment for an editable install.
2. Build configuration has moved from a custom `mplsetup.cfg` (also configurable via `MPLSETUP` environment variable) to Meson options. These may be specified using meson-python's build config settings for `setup-args`. See `meson_options.txt` for all options. For example, a `mplsetup.cfg` containing the following:

   ```
   [rc_options]
   backend=Agg

   [libs]
   system_qhull = True
   ```

   may be replaced by passing the following arguments to `pip`:

   ```
   --config-settings=setup-args="-DrcParams-backend=Agg"
   --config-settings=setup-args="-Dsystem-qhull=true"
   ```

Note that you must use `pip` >= 23.1 in order to pass more than one setting.

3. Relatedly, Meson's builtin options are now used instead of custom options, e.g., the LTO option is now `b_lto`.
4. On Windows, Meson activates a Visual Studio environment automatically. However, it will not do so if another compiler is available. See Meson's documentation if you wish to change the priority of chosen compilers.
5. Installation of test data was previously controlled by `mplsetup.cfg`, but has now been moved to Meson's install tags. To install test data, add the `tests` tag to the requested install (be sure to include the existing tags as below):

```
--config-settings=install-args="--tags=data,python-runtime,runtime,
↪tests"
```

6. Checking typing stubs with `stubtest` does not work easily with editable install. For the time being, we suggest using a normal (non-editable) install if you wish to run `stubtest`.

Increase to minimum supported versions of dependencies

For Matplotlib 3.9, the *minimum supported versions* are being bumped:

Dependency	min in mpl3.8	min in mpl3.9
NumPy	1.21.0	1.23.0
setuptools	42	64

This is consistent with our *Dependency version policy* and SPEC 0.

To comply with requirements of `setuptools_scm`, the minimum version of `setuptools` has been increased from 42 to 64.

Extensions require C++17

Matplotlib now requires a compiler that supports C++17 in order to build its extensions. According to SciPy's analysis, this should be available on all supported platforms.

Windows on ARM64 support

Windows on ARM64 now bundles FreeType 2.6.1 instead of 2.11.1 when building from source. This may cause small changes to text rendering, but should become consistent with all other platforms.

9.3 Version 3.8

9.3.1 What's new in Matplotlib 3.8.0 (Sept 13, 2023)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.8.0 (Sept 13, 2023)*
  - *Type Hints*
  - *Plotting and Annotation improvements*
    - *Support customizing antialiasing for text and annotation*
    - *rcParams for `AutoMinorLocator` divisions*
    - *Axline setters and getters*
    - *Clipping for contour plots*
    - *`Axes.ecdf`*
    - *`Figure.get_suptitle()`, `Figure.get_supxlabel()`, `Figure.get_supylabel()`*
    - *`Ellipse.get_vertices()`, `Ellipse.get_co_vertices()`*
    - *Remove inner ticks in `label_outer()`*
    - *Configurable legend shadows*
    - *`offset` parameter for MultipleLocator*
    - *Add a new valid color format `(matplotlib_color, alpha)`*
    - *The pie chart shadow can be controlled*
    - *`PolyQuadMesh` is a new class for drawing quadrilateral meshes*
    - *Shadow shade can be controlled*
    - *`SpinesProxy` now supports calling the `set()` method*
    - *Allow setting the tick label fonts with a keyword argument*
  - *Figure, Axes, and Legend Layout*
    - *pad_inches="layout" for savefig*
    - *Add a public method to modify the location of `Legend`*
    - *`rcParams['legend.loc']` now accepts float-tuple inputs*
  - *Mathtext improvements*
    - *Boldsymbol mathtext command `\boldsymbol`*
    - *`mathtext` has more sizable delimiters*
    - *`mathtext` documentation improvements*
    - *`mathtext` now supports `\substack`*

        * *mathtext now supports \middle delimiter*
        * *mathtext operators*
        * *mathtext spacing corrections*
        * *mathtext now supports \text*
        * *Bold-italic mathtext command \mathbfit*
    - *3D plotting improvements*
        * *Specify ticks and axis label positions for 3D plots*
        * *3D hover coordinates*
        * *3D plots can share view angles*
    - *Other improvements*
        * *macosx: New figures can be opened in either windows or tabs*
        * *matplotlib.mpl_toolkits is now an implicit namespace package*
        * *Plot Directive now can make responsive images with "srcset"*

Type Hints

Matplotlib now provides first-party PEP484 style type hints files for most public APIs.

While still considered provisional and subject to change (and sometimes we are not quite able to fully specify what we would like to), they should provide a reasonable basis to type check many common usage patterns, as well as integrating with many editors/IDEs.

Plotting and Annotation improvements

Support customizing antialiasing for text and annotation

`matplotlib.pyplot.annotate()` and `matplotlib.pyplot.text()` now support parameter *antialiased*. When *antialiased* is set to `True`, antialiasing will be applied to the text. When *antialiased* is set to `False`, antialiasing will not be applied to the text. When *antialiased* is not specified, antialiasing will be set by *rcParams["text.antialiased"]* (default: `True`) at the creation time of `Text` and `Annotation` object. Examples:

```
mpl.text.Text(.5, .5, "foo\nbar", antialiased=True)
plt.text(0.5, 0.5, '6 inches x 2 inches', antialiased=True)
ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5), antialiased=False)
```

If the text contains math expression, *antialiased* applies to the whole text. Examples:

```
# no part will be antialiased for the text below
plt.text(0.5, 0.25, r"$I'm \sqrt{x}$", antialiased=False)
```

Also note that antialiasing for tick labels will be set with *rcParams["text.antialiased"]* (default: `True`) when they are created (usually when a `Figure` is created) and cannot be changed afterwards.

Furthermore, with this new feature, you may want to make sure that you are creating and saving/showing the figure under the same context:

```
# previously this was a no-op, now it is what works
with rccontext(text.antialiased=False):
    fig, ax = plt.subplots()
    ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5))
    fig.savefig('/tmp/test.png')

# previously this had an effect, now this is a no-op
fig, ax = plt.subplots()
ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5))
with rccontext(text.antialiased=False):
    fig.savefig('/tmp/test.png')
```

rcParams for `AutoMinorLocator` divisions

The rcParams *rcParams["xtick.minor.ndivs"]* (default: `'auto'`) and *rcParams["ytick.minor.ndivs"]* (default: `'auto'`) have been added to enable setting the default number of divisions; if set to `auto`, the number of divisions will be chosen by the distance between major ticks.

Axline setters and getters

The returned object from *axes.Axes.axline* now supports getter and setter methods for its *xy1*, *xy2* and *slope* attributes:

```
line1.get_xy1()
line1.get_slope()
line2.get_xy2()
```

```
line1.set_xy1(.2, .3)
line1.set_slope(2.4)
line2.set_xy2(.1, .6)
```

Clipping for contour plots

contour and *contourf* now accept the *clip_path* parameter.

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches

x = y = np.arange(-3.0, 3.01, 0.025)
```

(continues on next page)

(continued from previous page)

```
X, Y = np.meshgrid(x, y)
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = (Z1 - Z2) * 2

fig, ax = plt.subplots()
patch = mpatches.RegularPolygon((0, 0), 5, radius=2,
                                transform=ax.transData)
ax.contourf(X, Y, Z, clip_path=patch)

plt.show()
```

`Axes.ecdf`

A new Axes method, *`ecdf`*, allows plotting empirical cumulative distribution functions without any binning.

```
import matplotlib.pyplot as plt
import numpy as np

fig, ax = plt.subplots()
ax.ecdf(np.random.randn(100))
```

`Figure.get_suptitle()`, `Figure.get_supxlabel()`, `Figure.get_supylabel()`

These methods return the strings set by `Figure.suptitle()`, `Figure.supxlabel()` and `Figure.supylabel()` respectively.

`Ellipse.get_vertices()`, `Ellipse.get_co_vertices()`

These methods return the coordinates of ellipse vertices of major and minor axis. Additionally, an example gallery demo is added which shows how to add an arrow to an ellipse showing a clockwise or counter-clockwise rotation of the ellipse. To place the arrow exactly on the ellipse, the coordinates of the vertices are used.

Remove inner ticks in `label_outer()`

Up to now, `label_outer()` has only removed the ticklabels. The ticks lines were left visible. This is now configurable through a new parameter `label_outer(remove_inner_ticks=True)`.

```
import numpy as np
import matplotlib.pyplot as plt

x = np.linspace(0, 2 * np.pi, 100)
```

(continues on next page)

(continued from previous page)

```
fig, axs = plt.subplots(2, 2, sharex=True, sharey=True,
                        gridspec_kw=dict(hspace=0, wspace=0))

axs[0, 0].plot(x, np.sin(x))
axs[0, 1].plot(x, np.cos(x))
axs[1, 0].plot(x, -np.cos(x))
axs[1, 1].plot(x, -np.sin(x))

for ax in axs.flat:
    ax.grid(color='0.9')
    ax.label_outer(remove_inner_ticks=True)
```

Configurable legend shadows

The *shadow* parameter of legends now accepts dicts in addition to booleans. Dictionaries can contain any keywords for *patches.Patch*. For example, this allows one to set the color and/or the transparency of a legend shadow:

```
ax.legend(loc='center left', shadow={'color': 'red', 'alpha': 0.5})
```

and to control the shadow location:

```
ax.legend(loc='center left', shadow={"ox":20, "oy":-20})
```

Configuration is currently not supported via *rcParams["legend.shadow"]* (default: `False`).

`offset` parameter for MultipleLocator

An *offset* may now be specified to shift all the ticks by the given value.

```
import matplotlib.pyplot as plt
import matplotlib.ticker as mticker

_, ax = plt.subplots()
ax.plot(range(10))
locator = mticker.MultipleLocator(base=3, offset=0.3)
ax.xaxis.set_major_locator(locator)

plt.show()
```

Add a new valid color format `(matplotlib_color, alpha)`

```
import matplotlib.pyplot as plt
from matplotlib.patches import Rectangle

fig, ax = plt.subplots()

rectangle = Rectangle((.2, .2), .6, .6,
                      facecolor=('blue', 0.2),
                      edgecolor=('green', 0.5))
ax.add_patch(rectangle)
```

Users can define a color using the new color specification, *(matplotlib_color, alpha)*. Note that an explicit alpha keyword argument will override an alpha value from *(matplotlib_color, alpha)*.

The pie chart shadow can be controlled

The *shadow* argument to *pie* can now be a dict, allowing more control of the *Shadow*-patch used.

`PolyQuadMesh` is a new class for drawing quadrilateral meshes

pcolor previously returned a flattened *PolyCollection* with only the valid polygons (unmasked) contained within it. Now, we return a *PolyQuadMesh*, which is a mixin incorporating the usefulness of 2D array and mesh coordinates handling, but still inheriting the draw methods of *PolyCollection*, which enables more control over the rendering properties than a normal *QuadMesh* that is returned from *pcolormesh*. The new class subclasses *PolyCollection* and thus should still behave the same as before. This new class keeps track of the mask for the user and updates the Polygons that are sent to the renderer appropriately.

Shadow shade can be controlled

The *Shadow* patch now has a *shade* argument to control the shadow darkness. If 1, the shadow is black, if 0, the shadow has the same color as the patch that is shadowed. The default value, which earlier was fixed, is 0.7.

`SpinesProxy` now supports calling the `set()` method

One can now call e.g. `ax.spines[:].set(visible=False)`.

Allow setting the tick label fonts with a keyword argument

`Axes.tick_params` now accepts a *labelfontfamily* keyword that changes the tick label font separately from the rest of the text objects:

```
Axis.tick_params(labelfontfamily='monospace')
```

Figure, Axes, and Legend Layout

pad_inches="layout" for savefig

When using constrained or compressed layout,

```
savefig(filename, bbox_inches="tight", pad_inches="layout")
```

will now use the padding sizes defined on the layout engine.

Add a public method to modify the location of `Legend`

Legend locations now can be tweaked after they've been defined.

```
from matplotlib import pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(1, 1, 1)

x = list(range(-100, 101))
y = [i**2 for i in x]

ax.plot(x, y, label="f(x)")
ax.legend()
ax.get_legend().set_loc("right")
# Or
# ax.get_legend().set(loc="right")

plt.show()
```

`rcParams['legend.loc']` now accepts float-tuple inputs

The *rcParams["legend.loc"]* (default: `'best'`) rcParams now accepts float-tuple inputs, same as the *loc* keyword argument to *Legend*. This allows users to set the location of the legend in a more flexible and consistent way.

Mathtext improvements

Improvements are to Mathtext, Matplotlib's native TeX-like mathematics parser (see *Writing mathematical expressions*, not to be confused with Matplotlib using LaTeX directly: *Text rendering with LaTeX*).

Boldsymbol mathtext command `\boldsymbol`

Supports using the `\boldsymbol{}` command in mathtext:

To change symbols to bold enclose the text in a font command as shown:

```
r'$\boldsymbol{a+2+\alpha}$'
```

$$a + 2 + \alpha$$

`mathtext` has more sizable delimiters

The `\lgroup` and `\rgroup` sizable delimiters have been added.

The following delimiter names have been supported earlier, but can now be sized with `\left` and `\right`:

- `\lbrace`, `\rbrace`, `\leftbrace`, and `\rightbrace`
- `\lbrack` and `\rbrack`
- `\leftparen` and `\rightparen`

There are really no obvious advantages in using these. Instead, they are added for completeness.

`mathtext` documentation improvements

The documentation is updated to take information directly from the parser. This means that (almost) all supported symbols, operators etc are shown at *Writing mathematical expressions*.

`mathtext` now supports `\substack`

`\substack` can be used to create multi-line subscripts or superscripts within an equation.

To use it to enclose the math in a substack command as shown:

```
r'$\sum_{\substack{1\leq i\leq 3\\ 1\leq j\leq 5}}$'
```

$$\sum_{\substack{1\leq i\leq 3\\ 1\leq j\leq 5}} \tag{9.1}$$

`mathtext` now supports `\middle` delimiter

The `\middle` delimiter has been added, and can now be used with the `\left` and `\right` delimiters:

To use the middle command enclose it in between the `\left` and `\right` delimiter command as shown:

```
r'$\left( \frac{a}{b} \middle| q \right)$'
```

$$\left(\frac{a}{b}\middle|q\right) \tag{9.2}$$

`mathtext` operators

There has been a number of operators added and corrected when a Unicode font is used. In addition, correct spacing has been added to a number of the previous operators. Especially, the characters used for `\gnapprox`, `\lnapprox`, `\leftangle`, and `\rightangle` have been corrected.

`mathtext` spacing corrections

As consequence of the updated documentation, the spacing on a number of relational and operator symbols were classified like that and therefore will be spaced properly.

`mathtext` now supports `\text`

`\text` can be used to obtain upright text within an equation and to get a plain dash (-).

```
import matplotlib.pyplot as plt
plt.text(0.1, 0.5, r"$a = \sin(\phi) \text{ such that } \phi = \frac{x}
 ↪{y}$")
plt.text(0.1, 0.3, r"$\text{dashes (-) are retained}$")
```

Bold-italic mathtext command `\mathbfit`

Supports use of bold-italic font style in mathtext using the `\mathbfit{}` command:

To change font to bold and italic enclose the text in a font command as shown:

```
r'$\mathbfit{\eta \leq C(\delta(\eta))}$
```

$$\boldsymbol{\eta \leq C(\delta(\eta))}$$

3D plotting improvements

Specify ticks and axis label positions for 3D plots

You can now specify the positions of ticks and axis labels for 3D plots.

```
import matplotlib.pyplot as plt

positions = ['lower', 'upper', 'default', 'both', 'none']
fig, axs = plt.subplots(2, 3, figsize=(12, 8),
                        subplot_kw={'projection': '3d'})
for ax, pos in zip(axs.flatten(), positions):
    for axis in ax.xaxis, ax.yaxis, ax.zaxis:
        axis.set_label_position(pos)
        axis.set_ticks_position(pos)
    title = f'position="{pos}"'
    ax.set(xlabel='x', ylabel='y', zlabel='z', title=title)
axs[1, 2].axis('off')
```

3D hover coordinates

The x, y, z coordinates displayed in 3D plots were previously showing nonsensical values. This has been fixed to report the coordinate on the view pane directly beneath the mouse cursor. This is likely to be most useful when viewing 3D plots along a primary axis direction when using an orthographic projection, or when a 2D plot has been projected onto one of the 3D axis panes. Note that there is still no way to directly display the coordinates of plotted data points.

3D plots can share view angles

3D plots can now share the same view angles, so that when you rotate one plot the other plots also rotate. This can be done with the *shareview* keyword argument when adding an axes, or by using the *ax1.shareview(ax2)* method of existing 3D axes.

Other improvements

macosx: New figures can be opened in either windows or tabs

There is a new *rcParams["macosx.window_mode"]* (default: `'system'`) rcParam to control how new figures are opened with the macosx backend. The default is **system** which uses the system settings, or one can specify either **tab** or **window** to explicitly choose the mode used to open new figures.

`matplotlib.mpl_toolkits` is now an implicit namespace package

Following the deprecation of `pkg_resources.declare_namespace` in `setuptools` 67.3.0, `matplotlib.mpl_toolkits` is now implemented as an implicit namespace, following PEP 420.

Plot Directive now can make responsive images with "srcset"

The plot sphinx directive (`matplotlib.sphinxext.plot_directive`, invoked in rst as `.. plot::`) can be configured to automatically make higher res figures and add these to the built html docs. In `conf.py`:

```
extensions = [
...
    'matplotlib.sphinxext.plot_directive',
    'matplotlib.sphinxext.figmpl_directive',
...]

plot_srcset = ['2x']
```

will make png files with double the resolution for hiDPI displays. Resulting html files will have image entries like:

```
<img src="../_images/nestedpage-index-2.png" style="" srcset="../_
↪images/nestedpage-index-2.png, ../_images/nestedpage-index-2.2x.png␣
↪2.00x" alt="" class="plot-directive "/>
```

9.3.2 API Changes for 3.8.1

Behaviour

Default behaviour of `hexbin` with *C* provided requires at least 1 point

The behaviour changed in 3.8.0 to be inclusive of *mincnt*. However, that resulted in errors or warnings with some reduction functions, so now the default is to require at least 1 point to call the reduction function. This effectively restores the default behaviour to match that of Matplotlib 3.7 and before.

Deprecations

Deprecations removed in `contour`

`contour.allsegs`, `contour.allkinds`, and `contour.find_nearest_contour` are no longer marked for deprecation.

Development

Minimum version of setuptools bumped to 64

To comply with requirements of `setuptools_scm`, the minimum version of `setuptools` has been increased from 42 to 64.

9.3.3 API Changes for 3.8.0

- *Behaviour Changes*
- *`matplotlib.mpl_toolkits` is now an implicit namespace package*
- *Deprecations*
- *Removals*
- *Development changes*

Behaviour Changes

Tk backend respects file format selection when saving figures

When saving a figure from a Tkinter GUI to a filename without an extension, the file format is now selected based on the value of the dropdown menu, rather than defaulting to PNG. When the filename contains an extension, or the OS automatically appends one, the behavior remains unchanged.

Placing of maximum and minimum minor ticks

Calculation of minor tick locations has been corrected to make the maximum and minimum minor ticks more consistent. In some cases this results in an extra minor tick on an Axis.

`hexbin` now defaults to `rcParams["patch.linewidth"]`

The default value of the *linewidths* argument of *Axes.hexbin* has been changed from `1.0` to *rcParams["patch.linewidth"]* (default: `1.0`). This improves the consistency with *QuadMesh* in *Axes.pcolormesh* and *Axes.hist2d*.

TwoSlopeNorm now auto-expands to always have two slopes

In the case where either `vmin` or `vmax` are not manually specified to *TwoSlopeNorm*, and where the data it is scaling is all less than or greater than the center point, the limits are now auto-expanded so there are two symmetrically sized slopes either side of the center point.

Previously `vmin` and `vmax` were clipped at the center point, which caused issues when displaying color bars.

This does not affect behaviour when `vmin` and `vmax` are manually specified by the user.

Event objects emitted for `axes_leave_event`

`axes_leave_event` now emits a synthetic *LocationEvent*, instead of reusing the last event object associated with a `motion_notify_event`.

Streamplot now draws streamlines as one piece if no width or no color variance

Since there is no need to draw streamlines piece by piece if there is no color change or width change, now streamplot will draw each streamline in one piece.

The behavior for varying width or varying color is not changed, same logic is used for these kinds of streamplots.

`canvas` argument now required for `FigureFrameWx`

`FigureFrameWx` now requires a keyword-only `canvas` argument when it is constructed.

`ContourSet` is now a single Collection

Prior to this release, *ContourSet* (the object returned by *contour*) was a custom object holding multiple *Collection*s (and not an *Artist*) -- one collection per level, each connected component of that level's contour being an entry in the corresponding collection.

ContourSet is now instead a plain *Collection* (and thus an *Artist*). The collection contains a single path per contour level; this path may be non-continuous in case there are multiple connected components.

Setting properties on the ContourSet can now usually be done using standard collection setters (`cset.set_linewidth(3)` to use the same linewidth everywhere or `cset.set_linewidth([1, 2, 3, ...])` to set different linewidths on each level) instead of having to go through the individual subcomponents (`cset.collections[0].set_linewidth(...)`). Note that during the transition period, it remains possible to access the (deprecated) `.collections` attribute; this causes the ContourSet to modify itself to use the old-style multi-Collection representation.

`SubFigure` default facecolor is now transparent

Subfigures default facecolor changed to `"none"`. Previously the default was the value of `figure.facecolor`.

Reject size related keyword arguments to MovieWriter *grab_frame* method

Although we pass *`Figure.savefig`* keyword arguments through the *`AbstractMovieWriter.grab_frame`* some of the arguments will result in invalid output if passed. To be successfully stitched into a movie, each frame must be exactly the same size, thus *bbox_inches* and *dpi* are excluded. Additionally, the movie writers are opinionated about the format of each frame, so the *format* argument is also excluded. Passing these arguments will now raise `TypeError` for all writers (it already did so for some arguments and some writers). The *bbox_inches* argument is already ignored (with a warning) if passed to *`Animation.save`*.

Additionally, if *`rcParams["savefig.bbox"]`* (default: `None`) is set to `'tight'`, *`AbstractMovieWriter.grab_frame`* will now error. Previously this rcParam would be temporarily overridden (with a warning) in *`Animation.save`*, it is now additionally overridden in *`AbstractMovieWriter.saving`*.

Changes of API after deprecation

- *`dviread.find_tex_file`* now raises `FileNotFoundError` when the requested filename is not found.
- *`Figure.colorbar`* now raises if *cax* is not given and it is unable to determine from which Axes to steal space, i.e. if *ax* is also not given and *mappable* has not been added to an Axes.
- *`pyplot.subplot`* and *`pyplot.subplot2grid`* no longer auto-remove preexisting overlapping Axes; explicitly call `Axes.remove` as needed.

Invalid types for Annotation xycoords now raise TypeError

Previously, a `RuntimeError` would be raised in some cases.

Default antialiasing behavior changes for `Text` and `Annotation`

`matplotlib.pyplot.annotate()` and `matplotlib.pyplot.text()` now support parameter *antialiased* when initializing. Examples:

```
mpl.text.Text(.5, .5, "foo\nbar", antialiased=True)
plt.text(0.5, 0.5, '6 inches x 2 inches', antialiased=True)
ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5), antialiased=False)
```

See "What's New" for more details on usage.

With this new feature, you may want to make sure that you are creating and saving/showing the figure under the same context:

```
# previously this was a no-op, now it is what works
with rccontext(text.antialiased=False):
    fig, ax = plt.subplots()
    ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5))
    fig.savefig('/tmp/test.png')

# previously this had an effect, now this is a no-op
fig, ax = plt.subplots()
ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5))
with rccontext(text.antialiased=False):
    fig.savefig('/tmp/test.png')
```

Also note that antialiasing for tick labels will be set with *rcParams["text.antialiased"]* (default: `True`) when they are created (usually when a `Figure` is created) - This means antialiasing for them can no longer be changed by modifying *rcParams["text.antialiased"]* (default: `True`).

`ScalarMappable.to_rgba()` now respects the mask of RGB(A) arrays

Previously, the mask was ignored. Now the alpha channel is set to 0 if any component (R, G, B, or A) is masked.

`Text.get_rotation_mode` return value

Passing `None` as `rotation_mode` to *Text* (the default value) or passing it to *Text.set_rotation_mode* will make *Text.get_rotation_mode* return `"default"` instead of `None`. The behaviour otherwise is the same.

PostScript paper size adds option to use figure size

The *rcParams["ps.papersize"]* (default: `'letter'`) rcParam can now be set to `'figure'`, which will use a paper size that corresponds exactly with the size of the figure that is being saved.

`hexbin` *mincnt* parameter made consistently inclusive

Previously, *mincnt* was inclusive with no *C* provided but exclusive when *C* is provided. It is now inclusive of *mincnt* in both cases.

`matplotlib.mpl_toolkits` is now an implicit namespace package

Following the deprecation of `pkg_resources.declare_namespace` in `setuptools` 67.3.0, `matplotlib.mpl_toolkits` is now implemented as an implicit namespace, following PEP 420.

As a consequence using `pip` to install a version of Matplotlib >= 3.8 on top of a version of Matplotlib < 3.8 (e.g. via `pip install --local` or `python -m venv --system-site-packages ...`) will fail because the old `matplotlib.mpl_toolkits` files will be found whereas the newer files will be found for all other modules. This will result in errors due to the version mismatch.

To avoid this issue you need to avoid having multiple versions of Matplotlib in different entries of `sys.path`. Either uninstall Matplotlib at the system level or use a more isolated virtual environment.

Deprecations

Calling `paths.get_path_collection_extents` with empty *offsets*

Calling *get_path_collection_extents* with an empty *offsets* parameter has an ambiguous interpretation and is therefore deprecated. When the deprecation period expires, this will produce an error.

`axes_grid1.axes_divider` API changes

The `AxesLocator` class is deprecated. The `new_locator` method of divider instances now instead returns an opaque callable (which can still be passed to `ax.set_axes_locator`).

`Divider.locate` is deprecated; use `Divider.new_locator(...)(ax, renderer)` instead.

`bbox.anchored()` with no explicit container

Not passing a *container* argument to *BboxBase.anchored* is now deprecated.

Functions in `mpl_toolkits.mplot3d.proj3d`

The function `transform` is just an alias for `proj_transform`, use the latter instead.

The following functions are either unused (so no longer required in Matplotlib) or considered private. If you rely on them, please make a copy of the code, including all functions that starts with a _ (considered private).

- `ortho_transformation`
- `persp_transformation`
- `proj_points`
- `proj_trans_points`
- `rot_x`
- `rotation_about_vector`
- `view_transformation`

Arguments other than `renderer` to `get_tightbbox`

... are keyword-only arguments. This is for consistency and that different classes have different additional arguments.

The object returned by `pcolor()` has changed to a `PolyQuadMesh` class

The old object was a *PolyCollection* with flattened vertices and array data. The new *PolyQuadMesh* class subclasses *PolyCollection*, but adds in better 2D coordinate and array handling in alignment with *QuadMesh*. Previously, if a masked array was input, the list of polygons within the collection would shrink to the size of valid polygons and users were required to keep track of which polygons were drawn and call `set_array()` with the smaller "compressed" array size. Passing the "compressed" and flattened array values is now deprecated and the full 2D array of values (including the mask) should be passed to *PolyQuadMesh.set_array*.

`LocationEvent.lastevent`

... is deprecated with no replacement.

`allsegs`, `allkinds`, `tcolors` and `tlinewidths` attributes of `ContourSet`

These attributes are deprecated; if required, directly retrieve the vertices and codes of the Path objects from `ContourSet.get_paths()` and the colors and the linewidths via `ContourSet.get_facecolor()`, `ContourSet.get_edgecolor()` and `ContourSet.get_linewidths()`.

`ContourSet.collections`

... is deprecated. *ContourSet* is now implemented as a single *Collection* of paths, each path corresponding to a contour level, possibly including multiple unconnected components.

During the deprecation period, accessing `ContourSet.collections` will revert the current ContourSet instance to the old object layout, with a separate *PathCollection* per contour level.

`INVALID_NON_AFFINE`, `INVALID_AFFINE`, `INVALID` attributes of `TransformNode`

These attributes are deprecated.

`Grouper.clean()`

with no replacement. The Grouper class now cleans itself up automatically.

`GridHelperCurveLinear.get_data_boundary`

... is deprecated. Use `grid_finder.extreme_finder(*[None] * 5)` to get the extremes of the grid.

np_load parameter of `cbook.get_sample_data`

This parameter is deprecated; *get_sample_data* now auto-loads numpy arrays. Use `get_sample_data(..., asfileobj=False)` instead to get the filename of the data file, which can then be passed to `open`, if desired.

`RendererAgg.tostring_rgb` and `FigureCanvasAgg.tostring_rgb`

... are deprecated with no direct replacement. Consider using `buffer_rgba` instead, which should cover most use cases.

The parameter of `Annotation.contains` and `Legend.contains` is renamed to *mouseevent*

... consistently with *Artist.contains*.

Accessing `event.guiEvent` after event handlers return

... is deprecated: for some GUI toolkits, it is unsafe to do so. In the future, `event.guiEvent` will be set to None once the event handlers return; you may separately stash the object at your own risk.

Widgets

The *visible* attribute getter of Selector widgets has been deprecated; use `get_visible`

Method parameters renamed to match base classes

The only parameter of `transform_affine` and `transform_non_affine` in `Transform` subclasses is renamed to *values*.

The *points* parameter of `transforms.IdentityTransform.transform` is renamed to *values*.

The *trans* parameter of `table.Cell.set_transform` is renamed to *t* consistently with *Artist.set_transform*.

The *clippath* parameters of `axis.Axis.set_clip_path` and `axis.Tick.set_clip_path` are renamed to *path* consistently with *Artist.set_clip_path*.

The *s* parameter of `images.NonUniformImage.set_filternorm` is renamed to *filternorm* consistently with `_ImageBase.set_filternorm`.

The *s* parameter of `images.NonUniformImage.set_filterrad` is renamed to *filterrad* consistently with `_ImageBase.set_filterrad`.

numdecs parameter and attribute of `LogLocator`

... are deprecated without replacement, because they have no effect.

`NavigationToolbar2QT.message` is deprecated

... with no replacement.

`ft2font.FT2Image.draw_rect` and `ft2font.FT2Font.get_xys`

... are deprecated as they are unused. If you rely on these, please let us know.

`backend_ps.psDefs`

The `psDefs` module-level variable in `backend_ps` is deprecated with no replacement.

Callable axisartist Axes

Calling an axisartist Axes to mean *axis* is deprecated; explicitly call the method instead.

`AnchoredEllipse` is deprecated

Instead, directly construct an *`AnchoredOffsetbox`*, an *`AuxTransformBox`*, and an *`Ellipse`*, as demonstrated in *Anchored Artists*.

Automatic papersize selection in PostScript

Setting *`rcParams["ps.papersize"]`* (default: `'letter'`) to `'auto'` or passing `papersize='auto'` to *`Figure.savefig`* is deprecated. Either pass an explicit paper type name, or omit this parameter to use the default from the rcParam.

`Tick.set_label1` and `Tick.set_label2`

... are deprecated. Calling these methods from third-party code usually has no effect, as the labels are overwritten at draw time by the tick formatter.

Passing extra positional arguments to `Figure.add_axes`

Positional arguments passed to *`Figure.add_axes`* other than a rect or an existing `Axes` are currently ignored, and doing so is now deprecated.

`CbarAxesBase.toggle_label`

... is deprecated. Instead, use standard methods for manipulating colorbar labels (*`Colorbar.set_label`*) and tick labels (*`Axes.tick_params`*).

`TexManager.texcache`

... is considered private and deprecated. The location of the cache directory is clarified in the doc-string.

Artists explicitly passed in will no longer be filtered by legend() based on their label

Currently, artists explicitly passed to `legend(handles=[...])` are filtered out if their label starts with an underscore. This behavior is deprecated; explicitly filter out such artists (`[art for art in artists if not art.get_label().startswith('_')]`) if necessary.

`FigureCanvasBase.switch_backends`

... is deprecated with no replacement.

`cbook.Stack` is deprecated

... with no replacement.

`inset_location.InsetPosition` is deprecated

Use *`inset_axes`* instead.

`axisartist.axes_grid` and `axisartist.axes_rgb`

These modules, which provide wrappers combining the functionality of *`axes_grid1`* and *`axisartist`*, are deprecated; directly use e.g. `AxesGrid(..., axes_class=axislines.Axes)` instead.

`ContourSet.antialiased`

... is deprecated; use *`get_antialiased`* or *`set_antialiased`* instead. Note that *`get_antialiased`* returns an array.

Passing non-int or sequence of non-int to `Table.auto_set_column_width`

Column numbers are ints, and formerly passing any other type was effectively ignored. This will become an error in the future.

`PdfPages(keep_empty=True)`

A zero-page pdf is not valid, thus passing `keep_empty=True` to *`backend_pdf.PdfPages`* and *`backend_pgf.PdfPages`*, and the `keep_empty` attribute of these classes, are deprecated. Currently, these classes default to keeping empty outputs, but that behavior is deprecated too. Explicitly passing `keep_empty=False` remains supported for now to help transition to the new behavior.

Furthermore, *`backend_pdf.PdfPages`* no longer immediately creates the target file upon instantiation, but only when the first figure is saved. To fully control file creation, directly pass an opened file object as argument (`with open(path, "wb") as file, PdfPages(file) as pdf: ...`).

Auto-closing of figures when switching backend

... is deprecated. Explicitly call `plt.close("all")` if necessary. In the future, allowable backend switches (i.e. those that do not swap a GUI event loop with another one) will not close existing figures.

Support for passing the "frac" key in `annotate(..., arrowprops={"frac": ...})`

... has been removed. This key has had no effect since Matplotlib 1.5.

Removals

cbook removals

- `matplotlib.cbook.MatplotlibDeprecationWarning` and `matplotlib.cbook.mplDeprecation` are removed; use *`matplotlib.MatplotlibDeprecationWarning`* instead.
- `cbook.maxdict`; use the standard library `functools.lru_cache` instead.

Groupers from `get_shared_x_axes` / `get_shared_y_axes` are immutable

Modifications to the Groupers returned by `get_shared_x_axes` and `get_shared_y_axes` are no longer allowed. Note that previously, calling e.g. `join()` would already fail to set up the correct structures for sharing axes; use *Axes.sharex* or *Axes.sharey* instead.

Deprecated modules removed

The following deprecated modules are removed:

- `afm`
- `docstring`
- `fontconfig_pattern`
- `tight_bbox`
- `tight_layout`
- `type1font`

Parameters to `plt.figure()` and the `Figure` constructor

All parameters to *pyplot.figure* and the *Figure* constructor, other than *num*, *figsize*, and *dpi*, are now keyword-only.

`stem(..., use_line_collection=False)`

... is no longer supported. This was a compatibility fallback to a former more inefficient representation of the stem lines.

Positional / keyword arguments

Passing all but the very few first arguments positionally in the constructors of Artists is no longer possible. Most arguments are now keyword-only.

The *emit* and *auto* parameters of `set_xlim`, `set_ylim`, `set_zlim`, `set_rlim` are now keyword-only.

The *transOffset* parameter of *Collection.set_offset_transform* and the various `create_collection` methods of legend handlers has been renamed to *offset_transform* (consistently with the property name).

`Axes.get_window_extent` / `Figure.get_window_extent` accept only *renderer*. This aligns the API with the general *Artist.get_window_extent* API. All other parameters were ignored anyway.

Methods to set parameters in `LogLocator` and `LogFormatter*`

In *LogFormatter* and derived subclasses, the methods `base` and `label_minor` for setting the respective parameter are removed and replaced by `set_base` and `set_label_minor`, respectively.

In *LogLocator*, the methods `base` and `subs` for setting the respective parameter are removed. Instead, use `set_params(base=..., subs=...)`.

`Axes.get_renderer_cache`

The canvas now takes care of the renderer and whether to cache it or not, so the `Axes.get_renderer_cache` method is removed. The alternative is to call `axes.figure.canvas.get_renderer()`.

Unused methods in `Axis`, `Tick`, `XAxis`, and `YAxis`

`Tick.label` is now removed. Use `Tick.label1` instead.

The following methods are no longer used and removed without a replacement:

- `Axis.get_ticklabel_extents`
- `Tick.get_pad_pixels`
- `XAxis.get_text_heights`
- `YAxis.get_text_widths`

`mlab.stride_windows`

... is removed. Use `numpy.lib.stride_tricks.sliding_window_view` instead.

`Axes3D`

The `dist` attribute has been privatized. Use the *zoom* keyword argument in *`Axes3D.set_box_aspect`* instead.

The `w_xaxis`, `w_yaxis`, and `w_zaxis` attributes are now removed. Instead use `xaxis`, `yaxis`, and `zaxis`.

3D Axis

`mplot3d.axis3d.Axis.set_pane_pos` is removed. This is an internal method where the provided values are overwritten during drawing. Hence, it does not serve any purpose to be directly accessible.

The two helper functions `mplot3d.axis3d.move_from_center` and `mplot3d.axis3d.tick_update_position` are considered internal and deprecated. If these are required, please vendor the code from the corresponding private methods `_move_from_center` and `_tick_update_position`.

`checkdep_usetex` removed

This method was only intended to disable tests in case no latex install was found. As such, it is considered to be private and for internal use only.

Please vendor the code from a previous version if you need this.

`date_ticker_factory` removed

The `date_ticker_factory` method in the *`matplotlib.dates`* module is removed. Instead use *`AutoDateLocator`* and *`AutoDateFormatter`* for a more flexible and scalable locator and formatter.

If you need the exact `date_ticker_factory` behavior, please copy the code from a previous version.

`transforms.Affine2D.identity()`

... is removed in favor of directly calling the *`Affine2D`* constructor with no arguments.

Removals in `testing.decorators`

The unused class `CleanupTestCase` and decorator `cleanup` are removed. The function `check_freetype_version` is considered internal and removed. Vendor the code from a previous version.

`text.get_rotation()`

... is removed with no replacement. Copy the previous implementation if needed. `Figure.callbacks` is removed ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

The Figure `callbacks` property has been removed. The only signal was "dpi_changed", which can be replaced by connecting to the "resize_event" on the canvas `figure.canvas.mpl_connect("resize_event", func)` instead.

Passing too many positional arguments to `tripcolor`

... raises `TypeError` (extra arguments were previously ignored).

The *filled* argument to `Colorbar` is removed

This behavior was already governed by the underlying `ScalarMappable`.

Widgets

The *visible* attribute setter of Selector widgets has been removed; use `set_visible` The associated getter is also deprecated, but not yet expired.

`Axes3D.set_frame_on` and `Axes3D.get_frame_on` removed

`Axes3D.set_frame_on` is documented as "Set whether the 3D axes panels are drawn.". However, it has no effect on 3D axes and is being removed in favor of `Axes3D.set_axis_on` and `Axes3D.set_axis_off`.

Miscellaneous internals

- `axes_grid1.axes_size.AddList`; use `sum(sizes, start=Fixed(0))` (for example) to sum multiple size objects.
- `axes_size.Padded`; use `size + pad` instead
- `axes_size.SizeFromFunc`, `axes_size.GetExtentHelper`
- `AxisArtistHelper.delta1` and `AxisArtistHelper.delta2`
- `axislines.GridHelperBase.new_gridlines` and `axislines.Axes.new_gridlines`
- `_DummyAxis.dataLim` and `_DummyAxis.viewLim`; use `get_data_interval()`, `set_data_interval()`, `get_view_interval()`, and `set_view_interval()` instead.
- `ImageMagickBase.delay` and `ImageMagickBase.output_args`
- `MathtextBackend`, `MathtextBackendAgg`, `MathtextBackendPath`, `MathTextWarning`
- `TexManager.get_font_config`; it previously returned an internal hashed key for used for caching purposes.
- `TextToPath.get_texmanager`; directly construct a *texmanager.TexManager* instead.
- `ticker.is_close_to_int`; use `math.isclose(x, round(x))` instead.
- `ticker.is_decade`; use `y = numpy.log(x)/numpy.log(base); numpy.isclose(y, numpy.round(y))` instead.

Backend-specific removals

- `backend_pdf.Name.hexify`
- `backend_pdf.Operator` and `backend_pdf.Op.op` are removed in favor of a single standard `enum.Enum` interface on *backend_pdf.Op*.
- `backend_pdf.fill`; vendor the code of the similarly named private functions if you rely on these functions.
- `backend_pgf.LatexManager.texcommand` and `backend_pgf.LatexManager.latex_header`
- `backend_pgf.NO_ESCAPE`
- `backend_pgf.common_texification`
- `backend_pgf.get_fontspec`
- `backend_pgf.get_preamble`
- `backend_pgf.re_mathsep`
- `backend_pgf.writeln`
- `backend_ps.convert_psfrags`

- backend_ps.quote_ps_string; vendor the code of the similarly named private functions if you rely on it.
- backend_svg.escape_attrib; vendor the code of the similarly named private functions if you rely on it.
- backend_svg.escape_cdata; vendor the code of the similarly named private functions if you rely on it.
- backend_svg.escape_comment; vendor the code of the similarly named private functions if you rely on it.
- backend_svg.short_float_fmt; vendor the code of the similarly named private functions if you rely on it.
- backend_svg.generate_transform and backend_svg.generate_css

Removal of deprecated APIs

The following deprecated APIs have been removed. Unless a replacement is stated, please vendor the previous implementation if needed.

- The following methods of *FigureCanvasBase*: pick (use Figure.pick instead), resize, draw_event, resize_event, close_event, key_press_event, key_release_event, pick_event, scroll_event, button_press_event, button_release_event, motion_notify_event, leave_notify_event, enter_notify_event (for all the foo_event methods, construct the relevant *Event* object and call canvas.callbacks.process(event.name, event) instead).
- ToolBase.destroy (connect to tool_removed_event instead).
- The *cleared* parameter to *FigureCanvasAgg.get_renderer* (call renderer.clear() instead).
- The following methods of *RendererCairo*: set_ctx_from_surface and set_width_height (use set_context instead, which automatically infers the canvas size).
- The window or win parameters and/or attributes of NavigationToolbar2Tk, NavigationToolbar2GTK3, and NavigationToolbar2GTK4, and the lastrect attribute of NavigationToolbar2Tk
- The error_msg_gtk function and the icon_filename and window_icon globals in backend_gtk3; the error_msg_wx function in backend_wx.
- FigureManagerGTK3Agg and FigureManagerGTK4Agg (use FigureManagerGTK3 instead); RendererGTK3Cairo and RendererGTK4Cairo.
- NavigationToolbar2Mac.prepare_configure_subplots (use *configure_subplots* instead).
- FigureManagerMac.close.
- The qApp global in *backend_qt* (use QtWidgets.QApplication.instance() instead).

- The `offset_text_height` method of `RendererWx`; the `sizer`, `figmgr`, `num`, `toolbar`, `toolmanager`, `get_canvas`, and `get_figure_manager` attributes or methods of `FigureFrameWx` (use `frame.GetSizer()`, `frame.canvas.manager`, `frame.canvas.manager.num`, `frame.GetToolBar()`, `frame.canvas.manager.toolmanager`, the *canvas_class* constructor parameter, and `frame.canvas.manager`, respectively, instead).
- `FigureFrameWxAgg` and `FigureFrameWxCairo` (use `FigureFrameWx(..., canvas_class=FigureCanvasWxAgg)` and `FigureFrameWx(..., canvas_class=FigureCanvasWxCairo)`, respectively, instead).
- The `filled` attribute and the `draw_all` method of *`Colorbar`* (instead of `draw_all`, use `figure.draw_without_rendering`).
- Calling *`MarkerStyle`* without setting the *marker* parameter or setting it to None (use `MarkerStyle("")` instead).
- Support for third-party canvas classes without a `required_interactive_framework` attribute (this can only occur if the canvas class does not inherit from *`FigureCanvasBase`*).
- The `canvas` and `background` attributes of *`MultiCursor`*; the `state_modifier_keys` attribute of selector widgets.
- Passing *useblit*, *horizOn*, or *vertOn* positionally to *`MultiCursor`*.
- Support for the `seaborn-<foo>` styles; use `seaborn-v0_8-<foo>` instead, or directly use the seaborn API.

Development changes

Increase to minimum supported versions of dependencies

For Matplotlib 3.8, the *minimum supported versions* are being bumped:

Dependency	min in mpl3.7	min in mpl3.8
Python	3.8	3.9
kiwisolver	1.0.1	1.3.1
NumPy	1.20.0	1.21.0
Pillow	6.2.1	8.0

This is consistent with our *Dependency version policy* and NEP29

Increase to minimum supported optional dependencies

For Matplotlib 3.8, the *minimum supported versions of optional dependencies* are being bumped:

Dependency	min in mpl3.7	min in mpl3.8
Tk	8.4	8.5
Qt	5.10	5.12

- There are no wheels or conda packages that support both Qt 5.11 (or older) and Python 3.9 (or newer).

This is consistent with our *Dependency version policy*

Provisional support for PEP484 Type Hint Annotations

New public API should be type hinted in `.pyi` stub files (except `pyplot` and tests which are typed in-line). Tests should be type hinted minimally, essentially only when `mypy` generates errors.

CI and configuration for running `mypy` have been added.

Generation of `pyplot.py` requires `black`

The autogenerated portions of `pyplot.py` use `black` autoformatting to ensure syntax-correct, readable output code.

As such `black` is now a development and test requirement (for the test which regenerates `pyplot`).

Wheels for some systems are no longer distributed

Pre-compiled wheels for 32-bit Linux and Windows are no longer provided on PyPI since Matplotlib 3.8.

Multi-architecture `universal2` wheels for macOS are no longer provided on PyPI since Matplotlib 3.8. In general, `pip` will always prefer the architecture-specific (`amd64`- or `arm64`-only) wheels, so these provided little benefit.

New wheel architectures

Wheels have been added for:

- musl based systems

9.4 Version 3.7

9.4.1 What's new in Matplotlib 3.7.0 (Feb 13, 2023)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.7.0 (Feb 13, 2023)*
  - *Plotting and Annotation improvements*
    - *`hatch` parameter for pie*
    - *Polar plot errors drawn in polar coordinates*
    - *Additional format string options in `bar_label`*

    - *`ellipse` boxstyle option for annotations*
    - *The* extent *of `imshow` can now be expressed with units*
    - *Reversed order of legend entries*

Plotting and Annotation improvements

`hatch` parameter for pie

`pie` now accepts a *hatch* keyword that takes as input a hatch or list of hatches:

```
fig, (ax1, ax2) = plt.subplots(ncols=2)
x = [10, 30, 60]

ax1.pie(x, hatch=['.', 'o', 'O'])
ax2.pie(x, hatch='.O')
```

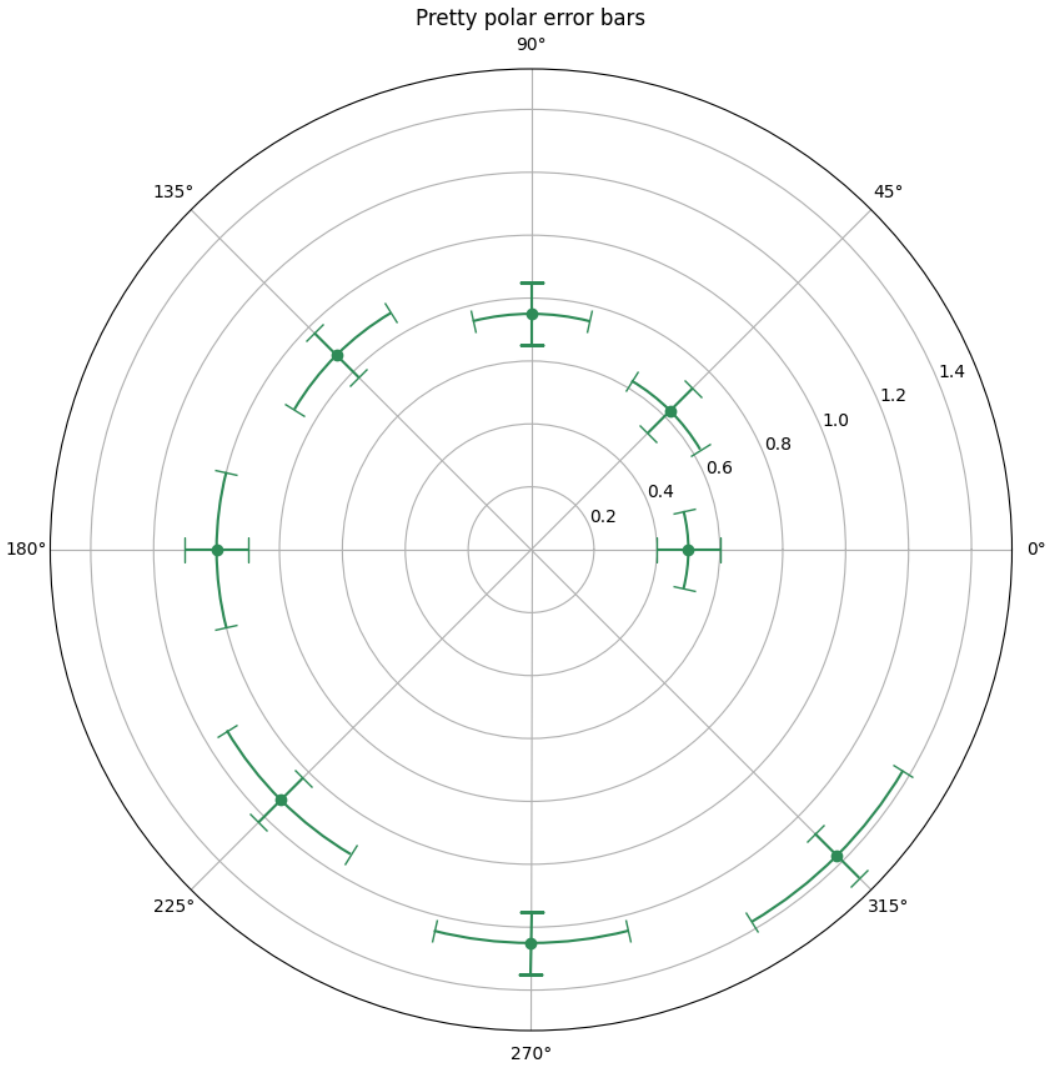
(continues on next page)

(continued from previous page)

```
ax1.set_title("hatch=['.', 'o', 'O']")
ax2.set_title("hatch='.O'")
```

Polar plot errors drawn in polar coordinates

Caps and error lines are now drawn with respect to polar coordinates, when plotting errorbars on polar plots.



Additional format string options in `bar_label`

The `fmt` argument of *`bar_label`* now accepts {}-style format strings:

```
import matplotlib.pyplot as plt

fruit_names = ['Coffee', 'Salted Caramel', 'Pistachio']
fruit_counts = [4000, 2000, 7000]

fig, ax = plt.subplots()
bar_container = ax.bar(fruit_names, fruit_counts)
ax.set(ylabel='pints sold', title='Gelato sales by flavor', ylim=(0,␣
↪8000))
ax.bar_label(bar_container, fmt='{:,.0f}')
```

It also accepts callables:

```
animal_names = ['Lion', 'Gazelle', 'Cheetah']
mph_speed = [50, 60, 75]

fig, ax = plt.subplots()
bar_container = ax.bar(animal_names, mph_speed)
ax.set(ylabel='speed in MPH', title='Running speeds', ylim=(0, 80))
ax.bar_label(
    bar_container, fmt=lambda x: '{:.1f} km/h'.format(x * 1.61)
)
```

`ellipse` boxstyle option for annotations

The `'ellipse'` option for boxstyle can now be used to create annotations with an elliptical outline. It can be used as a closed curve shape for longer texts instead of the `'circle'` boxstyle which can get quite big.

```
import matplotlib.pyplot as plt
fig, ax = plt.subplots(figsize=(5, 5))
t = ax.text(0.5, 0.5, "elliptical box",
        ha="center", size=15,
        bbox=dict(boxstyle="ellipse,pad=0.3"))
```

The *extent* of `imshow` can now be expressed with units

The *extent* parameter of *`imshow`* and *`set_extent`* can now be expressed with units.

```
import matplotlib.pyplot as plt
import numpy as np
```

(continues on next page)

(continued from previous page)

```
fig, ax = plt.subplots(layout='constrained')
date_first = np.datetime64('2020-01-01', 'D')
date_last = np.datetime64('2020-01-11', 'D')

arr = [[i+j for i in range(10)] for j in range(10)]

ax.imshow(arr, origin='lower', extent=[0, 10, date_first, date_last])

plt.show()
```

Reversed order of legend entries

The order of legend entries can now be reversed by passing `reverse=True` to *legend*.

`pcolormesh` accepts RGB(A) colors

The *pcolormesh* method can now handle explicit colors specified with RGB(A) values. To specify colors, the array must be 3D with a shape of `(M, N, [3, 4])`.

```
import matplotlib.pyplot as plt
import numpy as np

colors = np.linspace(0, 1, 90).reshape((5, 6, 3))
plt.pcolormesh(colors)
plt.show()
```

View current appearance settings for ticks, tick labels, and gridlines

The new *get_tick_params* method can be used to retrieve the appearance settings that will be applied to any additional ticks, tick labels, and gridlines added to the plot:

```
>>> import matplotlib.pyplot as plt

>>> fig, ax = plt.subplots()
>>> ax.yaxis.set_tick_params(labelsize=30, labelcolor='red',
...                          direction='out', which='major')
>>> ax.yaxis.get_tick_params(which='major')
{'direction': 'out',
'left': True,
'right': False,
'labelleft': True,
'labelright': False,
```

(continues on next page)

(continued from previous page)

```
'gridOn': False,
'labelsize': 30,
'labelcolor': 'red'}
>>> ax.yaxis.get_tick_params(which='minor')
{'left': True,
'right': False,
'labelleft': True,
'labelright': False,
'gridOn': False}
```

Style files can be imported from third-party packages

Third-party packages can now distribute style files that are globally available as follows. Assume that a package is importable as `import mypackage`, with a `mypackage/__init__.py` module. Then a `mypackage/presentation.mplstyle` style sheet can be used as `plt.style.use("mypackage.presentation")`.

The implementation does not actually import `mypackage`, making this process safe against possible import-time side effects. Subpackages (e.g. `dotted.package.name`) are also supported.

Improvements to 3D Plotting

3D plot pan and zoom buttons

The pan and zoom buttons in the toolbar of 3D plots are now enabled. Unselect both to rotate the plot. When the zoom button is pressed, zoom in by using the left mouse button to draw a bounding box, and out by using the right mouse button to draw the box. When zooming a 3D plot, the current view aspect ratios are kept fixed.

adjustable keyword argument for setting equal aspect ratios in 3D

While setting equal aspect ratios for 3D plots, users can choose to modify either the data limits or the bounding box in parity with 2D Axes.

```
import matplotlib.pyplot as plt
import numpy as np
from itertools import combinations, product

aspects = ('auto', 'equal', 'equalxy', 'equalyz', 'equalxz')
fig, axs = plt.subplots(1, len(aspects), subplot_kw={'projection': '3d
 ↪'},
                        figsize=(12, 6))

# Draw rectangular cuboid with side lengths [4, 3, 5]
r = [0, 1]
scale = np.array([4, 3, 5])
```

(continues on next page)

(continued from previous page)

```
pts = combinations(np.array(list(product(r, r, r))), 2)
for start, end in pts:
    if np.sum(np.abs(start - end)) == r[1] - r[0]:
        for ax in axs:
            ax.plot3D(*zip(start*scale, end*scale), color='C0')

# Set the aspect ratios
for i, ax in enumerate(axs):
    ax.set_aspect(aspects[i], adjustable='datalim')
    # Alternatively: ax.set_aspect(aspects[i], adjustable='box')
    # which will change the box aspect ratio instead of axis data␣
 ↪limits.
    ax.set_title(f"set_aspect('{aspects[i]}')")

plt.show()
```

`Poly3DCollection` supports shading

It is now possible to shade a *`Poly3DCollection`*. This is useful if the polygons are obtained from e.g. a 3D model.

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d.art3d import Poly3DCollection

# Define 3D shape
block = np.array([
    [[1, 1, 0],
     [1, 0, 0],
     [0, 1, 0]],
    [[1, 1, 0],
     [1, 1, 1],
     [1, 0, 0]],
    [[1, 1, 0],
     [1, 1, 1],
     [0, 1, 0]],
    [[1, 0, 0],
     [1, 1, 1],
     [0, 1, 0]]
])

ax = plt.subplot(projection='3d')
pc = Poly3DCollection(block, facecolors='b', shade=True)
ax.add_collection(pc)
plt.show()
```

rcParam for 3D pane color

The rcParams *rcParams["axes3d.xaxis.panecolor"]* (default: `(0.95, 0.95, 0.95, 0.5)`), *rcParams["axes3d.yaxis.panecolor"]* (default: `(0.9, 0.9, 0.9, 0.5)`), *rcParams["axes3d.zaxis.panecolor"]* (default: `(0.925, 0.925, 0.925, 0.5)`) can be used to change the color of the background panes in 3D plots. Note that it is often beneficial to give them slightly different shades to obtain a "3D effect" and to make them slightly transparent (alpha < 1).

```
import matplotlib.pyplot as plt
with plt.rc_context({'axes3d.xaxis.panecolor': (0.9, 0.0, 0.0, 0.5),
                     'axes3d.yaxis.panecolor': (0.7, 0.0, 0.0, 0.5),
                     'axes3d.zaxis.panecolor': (0.8, 0.0, 0.0, 0.5)}):
    fig = plt.figure()
    fig.add_subplot(projection='3d')
```

Figure and Axes Layout

`colorbar` now has a *location* keyword argument

The `colorbar` method now supports a *location* keyword argument to more easily position the color bar. This is useful when providing your own inset axes using the *cax* keyword argument and behaves similar to the case where axes are not provided (where the *location* keyword is passed through). *orientation* and *ticklocation* are no longer required as they are determined by *location*. *ticklocation* can still be provided if the automatic setting is not preferred. (*orientation* can also be provided but must be compatible with the *location*.)

An example is:

```
import matplotlib.pyplot as plt
import numpy as np
rng = np.random.default_rng(19680801)
imdata = rng.random((10, 10))
fig, ax = plt.subplots(layout='constrained')
im = ax.imshow(imdata)
fig.colorbar(im, cax=ax.inset_axes([0, 1.05, 1, 0.05]),
             location='top')
```

Figure legends can be placed outside figures using constrained_layout

Constrained layout will make space for Figure legends if they are specified by a *loc* keyword argument that starts with the string "outside". The codes are unique from axes codes, in that "outside upper right" will make room at the top of the figure for the legend, whereas "outside right upper" will make room on the right-hand side of the figure. See *Legend guide* for details.

Per-subplot keyword arguments in `subplot_mosaic`

It is now possible to pass keyword arguments through to Axes creation in each specific call to `add_subplot` in *`Figure.subplot_mosaic`* and *`pyplot.subplot_mosaic`*:

```
fig, axd = plt.subplot_mosaic(
    "AB;CD",
    per_subplot_kw={
        "A": {"projection": "polar"},
        ("C", "D"): {"xscale": "log"},
        "B": {"projection": "3d"},
    },
)
```

This is particularly useful for creating mosaics with mixed projections, but any keyword arguments can be passed through.

`subplot_mosaic` no longer provisional

The API on *`Figure.subplot_mosaic`* and *`pyplot.subplot_mosaic`* are now considered stable and will change under Matplotlib's normal deprecation process.

Widget Improvements

Custom styling of button widgets

Additional custom styling of button widgets may be achieved via the *label_props* and *radio_props* arguments to *`RadioButtons`*; and the *label_props*, *frame_props*, and *check_props* arguments to *`CheckButtons`*.

```
from matplotlib.widgets import CheckButtons, RadioButtons

fig, ax = plt.subplots(nrows=2, ncols=2, figsize=(5, 2), width_
 ↪ratios=[1, 2])
default_rb = RadioButtons(ax[0, 0], ['Apples', 'Oranges'])
styled_rb = RadioButtons(ax[0, 1], ['Apples', 'Oranges'],
                         label_props={'color': ['red', 'orange'],
                                      'fontsize': [16, 20]},
                         radio_props={'edgecolor': ['red', 'orange'],
                                      'facecolor': ['mistyrose',
 ↪'peachpuff']})

default_cb = CheckButtons(ax[1, 0], ['Apples', 'Oranges'],
                          actives=[True, True])
styled_cb = CheckButtons(ax[1, 1], ['Apples', 'Oranges'],
                         actives=[True, True],
                         label_props={'color': ['red', 'orange'],
                                      'fontsize': [16, 20]},
```

(continues on next page)

(continued from previous page)

```
                          frame_props={'edgecolor': ['red', 'orange'],
                                       'facecolor': ['mistyrose',
 ↪'peachpuff']},
                          check_props={'color': ['darkred', 'darkorange
 ↪']})

ax[0, 0].set_title('Default')
ax[0, 1].set_title('Stylized')
```

Blitting in Button widgets

The *Button*, *CheckButtons*, and *RadioButtons* widgets now support blitting for faster rendering, on backends that support it, by passing `useblit=True` to the constructor. Blitting is enabled by default on supported backends.

Other Improvements

Source links can be shown or hidden for each Sphinx plot directive

The *Sphinx plot directive* (`.. plot::`) now supports a `:show-source-link:` option to show or hide the link to the source code for each plot. The default is set using the `plot_html_show_source_link` variable in `conf.py` (which defaults to True).

Figure hooks

The new *rcParams["figure.hooks"]* (default: `[]`) provides a mechanism to register arbitrary customizations on pyplot figures; it is a list of "dotted.module.name:dotted.callable.name" strings specifying functions that are called on each figure created by *pyplot.figure*; these functions can e.g. attach callbacks or modify the toolbar. See *mplcvd -- an example of figure hook* for an example of toolbar customization.

New & Improved Narrative Documentation

- Brand new *Animations* tutorial.
- New grouped and stacked bar chart examples.
- New section for new contributors and reorganized git instructions in the *contributing guide*.
- Restructured *Annotations* tutorial.

9.4.2 API Changes for 3.7.0

- *Behaviour Changes*
- *Deprecations*

- *Removals*
- *Development changes*

Behaviour Changes

All Axes have `get_subplotspec` and `get_gridspec` methods now, which returns None for Axes not positioned via a gridspec

Previously, this method was only present for Axes positioned via a gridspec. Following this change, checking `hasattr(ax, "get_gridspec")` should now be replaced by `ax.get_gridspec() is not None`. For compatibility with older Matplotlib releases, one can also check `hasattr(ax, "get_gridspec") and ax.get_gridspec() is not None`.

`HostAxesBase.get_aux_axes` now defaults to using the same base axes class as the host axes

If using an `mpl_toolkits.axisartist`-based host Axes, the parasite Axes will also be based on `mpl_toolkits.axisartist`. This behavior is consistent with `HostAxesBase.twin`, `HostAxesBase.twinx`, and `HostAxesBase.twiny`.

`plt.get_cmap` and `matplotlib.cm.get_cmap` return a copy

Formerly, *get_cmap* and `matplotlib.cm.get_cmap` returned a global version of a *Colormap*. This was prone to errors as modification of the colormap would propagate from one location to another without warning. Now, a new copy of the colormap is returned.

`TrapezoidMapTriFinder` uses different random number generator

The random number generator used to determine the order of insertion of triangle edges in `TrapezoidMapTriFinder` has changed. This can result in a different triangle index being returned for a point that lies exactly on an edge between two triangles. This can also affect triangulation interpolation and refinement algorithms that use `TrapezoidMapTriFinder`.

`FuncAnimation(save_count=None)`

Passing `save_count=None` to *FuncAnimation* no longer limits the number of frames to 100. Make sure that it either can be inferred from *frames* or provide an integer *save_count*.

`CenteredNorm` halfrange is not modified when vcenter changes

Previously, the **halfrange** would expand in proportion to the amount that **vcenter** was moved away from either **vmin** or **vmax**. Now, the halfrange remains fixed when vcenter is changed, and **vmin** and **vmax** are updated based on the **vcenter** and **halfrange** values.

For example, this is what the values were when changing vcenter previously.

```
norm = CenteredNorm(vcenter=0, halfrange=1)
# Move vcenter up by one
norm.vcenter = 1
# updates halfrange and vmax (vmin stays the same)
# norm.halfrange == 2, vmin == -1, vmax == 3
```

and now, with that same example

```
norm = CenteredNorm(vcenter=0, halfrange=1)
norm.vcenter = 1
# updates vmin and vmax (halfrange stays the same)
# norm.halfrange == 1, vmin == 0, vmax == 2
```

The **halfrange** can be set manually or `norm.autoscale()` can be used to automatically set the limits after setting **vcenter**.

`fig.subplot_mosaic` no longer passes the `gridspec_kw` args to nested gridspecs.

For nested *`Figure.subplot_mosaic`* layouts, it is almost always inappropriate for *gridspec_kw* arguments to be passed to lower nest levels, and these arguments are incompatible with the lower levels in many cases. This dictionary is no longer passed to the inner layouts. Users who need to modify *gridspec_kw* at multiple levels should use *`Figure.subfigures`* to get nesting, and construct the inner layouts with *`Figure.subplots`* or *`Figure.subplot_mosaic`*.

`HPacker` alignment with bottom or top are now correct

Previously, the **bottom** and **top** alignments were swapped. This has been corrected so that the alignments correspond appropriately.

On Windows only fonts known to the registry will be discovered

Previously, Matplotlib would recursively walk user and system font directories to discover fonts, however this lead to a number of undesirable behaviors including finding deleted fonts. Now Matplotlib will only find fonts that are known to the Windows registry.

This means that any user installed fonts must go through the Windows font installer rather than simply being copied to the correct folder.

This only impacts the set of fonts Matplotlib will consider when using *`matplotlib.font_manager.findfont`*. To use an arbitrary font, directly pass the path to a font as shown in *Using ttf font files*.

`QuadMesh.set_array` now always raises `ValueError` for inputs with incorrect shapes

It could previously also raise `TypeError` in some cases.

`contour` and `contourf` auto-select suitable levels when given boolean inputs

If the height array given to *Axes.contour* or *Axes.contourf* is of bool dtype and *levels* is not specified, *levels* now defaults to `[0.5]` for *contour* and `[0, 0.5, 1]` for *Axes.contourf*.

`contour` no longer warns if no contour lines are drawn.

This can occur if the user explicitly passes a `levels` array with no values between `z.min()` and `z.max()`; or if `z` has the same value everywhere.

`AxesImage.set_extent` now raises `TypeError` for unknown keyword arguments

It previously raised a `ValueError`.

Change of `legend(loc="best")` behavior

The algorithm of the auto-legend locator has been tweaked to better handle non rectangular patches. Additional details on this change can be found in #9580 and #9598.

Deprecations

`Axes` subclasses should override `clear` instead of `cla`

For clarity, *axes.Axes.clear* is now preferred over *Axes.cla*. However, for backwards compatibility, the latter will remain as an alias for the former.

For additional compatibility with third-party libraries, Matplotlib will continue to call the `cla` method of any *Axes* subclasses if they define it. In the future, this will no longer occur, and Matplotlib will only call the `clear` method in *Axes* subclasses.

It is recommended to define only the `clear` method when on Matplotlib 3.6, and only `cla` for older versions.

rcParams type

Relying on `rcParams` being a `dict` subclass is deprecated.

Nothing will change for regular users because `rcParams` will continue to be dict-like (technically fulfill the `MutableMapping` interface).

The *RcParams* class does validation checking on calls to `.RcParams.__getitem__` and `.RcParams.__setitem__`. However, there are rare cases where we want to circumvent the validation logic and directly access the underlying data values. Previously, this could be accomplished via a call to the parent methods `dict.__getitem__(rcParams, key)` and `dict.__setitem__(rcParams, key, val)`.

Matplotlib 3.7 introduces `rcParams._set(key, val)` and `rcParams._get(key)` as a replacement to calling the parent methods. They are intentionally marked private to discourage external use; However, if direct *RcParams* data access is needed, please switch from the dict functions to the new `_get()` and `_set()`. Even though marked private, we guarantee API stability for these methods and they are subject to Matplotlib's API and deprecation policy.

Please notify the Matplotlib developers if you rely on `rcParams` being a dict subclass in any other way, for which there is no migration path yet.

Deprecation aliases in cbook

The module `matplotlib.cbook.deprecation` was previously deprecated in Matplotlib 3.4, along with deprecation-related API in `matplotlib.cbook`. Due to technical issues, `matplotlib.cbook.MatplotlibDeprecationWarning` and `matplotlib.cbook.mplDeprecation` did not raise deprecation warnings on use. Changes in Python have now made it possible to warn when these aliases are being used.

In order to avoid downstream breakage, these aliases will now warn, and their removal has been pushed from 3.6 to 3.8 to give time to notice said warnings. As replacement, please use *matplotlib.MatplotlibDeprecationWarning*.

`draw_gouraud_triangle`

... is deprecated as in most backends this is a redundant call. Use *draw_gouraud_triangles* instead. A `draw_gouraud_triangle` call in a custom *Artist* can readily be replaced as:

```
self.draw_gouraud_triangles(gc, points.reshape((1, 3, 2)),
                            colors.reshape((1, 3, 4)), trans)
```

A *draw_gouraud_triangles* method can be implemented from an existing `draw_gouraud_triangle` method as:

```
transform = transform.frozen()
for tri, col in zip(triangles_array, colors_array):
    self.draw_gouraud_triangle(gc, tri, col, transform)
```

`matplotlib.pyplot.get_plot_commands`

... is a pending deprecation. This is considered internal and no end-user should need it.

`matplotlib.tri` submodules are deprecated

The `matplotlib.tri.*` submodules are deprecated. All functionality is available in `matplotlib.tri` directly and should be imported from there.

Passing undefined *label_mode* to `Grid`

... is deprecated. This includes *mpl_toolkits.axes_grid1.axes_grid.Grid*, *mpl_toolkits.axes_grid1.axes_grid.AxesGrid*, and *mpl_toolkits.axes_grid1.axes_grid.ImageGrid* as well as the corresponding classes imported from `mpl_toolkits.axisartist.axes_grid`.

Pass `label_mode='keep'` instead to get the previous behavior of not modifying labels.

Colorbars for orphaned mappables are deprecated, but no longer raise

Before 3.6.0, Colorbars for mappables that do not have a parent axes would steal space from the current Axes. 3.6.0 raised an error on this, but without a deprecation cycle. For 3.6.1 this is reverted, the current axes is used, but a deprecation warning is shown instead. In this undetermined case users and libraries should explicitly specify what axes they want space to be stolen from: `fig.colorbar(mappable, ax=plt.gca())`.

`Animation` attributes

The attributes `repeat` of *TimedAnimation* and subclasses and `save_count` of *FuncAnimation* are considered private and deprecated.

`contour.ClabelText` and `ContourLabeler.set_label_props`

... are deprecated.

Use `Text(..., transform_rotates_text=True)` as a replacement for `contour.ClabelText(...)` and `text.set(text=text, color=color, fontproperties=labeler.labelFontProps, clip_box=labeler.axes.bbox)` as a replacement for the `ContourLabeler.set_label_props(label, text, color)`.

`ContourLabeler` attributes

The `labelFontProps`, `labelFontSizeList`, and `labelTextsList` attributes of *ContourLabeler* have been deprecated. Use the `labelTexts` attribute and the font properties of the corresponding text objects instead.

`backend_ps.PsBackendHelper` and `backend_ps.ps_backend_helper`

... are deprecated with no replacement.

`backend_webagg.ServerThread` is deprecated

... with no replacement.

`parse_fontconfig_pattern` will no longer ignore unknown constant names

Previously, in a fontconfig pattern like `DejaVu Sans:foo`, the unknown `foo` constant name would be silently ignored. This now raises a warning, and will become an error in the future.

`BufferRegion.to_string` and `BufferRegion.to_string_argb`

... are deprecated. Use `np.asarray(buffer_region)` to get an array view on a buffer region without making a copy; to convert that view from RGBA (the default) to ARGB, use `np.take(..., [2, 1, 0, 3], axis=2)`.

num2julian, julian2num and JULIAN_OFFSET

... of the *dates* module are deprecated without replacements. These are undocumented and not exported. If you rely on these, please make a local copy.

unit_cube, tunit_cube, and tunit_edges

... of *Axes3D* are deprecated without replacements. If you rely on them, please copy the code of the corresponding private function (name starting with _).

Most arguments to widgets have been made keyword-only

Passing all but the very few first arguments positionally in the constructors of Widgets is deprecated. Most arguments will become keyword-only in a future version.

SimpleEvent

The `SimpleEvent` nested class (previously accessible via the public subclasses of `ConnectionStyle._Base`, such as *ConnectionStyle.Arc*, has been deprecated.

RadioButtons.circles

... is deprecated. (RadioButtons now draws itself using *scatter*.)

CheckButtons.rectangles and CheckButtons.lines

`CheckButtons.rectangles` and `CheckButtons.lines` are deprecated. (`CheckButtons` now draws itself using *scatter*.)

OffsetBox.get_extent_offsets and OffsetBox.get_extent

... are deprecated; these methods are also deprecated on all subclasses of *OffsetBox*.

To get the offsetbox extents, instead of `get_extent`, use *OffsetBox.get_bbox*, which directly returns a *Bbox* instance.

To also get the child offsets, instead of `get_extent_offsets`, separately call *get_offset* on each children after triggering a draw.

legend.legendHandles

... was undocumented and has been renamed to `legend_handles`. Using `legendHandles` is deprecated.

ticklabels parameter of Axis.set_ticklabels renamed to labels

offsetbox.bbox_artist

... is deprecated. This is just a wrapper to call *patches.bbox_artist* if a flag is set in the file, so use that directly if you need the behavior.

`Quiver.quiver_doc` and `Barbs.barbs_doc`

... are deprecated. These are the doc-string and should not be accessible as a named class member.

Deprecate unused parameter *x* to `TextBox.begin_typing`

This parameter was unused in the method, but was a required argument.

Deprecation of top-level cmap registration and access functions in `mpl.cm`

As part of a multi-step process we are refactoring the global state for managing the registered colormaps.

In Matplotlib 3.5 we added a *ColormapRegistry* class and exposed an instance at the top level as `matplotlib.colormaps`. The existing top level functions in *matplotlib.cm* (`get_cmap`, `register_cmap`, `unregister_cmap`) were changed to be aliases around the same instance. In Matplotlib 3.6 we have marked those top level functions as pending deprecation.

In Matplotlib 3.7, the following functions have been marked for deprecation:

- `matplotlib.cm.get_cmap`; use `matplotlib.colormaps[name]` instead if you have a `str`.

  Added 3.6.1 Use *matplotlib.cm.ColormapRegistry.get_cmap* if you have a string, `None` or a *matplotlib.colors.Colormap* object that you want to convert to a *matplotlib.colors.Colormap* instance.

- `matplotlib.cm.register_cmap`; use *matplotlib.colormaps.register* instead
- `matplotlib.cm.unregister_cmap`; use *matplotlib.colormaps.unregister* instead
- `matplotlib.pyplot.register_cmap`; use *matplotlib.colormaps.register* instead

The *matplotlib.pyplot.get_cmap* function will stay available for backward compatibility.

`BrokenBarHCollection` is deprecated

It was just a thin wrapper inheriting from *PolyCollection*; *broken_barh* has now been changed to return a *PolyCollection* instead.

The `BrokenBarHCollection.span_where` helper is likewise deprecated; for the duration of the deprecation it has been moved to the parent *PolyCollection* class. Use *fill_between* as a replacement; see *Shade regions defined by a logical mask using fill_between* for an example.

Passing inconsistent `loc` and `nth_coord` to axisartist helpers

Trying to construct for example a "top y-axis" or a "left x-axis" is now deprecated.

passthru_pt

This attribute of `AxisArtistHelpers` is deprecated.

axes3d.vvec, axes3d.eye, axes3d.sx, and axes3d.sy

... are deprecated without replacement.

Line2D

When creating a Line2D or using *Line2D.set_xdata* and *Line2D.set_ydata*, passing x/y data as non sequence is deprecated.

Removals

epoch2num and num2epoch are removed

These methods convert from unix timestamps to matplotlib floats, but are not used internally to Matplotlib, and should not be needed by end users. To convert a unix timestamp to datetime, simply use `datetime.datetime.fromtimestamp`, or to use NumPy `datetime64` `dt = np.datetime64(e*1e6, 'us')`.

Locator and Formatter wrapper methods

The `set_view_interval`, `set_data_interval` and `set_bounds` methods of *Locator*s and *Formatter*s (and their common base class, TickHelper) are removed. Directly manipulate the view and data intervals on the underlying axis instead.

Interactive cursor details

Setting a mouse cursor on a window has been moved from the toolbar to the canvas. Consequently, several implementation details on toolbars and within backends have been removed.

NavigationToolbar2.set_cursor and backend_tools.SetCursorBase.set_cursor

Instead, use the *FigureCanvasBase.set_cursor* method on the canvas (available as the `canvas` attribute on the toolbar or the Figure.)

backend_tools.SetCursorBase and subclasses

`backend_tools.SetCursorBase` was subclassed to provide backend-specific implementations of `set_cursor`. As that is now removed, the subclassing is no longer necessary. Consequently, the following subclasses are also removed:

- `matplotlib.backends.backend_gtk3.SetCursorGTK3`
- `matplotlib.backends.backend_qt5.SetCursorQt`
- `matplotlib.backends._backend_tk.SetCursorTk`
- `matplotlib.backends.backend_wx.SetCursorWx`

Instead, use the *backend_tools.ToolSetCursor* class.

`cursord` in GTK and wx backends

The `backend_gtk3.cursord` and `backend_wx.cursord` dictionaries are removed. This makes the GTK module importable on headless environments.

`auto_add_to_figure=True` for `Axes3D`

... is no longer supported. Instead use `fig.add_axes(ax)`.

The first parameter of `Axes.grid` and `Axis.grid` has been renamed to *visible*

The parameter was previously named *b*. This name change only matters if that parameter was passed using a keyword argument, e.g. `grid(b=False)`.

Removal of deprecations in the Selector widget API

RectangleSelector and EllipseSelector

The *drawtype* keyword argument to *RectangleSelector* is removed. From now on, the only behaviour will be `drawtype='box'`.

Support for `drawtype=line` is removed altogether. As a result, the *lineprops* keyword argument to *RectangleSelector* is also removed.

To retain the behaviour of `drawtype='none'`, use `rectprops={'visible': False}` to make the drawn *Rectangle* invisible.

Cleaned up attributes and arguments are:

- The `active_handle` attribute has been privatized and removed.
- The `drawtype` attribute has been privatized and removed.
- The `eventpress` attribute has been privatized and removed.
- The `eventrelease` attribute has been privatized and removed.
- The `interactive` attribute has been privatized and removed.
- The *marker_props* argument is removed, use *handle_props* instead.
- The *maxdist* argument is removed, use *grab_range* instead.
- The *rectprops* argument is removed, use *props* instead.
- The `rectprops` attribute has been privatized and removed.
- The `state` attribute has been privatized and removed.
- The `to_draw` attribute has been privatized and removed.

PolygonSelector

- The *line* attribute is removed. If you want to change the selector artist properties, use the `set_props` or `set_handle_props` methods.
- The *lineprops* argument is removed, use *props* instead.
- The *markerprops* argument is removed, use *handle_props* instead.
- The *maxdist* argument and attribute is removed, use *grab_range* instead.
- The *vertex_select_radius* argument and attribute is removed, use *grab_range* instead.

SpanSelector

- The `active_handle` attribute has been privatized and removed.
- The `eventpress` attribute has been privatized and removed.
- The `eventrelease` attribute has been privatized and removed.
- The `pressv` attribute has been privatized and removed.
- The `prev` attribute has been privatized and removed.
- The `rect` attribute has been privatized and removed.
- The *rectprops* parameter has been renamed to *props*.
- The `rectprops` attribute has been privatized and removed.
- The *span_stays* parameter has been renamed to *interactive*.
- The `span_stays` attribute has been privatized and removed.
- The `state` attribute has been privatized and removed.

LassoSelector

- The *lineprops* argument is removed, use *props* instead.
- The `onpress` and `onrelease` methods are removed. They are straight aliases for `press` and `release`.
- The `matplotlib.widgets.TextBox.DIST_FROM_LEFT` attribute has been removed. It was marked as private in 3.5.

`backend_template.show`

... has been removed, in order to better demonstrate the new backend definition API.

Unused positional parameters to `print_<fmt>` methods

None of the `print_<fmt>` methods implemented by canvas subclasses used positional arguments other that the first (the output filename or file-like), so these extra parameters are removed.

`QuadMesh` signature

The *QuadMesh* signature

```
def __init__(meshWidth, meshHeight, coordinates,
             antialiased=True, shading='flat', **kwargs)
```

is removed and replaced by the new signature

```
def __init__(coordinates, *, antialiased=True, shading='flat',␣
 ↪**kwargs)
```

In particular:

- The *coordinates* argument must now be a (M, N, 2) array-like. Previously, the grid shape was separately specified as (*meshHeight* + 1, *meshWidth* + 1) and *coordinates* could be an array-like of any shape with M * N * 2 elements.
- All parameters except *coordinates* are keyword-only now.

Expiration of `FancyBboxPatch` deprecations

The *FancyBboxPatch* constructor no longer accepts the *bbox_transmuter* parameter, nor can the *boxstyle* parameter be set to "custom" -- instead, directly set *boxstyle* to the relevant boxstyle instance. The *mutation_scale* and *mutation_aspect* parameters have also become keyword-only.

The *mutation_aspect* parameter is now handled internally and no longer passed to the boxstyle callables when mutating the patch path.

Testing support

`matplotlib.test()` has been removed

Run tests using `pytest` from the commandline instead. The variable `matplotlib.default_test_modules` was only used for `matplotlib.test()` and is thus removed as well.

To test an installed copy, be sure to specify both `matplotlib` and `mpl_toolkits` with `--pyargs`:

```
pytest --pyargs matplotlib.tests mpl_toolkits.tests
```

See *Testing* for more details.

Auto-removal of grids by `pcolor` and `pcolormesh`

pcolor and *pcolormesh* previously remove any visible axes major grid. This behavior is removed; please explicitly call `ax.grid(False)` to remove the grid.

Modification of `Axes` children sublists

See *Axes children are no longer separated by type* for more information; modification of the following sublists is no longer supported:

- `Axes.artists`
- `Axes.collections`
- `Axes.images`
- `Axes.lines`
- `Axes.patches`
- `Axes.tables`
- `Axes.texts`

To remove an Artist, use its *Artist.remove* method. To add an Artist, use the corresponding `Axes.add_*` method.

Passing incorrect types to `Axes.add_*` methods

The following `Axes.add_*` methods will now raise if passed an unexpected type. See their documentation for the types they expect.

- *Axes.add_collection*
- *Axes.add_image*
- *Axes.add_line*
- *Axes.add_patch*
- *Axes.add_table*

`ConversionInterface.convert` no longer accepts unitless values

Previously, custom subclasses of *units.ConversionInterface* needed to implement a `convert` method that not only accepted instances of the unit, but also unitless values (which are passed through as is). This is no longer the case (`convert` is never called with a unitless value), and such support in `.StrCategoryConverter` is removed. Likewise, the `.ConversionInterface.is_numlike` helper is removed.

Consider calling *Axis.convert_units* instead, which still supports unitless values.

Normal list of `Artist` objects now returned by `HandlerLine2D.create_artists`

For Matplotlib 3.5 and 3.6 a proxy list was returned that simulated the return of *HandlerLine2DCompound.create_artists*. Now a list containing only the single artist is return.

rcParams will no longer cast inputs to str

rcParams that expect a (non-pathlike) str no longer cast non-str inputs using `str`. This will avoid confusing errors in subsequent code if e.g. a list input gets implicitly cast to a str.

Case-insensitive scales

Previously, scales could be set case-insensitively (e.g., `set_xscale("LoG")`). Now all builtin scales use lowercase names.

Support for `nx1 = None` or `ny1 = None` in `AxesLocator` and `Divider.locate`

In *axes_grid1.axes_divider*, various internal APIs no longer supports passing `nx1 = None` or `ny1 = None` to mean `nx + 1` or `ny + 1`, in preparation for a possible future API which allows indexing and slicing of dividers (possibly `divider[a:b] == divider.new_locator(a, b)`, but also `divider[a:] == divider.new_locator(a, <end>)`). The user-facing *Divider.new_locator* API is unaffected -- it correctly normalizes `nx1 = None` and `ny1 = None` as needed.

change signature of `.FigureCanvasBase.enter_notify_event`

The *xy* parameter is now required and keyword only. This was deprecated in 3.0 and originally slated to be removed in 3.5.

`Colorbar` tick update parameters

The *update_ticks* parameter of *Colorbar.set_ticks* and *Colorbar.set_ticklabels* was ignored since 3.5 and has been removed.

plot directive removals

The public methods:

- `matplotlib.sphinxext.split_code_at_show`
- `matplotlib.sphinxext.unescape_doctest`
- `matplotlib.sphinxext.run_code`

have been removed.

The deprecated *encoding* option to the plot directive has been removed.

Miscellaneous removals

- `is_url` and `URL_REGEX` are removed. (They were previously defined in the toplevel *matplotlib* module.)
- The `ArrowStyle.beginarrow` and `ArrowStyle.endarrow` attributes are removed; use the `arrow` attribute to define the desired heads and tails of the arrow.
- `backend_pgf.LatexManager.str_cache` is removed.
- `backends.qt_compat.ETS` and `backends.qt_compat.QT_RC_MAJOR_VERSION` are removed, with no replacement.
- The `blocking_input` module is removed. Instead, use `canvas.start_event_loop()` and `canvas.stop_event_loop()` while connecting event callbacks as needed.
- `cbook.report_memory` is removed; use `psutil.virtual_memory` instead.
- `cm.LUTSIZE` is removed. Use *rcParams["image.lut"]* (default: `256`) instead. This value only affects colormap quantization levels for default colormaps generated at module import time.
- `Colorbar.patch` is removed; this attribute was not correctly updated anymore.
- `ContourLabeler.get_label_width` is removed.
- `Dvi.baseline` is removed (with no replacement).
- The *format* parameter of `dviread.find_tex_file` is removed (with no replacement).
- `FancyArrowPatch.get_path_in_displaycoord` and `ConnectionPatch.get_path_in_displaycoord` are removed. The path in display coordinates can still be obtained, as for other patches, using `patch.get_transform().transform_path(patch.get_path())`.
- The `font_manager.win32InstalledFonts` and `font_manager.get_fontconfig_fonts` helper functions are removed.
- All parameters of `imshow` starting from *aspect* are keyword-only.
- `QuadMesh.convert_mesh_to_paths` and `QuadMesh.convert_mesh_to_triangles` are removed. `QuadMesh.get_paths()` can be used as an alternative for the former; there is no replacement for the latter.
- `ScalarMappable.callbacksSM` is removed. Use `ScalarMappable.callbacks` instead.
- `streamplot.get_integrator` is removed.
- `style.core.STYLE_FILE_PATTERN`, `style.core.load_base_library`, and `style.core.iter_user_libraries` are removed.
- `SubplotParams.validate` is removed. Use *SubplotParams.update* to change *SubplotParams* while always keeping it in a valid state.
- The `grey_arrayd`, `font_family`, `font_families`, and `font_info` attributes of *TexManager* are removed.
- `Text.get_prop_tup` is removed with no replacements (because the *Text* class cannot know whether a backend needs to update cache e.g. when the text's color changes).

- `Tick.apply_tickdir` didn't actually update the tick markers on the existing Line2D objects used to draw the ticks and is removed; use *`Axis.set_tick_params`* instead.
- `tight_layout.auto_adjust_subplotpars` is removed.
- The `grid_info` attribute of `axisartist` classes has been removed.
- `axes_grid1.axes_grid.CbarAxes` and `axisartist.axes_grid.CbarAxes` are removed (they are now dynamically generated based on the owning axes class).
- The `axes_grid1.Divider.get_vsize_hsize` and `axes_grid1.Grid.get_vsize_hsize` methods are removed.
- `AxesDivider.append_axes(..., add_to_figure=False)` is removed. Use `ax.remove()` to remove the Axes from the figure if needed.
- `FixedAxisArtistHelper.change_tick_coord` is removed with no replacement.
- `floating_axes.GridHelperCurveLinear.get_boundary` is removed with no replacement.
- `ParasiteAxesBase.get_images_artists` is removed.
- The "units finalize" signal (previously emitted by Axis instances) is removed. Connect to "units" instead.
- Passing formatting parameters positionally to `stem()` is no longer possible.
- `axisartist.clip_path` is removed with no replacement.

Development changes

Windows wheel runtime bundling

Wheels built for Windows now bundle the MSVC runtime DLL `msvcp140.dll`. This enables importing Matplotlib on systems that do not have the runtime installed.

Increase to minimum supported versions of dependencies

For Matplotlib 3.7, the *minimum supported versions* are being bumped:

Dependency	min in mpl3.6	min in mpl3.7
NumPy	1.19	1.20
pyparsing	2.2.1	2.3.1
Qt		5.10

- There are no wheels or conda packages that support both Qt 5.9 (or older) and Python 3.8 (or newer).

This is consistent with our *Dependency version policy* and NEP29

New dependencies

- importlib-resources (>= 3.2.0; only required on Python < 3.10)

Maximum line length increased to 88 characters

The maximum line length for new contributions has been extended from 79 characters to 88 characters. This change provides an extra 9 characters to allow code which is a single idea to fit on fewer lines (often a single line). The chosen length is the same as black.

9.5 Version 3.6

9.5.1 What's new in Matplotlib 3.6.0 (Sep 15, 2022)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.6.0 (Sep 15, 2022)*
  - *Figure and Axes creation / management*
    - *`subplots`, `subplot_mosaic` accept* height_ratios *and* width_ratios *arguments*
    - *Constrained layout is no longer considered experimental*
    - *New `layout_engine` module*
    - *Compressed layout for fixed-aspect ratio Axes*
    - *Layout engines may now be removed*
    - *`Axes.inset_axes` flexibility*
    - *WebP is now a supported output format*
    - *Garbage collection is no longer run on figure close*
  - *Plotting methods*
    - *Striped lines (experimental)*
    - *Custom cap widths in box and whisker plots in `bxp` and `boxplot`*
    - *Easier labelling of bars in bar plot*
    - *New style format string for colorbar ticks*
    - *Linestyles for negative contours may be set individually*
    - *Improved quad contour calculations via ContourPy*
    - *`errorbar` supports* markerfacecoloralt

    - *`streamplot` can disable streamline breaks*
    - *New axis scale `asinh` (experimental)*
    - *`stairs(..., fill=True)` hides patch edge by setting linewidth*
    - *Fix the dash offset of the Patch class*
    - *Rectangle patch rotation point*
  - *Colors and colormaps*
    - *Color sequence registry*
    - *Colormap method for creating a different lookup table size*
    - *Setting norms with strings*
  - *Titles, ticks, and labels*
    - *`plt.xticks` and `plt.yticks` support* minor *keyword argument*
  - *Legends*
    - *Legend can control alignment of title and handles*
    - ncol *keyword argument to `legend` renamed to* ncols
  - *Markers*
    - *`marker` can now be set to the string "none"*
    - *Customization of `MarkerStyle` join and cap style*
  - *Fonts and Text*
    - *Font fallback*
    - *List of available font names*
    - *`math_to_image` now has a* color *keyword argument*
    - *Active URL area rotates with link text*
  - *rcParams improvements*
    - *Allow setting figure label size and weight globally and separately from title*
    - *Mathtext parsing can be disabled globally*
    - *Double-quoted strings in matplotlibrc*
  - *3D Axes improvements*
    - *Standardized views for primary plane viewing angles*
    - *Custom focal length for 3D camera*
    - *3D plots gained a 3rd "roll" viewing angle*
    - *Equal aspect ratio for 3D plots*

- *Interactive tool improvements*
  - *Rotation, aspect ratio correction and add/remove state*
  - *`MultiCursor` now supports Axes split over multiple figures*
  - *`PolygonSelector` bounding boxes*
  - *Setting `PolygonSelector` vertices*
  - *`SpanSelector` widget can now be snapped to specified values*
  - *More toolbar icons are styled for dark themes*
- *Platform-specific changes*
  - *Wx backend uses standard toolbar*
  - *Improvements to macosx backend*
    - *Modifier keys handled more consistently*
    - *`savefig.directory` rcParam support*
    - *`figure.raise_window` rcParam support*
    - *Full-screen toggle support*
    - *Improved animation and blitting support*
  - *macOS application icon applied on Qt backend*
  - *New minimum macOS version*
  - *Windows on ARM support*

Figure and Axes creation / management

`subplots`, `subplot_mosaic` accept *height_ratios* and *width_ratios* arguments

The relative width and height of columns and rows in *`subplots`* and *`subplot_mosaic`* can be controlled by passing *height_ratios* and *width_ratios* keyword arguments to the methods:

```
fig = plt.figure()
axs = fig.subplots(3, 1, sharex=True, height_ratios=[3, 1, 1])
```

Previously, this required passing the ratios in *gridspec_kw* arguments:

```
fig = plt.figure()
axs = fig.subplots(3, 1, sharex=True,
                   gridspec_kw=dict(height_ratios=[3, 1, 1]))
```

Constrained layout is no longer considered experimental

The constrained layout engine and API is no longer considered experimental. Arbitrary changes to behaviour and API are no longer permitted without a deprecation period.

New `layout_engine` module

Matplotlib ships with `tight_layout` and `constrained_layout` layout engines. A new *layout_engine* module is provided to allow downstream libraries to write their own layout engines and *Figure* objects can now take a *LayoutEngine* subclass as an argument to the *layout* parameter.

Compressed layout for fixed-aspect ratio Axes

Simple arrangements of Axes with fixed aspect ratios can now be packed together with `fig, axs = plt.subplots(2, 3, layout='compressed')`.

With `layout='tight'` or `'constrained'`, Axes with a fixed aspect ratio can leave large gaps between each other:

Using the `layout='compressed'` layout reduces the space between the Axes, and adds the extra space to the outer margins:

See *Grids of fixed aspect-ratio Axes: "compressed" layout* for further details.

Layout engines may now be removed

The layout engine on a Figure may now be removed by calling *Figure.set_layout_engine* with `'none'`. This may be useful after computing layout in order to reduce computations, e.g., for subsequent animation loops.

A different layout engine may be set afterwards, so long as it is compatible with the previous layout engine.

`Axes.inset_axes` flexibility

matplotlib.axes.Axes.inset_axes now accepts the *projection*, *polar* and *axes_class* keyword arguments, so that subclasses of *matplotlib.axes.Axes* may be returned.

```
fig, ax = plt.subplots()

ax.plot([0, 2], [1, 2])

polar_ax = ax.inset_axes([0.75, 0.25, 0.2, 0.2], projection='polar')
polar_ax.plot([0, 2], [1, 2])
```

WebP is now a supported output format

Figures may now be saved in WebP format by using the `.webp` file extension, or passing `format='webp'` to *savefig*. This relies on Pillow support for WebP.

Garbage collection is no longer run on figure close

Matplotlib has a large number of circular references (between Figure and Manager, between Axes and Figure, Axes and Artist, Figure and Canvas, etc.) so when the user drops their last reference to a Figure (and clears it from pyplot's state), the objects will not immediately be deleted.

To account for this we have long (since before 2004) had a `gc.collect` (of the lowest two generations only) in the closing code in order to promptly clean up after ourselves. However this is both not doing what we want (as most of our objects will actually survive) and due to clearing out the first generation opened us up to having unbounded memory usage.

In cases with a very tight loop between creating the figure and destroying it (e.g. `plt.figure(); plt.close()`) the first generation will never grow large enough for Python to consider running the collection on the higher generations. This will lead to unbounded memory usage as the long-lived objects are never re-considered to look for reference cycles and hence are never deleted.

We now no longer do any garbage collection when a figure is closed, and rely on Python automatically deciding to run garbage collection periodically. If you have strict memory requirements, you can call `gc.collect` yourself but this may have performance impacts in a tight computation loop.

Plotting methods

Striped lines (experimental)

The new *gapcolor* parameter to *plot* enables the creation of striped lines.

```
x = np.linspace(1., 3., 10)
y = x**3

fig, ax = plt.subplots()
ax.plot(x, y, linestyle='--', color='orange', gapcolor='blue',
        linewidth=3, label='a striped line')
ax.legend()
```

Custom cap widths in box and whisker plots in `bxp` and `boxplot`

The new *capwidths* parameter to *bxp* and *boxplot* allows controlling the widths of the caps in box and whisker plots.

```
x = np.linspace(-7, 7, 140)
x = np.hstack([-25, x, 25])
capwidths = [0.01, 0.2]
```

(continues on next page)

(continued from previous page)

```
fig, ax = plt.subplots()
ax.boxplot([x, x], notch=True, capwidths=capwidths)
ax.set_title(f'{capwidths=}')
```

Easier labelling of bars in bar plot

The *label* argument of `bar` and `barh` can now be passed a list of labels for the bars. The list must be the same length as *x* and labels the individual bars. Repeated labels are not de-duplicated and will cause repeated label entries, so this is best used when bars also differ in style (e.g., by passing a list to *color*, as below.)

```
x = ["a", "b", "c"]
y = [10, 20, 15]
color = ['C0', 'C1', 'C2']

fig, ax = plt.subplots()
ax.bar(x, y, color=color, label=x)
ax.legend()
```

New style format string for colorbar ticks

The *format* argument of `colorbar` (and other colorbar methods) now accepts `{}`-style format strings.

```
fig, ax = plt.subplots()
im = ax.imshow(z)
fig.colorbar(im, format='{x:.2e}')  # Instead of '%.2e'
```

Linestyles for negative contours may be set individually

The line style of negative contours may be set by passing the *negative_linestyles* argument to `Axes.contour`. Previously, this style could only be set globally via `rcParams["contour.negative_linestyle"]` (default: `'dashed'`).

```
delta = 0.025
x = np.arange(-3.0, 3.0, delta)
y = np.arange(-2.0, 2.0, delta)
X, Y = np.meshgrid(x, y)
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = (Z1 - Z2) * 2

fig, axs = plt.subplots(1, 2)

CS = axs[0].contour(X, Y, Z, 6, colors='k')
```

(continues on next page)

(continued from previous page)

```
axs[0].clabel(CS, fontsize=9, inline=True)
axs[0].set_title('Default negative contours')

CS = axs[1].contour(X, Y, Z, 6, colors='k', negative_linestyles='dotted
 ↪')
axs[1].clabel(CS, fontsize=9, inline=True)
axs[1].set_title('Dotted negative contours')
```

Improved quad contour calculations via ContourPy

The contouring functions *contour* and *contourf* have a new keyword argument *algorithm* to control which algorithm is used to calculate the contours. There is a choice of four algorithms to use, and the default is to use `algorithm='mpl2014'` which is the same algorithm that Matplotlib has been using since 2014.

Previously Matplotlib shipped its own C++ code for calculating the contours of quad grids. Now the external library ContourPy is used instead.

Other possible values of the *algorithm* keyword argument at this time are `'mpl2005'`, `'serial'` and `'threaded'`; see the ContourPy documentation for further details.

Note

Contour lines and polygons produced by `algorithm='mpl2014'` will be the same as those produced before this change to within floating-point tolerance. The exception is for duplicate points, i.e. contours containing adjacent (x, y) points that are identical; previously the duplicate points were removed, now they are kept. Contours affected by this will produce the same visual output, but there will be a greater number of points in the contours.

The locations of contour labels obtained by using *clabel* may also be different.

`errorbar` supports *markerfacecoloralt*

The *markerfacecoloralt* parameter is now passed to the line plotter from *Axes.errorbar*. The documentation now accurately lists which properties are passed to *Line2D*, rather than claiming that all keyword arguments are passed on.

```
x = np.arange(0.1, 4, 0.5)
y = np.exp(-x)

fig, ax = plt.subplots()
ax.errorbar(x, y, xerr=0.2, yerr=0.4,
            linestyle=':', color='darkgrey',
            marker='o', markersize=20, fillstyle='left',
            markerfacecolor='tab:blue', markerfacecoloralt='tab:orange
```

(continues on next page)

(continued from previous page)

```
↪',
            markeredgecolor='tab:brown', markeredgewidth=2)
```

`streamplot` can disable streamline breaks

It is now possible to specify that streamplots have continuous, unbroken streamlines. Previously streamlines would end to limit the number of lines within a single grid cell. See the difference between the plots below:

New axis scale `asinh` (experimental)

The new `asinh` axis scale offers an alternative to `symlog` that smoothly transitions between the quasi-linear and asymptotically logarithmic regions of the scale. This is based on an arcsinh transformation that allows plotting both positive and negative values that span many orders of magnitude.

`stairs(..., fill=True)` hides patch edge by setting linewidth

`stairs(..., fill=True)` would previously hide Patch edges by setting `edgecolor="none"`. Consequently, calling `set_color()` on the Patch later would make the Patch appear larger.

Now, by using `linewidth=0`, this apparent size change is prevented. Likewise calling `stairs(..., fill=True, linewidth=3)` will behave more transparently.

Fix the dash offset of the Patch class

Formerly, when setting the line style on a *Patch* object using a dash tuple, the offset was ignored. Now the offset is applied to the Patch as expected and it can be used as it is used with *Line2D* objects.

Rectangle patch rotation point

The rotation point of the *Rectangle* can now be set to 'xy', 'center' or a 2-tuple of numbers using the *rotation_point* argument.

Colors and colormaps

Color sequence registry

The color sequence registry, *ColorSequenceRegistry*, contains sequences (i.e., simple lists) of colors that are known to Matplotlib by name. This will not normally be used directly, but through the universal instance at *matplotlib.color_sequences*.

Colormap method for creating a different lookup table size

The new method *Colormap.resampled* creates a new *Colormap* instance with the specified lookup table size. This is a replacement for manipulating the lookup table size via `get_cmap`.

Use:

```
get_cmap(name).resampled(N)
```

instead of:

```
get_cmap(name, lut=N)
```

Setting norms with strings

Norms can now be set (e.g. on images) using the string name of the corresponding scale, e.g. `imshow(array, norm="log")`. Note that in that case, it is permissible to also pass *vmin* and *vmax*, as a new Norm instance will be created under the hood.

Titles, ticks, and labels

`plt.xticks` and `plt.yticks` support *minor* keyword argument

It is now possible to set or get minor ticks using *pyplot.xticks* and *pyplot.yticks* by setting `minor=True`.

```
plt.figure()
plt.plot([1, 2, 3, 3.5], [2, 1, 0, -0.5])
plt.xticks([1, 2, 3], ["One", "Zwei", "Trois"])
plt.xticks([np.sqrt(2), 2.5, np.pi],
           [r"$\sqrt{2}$", r"$\frac{5}{2}$", r"$\pi$"], minor=True)
```

Legends

Legend can control alignment of title and handles

Legend now supports controlling the alignment of the title and handles via the keyword argument *alignment*. You can also use *Legend.set_alignment* to control the alignment on existing Legends.

```
fig, axs = plt.subplots(3, 1)
for i, alignment in enumerate(['left', 'center', 'right']):
    axs[i].plot(range(10), label='test')
    axs[i].legend(title=f'{alignment=}', alignment=alignment)
```

ncol keyword argument to `legend` renamed to *ncols*

The *ncol* keyword argument to *legend* for controlling the number of columns is renamed to *ncols* for consistency with the *ncols* and *nrows* keywords of *subplots* and *GridSpec*. *ncol* remains supported for backwards compatibility, but is discouraged.

Markers

`marker` can now be set to the string "none"

The string "none" means *no-marker*, consistent with other APIs which support the lowercase version. Using "none" is recommended over using "None", to avoid confusion with the None object.

Customization of `MarkerStyle` join and cap style

New *MarkerStyle* parameters allow control of join style and cap style, and for the user to supply a transformation to be applied to the marker (e.g. a rotation).

```
from matplotlib.markers import CapStyle, JoinStyle, MarkerStyle
from matplotlib.transforms import Affine2D

fig, axs = plt.subplots(3, 1, layout='constrained')
for ax in axs:
    ax.axis('off')
    ax.set_xlim(-0.5, 2.5)

axs[0].set_title('Cap styles', fontsize=14)
for col, cap in enumerate(CapStyle):
    axs[0].plot(col, 0, markersize=32, markeredgewidth=8,
                marker=MarkerStyle('1', capstyle=cap))
    # Show the marker edge for comparison with the cap.
    axs[0].plot(col, 0, markersize=32, markeredgewidth=1,
                markerfacecolor='none', markeredgecolor='lightgrey',
                marker=MarkerStyle('1'))
    axs[0].annotate(cap.name, (col, 0),
                    xytext=(20, -5), textcoords='offset points')

axs[1].set_title('Join styles', fontsize=14)
for col, join in enumerate(JoinStyle):
    axs[1].plot(col, 0, markersize=32, markeredgewidth=8,
                marker=MarkerStyle('*', joinstyle=join))
    # Show the marker edge for comparison with the join.
    axs[1].plot(col, 0, markersize=32, markeredgewidth=1,
                markerfacecolor='none', markeredgecolor='lightgrey',
                marker=MarkerStyle('*'))
    axs[1].annotate(join.name, (col, 0),
                    xytext=(20, -5), textcoords='offset points')
```

(continues on next page)

(continued from previous page)

```
axs[2].set_title('Arbitrary transforms', fontsize=14)
for col, (size, rot) in enumerate(zip([2, 5, 7], [0, 45, 90])):
    t = Affine2D().rotate_deg(rot).scale(size)
    axs[2].plot(col, 0, marker=MarkerStyle('*', transform=t))
```

Fonts and Text

Font fallback

It is now possible to specify a list of fonts families and Matplotlib will try them in order to locate a required glyph.

```
plt.rcParams["font.size"] = 20
fig = plt.figure(figsize=(4.75, 1.85))

text = "There are 四個字 in between!"
fig.text(0.05, 0.65, text, family=["Noto Sans CJK JP", "Noto Sans TC"])
fig.text(0.05, 0.45, text, family=["DejaVu Sans", "Noto Sans CJK JP",
 ↪"Noto Sans TC"])
```

This currently works with the Agg (and all of the GUI embeddings), svg, pdf, ps, and inline backends.

List of available font names

The list of available fonts are now easily accessible. To get a list of the available font names in Matplotlib use:

```
from matplotlib import font_manager
font_manager.get_font_names()
```

`math_to_image` now has a *color* keyword argument

To easily support external libraries that rely on the MathText rendering of Matplotlib to generate equation images, a *color* keyword argument was added to *`math_to_image`*.

```
from matplotlib import mathtext
mathtext.math_to_image('$x^2$', 'filename.png', color='Maroon')
```

Active URL area rotates with link text

When link text is rotated in a figure, the active URL area will now include the rotated link area. Previously, the active area remained in the original, non-rotated, position.

rcParams improvements

Allow setting figure label size and weight globally and separately from title

For figure labels, `Figure.supxlabel` and `Figure.supylabel`, the size and weight can be set separately from the figure title using *rcParams["figure.labelsize"]* (default: `'large'`) and *rcParams["figure.labelweight"]* (default: `'normal'`).

```
# Original (previously combined with below) rcParams:
plt.rcParams['figure.titlesize'] = 64
plt.rcParams['figure.titleweight'] = 'bold'

# New rcParams:
plt.rcParams['figure.labelsize'] = 32
plt.rcParams['figure.labelweight'] = 'bold'

fig, axs = plt.subplots(2, 2, layout='constrained')
for ax in axs.flat:
    ax.set(xlabel='xlabel', ylabel='ylabel')

fig.suptitle('suptitle')
fig.supxlabel('supxlabel')
fig.supylabel('supylabel')
```

Note that if you have changed *rcParams["figure.titlesize"]* (default: `'large'`) or *rcParams["figure.titleweight"]* (default: `'normal'`), you must now also change the introduced parameters for a result consistent with past behaviour.

Mathtext parsing can be disabled globally

The *rcParams["text.parse_math"]* (default: `True`) setting may be used to disable parsing of mathtext in all *Text* objects (most notably from the *Axes.text* method).

Double-quoted strings in matplotlibrc

You can now use double-quotes around strings. This allows using the '#' character in strings. Without quotes, '#' is interpreted as start of a comment. In particular, you can now define hex-colors:

```
grid.color: "#b0b0b0"
```

3D Axes improvements

Standardized views for primary plane viewing angles

When viewing a 3D plot in one of the primary view planes (i.e., perpendicular to the XY, XZ, or YZ planes), the Axis will be displayed in a standard location. For further information on 3D views, see *mplot3d View Angles* and *Primary 3D view planes*.

Custom focal length for 3D camera

The 3D Axes can now better mimic real-world cameras by specifying the focal length of the virtual camera. The default focal length of 1 corresponds to a Field of View (FOV) of 90°, and is backwards-compatible with existing 3D plots. An increased focal length between 1 and infinity "flattens" the image, while a decreased focal length between 1 and 0 exaggerates the perspective and gives the image more apparent depth.

The focal length can be calculated from a desired FOV via the equation:

$$focal_length = 1/\tan(FOV/2) \tag{9.3}$$

```
from mpl_toolkits.mplot3d import axes3d

X, Y, Z = axes3d.get_test_data(0.05)

fig, axs = plt.subplots(1, 3, figsize=(7, 4),
                        subplot_kw={'projection': '3d'})

for ax, focal_length in zip(axs, [0.2, 1, np.inf]):
    ax.plot_wireframe(X, Y, Z, rstride=10, cstride=10)
    ax.set_proj_type('persp', focal_length=focal_length)
    ax.set_title(f"{focal_length=}")
```

3D plots gained a 3rd "roll" viewing angle

3D plots can now be viewed from any orientation with the addition of a 3rd roll angle, which rotates the plot about the viewing axis. Interactive rotation using the mouse still only controls elevation and azimuth, meaning that this feature is relevant to users who create more complex camera angles programmatically. The default roll angle of 0 is backwards-compatible with existing 3D plots.

```
from mpl_toolkits.mplot3d import axes3d

X, Y, Z = axes3d.get_test_data(0.05)

fig, ax = plt.subplots(subplot_kw={'projection': '3d'})

ax.plot_wireframe(X, Y, Z, rstride=10, cstride=10)
ax.view_init(elev=0, azim=0, roll=30)
ax.set_title('elev=0, azim=0, roll=30')
```

Equal aspect ratio for 3D plots

Users can set the aspect ratio for the X, Y, Z axes of a 3D plot to be 'equal', 'equalxy', 'equalxz', or 'equalyz' rather than the default of 'auto'.

```
from itertools import combinations, product

aspects = [
    ['auto', 'equal', '.'],
    ['equalxy', 'equalyz', 'equalxz'],
]
fig, axs = plt.subplot_mosaic(aspects, figsize=(7, 6),
                              subplot_kw={'projection': '3d'})

# Draw rectangular cuboid with side lengths [1, 1, 5]
r = [0, 1]
scale = np.array([1, 1, 5])
pts = combinations(np.array(list(product(r, r, r))), 2)
for start, end in pts:
    if np.sum(np.abs(start - end)) == r[1] - r[0]:
        for ax in axs.values():
            ax.plot3D(*zip(start*scale, end*scale), color='C0')

# Set the aspect ratios
for aspect, ax in axs.items():
    ax.set_box_aspect((3, 4, 5))
    ax.set_aspect(aspect)
    ax.set_title(f'set_aspect({aspect!r})')
```

Interactive tool improvements

Rotation, aspect ratio correction and add/remove state

The *RectangleSelector* and *EllipseSelector* can now be rotated interactively between -45° and 45°. The range limits are currently dictated by the implementation. The rotation is enabled or disabled by striking the *r* key ('r' is the default key mapped to 'rotate' in *state_modifier_keys*) or by calling `selector.add_state('rotate')`.

The aspect ratio of the axes can now be taken into account when using the "square" state. This is enabled by specifying `use_data_coordinates='True'` when the selector is initialized.

In addition to changing selector state interactively using the modifier keys defined in *state_modifier_keys*, the selector state can now be changed programmatically using the *add_state* and *remove_state* methods.

```
from matplotlib.widgets import RectangleSelector

values = np.arange(0, 100)

fig = plt.figure()
ax = fig.add_subplot()
ax.plot(values, values)
```

(continues on next page)

(continued from previous page)

```
selector = RectangleSelector(ax, print, interactive=True,
                             drag_from_anywhere=True,
                             use_data_coordinates=True)
selector.add_state('rotate')  # alternatively press 'r' key
# rotate the selector interactively

selector.remove_state('rotate')  # alternatively press 'r' key

selector.add_state('square')
```

`MultiCursor` now supports Axes split over multiple figures

Previously, *`MultiCursor`* only worked if all target Axes belonged to the same figure.

As a consequence of this change, the first argument to the *`MultiCursor`* constructor has become unused (it was previously the joint canvas of all Axes, but the canvases are now directly inferred from the list of Axes).

`PolygonSelector` bounding boxes

`PolygonSelector` now has a *draw_bounding_box* argument, which when set to `True` will draw a bounding box around the polygon once it is complete. The bounding box can be resized and moved, allowing the points of the polygon to be easily resized.

Setting `PolygonSelector` vertices

The vertices of *`PolygonSelector`* can now be set programmatically by using the *`PolygonSelector.verts`* property. Setting the vertices this way will reset the selector, and create a new complete selector with the supplied vertices.

`SpanSelector` widget can now be snapped to specified values

The *`SpanSelector`* widget can now be snapped to values specified by the *snap_values* argument.

More toolbar icons are styled for dark themes

On the macOS and Tk backends, toolbar icons will now be inverted when using a dark theme.

Platform-specific changes

Wx backend uses standard toolbar

Instead of a custom sizer, the toolbar is set on Wx windows as a standard toolbar.

Improvements to macosx backend

Modifier keys handled more consistently

The macosx backend now handles modifier keys in a manner more consistent with other backends. See the table in *Event connections* for further information.

`savefig.directory` rcParam support

The macosx backend will now obey the *rcParams["savefig.directory"]* (default: `'~'`) setting. If set to a non-empty string, then the save dialog will default to this directory, and preserve subsequent save directories as they are changed.

`figure.raise_window` rcParam support

The macosx backend will now obey the *rcParams["figure.raise_window"]* (default: `True`) setting. If set to False, figure windows will not be raised to the top on update.

Full-screen toggle support

As supported on other backends, the macosx backend now supports toggling fullscreen view. By default, this view can be toggled by pressing the `f` key.

Improved animation and blitting support

The macosx backend has been improved to fix blitting, animation frames with new artists, and to reduce unnecessary draw calls.

macOS application icon applied on Qt backend

When using the Qt-based backends on macOS, the application icon will now be set, as is done on other backends/platforms.

New minimum macOS version

The macosx backend now requires macOS >= 10.12.

Windows on ARM support

Preliminary support for Windows on arm64 target has been added. This support requires FreeType 2.11 or above.

No binary wheels are available yet but it may be built from source.

9.5.2 API Changes for 3.6.1

Deprecations

Colorbars for orphaned mappables are deprecated, but no longer raise

Before 3.6.0, Colorbars for mappables that do not have a parent Axes would steal space from the current Axes. 3.6.0 raised an error on this, but without a deprecation cycle. For 3.6.1 this is reverted; the current Axes is used, but a deprecation warning is shown instead. In this undetermined case, users and libraries should explicitly specify what Axes they want space to be stolen from: `fig.colorbar(mappable, ax=plt.gca())`.

9.5.3 API Changes for 3.6.0

- *Behaviour changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behaviour changes

`plt.get_cmap` and `matplotlib.cm.get_cmap` return a copy

Formerly, *get_cmap* and `matplotlib.cm.get_cmap` returned a global version of a *Colormap*. This was prone to errors as modification of the colormap would propagate from one location to another without warning. Now, a new copy of the colormap is returned.

Large `imshow` images are now downsampled

When showing an image using *imshow* that has more than 2^{24} columns or 2^{23} rows, the image will now be downsampled to below this resolution before being resampled for display by the AGG renderer. Previously such a large image would be shown incorrectly. To prevent this downsampling and the warning it raises, manually downsample your data before handing it to *imshow*.

Default date limits changed to 1970-01-01 – 1970-01-02

Previously the default limits for an empty axis set up for dates (*Axis.axis_date*) was 2000-01-01 to 2010-01-01. This has been changed to 1970-01-01 to 1970-01-02. With the default epoch, this makes the numeric limit for date axes the same as for other axes (0.0-1.0), and users are less likely to set a locator with far too many ticks.

markerfmt argument to `stem`

The behavior of the *markerfmt* parameter of *stem* has changed:

- If *markerfmt* does not contain a color, the color is taken from *linefmt*.
- If *markerfmt* does not contain a marker, the default is 'o'.

Before, *markerfmt* was passed unmodified to `plot(..., fmt)`, which had a number of unintended side-effects; e.g. only giving a color switched to a solid line without markers.

For a simple call `stem(x, y)` without parameters, the new rules still reproduce the old behavior.

`get_ticklabels` now always populates labels

Previously *Axis.get_ticklabels* (and *Axes.get_xticklabels*, *Axes.get_yticklabels*) would only return empty strings unless a draw had already been performed. Now the ticks and their labels are updated when the labels are requested.

Warning when scatter plot color settings discarded

When making an animation of a scatter plot, if you don't set *c* (the color value parameter) when initializing the artist, the color settings are ignored. *Axes.scatter* now raises a warning if color-related settings are changed without setting *c*.

3D `contourf` polygons placed between levels

The polygons used in a 3D *contourf* plot are now placed halfway between the contour levels, as each polygon represents the location of values that lie between two levels.

Axes title now avoids y-axis offset

Previously, Axes titles could overlap the y-axis offset text, which is often in the upper left corner of the axes. Now titles are moved above the offset text if overlapping when automatic title positioning is in effect (i.e. if *y* in *Axes.set_title* is *None* and *rcParams["axes.titley"]* (default: `None`) is also *None*).

Dotted operators gain extra space in mathtext

In mathtext, `\doteq \doteqdot \dotminus \dotplus \dots` are now surrounded by extra space because they are correctly treated as relational or binary operators.

math parameter of `mathtext.get_unicode_index` defaults to False

In math mode, ASCII hyphens (U+002D) are now replaced by Unicode minus signs (U+2212) at the parsing stage.

`ArtistList` proxies copy contents on iteration

When iterating over the contents of the dynamically generated proxy lists for the Artist-type accessors (see *Axes children are no longer separated by type*), a copy of the contents is made. This ensure that artists can safely be added or removed from the Axes while iterating over their children.

This is a departure from the expected behavior of mutable iterable data types in Python — iterating over a list while mutating it has surprising consequences and dictionaries will error if they change size during iteration. Because all of the accessors are filtered views of the same underlying list, it is possible for seemingly unrelated changes, such as removing a Line, to affect the iteration over any of the other accessors. In this case, we have opted to make a copy of the relevant children before yielding them to the user.

This change is also consistent with our plan to make these accessors immutable in Matplotlib 3.7.

`AxesImage` string representation

The string representation of *`AxesImage`* changes from stating the position in the figure `"AxesImage(80,52.8;496x369.6)"` to giving the number of pixels `"AxesImage(size=(300, 200))"`.

Improved autoscaling for Bézier curves

Bézier curves are now autoscaled to their extents - previously they were autoscaled to their ends and control points, which in some cases led to unnecessarily large limits.

`QuadMesh` mouseover defaults to False

New in 3.5, *`QuadMesh.get_cursor_data`* allows display of data values under the cursor. However, this can be very slow for large meshes, so mouseover now defaults to *False*.

Changed pgf backend document class

The pgf backend now uses the `article` document class as basis for compilation.

`MathtextBackendAgg.get_results` no longer returns `used_characters`

The last item (`used_characters`) in the tuple returned by `MathtextBackendAgg.get_results` has been removed. In order to unpack this tuple in a backward and forward-compatible way, use e.g. `ox, oy, width, height, descent, image, *_ = parse(...)`, which will ignore `used_characters` if it was present.

`Type1Font` objects include more properties

The `matplotlib._type1font.Type1Font.prop` dictionary now includes more keys, such as `CharStrings` and `Subrs`. The value of the `Encoding` key is now a dictionary mapping codes to glyph names. The `matplotlib._type1font.Type1Font.transform` method now correctly removes `UniqueID` properties from the font.

`rcParams.copy()` returns `RcParams` rather than `dict`

Returning an *RcParams* instance from *RcParams.copy* makes the copy still validate inputs, and additionally avoids emitting deprecation warnings when using a previously copied instance to update the global instance (even if some entries are deprecated).

`rc_context` no longer resets the value of `'backend'`

matplotlib.rc_context incorrectly reset the value of *rcParams["backend"]* if backend resolution was triggered in the context. This affected only the value. The actual backend was not changed. Now, *matplotlib.rc_context* does not reset *rcParams["backend"]* anymore.

Default `rcParams["animation.convert_args"]` changed

It now defaults to `["-layers", "OptimizePlus"]` to try to generate smaller GIFs. Set it back to an empty list to recover the previous behavior.

Style file encoding now specified to be UTF-8

It has been impossible to import Matplotlib with a non UTF-8 compatible locale encoding because we read the style library at import time. This change is formalizing and documenting the status quo so there is no deprecation period.

MacOSX backend uses sRGB instead of GenericRGB color space

MacOSX backend now display sRGB tagged image instead of GenericRGB which is an older (now deprecated) Apple color space. This is the source color space used by ColorSync to convert to the current display profile.

Renderer optional for `get_tightbbox` and `get_window_extent`

The *Artist.get_tightbbox* and *Artist.get_window_extent* methods no longer require the *renderer* keyword argument, saving users from having to query it from `fig.canvas.get_renderer`. If the *renderer* keyword argument is not supplied, these methods first check if there is a cached renderer from a previous draw and use that. If there is no cached renderer, then the methods will use `fig.canvas.get_renderer()` as a fallback.

`FigureFrameWx` constructor, subclasses, and `get_canvas`

The `FigureCanvasWx` constructor gained a *canvas_class* keyword-only parameter which specifies the canvas class that should be used. This parameter will become required in the future. The `get_canvas` method, which was previously used to customize canvas creation, is deprecated. The `FigureFrameWxAgg` and `FigureFrameWxCairo` subclasses, which overrode `get_canvas`, are deprecated.

`FigureFrameWx.sizer`

... has been removed. The frame layout is no longer based on a sizer, as the canvas is now the sole child widget; the toolbar is now a regular toolbar added using `SetToolBar`.

Incompatible layout engines raise

You cannot switch between `tight_layout` and `constrained_layout` if a colorbar has already been added to a figure. Invoking the incompatible layout engine used to warn, but now raises with a `RuntimeError`.

`CallbackRegistry` raises on unknown signals

When Matplotlib instantiates a *`CallbackRegistry`*, it now limits callbacks to the signals that the registry knows about. In practice, this means that calling *`mpl_connect`* with an invalid signal name now raises a `ValueError`.

Changed exception type for incorrect SVG date metadata

Providing date metadata with incorrect type to the SVG backend earlier resulted in a `ValueError`. Now, a `TypeError` is raised instead.

Specified exception types in `Grid`

In a few cases an `Exception` was thrown when an incorrect argument value was set in the *`mpl_toolkits.axes_grid1.axes_grid.Grid`* (= `mpl_toolkits.axisartist.axes_grid.Grid`) constructor. These are replaced as follows:

- Providing an incorrect value for *ngrids* now raises a `ValueError`
- Providing an incorrect type for *rect* now raises a `TypeError`

Deprecations

Parameters to `plt.figure()` and the `Figure` constructor

All parameters to *`pyplot.figure`* and the *`Figure`* constructor, other than *num*, *figsize*, and *dpi*, will become keyword-only after a deprecation period.

Deprecation aliases in cbook

The module `matplotlib.cbook.deprecation` was previously deprecated in Matplotlib 3.4, along with deprecation-related API in `matplotlib.cbook`. Due to technical issues, `matplotlib.cbook.MatplotlibDeprecationWarning` and `matplotlib.cbook.mplDeprecation` did not raise deprecation warnings on use. Changes in Python have now made it possible to warn when these aliases are being used.

In order to avoid downstream breakage, these aliases will now warn, and their removal has been pushed from 3.6 to 3.8 to give time to notice said warnings. As replacement, please use *`matplotlib.MatplotlibDeprecationWarning`*.

`Axes` subclasses should override `clear` instead of `cla`

For clarity, *axes.Axes.clear* is now preferred over *Axes.cla*. However, for backwards compatibility, the latter will remain as an alias for the former.

For additional compatibility with third-party libraries, Matplotlib will continue to call the `cla` method of any *Axes* subclasses if they define it. In the future, this will no longer occur, and Matplotlib will only call the `clear` method in *Axes* subclasses.

It is recommended to define only the `clear` method when on Matplotlib 3.6, and only `cla` for older versions.

Pending deprecation top-level cmap registration and access functions in `mpl.cm`

As part of a multi-step process we are refactoring the global state for managing the registered colormaps.

In Matplotlib 3.5 we added a *ColormapRegistry* class and exposed an instance at the top level as `matplotlib.colormaps`. The existing top level functions in *matplotlib.cm* (`get_cmap`, `register_cmap`, `unregister_cmap`) were changed to be aliases around the same instance.

In Matplotlib 3.6 we have marked those top level functions as pending deprecation with the intention of deprecation in Matplotlib 3.7. The following functions have been marked for pending deprecation:

- `matplotlib.cm.get_cmap`; use `matplotlib.colormaps[name]` instead if you have a `str`.

  Added 3.6.1 Use *matplotlib.cm.ColormapRegistry.get_cmap* if you have a string, `None` or a *matplotlib.colors.Colormap* object that you want to convert to a *matplotlib.colors.Colormap* instance.

- `matplotlib.cm.register_cmap`; use *matplotlib.colormaps.register* instead
- `matplotlib.cm.unregister_cmap`; use *matplotlib.colormaps.unregister* instead
- `matplotlib.pyplot.register_cmap`; use *matplotlib.colormaps.register* instead

The *matplotlib.pyplot.get_cmap* function will stay available for backward compatibility.

Pending deprecation of layout methods

The methods *set_tight_layout*, *set_constrained_layout*, are discouraged, and now emit a `PendingDeprecationWarning` in favor of explicitly referencing the layout engine via `figure.set_layout_engine('tight')` and `figure.set_layout_engine('constrained')`. End users should not see the warning, but library authors should adjust.

The methods *set_constrained_layout_pads* and *get_constrained_layout_pads* are will be deprecated in favor of `figure.get_layout_engine().set()` and `figure.get_layout_engine().get()`, and currently emit a `PendingDeprecationWarning`.

seaborn styles renamed

Matplotlib currently ships many style files inspired from the seaborn library ("seaborn", "seaborn-bright", "seaborn-colorblind", etc.) but they have gone out of sync with the library itself since the release of seaborn 0.9. To prevent confusion, the style files have been renamed "seaborn-v0_8", "seaborn-v0_8-bright", "seaborn-v0_8-colorblind", etc. Users are encouraged to directly use seaborn to access the up-to-date styles.

Auto-removal of overlapping Axes by `plt.subplot` and `plt.subplot2grid`

Previously, *pyplot.subplot* and *pyplot.subplot2grid* would automatically remove preexisting Axes that overlap with the newly added Axes. This behavior was deemed confusing, and is now deprecated. Explicitly call `ax.remove()` on Axes that need to be removed.

Passing *linefmt* positionally to `stem` is undeprecated

Positional use of all formatting parameters in *stem* has been deprecated since Matplotlib 3.5. This deprecation is relaxed so that one can still pass *linefmt* positionally, i.e. `stem(x, y, 'r')`.

`stem(..., use_line_collection=False)`

... is deprecated with no replacement. This was a compatibility fallback to a former more inefficient representation of the stem lines.

Positional / keyword arguments

Passing all but the very few first arguments positionally in the constructors of Artists is deprecated. Most arguments will become keyword-only in a future version.

Passing too many positional arguments to `tripcolor` is now deprecated (extra arguments were previously silently ignored).

Passing *emit* and *auto* parameters of `set_xlim`, `set_ylim`, `set_zlim`, `set_rlim` positionally is deprecated; they will become keyword-only in a future release.

The *transOffset* parameter of *Collection.set_offset_transform* and the various `create_collection` methods of legend handlers has been renamed to *offset_transform* (consistently with the property name).

Calling `MarkerStyle()` with no arguments or `MarkerStyle(None)` is deprecated; use `MarkerStyle("")` to construct an empty marker style.

`Axes.get_window_extent` / `Figure.get_window_extent` accept only *renderer*. This aligns the API with the general *Artist.get_window_extent* API. All other parameters were ignored anyway.

The *cleared* parameter of `get_renderer`, which only existed for AGG-based backends, has been deprecated. Use `renderer.clear()` instead to explicitly clear the renderer buffer.

Methods to set parameters in `LogLocator` and `LogFormatter*`

In *`LogFormatter`* and derived subclasses, the methods `base` and `label_minor` for setting the respective parameter are deprecated and replaced by `set_base` and `set_label_minor`, respectively.

In *`LogLocator`*, the methods `base` and `subs` for setting the respective parameter are deprecated. Instead, use `set_params(base=..., subs=...)`.

`Axes.get_renderer_cache`

The canvas now takes care of the renderer and whether to cache it or not. The alternative is to call `axes.figure.canvas.get_renderer()`.

Groupers from `get_shared_x_axes` / `get_shared_y_axes` will be immutable

Modifications to the Groupers returned by `get_shared_x_axes` and `get_shared_y_axes` are deprecated. In the future, these methods will return immutable views on the grouper structures. Note that previously, calling e.g. `join()` would already fail to set up the correct structures for sharing axes; use *`Axes.sharex`* or *`Axes.sharey`* instead.

Unused methods in `Axis`, `Tick`, `XAxis`, and `YAxis`

`Tick.label` has been pending deprecation since 3.1 and is now deprecated. Use `Tick.label1` instead.

The following methods are no longer used and deprecated without a replacement:

- `Axis.get_ticklabel_extents`
- `Tick.get_pad_pixels`
- `XAxis.get_text_heights`
- `YAxis.get_text_widths`

`mlab.stride_windows`

... is deprecated. Use `np.lib.stride_tricks.sliding_window_view` instead (or `np.lib.stride_tricks.as_strided` on NumPy < 1.20).

Event handlers

The `draw_event`, `resize_event`, `close_event`, `key_press_event`, `key_release_event`, `pick_event`, `scroll_event`, `button_press_event`, `button_release_event`, `motion_notify_event`, `enter_notify_event` and `leave_notify_event` methods of *`FigureCanvasBase`* are deprecated. They had inconsistent signatures across backends, and made it difficult to improve event metadata.

In order to trigger an event on a canvas, directly construct an *`Event`* object of the correct class and call `canvas.callbacks.process(event.name, event)`.

Widgets

All parameters to `MultiCursor` starting from *useblit* are becoming keyword-only (passing them positionally is deprecated).

The `canvas` and `background` attributes of `MultiCursor` are deprecated with no replacement.

The *visible* attribute of Selector widgets has been deprecated; use `set_visible` or `get_visible` instead.

The *state_modifier_keys* attribute of Selector widgets has been privatized and the modifier keys must be set when creating the widget.

`Axes3D.dist`

... has been privatized. Use the *zoom* keyword argument in *`Axes3D.set_box_aspect`* instead.

3D Axis

The previous constructor of *`axis3d.Axis`*, with signature `(self, adir, v_intervalx, d_intervalx, axes, *args, rotate_label=None, **kwargs)` is deprecated in favor of a new signature closer to the one of 2D Axis; it is now `(self, axes, *, rotate_label=None, **kwargs)` where `kwargs` are forwarded to the 2D Axis constructor. The axis direction is now inferred from the axis class' `axis_name` attribute (as in the 2D case); the `adir` attribute is deprecated.

The `init3d` method of 3D Axis is also deprecated; all the relevant initialization is done as part of the constructor.

The `d_interval` and `v_interval` attributes of 3D Axis are deprecated; use `get_data_interval` and `get_view_interval` instead.

The `w_xaxis`, `w_yaxis`, and `w_zaxis` attributes of `Axis3D` have been pending deprecation since 3.1. They are now deprecated. Instead use `xaxis`, `yaxis`, and `zaxis`.

`mplot3d.axis3d.Axis.set_pane_pos` is deprecated. This is an internal method where the provided values are overwritten during drawing. Hence, it does not serve any purpose to be directly accessible.

The two helper functions `mplot3d.axis3d.move_from_center` and `mplot3d.axis3d.tick_update_position` are considered internal and deprecated. If these are required, please vendor the code from the corresponding private methods `_move_from_center` and `_tick_update_position`.

`Figure.callbacks` is deprecated

The Figure `callbacks` property is deprecated. The only signal was "dpi_changed", which can be replaced by connecting to the "resize_event" on the canvas `figure.canvas.mpl_connect("resize_event", func)` instead.

`FigureCanvas` without a `required_interactive_framework` attribute

Support for such canvas classes is deprecated. Note that canvas classes which inherit from `FigureCanvasBase` always have such an attribute.

Backend-specific deprecations

- `backend_gtk3.FigureManagerGTK3Agg` and `backend_gtk4.FigureManagerGTK4Agg`; directly use `backend_gtk3.FigureManagerGTK3` and `backend_gtk4.FigureManagerGTK4` instead.
- The *window* parameter to `backend_gtk3.NavigationToolbar2GTK3` had no effect, and is now deprecated.
- `backend_gtk3.NavigationToolbar2GTK3.win`
- `backend_gtk3.RendererGTK3Cairo` and `backend_gtk4.RendererGTK4Cairo`; use *RendererCairo* instead, which has gained the `set_context` method, which also auto-infers the size of the underlying surface.
- `backend_cairo.RendererCairo.set_ctx_from_surface` and `backend_cairo.RendererCairo.set_width_height` in favor of *RendererCairo.set_context*.
- `backend_gtk3.error_msg_gtk`
- `backend_gtk3.icon_filename` and `backend_gtk3.window_icon`
- `backend_macosx.NavigationToolbar2Mac.prepare_configure_subplots` has been replaced by `configure_subplots()`.
- `backend_pdf.Name.hexify`
- `backend_pdf.Operator` and `backend_pdf.Op.op` are deprecated in favor of a single standard `enum.Enum` interface on *backend_pdf.Op*.
- `backend_pdf.fill`; vendor the code of the similarly named private functions if you rely on these functions.
- `backend_pgf.LatexManager.texcommand` and `backend_pgf.LatexManager.latex_header`
- `backend_pgf.NO_ESCAPE`
- `backend_pgf.common_texification`
- `backend_pgf.get_fontspec`
- `backend_pgf.get_preamble`
- `backend_pgf.re_mathsep`
- `backend_pgf.writeln`
- `backend_ps.convert_psfrags`
- `backend_ps.quote_ps_string`; vendor the code of the similarly named private functions if you rely on it.

- `backend_qt.qApp`; use `QtWidgets.QApplication.instance()` instead.
- `backend_svg.escape_attrib`; vendor the code of the similarly named private functions if you rely on it.
- `backend_svg.escape_cdata`; vendor the code of the similarly named private functions if you rely on it.
- `backend_svg.escape_comment`; vendor the code of the similarly named private functions if you rely on it.
- `backend_svg.short_float_fmt`; vendor the code of the similarly named private functions if you rely on it.
- `backend_svg.generate_transform` and `backend_svg.generate_css`
- `backend_tk.NavigationToolbar2Tk.lastrect` and `backend_tk.RubberbandTk.lastrect`
- `backend_tk.NavigationToolbar2Tk.window`; use `toolbar.master` instead.
- `backend_tools.ToolBase.destroy`; To run code upon tool removal, connect to the `tool_removed_event` event.
- `backend_wx.RendererWx.offset_text_height`
- `backend_wx.error_msg_wx`
- `FigureCanvasBase.pick`; directly call *`Figure.pick`*, which has taken over the responsibility of checking the canvas widget lock as well.
- `FigureCanvasBase.resize`, which has no effect; use `FigureManagerBase.resize` instead.
- `FigureManagerMac.close`
- `FigureFrameWx.sizer`; use `frame.GetSizer()` instead.
- `FigureFrameWx.figmgr` and `FigureFrameWx.get_figure_manager`; use `frame.canvas.manager` instead.
- `FigureFrameWx.num`; use `frame.canvas.manager.num` instead.
- `FigureFrameWx.toolbar`; use `frame.GetToolBar()` instead.
- `FigureFrameWx.toolmanager`; use `frame.canvas.manager.toolmanager` instead.

Modules

The modules `matplotlib.afm`, `matplotlib.docstring`, `matplotlib.fontconfig_pattern`, `matplotlib.tight_bbox`, `matplotlib.tight_layout`, and `matplotlib.type1font` are considered internal and public access is deprecated.

`checkdep_usetex` deprecated

This method was only intended to disable tests in case no latex install was found. As such, it is considered to be private and for internal use only.

Please vendor the code if you need this.

`date_ticker_factory` deprecated

The `date_ticker_factory` method in the *`matplotlib.dates`* module is deprecated. Instead use *`AutoDateLocator`* and *`AutoDateFormatter`* for a more flexible and scalable locator and formatter.

If you need the exact `date_ticker_factory` behavior, please copy the code.

`dviread.find_tex_file` will raise `FileNotFoundError`

In the future, `dviread.find_tex_file` will raise a `FileNotFoundError` for missing files. Previously, it would return an empty string in such cases. Raising an exception allows attaching a user-friendly message instead. During the transition period, a warning is raised.

`transforms.Affine2D.identity()`

... is deprecated in favor of directly calling the *`Affine2D`* constructor with no arguments.

Deprecations in `testing.decorators`

The unused class `CleanupTestCase` and decorator `cleanup` are deprecated and will be removed. Vendor the code, including the private function `_cleanup_cm`.

The function `check_freetype_version` is considered internal and deprecated. Vendor the code of the private function `_check_freetype_version`.

`text.get_rotation()`

... is deprecated with no replacement. Copy the original implementation if needed.

Miscellaneous internals

- `axes_grid1.axes_size.AddList`; use `sum(sizes, start=Fixed(0))` (for example) to sum multiple size objects.
- `axes_size.Padded`; use `size + pad` instead
- `axes_size.SizeFromFunc`, `axes_size.GetExtentHelper`
- `AxisArtistHelper.delta1` and `AxisArtistHelper.delta2`
- `axislines.GridHelperBase.new_gridlines` and `axislines.Axes.new_gridlines`
- `cbook.maxdict`; use the standard library `functools.lru_cache` instead.

- `_DummyAxis.dataLim` and `_DummyAxis.viewLim`; use `get_data_interval()`, `set_data_interval()`, `get_view_interval()`, and `set_view_interval()` instead.
- `GridSpecBase.get_grid_positions(..., raw=True)`
- `ImageMagickBase.delay` and `ImageMagickBase.output_args`
- `MathtextBackend`, `MathtextBackendAgg`, `MathtextBackendPath`, `MathTextWarning`
- `TexManager.get_font_config`; it previously returned an internal hashed key for used for caching purposes.
- `TextToPath.get_texmanager`; directly construct a *texmanager.TexManager* instead.
- `ticker.is_close_to_int`; use `math.isclose(x, round(x))` instead.
- `ticker.is_decade`; use `y = numpy.log(x)/numpy.log(base); numpy.isclose(y, numpy.round(y))` instead.

Removals

The following deprecated APIs have been removed:

Removed behaviour

Stricter validation of function parameters

- Unknown keyword arguments to *Figure.savefig*, *pyplot.savefig*, and the `FigureCanvas.print_*` methods now raise a `TypeError`, instead of being ignored.
- Extra parameters to the *Axes* constructor, i.e., those other than *fig* and *rect*, are now keyword only.
- Passing arguments not specifically listed in the signatures of *Axes3D.plot_surface* and *Axes3D.plot_wireframe* is no longer supported; pass any extra arguments as keyword arguments instead.
- Passing positional arguments to *LineCollection* has been removed; use specific keyword argument names now.

`imread` no longer accepts URLs

Passing a URL to *imread()* has been removed. Please open the URL for reading and directly use the Pillow API (e.g., `PIL.Image.open(urllib.request.urlopen(url))`, or `PIL.Image.open(io.BytesIO(requests.get(url).content))`) instead.

MarkerStyle is immutable

The methods `MarkerStyle.set_fillstyle` and `MarkerStyle.set_marker` have been removed. Create a new *MarkerStyle* with the respective parameters instead.

Passing bytes to `FT2Font.set_text`

... is no longer supported. Pass `str` instead.

Support for passing tool names to `ToolManager.add_tool`

... has been removed. The second parameter to *`ToolManager.add_tool`* must now always be a tool class.

`backend_tools.ToolFullScreen` now inherits from `ToolBase`, not from `ToolToggleBase`

`ToolFullScreen` can only switch between the non-fullscreen and fullscreen states, but not unconditionally put the window in a given state; hence the `enable` and `disable` methods were misleadingly named. Thus, the *`ToolToggleBase`*-related API (`enable`, `disable`, etc.) was removed.

`BoxStyle._Base` and `transmute` method of box styles

... have been removed. Box styles implemented as classes no longer need to inherit from a base class.

Loaded modules logging

The list of currently loaded modules is no longer logged at the DEBUG level at Matplotlib import time, because it can produce extensive output and make other valuable DEBUG statements difficult to find. If you were relying on this output, please arrange for your own logging (the built-in `sys.modules` can be used to get the currently loaded modules).

Modules

- The `cbook.deprecation` module has been removed from the public API as it is considered internal.
- The `mpl_toolkits.axes_grid` module has been removed. All functionality from `mpl_toolkits.axes_grid` can be found in either *`mpl_toolkits.axes_grid1`* or *`mpl_toolkits.axisartist`*. Axes classes from `mpl_toolkits.axes_grid` based on `Axis` from *`mpl_toolkits.axisartist`* can be found in *`mpl_toolkits.axisartist`*.

Classes, methods and attributes

The following module-level classes/variables have been removed:

- `cm.cmap_d`
- `colorbar.colorbar_doc`, `colorbar.colorbar_kw_doc`
- `ColorbarPatch`
- `mathtext.Fonts` and all its subclasses
- `mathtext.FontConstantsBase` and all its subclasses

- `mathtext.latex_to_bakoma`, `mathtext.latex_to_cmex`, `mathtext.latex_to_standard`
- `mathtext.MathtextBackendPdf`, `mathtext.MathtextBackendPs`, `mathtext.MathtextBackendSvg`, `mathtext.MathtextBackendCairo`; use `.MathtextBackendPath` instead.
- `mathtext.Node` and all its subclasses
- `mathtext.NUM_SIZE_LEVELS`
- `mathtext.Parser`
- `mathtext.Ship`
- `mathtext.SHRINK_FACTOR` and `mathtext.GROW_FACTOR`
- `mathtext.stix_virtual_fonts`,
- `mathtext.tex2uni`
- `backend_pgf.TmpDirCleaner`
- `backend_ps.GraphicsContextPS`; use `GraphicsContextBase` instead.
- `backend_wx.IDLE_DELAY`
- `axes_grid1.parasite_axes.ParasiteAxesAuxTransBase`; use *ParasiteAxesBase* instead.
- `axes_grid1.parasite_axes.ParasiteAxesAuxTrans`; use *ParasiteAxes* instead.

The following class attributes have been removed:

- `Line2D.validCap` and `Line2D.validJoin`; validation is centralized in `rcsetup`.
- `Patch.validCap` and `Patch.validJoin`; validation is centralized in `rcsetup`.
- `renderer.M`, `renderer.eye`, `renderer.vvec`, `renderer.get_axis_position` placed on the Renderer during 3D Axes draw; these attributes are all available via *Axes3D*, which can be accessed via `self.axes` on all *Artist*s.
- `RendererPdf.mathtext_parser`, `RendererPS.mathtext_parser`, `RendererSVG.mathtext_parser`, `RendererCairo.mathtext_parser`
- `StandardPsFonts.pswriter`
- `Subplot.figbox`; use *Axes.get_position* instead.
- `Subplot.numRows`; `ax.get_gridspec().nrows` instead.
- `Subplot.numCols`; `ax.get_gridspec().ncols` instead.
- `SubplotDivider.figbox`
- `cids`, `cnt`, `observers`, `change_observers`, and `submit_observers` on all *Widget*s

The following class methods have been removed:

- `Axis.cla()`; use *Axis.clear* instead.

- `RadialAxis.cla()` and `ThetaAxis.cla()`; use *RadialAxis.clear* or *ThetaAxis.clear* instead.
- `Spine.cla()`; use *Spine.clear* instead.
- `ContourLabeler.get_label_coords()`; there is no replacement as it was considered an internal helper.
- `FancyArrowPatch.get_dpi_cor` and `FancyArrowPatch.set_dpi_cor`
- `FigureCanvas.get_window_title()` and `FigureCanvas.set_window_title()`; use *FigureManagerBase.get_window_title* or *FigureManagerBase.set_window_title* if using pyplot, or use GUI-specific methods if embedding.
- `FigureManager.key_press()` and `FigureManager.button_press()`; trigger the events directly on the canvas using `canvas.callbacks.process(event.name, event)` for key and button events.
- `RendererAgg.get_content_extents()` and `RendererAgg.tostring_rgba_minimized()`
- `NavigationToolbar2Wx.get_canvas()`
- `ParasiteAxesBase.update_viewlim()`; use `ParasiteAxesBase.apply_aspect` instead.
- `Subplot.get_geometry()`; use `SubplotBase.get_subplotspec` instead.
- `Subplot.change_geometry()`; use `SubplotBase.set_subplotspec` instead.
- `Subplot.update_params()`; this method did nothing.
- `Subplot.is_first_row()`; use `ax.get_subplotspec().is_first_row` instead.
- `Subplot.is_first_col()`; use `ax.get_subplotspec().is_first_col` instead.
- `Subplot.is_last_row()`; use `ax.get_subplotspec().is_last_row` instead.
- `Subplot.is_last_col()`; use `ax.get_subplotspec().is_last_col` instead.
- `SubplotDivider.change_geometry()`; use *SubplotDivider.set_subplotspec* instead.
- `SubplotDivider.get_geometry()`; use *SubplotDivider.get_subplotspec* instead.
- `SubplotDivider.update_params()`
- `get_depth`, `parse`, `to_mask`, `to_rgba`, and `to_png` of *MathTextParser*; use *mathtext.math_to_image* instead.
- `MovieWriter.cleanup()`; the cleanup logic is instead fully implemented in *MovieWriter.finish* and `cleanup` is no longer called.

Functions

The following functions have been removed;

- `backend_template.new_figure_manager()`, `backend_template.new_figure_manager_given_figure()`, and `backend_template.draw_if_interactive()` have been removed, as part of the introduction of the simplified backend API.
- Deprecation-related re-imports `cbook.deprecated()`, and `cbook.warn_deprecated()`.
- `colorbar.colorbar_factory()`; use *Colorbar* instead. `colorbar.make_axes_kw_doc()`
- `mathtext.Error()`
- `mathtext.ship()`
- `mathtext.tex2uni()`
- `axes_grid1.parasite_axes.parasite_axes_auxtrans_class_factory()`; use *parasite_axes_class_factory* instead.
- `sphinxext.plot_directive.align()`; use `docutils.parsers.rst.directives.images.Image.align` instead.

Arguments

The following arguments have been removed:

- *dpi* from `print_ps()` in the PS backend and `print_pdf()` in the PDF backend. Instead, the methods will obtain the DPI from the `savefig` machinery.
- *dpi_cor* from *FancyArrowPatch*
- *minimum_descent* from `TextArea`; it is now effectively always True
- *origin* from `FigureCanvasWx.gui_repaint()`
- *project* from `Line3DCollection.draw()`
- *renderer* from *Line3DCollection.do_3d_projection*, *Patch3D.do_3d_projection*, *PathPatch3D.do_3d_projection*, *Path3DCollection.do_3d_projection*, *Patch3DCollection.do_3d_projection*, *Poly3DCollection.do_3d_projection*
- *resize_callback* from the Tk backend; use `get_tk_widget().bind('<Configure>', ..., True)` instead.
- *return_all* from `gridspec.get_position()`
- Keyword arguments to `gca()`; there is no replacement.

rcParams

The setting *rcParams["ps.useafm"]* (default: `False`) no longer has any effect on *matplotlib.mathtext*.

Development changes

Increase to minimum supported versions of dependencies

For Matplotlib 3.6, the *minimum supported versions* are being bumped:

Dependency	min in mpl3.5	min in mpl3.6
Python	3.7	3.8
NumPy	1.17	1.19

This is consistent with our *Dependency version policy* and NEP29

Build setup options changes

The `gui_support.macosx` setup option has been renamed to `packages.macosx`.

New wheel architectures

Wheels have been added for:

- Python 3.11
- PyPy 3.8 and 3.9

Increase to required versions of documentation dependencies

sphinx >= 3.0 and numpydoc >= 1.0 are now required for building the documentation.

9.6 Version 3.5

9.6.1 What's new in Matplotlib 3.5.2 (May 02, 2022)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.5.2 (May 02, 2022)*
  - *Windows on ARM support*

Windows on ARM support

Preliminary support for Windows on arm64 target has been added; this requires FreeType 2.11 or above.

No binary wheels are available yet but it may be built from source.

9.6.2 What's new in Matplotlib 3.5.0 (Nov 15, 2021)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.5.0 (Nov 15, 2021)*
  - *Figure and Axes creation / management*
    - *`subplot_mosaic` supports simple Axes sharing*
    - *Figure now has `draw_without_rendering` method*
    - *Figure `__init__` passes keyword arguments through to set*
  - *Plotting methods*
    - *Add `Annulus` patch*
    - *`set_data` method for `FancyArrow` patch*
    - *New arrow styles in `ArrowStyle` and `ConnectionPatch`*
    - *Setting collection offset transform after initialization*
  - *Colors and colormaps*
    - *Colormap registry (experimental)*
    - *Image interpolation now possible at RGBA stage*
    - *`imshow` supports half-float arrays*
    - *A callback registry has been added to Normalize objects*
  - *Titles, ticks, and labels*
    - *Settings tick positions and labels simultaneously in `set_ticks`*
  - *Fonts and Text*
    - *Triple and quadruple dot mathtext accents*
    - *Font properties of legend title are configurable*
    - *`Text` and `TextBox` added* parse_math *option*
    - *Text can be positioned inside TextBox widget*
    - *Simplifying the font setting for usetex mode*

    - *Type 42 subsetting is now enabled for PDF/PS backends*
  - *rcParams improvements*
    - *Allow setting default legend labelcolor globally*
  - *3D Axes improvements*
    - *Axes3D now allows manual control of draw order*
    - *Allow changing the vertical axis in 3d plots*
    - `plot_surface` *supports masked arrays and NaNs*
    - *3D plotting methods support* data *keyword argument*
  - *Interactive tool improvements*
    - *Colorbars now have pan and zoom functionality*
    - *Updated the appearance of Slider widgets*
    - *Removing points on a PolygonSelector*
    - *Dragging selectors*
    - *Clearing selectors*
    - *Setting artist properties of selectors*
    - *Ignore events outside selection*
    - `CallbackRegistry` *objects gain a method to temporarily block signals*
    - *Directional sizing cursors*
  - *Sphinx extensions*
    - *More configuration of* `mathmpl` *sphinx extension*
  - *Backend-specific improvements*
    - *GTK backend*
    - *Qt backends*
    - *HiDPI support in Cairo-based, GTK, and Tk backends*
    - *Qt figure options editor improvements*
    - *WX backends support mouse navigation buttons*
    - *WebAgg uses asyncio instead of Tornado*
  - *Version information*

Figure and Axes creation / management

`subplot_mosaic` supports simple Axes sharing

Figure.subplot_mosaic, *pyplot.subplot_mosaic* support *simple* Axes sharing (i.e., only `True`/`False` may be passed to *sharex*/*sharey*). When `True`, tick label visibility and Axis units will be shared.

```
mosaic = [
    ['A', [['B', 'C'],
           ['D', 'E']]],
    ['F', 'G'],
]
fig = plt.figure(constrained_layout=True)
ax_dict = fig.subplot_mosaic(mosaic, sharex=True, sharey=True)
# All Axes use these scales after this call.
ax_dict['A'].set(xscale='log', yscale='logit')
```

Figure now has `draw_without_rendering` method

Some aspects of a figure are only determined at draw-time, such as the exact position of text artists or deferred computation like automatic data limits. If you need these values, you can use `figure.canvas.draw()` to force a full draw. However, this has side effects, sometimes requires an open file, and is doing more work than is needed.

The new *Figure.draw_without_rendering* method runs all the updates that `draw()` does, but skips rendering the figure. It's thus more efficient if you need the updated values to configure further aspects of the figure.

Figure `__init__` passes keyword arguments through to set

Similar to many other sub-classes of *Artist*, the *FigureBase*, *SubFigure*, and *Figure* classes will now pass any additional keyword arguments to *set* to allow properties of the newly created object to be set at initialization time. For example:

```
from matplotlib.figure import Figure
fig = Figure(label='my figure')
```

Plotting methods

Add `Annulus` patch

Annulus is a new class for drawing elliptical annuli.

`set_data` method for `FancyArrow` patch

FancyArrow, the patch returned by `ax.arrow`, now has a `set_data` method that allows modifying the arrow after creation, e.g., for animation.

New arrow styles in `ArrowStyle` and `ConnectionPatch`

The new *arrow* parameter to *ArrowStyle* substitutes the use of the *beginarrow* and *endarrow* parameters in the creation of arrows. It receives arrows strings like `'<-'`, `']-['` and `']->'` instead of individual booleans.

Two new styles `']->'` and `'<-['` are also added via this mechanism. *ConnectionPatch*, which accepts arrow styles though its *arrowstyle* parameter, also accepts these new styles.

Setting collection offset transform after initialization

The added *collections.Collection.set_offset_transform* may be used to set the offset transform after initialization. This can be helpful when creating a *collections.Collection* outside an Axes object, and later adding it with *Axes.add_collection()* and setting the offset transform to `Axes.transData`.

Colors and colormaps

Colormap registry (experimental)

Colormaps are now managed via *matplotlib.colormaps* (or *pyplot.colormaps*), which is a *ColormapRegistry*. While we are confident that the API is final, we formally mark it as experimental for 3.5 because we want to keep the option to still modify the API for 3.6 should the need arise.

Colormaps can be obtained using item access:

```
import matplotlib.pyplot as plt
cmap = plt.colormaps['viridis']
```

To register new colormaps use:

```
plt.colormaps.register(my_colormap)
```

We recommend to use the new API instead of the `matplotlib.cm.get_cmap` and `matplotlib.cm.register_cmap` functions for new code. `matplotlib.cm.get_cmap` and `matplotlib.cm.register_cmap` will eventually be deprecated and removed. Within *pyplot*, `plt.get_cmap()` and `plt.register_cmap()` will continue to be supported for backward compatibility.

Image interpolation now possible at RGBA stage

Images in Matplotlib created via *imshow* are resampled to match the resolution of the current canvas. It is useful to apply an auto-aliasing filter when downsampling to reduce Moiré effects. By default, interpolation is done on the data, a norm applied, and then the colormapping performed.

However, it is often desirable for the anti-aliasing interpolation to happen in RGBA space, where the colors are interpolated rather than the data. This usually leads to colors outside the colormap, but visually blends adjacent colors, and is what browsers and other image processing software do.

A new keyword argument *interpolation_stage* is provided for *imshow* to set the stage at which the anti-aliasing interpolation happens. The default is the current behaviour of "data", with the alternative being "rgba" for the newly-available behavior.

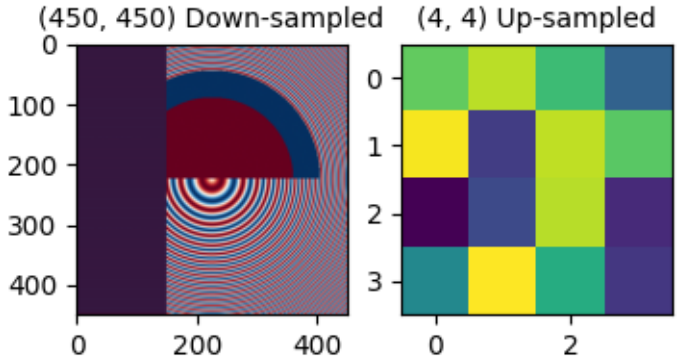


Fig. 1: Example of the interpolation stage options.

For more details see the discussion of the new keyword argument in *Image resampling*.

`imshow` supports half-float arrays

The *imshow* method now supports half-float arrays, i.e., NumPy arrays with dtype `np.float16`.

A callback registry has been added to Normalize objects

colors.Normalize objects now have a callback registry, `callbacks`, that can be connected to by other objects to be notified when the norm is updated. The callback emits the key `changed` when the norm is modified. *cm.ScalarMappable* is now a listener and will register a change when the norm's vmin, vmax or other attributes are changed.

Titles, ticks, and labels

Settings tick positions and labels simultaneously in `set_ticks`

Axis.set_ticks (and the corresponding *Axes.set_xticks* / *Axes.set_yticks*) has a new parameter *labels* allowing to set tick positions and labels simultaneously.

Previously, setting tick labels was done using *Axis.set_ticklabels* (or the corresponding *Axes.set_xticklabels* / *Axes.set_yticklabels*); this usually only makes sense if tick positions were previously fixed with *set_ticks*:

```
ax.set_xticks([1, 2, 3])
ax.set_xticklabels(['a', 'b', 'c'])
```

The combined functionality is now available in *set_ticks*:

```
ax.set_xticks([1, 2, 3], ['a', 'b', 'c'])
```

The use of *Axis.set_ticklabels* is discouraged, but it will stay available for backward compatibility.

Note: This addition makes the API of *set_ticks* also more similar to *pyplot.xticks* / *pyplot.yticks*, which already had the additional *labels* parameter.

Fonts and Text

Triple and quadruple dot mathtext accents

In addition to single and double dot accents, mathtext now supports triple and quadruple dot accents.

```
fig = plt.figure(figsize=(3, 1))
fig.text(0.5, 0.5, r'$\dot{a} \ddot{b} \dddot{c} \ddddot{d}$',␣
 ↪fontsize=40,
         horizontalalignment='center', verticalalignment='center')
```

Font properties of legend title are configurable

Title's font properties can be set via the *title_fontproperties* keyword argument, for example:

`Text` and `TextBox` added *parse_math* option

Text and *TextBox* objects now allow a *parse_math* keyword-only argument which controls whether math should be parsed from the displayed string. If *True*, the string will be parsed as a math text object. If *False*, the string will be considered a literal and no parsing will occur.

Text can be positioned inside TextBox widget

A new parameter called *textalignment* can be used to control for the position of the text inside the Axes of the *TextBox* widget.

Simplifying the font setting for usetex mode

Now the *rcParams["font.family"]* (default: `['sans-serif']`) accepts some font names as value for a more user-friendly setup.

```
plt.rcParams.update({
    "text.usetex": True,
    "font.family": "Helvetica"
})
```

Type 42 subsetting is now enabled for PDF/PS backends

backend_pdf and *backend_ps* now use a unified Type 42 font subsetting interface, with the help of fontTools

Set *rcParams["pdf.fonttype"]* (default: 3) or *rcParams["ps.fonttype"]* (default: 3) to 42 to trigger this workflow:

```
# for PDF backend
plt.rcParams['pdf.fonttype'] = 42

# for PS backend
plt.rcParams['ps.fonttype'] = 42

fig, ax = plt.subplots()
ax.text(0.4, 0.5, 'subsetted document is smaller in size!')

fig.savefig("document.pdf")
fig.savefig("document.ps")
```

rcParams improvements

Allow setting default legend labelcolor globally

A new *rcParams["legend.labelcolor"]* (default: 'None') sets the default *labelcolor* argument for *Figure.legend*. The special values 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec') will cause the legend text to match the corresponding color of marker.

3D Axes improvements

Axes3D now allows manual control of draw order

The *Axes3D* class now has *computed_zorder* parameter. When set to False, Artists are drawn using their `zorder` attribute.

Allow changing the vertical axis in 3d plots

view_init now has the parameter *vertical_axis* which allows switching which axis is aligned vertically.

`plot_surface` supports masked arrays and NaNs

axes3d.Axes3D.plot_surface supports masked arrays and NaNs, and will now hide quads that contain masked or NaN points. The behaviour is similar to *Axes.contour* with `corner_mask=True`.

3D plotting methods support *data* keyword argument

To match all 2D plotting methods, the 3D Axes now support the *data* keyword argument. This allows passing arguments indirectly from a DataFrame-like structure.

```
data = {  # A labelled data set, or e.g., Pandas DataFrame.
    'x': ...,
    'y': ...,
    'z': ...,
    'width': ...,
    'depth': ...,
    'top': ...,
}

fig, ax = plt.subplots(subplot_kw={'projection': '3d'})
ax.bar3d('x', 'y', 'z', 'width', 'depth', 'top', data=data)
```

Interactive tool improvements

Colorbars now have pan and zoom functionality

Interactive plots with colorbars can now be zoomed and panned on the colorbar axis. This adjusts the *vmin* and *vmax* of the `ScalarMappable` associated with the colorbar. This is currently only enabled for continuous norms. Norms used with contourf and categoricals, such as `BoundaryNorm` and `NoNorm`, have the interactive capability disabled by default. `cb.ax.set_navigate()` can be used to set whether a colorbar axes is interactive or not.

Updated the appearance of Slider widgets

The appearance of *`Slider`* and *`RangeSlider`* widgets were updated and given new styling parameters for the added handles.

Removing points on a PolygonSelector

After completing a *`PolygonSelector`*, individual points can now be removed by right-clicking on them.

Dragging selectors

The *`SpanSelector`*, *`RectangleSelector`* and *`EllipseSelector`* have a new keyword argument, *drag_from_anywhere*, which when set to `True` allows you to click and drag from anywhere inside the selector to move it. Previously it was only possible to move it by either activating the move modifier button, or clicking on the central handle.

The size of the *`SpanSelector`* can now be changed using the edge handles.

Clearing selectors

The selectors (*EllipseSelector*, *LassoSelector*, *PolygonSelector*, *RectangleSelector*, and *SpanSelector*) have a new method *clear*, which will clear the current selection and get the selector ready to make a new selection. This is equivalent to pressing the *escape* key.

Setting artist properties of selectors

The artist properties of the *EllipseSelector*, *LassoSelector*, *PolygonSelector*, *RectangleSelector* and *SpanSelector* selectors can be changed using the `set_props` and `set_handle_props` methods.

Ignore events outside selection

The *EllipseSelector*, *RectangleSelector* and *SpanSelector* selectors have a new keyword argument, *ignore_event_outside*, which when set to `True` will ignore events outside of the current selection. The handles or the new dragging functionality can instead be used to change the selection.

`CallbackRegistry` objects gain a method to temporarily block signals

The context manager *blocked* can be used to block callback signals from being processed by the `CallbackRegistry`. The optional keyword, *signal*, can be used to block a specific signal from being processed and let all other signals pass.

```
import matplotlib.pyplot as plt

fig, ax = plt.subplots()
ax.imshow([[0, 1], [2, 3]])

# Block all interactivity through the canvas callbacks
with fig.canvas.callbacks.blocked():
    plt.show()

fig, ax = plt.subplots()
ax.imshow([[0, 1], [2, 3]])

# Only block key press events
with fig.canvas.callbacks.blocked(signal="key_press_event"):
    plt.show()
```

Directional sizing cursors

Canvases now support setting directional sizing cursors, i.e., horizontal and vertical double arrows. These are used in e.g., selector widgets. Try the *Mouse Cursor* example to see the cursor in your desired backend.

Sphinx extensions

More configuration of `mathmpl` sphinx extension

The *matplotlib.sphinxext.mathmpl* sphinx extension supports two new configuration options that may be specified in your `conf.py`:

- `mathmpl_fontsize` (float), which sets the font size of the math text in points;
- `mathmpl_srcset` (list of str), which provides a list of sizes to support responsive resolution images The list should contain additional x-descriptors (`'1.5x'`, `'2x'`, etc.) to generate (1x is the default and always included.)

Backend-specific improvements

GTK backend

A backend supporting GTK4 has been added. Both Agg and Cairo renderers are supported. The GTK4 backends may be selected as GTK4Agg or GTK4Cairo.

Qt backends

Support for Qt6 (using either PyQt6 or PySide6) has been added, with either the Agg or Cairo renderers. Simultaneously, support for Qt4 has been dropped. Both Qt6 and Qt5 are supported by a combined backend (QtAgg or QtCairo), and the loaded version is determined by modules already imported, the *QT_API* environment variable, and available packages. See *Qt Bindings* for details. The versioned Qt5 backend names (Qt5Agg or Qt5Cairo) remain supported for backwards compatibility.

HiDPI support in Cairo-based, GTK, and Tk backends

The GTK3 backends now support HiDPI fully, including mixed monitor cases (on Wayland only). The newly added GTK4 backends also support HiDPI.

The TkAgg backend now supports HiDPI **on Windows only**, including mixed monitor cases.

All Cairo-based backends correctly support HiDPI as well as their Agg counterparts did (i.e., if the toolkit supports HiDPI, then the *Cairo backend will now support it, but not otherwise.)

Qt figure options editor improvements

The figure options editor in the Qt backend now also supports editing the left and right titles (plus the existing centre title). Editing Axis limits is better supported when using a date converter. The `symlog` option is now available in Axis scaling options. All entries with the same label are now shown in the Curves tab.

WX backends support mouse navigation buttons

The WX backends now support navigating through view states using the mouse forward/backward buttons, as in other backends.

WebAgg uses asyncio instead of Tornado

The WebAgg backend defaults to using `asyncio` over Tornado for timer support. This allows using the WebAgg backend in JupyterLite.

Version information

We switched to the release-branch-semver version scheme of setuptools-scm. This only affects the version information for development builds. Their version number now describes the targeted release, i.e. 3.5.0.dev820+g6768ef8c4c is 820 commits after the previous release and is scheduled to be officially released as 3.5.0 later.

In addition to the string `__version__`, there is now a namedtuple `__version_info__` as well, which is modelled after sys.version_info. Its primary use is safely comparing version information, e.g. `if __version_info__ >= (3, 4, 2)`.

9.6.3 API Changes for 3.5.3

- *Passing* linefmt *positionally is undeprecated*

Passing *linefmt* positionally is undeprecated

Positional use of all formatting parameters in *stem* has been deprecated since Matplotlib 3.5. This deprecation is relaxed so that one can still pass *linefmt* positionally, i.e. `stem(x, y, 'r')`.

9.6.4 API Changes for 3.5.2

- *QuadMesh mouseover defaults to False*

QuadMesh mouseover defaults to False

New in 3.5, *QuadMesh.get_cursor_data* allows display of data values under the cursor. However, this can be very slow for large meshes, so by `.QuadMesh.set_mouseover` defaults to *False*.

9.6.5 API Changes for 3.5.0

- *Behaviour changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behaviour changes

First argument to `subplot_mosaic` renamed

Both *Figure.subplot_mosaic*, and *pyplot.subplot_mosaic* have had the first positional argument renamed from *layout* to *mosaic*. As we have consolidated the *constrained_layout* and *tight_layout* keyword arguments in the Figure creation functions of *pyplot* into a single *layout* keyword argument, the original `subplot_mosaic` argument name would collide.

As this API is provisional, we are changing this argument name with no deprecation period.

`Axes` children are no longer separated by type

Formerly, *axes.Axes* children were separated by *Artist* type, into sublists such as `Axes.lines`. For methods that produced multiple elements (such as *Axes.errorbar*), though individual parts would have similar *zorder*, this separation might cause them to be drawn at different times, causing inconsistent results when overlapping other Artists.

Now, the children are no longer separated by type, and the sublist properties are generated dynamically when accessed. Consequently, Artists will now always appear in the correct sublist; e.g., if *axes.Axes.add_line* is called on a *Patch*, it will appear in the `Axes.patches` sublist, *not* `Axes.lines`. The `Axes.add_*` methods will now warn if passed an unexpected type.

Modification of the following sublists is still accepted, but deprecated:

- `Axes.artists`
- `Axes.collections`
- `Axes.images`
- `Axes.lines`
- `Axes.patches`
- `Axes.tables`
- `Axes.texts`

To remove an Artist, use its *Artist.remove* method. To add an Artist, use the corresponding `Axes.add_*` method.

`MatplotlibDeprecationWarning` now subclasses `DeprecationWarning`

Historically, it has not been possible to filter *MatplotlibDeprecationWarning*s by checking for `DeprecationWarning`, since we subclass `UserWarning` directly.

The decision to not subclass `DeprecationWarning` has to do with a decision from core Python in the 2.x days to not show `DeprecationWarning`s to users. However, there is now a more sophisticated filter in place (see https://www.python.org/dev/peps/pep-0565/).

Users will now see *MatplotlibDeprecationWarning* only during interactive sessions, and these can be silenced by the standard mechanism:

```
warnings.filterwarnings("ignore", category=DeprecationWarning)
```

Library authors must now enable `DeprecationWarning`s explicitly in order for (non-interactive) CI/CD pipelines to report back these warnings, as is standard for the rest of the Python ecosystem:

```
warnings.filterwarnings("always", DeprecationWarning)
```

`Artist.set` applies artist properties in the order in which they are given

The change only affects the interaction between the *color*, *edgecolor*, *facecolor*, and (for *Collection*s) *alpha* properties: the *color* property now needs to be passed first in order not to override the other properties. This is consistent with e.g. *Artist.update*, which did not reorder the properties passed to it.

`pcolor(mesh)` shading defaults to auto

The *shading* keyword argument for *Axes.pcolormesh* and *Axes.pcolor* default has been changed to 'auto'.

Passing `Z(M, N), x(N), y(M)` to `pcolormesh` with `shading='flat'` will now raise a `TypeError`. Use `shading='auto'` or `shading='nearest'` for `x` and `y` to be treated as cell centers, or drop the last column and row of `Z` to get the old behaviour with `shading='flat'`.

Colorbars now have pan and zoom functionality

Interactive plots with colorbars can now be zoomed and panned on the colorbar axis. This adjusts the *vmin* and *vmax* of the *ScalarMappable* associated with the colorbar. This is currently only enabled for continuous norms. Norms used with `contourf` and categoricals, such as *BoundaryNorm* and *NoNorm*, have the interactive capability disabled by default. *cb.ax.set_navigate()* can be used to set whether a colorbar axes is interactive or not.

Colorbar lines no longer clipped

If a colorbar has lines added to it (e.g. for contour lines), these will no longer be clipped. This is an improvement for lines on the edge of the colorbar, but could lead to lines off the colorbar if the limits of the colorbar are changed.

`Figure.suppressComposite` now also controls compositing of Axes images

The output of `NonUniformImage` and `PcolorImage` has changed

Pixel-level differences may be observed in images generated using *NonUniformImage* or *PcolorImage*, typically for pixels exactly at the boundary between two data cells (no user-facing axes method currently generates *NonUniformImage*s, and only *pcolorfast* can generate *PcolorImage*s). These artists are also now slower, normally by ~1.5x but sometimes more (in particular for `NonUniformImage(interpolation="bilinear")`. This slowdown arises from fixing occasional floating point inaccuracies.

Change of the (default) legend handler for `Line2D` instances

The default legend handler for Line2D instances (*HandlerLine2D*) now consistently exposes all the attributes and methods related to the line marker (#11358). This makes it easy to change the marker features after instantiating a legend.

```
import matplotlib.pyplot as plt

fig, ax = plt.subplots()

ax.plot([1, 3, 2], marker="s", label="Line", color="pink", mec="red",␣
 ↪ms=8)
leg = ax.legend()

leg.legendHandles[0].set_color("lightgray")
leg.legendHandles[0].set_mec("black")   # marker edge color
```

The former legend handler for Line2D objects has been renamed *HandlerLine2DCompound*. To revert to the previous behaviour, one can use

```
import matplotlib.legend as mlegend
from matplotlib.legend_handler import HandlerLine2DCompound
from matplotlib.lines import Line2D

mlegend.Legend.update_default_handler_map({Line2D:␣
 ↪HandlerLine2DCompound()})
```

Setting `Line2D` marker edge/face color to *None* use rcParams

`Line2D.set_markeredgecolor(None)` and `Line2D.set_markerfacecolor(None)` now set the line property using the corresponding rcParam (*rcParams["lines.markeredgecolor"]* (default: `'auto'`) and *rcParams["lines.markerfacecolor"]* (default: `'auto'`)). This is consistent with other *Line2D* property setters.

Default theta tick locations for wedge polar plots have changed

For polar plots that don't cover a full circle, the default theta tick locations are now at multiples of 10°, 15°, 30°, 45°, 90°, rather than using values that mostly make sense for linear plots (20°, 25°, etc.).

`axvspan` now plots full wedges in polar plots

... rather than triangles.

Convenience converter from `Scale` to `Normalize` now public

Downstream libraries can take advantage of *colors.make_norm_from_scale* to create a *Normalize* subclass directly from an existing scale. Usually norms have a scale, and the advantage of having a *ScaleBase* attached to a norm is to provide a scale, and associated tick locators and formatters, for the colorbar.

`ContourSet` always use `PathCollection`

In order to correct rendering issues with closed loops, the *ContourSet* now creates a *PathCollection* instead of a *LineCollection* for line contours. This type matches the artist used for filled contours.

This affects *ContourSet* itself and its subclasses, *QuadContourSet* (returned by *Axes.contour*), and *TriContourSet* (returned by *Axes.tricontour*).

`hatch.SmallFilledCircles` inherits from `hatch.Circles`

The *hatch.SmallFilledCircles* class now inherits from *hatch.Circles* rather than from *hatch.SmallCircles*.

hexbin with a log norm

hexbin no longer (incorrectly) adds 1 to every bin value if a log norm is being used.

Setting invalid `rcParams["date.converter"]` now raises ValueError

Previously, invalid values passed to *rcParams["date.converter"]* (default: `'auto'`) would be ignored with a `UserWarning`, but now raise `ValueError`.

`Text` and `TextBox` added *parse_math* option

Text and *TextBox* objects now allow a *parse_math* keyword-only argument which controls whether math should be parsed from the displayed string. If *True*, the string will be parsed as a math text object. If *False*, the string will be considered a literal and no parsing will occur.

For *Text*, this argument defaults to *True*. For *TextBox* this argument defaults to *False*.

`Type1Font` objects now decrypt the encrypted part

Type 1 fonts have a large part of their code encrypted as an obsolete copy-protection measure. This part is now available decrypted as the `decrypted` attribute of `matplotlib.type1font.Type1Font`. This decrypted data is not yet parsed, but this is a prerequisite for implementing subsetting.

3D contourf polygons placed between levels

The polygons used in a 3D *contourf* plot are now placed halfway between the contour levels, as each polygon represents the location of values that lie between two levels.

`AxesDivider` now defaults to rcParams-specified pads

AxesDivider.append_axes, `AxesDivider.new_horizontal`, and `AxesDivider.new_vertical` now default to paddings specified by *rcParams["figure.subplot.wspace"]* (default: `0.2`) and *rcParams["figure.subplot.hspace"]* (default: `0.2`) rather than zero.

Deprecations

Discouraged: `Figure` parameters *tight_layout* and *constrained_layout*

The `Figure` parameters *tight_layout* and *constrained_layout* are triggering competing layout mechanisms and thus should not be used together.

To make the API clearer, we've merged them under the new parameter *layout* with values 'constrained' (equal to `constrained_layout=True`), 'tight' (equal to `tight_layout=True`). If given, *layout* takes precedence.

The use of *tight_layout* and *constrained_layout* is discouraged in favor of *layout*. However, these parameters will stay available for backward compatibility.

Modification of `Axes` children sublists

See *Axes children are no longer separated by type* for more information; modification of the following sublists is deprecated:

- `Axes.artists`
- `Axes.collections`
- `Axes.images`
- `Axes.lines`
- `Axes.patches`
- `Axes.tables`
- `Axes.texts`

To remove an Artist, use its *Artist.remove* method. To add an Artist, use the corresponding `Axes.add_*` method.

Passing incorrect types to `Axes.add_*` methods

The following `Axes.add_*` methods will now warn if passed an unexpected type. See their documentation for the types they expect.

- *Axes.add_collection*

- *Axes.add_image*
- *Axes.add_line*
- *Axes.add_patch*
- *Axes.add_table*

Discouraged: `plot_date`

The use of *plot_date* is discouraged. This method exists for historic reasons and may be deprecated in the future.

- `datetime`-like data should directly be plotted using *plot*.
- If you need to plot plain numeric data as *Matplotlib date format* or need to set a timezone, call `ax.xaxis.axis_date` / `ax.yaxis.axis_date` before *plot*. See *Axis.axis_date*.

`epoch2num` and `num2epoch` are deprecated

These methods convert from unix timestamps to matplotlib floats, but are not used internally to matplotlib, and should not be needed by end users. To convert a unix timestamp to datetime, simply use `datetime.datetime.utcfromtimestamp`, or to use NumPy `datetime64` `dt = np.datetime64(e*1e6, 'us')`.

Auto-removal of grids by `pcolor` and `pcolormesh`

pcolor and *pcolormesh* currently remove any visible axes major grid. This behavior is deprecated; please explicitly call `ax.grid(False)` to remove the grid.

The first parameter of `Axes.grid` and `Axis.grid` has been renamed to *visible*

The parameter was previously named *b*. This deprecation only matters if that parameter was passed using a keyword argument, e.g. `grid(b=False)`.

Unification and cleanup of Selector widget API

The API for Selector widgets has been unified to use:

- *props* for the properties of the Artist representing the selection.
- *handle_props* for the Artists representing handles for modifying the selection.
- *grab_range* for the maximal tolerance to grab a handle with the mouse.

Additionally, several internal parameters and attribute have been deprecated with the intention of keeping them private.

RectangleSelector and EllipseSelector

The *drawtype* keyword argument to `RectangleSelector` is deprecated. In the future the only behaviour will be the default behaviour of `drawtype='box'`.

Support for `drawtype=line` will be removed altogether as it is not clear which points are within and outside a selector that is just a line. As a result, the *lineprops* keyword argument to `RectangleSelector` is also deprecated.

To retain the behaviour of `drawtype='none'`, use `rectprops={'visible': False}` to make the drawn `Rectangle` invisible.

Cleaned up attributes and arguments are:

- The `active_handle` attribute has been privatized and deprecated.
- The `drawtype` attribute has been privatized and deprecated.
- The `eventpress` attribute has been privatized and deprecated.
- The `eventrelease` attribute has been privatized and deprecated.
- The `interactive` attribute has been privatized and deprecated.
- The *marker_props* argument is deprecated, use *handle_props* instead.
- The *maxdist* argument is deprecated, use *grab_range* instead.
- The *rectprops* argument is deprecated, use *props* instead.
- The `rectprops` attribute has been privatized and deprecated.
- The `state` attribute has been privatized and deprecated.
- The `to_draw` attribute has been privatized and deprecated.

PolygonSelector

- The *line* attribute is deprecated. If you want to change the selector artist properties, use the `set_props` or `set_handle_props` methods.
- The *lineprops* argument is deprecated, use *props* instead.
- The *markerprops* argument is deprecated, use *handle_props* instead.
- The *maxdist* argument and attribute is deprecated, use *grab_range* instead.
- The *vertex_select_radius* argument and attribute is deprecated, use *grab_range* instead.

SpanSelector

- The `active_handle` attribute has been privatized and deprecated.
- The `eventpress` attribute has been privatized and deprecated.
- The `eventrelease` attribute has been privatized and deprecated.
- The *maxdist* argument and attribute is deprecated, use *grab_range* instead.

- The `pressv` attribute has been privatized and deprecated.
- The `prev` attribute has been privatized and deprecated.
- The `rect` attribute has been privatized and deprecated.
- The *rectprops* argument is deprecated, use *props* instead.
- The `rectprops` attribute has been privatized and deprecated.
- The *span_stays* argument is deprecated, use the *interactive* argument instead.
- The `span_stays` attribute has been privatized and deprecated.
- The `state` attribute has been privatized and deprecated.

LassoSelector

- The *lineprops* argument is deprecated, use *props* instead.
- The `onpress` and `onrelease` methods are deprecated. They are straight aliases for `press` and `release`.

`ConversionInterface.convert` no longer needs to accept unitless values

Previously, custom subclasses of *units.ConversionInterface* needed to implement a `convert` method that not only accepted instances of the unit, but also unitless values (which are passed through as is). This is no longer the case (`convert` is never called with a unitless value), and such support in *StrCategoryConverter* is deprecated. Likewise, the `.ConversionInterface.is_numlike` helper is deprecated.

Consider calling *Axis.convert_units* instead, which still supports unitless values.

Locator and Formatter wrapper methods

The `set_view_interval`, `set_data_interval` and `set_bounds` methods of *Locator*s and *Formatter*s (and their common base class, TickHelper) are deprecated. Directly manipulate the view and data intervals on the underlying axis instead.

Unused positional parameters to `print_<fmt>` methods

None of the `print_<fmt>` methods implemented by canvas subclasses used positional arguments other that the first (the output filename or file-like), so these extra parameters are deprecated.

`QuadMesh` signature

The *QuadMesh* signature

```
def __init__(meshWidth, meshHeight, coordinates,
             antialiased=True, shading='flat', **kwargs)
```

is deprecated and replaced by the new signature

```
def __init__(coordinates, *, antialiased=True, shading='flat',␣
↪**kwargs)
```

In particular:

- The *coordinates* argument must now be a (M, N, 2) array-like. Previously, the grid shape was separately specified as (*meshHeight* + 1, *meshWidth* + 1) and *coordinates* could be an array-like of any shape with M * N * 2 elements.
- All parameters except *coordinates* are keyword-only now.

rcParams will no longer cast inputs to str

After a deprecation period, rcParams that expect a (non-pathlike) str will no longer cast non-str inputs using `str`. This will avoid confusing errors in subsequent code if e.g. a list input gets implicitly cast to a str.

Case-insensitive scales

Previously, scales could be set case-insensitively (e.g., `set_xscale("LoG")`). This is deprecated; all builtin scales use lowercase names.

Interactive cursor details

Setting a mouse cursor on a window has been moved from the toolbar to the canvas. Consequently, several implementation details on toolbars and within backends have been deprecated.

`NavigationToolbar2.set_cursor` and `backend_tools.SetCursorBase.set_cursor`

Instead, use the *`FigureCanvasBase.set_cursor`* method on the canvas (available as the `canvas` attribute on the toolbar or the Figure.)

`backend_tools.SetCursorBase` and subclasses

`backend_tools.SetCursorBase` was subclassed to provide backend-specific implementations of `set_cursor`. As that is now deprecated, the subclassing is no longer necessary. Consequently, the following subclasses are also deprecated:

- `matplotlib.backends.backend_gtk3.SetCursorGTK3`
- `matplotlib.backends.backend_qt5.SetCursorQt`
- `matplotlib.backends._backend_tk.SetCursorTk`
- `matplotlib.backends.backend_wx.SetCursorWx`

Instead, use the *`backend_tools.ToolSetCursor`* class.

`cursord` in GTK, Qt, and wx backends

The `backend_gtk3.cursord`, `backend_qt.cursord`, and `backend_wx.cursord` dictionaries are deprecated. This makes the GTK module importable on headless environments.

Miscellaneous deprecations

- `is_url` and `URL_REGEX` are deprecated. (They were previously defined in the toplevel *matplotlib* module.)
- The `ArrowStyle.beginarrow` and `ArrowStyle.endarrow` attributes are deprecated; use the `arrow` attribute to define the desired heads and tails of the arrow.
- `backend_pgf.LatexManager.str_cache` is deprecated.
- `backends.qt_compat.ETS` and `backends.qt_compat.QT_RC_MAJOR_VERSION` are deprecated, with no replacement.
- The `blocking_input` module has been deprecated. Instead, use `canvas.start_event_loop()` and `canvas.stop_event_loop()` while connecting event callbacks as needed.
- `cbook.report_memory` is deprecated; use `psutil.virtual_memory` instead.
- `cm.LUTSIZE` is deprecated. Use *rcParams["image.lut"]* (default: `256`) instead. This value only affects colormap quantization levels for default colormaps generated at module import time.
- `Collection.__init__` previously ignored *transOffset* without *offsets* also being specified. In the future, *transOffset* will begin having an effect regardless of *offsets*. In the meantime, if you wish to set *transOffset*, call *Collection.set_offset_transform* explicitly.
- `Colorbar.patch` is deprecated; this attribute is not correctly updated anymore.
- `ContourLabeler.get_label_width` is deprecated.
- `dviread.PsfontsMap` now raises LookupError instead of KeyError for missing fonts.
- `Dvi.baseline` is deprecated (with no replacement).
- The *format* parameter of `dviread.find_tex_file` is deprecated (with no replacement).
- `FancyArrowPatch.get_path_in_displaycoord` and `ConnectionPatch.get_path_in_displaycoord` are deprecated. The path in display coordinates can still be obtained, as for other patches, using `patch.get_transform().transform_path(patch.get_path())`.
- The `font_manager.win32InstalledFonts` and `font_manager.get_fontconfig_fonts` helper functions have been deprecated.
- All parameters of `imshow` starting from *aspect* will become keyword-only.
- `QuadMesh.convert_mesh_to_paths` and `QuadMesh.convert_mesh_to_triangles` are deprecated. `QuadMesh.get_paths()` can be used as an alternative for the former; there is no replacement for the latter.

- `ScalarMappable.callbacksSM` is deprecated. Use `ScalarMappable.callbacks` instead.
- `streamplot.get_integrator` is deprecated.
- `style.core.STYLE_FILE_PATTERN`, `style.core.load_base_library`, and `style.core.iter_user_libraries` are deprecated.
- `SubplotParams.validate` is deprecated. Use *SubplotParams.update* to change *SubplotParams* while always keeping it in a valid state.
- The `grey_arrayd`, `font_family`, `font_families`, and `font_info` attributes of *TexManager* are deprecated.
- `Text.get_prop_tup` is deprecated with no replacements (because the *Text* class cannot know whether a backend needs to update cache e.g. when the text's color changes).
- `Tick.apply_tickdir` didn't actually update the tick markers on the existing Line2D objects used to draw the ticks and is deprecated; use *Axis.set_tick_params* instead.
- `tight_layout.auto_adjust_subplotpars` is deprecated.
- The `grid_info` attribute of `axisartist` classes has been deprecated.
- `axisartist.clip_path` is deprecated with no replacement.
- `axes_grid1.axes_grid.CbarAxes` and `axes_grid1.axisartist.CbarAxes` are deprecated (they are now dynamically generated based on the owning axes class).
- The `axes_grid1.Divider.get_vsize_hsize` and `axes_grid1.Grid.get_vsize_hsize` methods are deprecated. Copy their implementations if needed.
- `AxesDivider.append_axes(..., add_to_figure=False)` is deprecated. Use `ax.remove()` to remove the Axes from the figure if needed.
- `FixedAxisArtistHelper.change_tick_coord` is deprecated with no replacement.
- `floating_axes.GridHelperCurveLinear.get_boundary` is deprecated, with no replacement.
- `ParasiteAxesBase.get_images_artists` has been deprecated.
- The "units finalize" signal (previously emitted by Axis instances) is deprecated. Connect to "units" instead.
- Passing formatting parameters positionally to `stem()` is deprecated

`plot_directive` deprecations

The `:encoding:` option to `.. plot` directive has had no effect since Matplotlib 1.3.1, and is now deprecated.

The following helpers in *matplotlib.sphinxext.plot_directive* are deprecated:

- `unescape_doctest` (use `doctest.script_from_examples` instead),
- `split_code_at_show`,

- `run_code`.

Testing support

`matplotlib.test()` is deprecated

Run tests using `pytest` from the commandline instead. The variable `matplotlib.default_test_modules` is only used for `matplotlib.test()` and is thus deprecated as well.

To test an installed copy, be sure to specify both `matplotlib` and `mpl_toolkits` with `--pyargs`:

```
pytest --pyargs matplotlib.tests mpl_toolkits.tests
```

See *Testing* for more details.

Unused pytest fixtures and markers

The fixture `matplotlib.testing.conftest.mpl_image_comparison_parameters` is not used internally by Matplotlib. If you use this please copy it into your code base.

The `@pytest.mark.style` marker is deprecated; use `@mpl.style.context`, which has the same effect.

Support for `nx1 = None` or `ny1 = None` in `AxesLocator` and `Divider.locate`

In *axes_grid1.axes_divider*, various internal APIs will stop supporting passing `nx1 = None` or `ny1 = None` to mean `nx + 1` or `ny + 1`, in preparation for a possible future API which allows indexing and slicing of dividers (possibly `divider[a:b] == divider.new_locator(a, b)`, but also `divider[a:] == divider.new_locator(a, <end>)`). The user-facing *Divider.new_locator* API is unaffected -- it correctly normalizes `nx1 = None` and `ny1 = None` as needed.

Removals

The following deprecated APIs have been removed:

Removed behaviour

Stricter validation of function parameters

- Calling *Figure.add_axes* with no arguments will raise an error. Adding a free-floating axes needs a position rectangle. If you want a figure-filling single axes, use *Figure.add_subplot* instead.
- *Figure.add_subplot* validates its inputs; in particular, for `add_subplot(rows, cols, index)`, all parameters must be integral. Previously strings and floats were accepted and converted to int.
- Passing *None* as the *which* argument to `autofmt_xdate` is no longer supported; use its more explicit synonym, `which="major"`, instead.

- Setting the *orientation* of an `eventplot()` or *EventCollection* to "none" or *None* is no longer supported; set it to "horizontal" instead. Moreover, the two orientations ("horizontal" and "vertical") are now case-sensitive.
- Passing parameters *norm* and *vmin*/*vmax* simultaneously to functions using colormapping such as `scatter()` and `imshow()` is no longer supported. Instead of `norm=LogNorm(), vmin=min_val, vmax=max_val` pass `norm=LogNorm(min_val, max_val)`. *vmin* and *vmax* should only be used without setting *norm*.
- Passing *None* as either the *radius* or *startangle* arguments of *Axes.pie* is no longer accepted; use the explicit defaults of 1 and 0, respectively, instead.
- Passing *None* as the *normalize* argument of *Axes.pie* (the former default) is no longer accepted, and the pie will always be normalized by default. If you wish to plot an incomplete pie, explicitly pass `normalize=False`.
- Support for passing *None* to `subplot_class_factory` has been removed. Explicitly pass in the base *Axes* class instead.
- Passing multiple keys as a single comma-separated string or multiple arguments to *ToolManager.update_keymap* is no longer supported; pass keys as a list of strings instead.
- Passing the dash offset as *None* is no longer accepted, as this was never universally implemented, e.g. for vector output. Set the offset to 0 instead.
- Setting a custom method overriding *Artist.contains* using `Artist.set_contains` has been removed, as has `Artist.get_contains`. There is no replacement, but you may still customize pick events using *Artist.set_picker*.
- *semilogx*, *semilogy*, *loglog*, *LogScale*, and *SymmetricalLogScale* used to take keyword arguments that depends on the axis orientation ("basex" vs "basey", "subsx" vs "subsy", "nonposx" vs "nonposy"); these parameter names have been removed in favor of "base", "subs", "nonpositive". This removal also affects e.g. `ax.set_yscale("log", basey=...)` which must now be spelled `ax.set_yscale("log", base=...)`.

  The change from "nonpos" to "nonpositive" also affects *LogTransform*, *InvertedLogTransform*, *SymmetricalLogTransform*, etc.

  To use *different* bases for the x-axis and y-axis of a *loglog* plot, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.
- Passing *None*, or no argument, to `parasite_axes_class_factory`, `parasite_axes_auxtrans_class_factory`, `host_axes_class_factory` is no longer accepted; pass an explicit base class instead.

Case-sensitivity is now enforced more

- Upper or mixed-case property names are no longer normalized to lowercase in *Artist.set* and *Artist.update*. This allows one to pass names such as *patchA* or *UVC*.
- Case-insensitive capstyles and joinstyles are no longer lower-cased; please pass capstyles ("miter", "round", "bevel") and joinstyles ("butt", "round", "projecting") as lowercase.

- Saving metadata in PDF with the PGF backend no longer changes keys to lowercase. Only the canonically cased keys listed in the PDF specification (and the *PdfPages* documentation) are accepted.

No implicit initialization of `Tick` attributes

The *Tick* constructor no longer initializes the attributes `tick1line`, `tick2line`, `gridline`, `label1`, and `label2` via `_get_tick1line`, `_get_tick2line`, `_get_gridline`, `_get_text1`, and `_get_text2`. Please directly set the attribute in the subclass' `__init__` instead.

`NavigationToolbar2` subclass changes

Overriding the `_init_toolbar` method of *NavigationToolbar2* to initialize third-party toolbars is no longer supported. Instead, the toolbar should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate).

The `press` and `release` methods of *NavigationToolbar2* were called when pressing or releasing a mouse button, but *only* when an interactive pan or zoom was occurring (contrary to what the docs stated). They are no longer called; if you write a backend which needs to customize such events, please directly override `press_pan`/`press_zoom`/`release_pan`/`release_zoom` instead.

Removal of old file mode flag

Flags containing "U" passed to *cbook.to_filehandle* and *cbook.open_file_cm* are no longer accepted. This is consistent with their removal from `open` in Python 3.9.

Keymaps toggling `Axes.get_navigate` have been removed

This includes numeric key events and rcParams.

The `TTFPATH` and `AFMPATH` environment variables

Support for the (undocumented) `TTFPATH` and `AFMPATH` environment variables has been removed. Register additional fonts using `matplotlib.font_manager.fontManager.addfont()`.

Modules

- `matplotlib.backends.qt_editor.formsubplottool`; use `matplotlib.backends.backend_qt.SubplotToolQt` instead.
- `matplotlib.compat`
- `matplotlib.ttconv`
- The Qt4-based backends, `qt4agg` and `qt4cairo`, have been removed. Qt4 has reached its end-of-life in 2015 and there are no releases of either PyQt4 or PySide for recent versions of Python. Please use one of the Qt5 or Qt6 backends.

Classes, methods and attributes

The following module-level classes/variables have been removed:

- `backend_bases.StatusbarBase` and all its subclasses, and `StatusBarWx`; messages are displayed in the toolbar
- `backend_pgf.GraphicsContextPgf`
- `MODIFIER_KEYS`, `SUPER`, `ALT`, `CTRL`, and `SHIFT` of *matplotlib.backends.backend_qt5agg* and *matplotlib.backends.backend_qt5cairo*
- `backend_wx.DEBUG_MSG`
- `dviread.Encoding`
- `Fil`, `Fill`, `Filll`, `NegFil`, `NegFill`, `NegFilll`, and `SsGlue` from *mathtext*; directly construct glue instances with `Glue("fil")`, etc.
- `mathtext.GlueSpec`
- `OldScalarFormatter`, `IndexFormatter` and `IndexDateFormatter`; use *FuncFormatter* instead
- `OldAutoLocator`
- `AVConvBase`, `AVConvWriter` and `AVConvFileWriter`. Debian 8 (2015, EOL 06/2020) and Ubuntu 14.04 (EOL 04/2019) were the last versions of Debian and Ubuntu to ship avconv. It remains possible to force the use of avconv by using the FFmpeg-based writers with *rcParams["animation.ffmpeg_path"]* (default: `'ffmpeg'`) set to "avconv".
- `matplotlib.axes._subplots._subplot_classes`
- `axes_grid1.axes_rgb.RGBAxesBase`; use `RGBAxes` instead

The following class attributes have been removed:

- `backend_pgf.LatexManager.latex_stdin_utf8`
- `backend_pgf.PdfPages.metadata`
- `ContourSet.ax` and `Quiver.ax`; use `ContourSet.axes` or `Quiver.axes` as with other artists
- `DateFormatter.illegal_s`
- `dates.YearLocator.replaced`; *YearLocator* is now a subclass of *RRuleLocator*, and the attribute `YearLocator.replaced` has been removed. For tick locations that required modifying this, a custom rrule and *RRuleLocator* can be used instead.
- `FigureManagerBase.statusbar`; messages are displayed in the toolbar
- `FileMovieWriter.clear_temp`
- `mathtext.Glue.glue_subtype`
- `MovieWriter.args_key`, `MovieWriter.exec_key`, and `HTMLWriter.args_key`

- `NavigationToolbar2QT.basedir`; the base directory to the icons is `os.path.join(mpl.get_data_path(), "images")`
- `NavigationToolbar2QT.ctx`
- `NavigationToolbar2QT.parent`; to access the parent window, use `toolbar.canvas.parent()` or `toolbar.parent()`
- `prevZoomRect`, `retinaFix`, `savedRetinaImage`, `wxoverlay`, `zoomAxes`, `zoomStartX`, and `zoomStartY` attributes of `NavigationToolbar2Wx`
- `NonUniformImage.is_grayscale`, `PcolorImage.is_grayscale`, for consistency with `AxesImage.is_grayscale`. (Note that previously, these attributes were only available *after rendering the image*).
- `RendererCairo.fontweights`, `RendererCairo.fontangles`
- `used_characters` of *`RendererPdf`*, *`PdfFile`*, and *`RendererPS`*
- `LogScale.LogTransform`, `LogScale.InvertedLogTransform`, `SymmetricalScale.SymmetricalTransform`, and `SymmetricalScale.InvertedSymmetricalTransform`; directly access the transform classes from *`matplotlib.scale`*
- `cachedir`, `rgba_arrayd`, `serif`, `sans_serif`, `cursive`, and `monospace` attributes of *`TexManager`*
- `axleft`, `axright`, `axbottom`, `axtop`, `axwspace`, and `axhspace` attributes of *`widgets.SubplotTool`*; access the `ax` attribute of the corresponding slider
- `widgets.TextBox.params_to_disable`
- `angle_helper.LocatorBase.den`; it has been renamed to *nbins*
- `axes_grid.CbarAxesBase.cbid` and `axes_grid.CbarAxesBase.locator`; use `mappable.colorbar_cid` or `colorbar.locator` instead

The following class methods have been removed:

- `Axes.update_datalim_bounds`; use `ax.dataLim.set(Bbox.union([ax.dataLim, bounds]))`
- `pan` and `zoom` methods of *`Axis`* and *`Locator`* have been removed; panning and zooming are now implemented using the `start_pan`, `drag_pan`, and `end_pan` methods of *`Axes`*
- `.BboxBase.inverse_transformed`; call *`BboxBase.transformed`* on the *`inverted()`* transform
- `Collection.set_offset_position` and `Collection.get_offset_position` have been removed; the `offset_position` of the *`Collection`* class is now "screen"
- `Colorbar.on_mappable_changed` and `Colorbar.update_bruteforce`; use `Colorbar.update_normal()` instead
- `docstring.Substitution.from_params` has been removed; directly assign to `params` of `docstring.Substitution` instead
- `DraggableBase.artist_picker`; set the artist's picker instead

- `DraggableBase.on_motion_blit`; use *`DraggableBase.on_motion`* instead
- `FigureCanvasGTK3._renderer_init`
- `Locator.refresh()` and the associated helper methods `NavigationToolbar2.draw()` and `ToolViewsPositions.refresh_locators()`
- `track_characters` and `merge_used_characters` of *`RendererPdf`*, *`PdfFile`*, and *`RendererPS`*
- `RendererWx.get_gc`
- `SubplotSpec.get_rows_columns`; use the `GridSpec.nrows`, `GridSpec.ncols`, `SubplotSpec.rowspan`, and `SubplotSpec.colspan` properties instead.
- `ScalarMappable.update_dict`, `ScalarMappable.add_checker()`, and `ScalarMappable.check_update()`; register a callback in `ScalarMappable.callbacks` to be notified of updates
- `TexManager.make_tex_preview` and `TexManager.make_dvi_preview`
- `funcleft`, `funcright`, `funcbottom`, `functop`, `funcwspace`, and `funchspace` methods of *`widgets.SubplotTool`*
- `axes_grid1.axes_rgb.RGBAxes.add_RGB_to_figure`
- `axisartist.axis_artist.AxisArtist.dpi_transform`
- `axisartist.grid_finder.MaxNLocator.set_factor` and `axisartist.grid_finder.FixedLocator.set_factor`; the factor is always 1 now

Functions

- `bezier.make_path_regular` has been removed; use `Path.cleaned()` (or `Path.cleaned(curves=True)`, etc.) instead, but note that these methods add a `STOP` code at the end of the path.
- `bezier.concatenate_paths` has been removed; use `Path.make_compound_path()` instead.
- `cbook.local_over_kwdict` has been removed; use *`cbook.normalize_kwargs`* instead.
- `qt_compat.is_pyqt5` has been removed due to the release of PyQt6. The Qt version can be checked using `QtCore.qVersion()`.
- `testing.compare.make_external_conversion_command` has been removed.
- `axes_grid1.axes_rgb.imshow_rgb` has been removed; use `imshow(np.dstack([r, g, b]))` instead.

Arguments

- The *s* parameter to *`Axes.annotate`* and *`pyplot.annotate`* is no longer supported; use the new name *text*.

- The *inframe* parameter to *matplotlib.axes.Axes.draw* has been removed; use *Axes.redraw_in_frame* instead.
- The *required*, *forbidden* and *allowed* parameters of *cbook.normalize_kwargs* have been removed.
- The *ismath* parameter of the `draw_tex` method of all renderer classes has been removed (as a call to `draw_tex` — not to be confused with `draw_text`! — means that the entire string should be passed to the `usetex` machinery anyways). Likewise, the text machinery will no longer pass the *ismath* parameter when calling `draw_tex` (this should only matter for backend implementers).
- The *quality*, *optimize*, and *progressive* parameters of *Figure.savefig* (which only affected JPEG output) have been removed, as well as from the corresponding `print_jpg` methods. JPEG output options can be set by directly passing the relevant parameters in *pil_kwargs*.
- The *clear_temp* parameter of *FileMovieWriter* has been removed; files placed in a temporary directory (using `frame_prefix=None`, the default) will be cleared; files placed elsewhere will not.
- The *copy* parameter of `mathtext.Glue` has been removed.
- The *quantize* parameter of *Path.cleaned()* has been removed.
- The *dummy* parameter of *RendererPgf* has been removed.
- The *props* parameter of *Shadow* has been removed; use keyword arguments instead.
- The *recursionlimit* parameter of `matplotlib.test` has been removed.
- The *label* parameter of *Tick* has no effect and has been removed.
- *MaxNLocator* no longer accepts a positional parameter and the keyword argument *nbins* simultaneously because they specify the same quantity.
- The *add_all* parameter to `axes_grid.Grid`, `axes_grid.ImageGrid`, `axes_rgb.make_rgb_axes`, and `axes_rgb.RGBAxes` have been removed; the APIs always behave as if `add_all=True`.
- The *den* parameter of `axisartist.angle_helper.LocatorBase` has been removed; use *nbins* instead.
- The *s* keyword argument to *AnnotationBbox.get_fontsize* has no effect and has been removed.
- The *offset_position* keyword argument of the *Collection* class has been removed; the `offset_position` now "screen".
- Arbitrary keyword arguments to `StreamplotSet` have no effect and have been removed.
- The *fontdict* and *minor* parameters of *Axes.set_xticklabels* / *Axes.set_yticklabels* are now keyword-only.
- All parameters of *Figure.subplots* except *nrows* and *ncols* are now keyword-only; this avoids typing e.g. `subplots(1, 1, 1)` when meaning `subplot(1, 1, 1)`, but actually getting `subplots(1, 1, sharex=1)`.

- All parameters of *pyplot.tight_layout* are now keyword-only, to be consistent with *Figure.tight_layout*.
- `ColorbarBase` only takes a single positional argument now, the `Axes` to create it in, with all other options required to be keyword arguments. The warning for keyword arguments that were overridden by the mappable is now removed.
- Omitting the *renderer* parameter to *matplotlib.axes.Axes.draw* is no longer supported; use `axes.draw_artist(axes)` instead.
- Passing `ismath="TeX!"` to *RendererAgg.get_text_width_height_descent* is no longer supported; pass `ismath="TeX"` instead,
- Changes to the signature of the *matplotlib.axes.Axes.draw* method make it consistent with all other artists; thus additional parameters to *Artist.draw* have also been removed.

rcParams

- The `animation.avconv_path` and `animation.avconv_args` rcParams have been removed.
- The `animation.html_args` rcParam has been removed.
- The `keymap.all_axes` rcParam has been removed.
- The `mathtext.fallback_to_cm` rcParam has been removed. Use *rcParams["mathtext.fallback"]* (default: `'cm'`) instead.
- The `savefig.jpeg_quality` rcParam has been removed.
- The `text.latex.preview` rcParam has been removed.
- The following deprecated rcParams validators, defined in *rcsetup*, have been removed:
  - `validate_alignment`
  - `validate_axes_titlelocation`
  - `validate_axis_locator`
  - `validate_bool_maybe_none`
  - `validate_fontset`
  - `validate_grid_axis`
  - `validate_hinting`
  - `validate_legend_loc`
  - `validate_mathtext_default`
  - `validate_movie_frame_fmt`
  - `validate_movie_html_fmt`
  - `validate_movie_writer`
  - `validate_nseq_float`

  - `validate_nseq_int`
  - `validate_orientation`
  - `validate_pgf_texsystem`
  - `validate_ps_papersize`
  - `validate_svg_fonttype`
  - `validate_toolbar`
  - `validate_webagg_address`

- Some rcParam validation has become stricter:
  - *`rcParams["axes.axisbelow"]`* (default: `'line'`) no longer accepts strings starting with "line" (case-insensitive) as "line"; use "line" (case-sensitive) instead.
  - *`rcParams["text.latex.preamble"]`* (default: `''`) and `pdf.preamble` no longer accept non-string values.
  - All `*.linestyle` rcParams no longer accept `offset = None`; set the offset to 0 instead.

Development changes

Increase to minimum supported versions of dependencies

For Matplotlib 3.5, the *minimum supported versions* and some *optional dependencies* are being bumped:

Dependency	min in mpl3.4	min in mpl3.5
NumPy	1.16	1.17
Tk (optional)	8.3	8.4

This is consistent with our *Dependency version policy* and NEP29

New wheel architectures

Wheels have been added for:

- Python 3.10
- PyPy 3.7
- macOS on Apple Silicon (both arm64 and universal2)

New build dependencies

Versioning has been switched from bundled versioneer to setuptools-scm using the `release-branch-semver` version scheme. The latter is well-maintained, but may require slight modification to packaging scripts.

The setuptools-scm-git-archive plugin is also used for consistent version export.

Data directory is no longer optional

Historically, the `mpl-data` directory has been optional (example files were unnecessary, and fonts could be deleted if a suitable dependency on a system font were provided). Though example files are still optional, they have been substantially pared down, and we now consider the directory to be required.

Specifically, the `matplotlibrc` file found there is used for runtime verifications and must exist. Packagers may still symlink fonts to system versions if needed.

New runtime dependencies

fontTools for type 42 subsetting

A new dependency fontTools is integrated into Matplotlib 3.5. It is designed to be used with PS/EPS and PDF documents; and handles Type 42 font subsetting.

Underscore support in LaTeX

The underscore package is now a requirement to improve support for underscores in LaTeX.

This is consistent with our *Dependency version policy*.

Matplotlib-specific build options moved from `setup.cfg` to `mplsetup.cfg`

In order to avoid conflicting with the use of `setup.cfg` by `setuptools`, the Matplotlib-specific build options have moved from `setup.cfg` to `mplsetup.cfg`. The `setup.cfg.template` has been correspondingly been renamed to `mplsetup.cfg.template`.

Note that the path to this configuration file can still be set via the `MPLSETUPCFG` environment variable, which allows one to keep using the same file before and after this change.

9.7 Version 3.4

9.7.1 What's new in Matplotlib 3.4.0 (Mar 26, 2021)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.4.0 (Mar 26, 2021)*
  - *Figure and Axes creation / management*
    - *New subfigure functionality*
    - *Single-line string notation for `subplot_mosaic`*
    - *Changes to behavior of Axes creation methods (`gca`, `add_axes`, `add_subplot`)*

    - *`add_subplot/add_axes` gained an* axes_class *parameter*
    - *Subplot and subplot2grid can now work with constrained layout*
  - *Plotting methods*
    - *`axline` supports* transform *parameter*
    - *New automatic labeling for bar charts*
    - *A list of hatches can be specified to* `bar` *and* `barh`
    - *Setting `BarContainer` orientation*
    - *Contour plots now default to using ScalarFormatter*
    - *`Axes.errorbar` cycles non-color properties correctly*
    - *`errorbar`* errorevery *parameter matches* markevery
    - *`hexbin` supports data reference for* C *parameter*
    - *Support callable for formatting of Sankey labels*
    - *`Axes.spines` access shortcuts*
    - *New `stairs` method and `StepPatch` artist*
    - *Added* orientation *parameter for stem plots*
    - *Angles on Bracket arrow styles*
    - *`TickedStroke` patheffect*
  - *Colors and colormaps*
    - *Collection color specification and mapping*
    - *Transparency (alpha) can be set as an array in collections*
    - *pcolormesh has improved transparency handling by enabling snapping*
    - *IPython representations for Colormap objects*
    - *`Colormap.set_extremes` and `Colormap.with_extremes`*
    - *Get under/over/bad colors of Colormap objects*
    - *New `cm.unregister_cmap` function*
    - *New `CenteredNorm` for symmetrical data around a center*
    - *New `FuncNorm` for arbitrary normalizations*
    - *GridSpec-based colorbars can now be positioned above or to the left of the main axes*
  - *Titles, ticks, and labels*
    - *supxlabel and supylabel*
    - *Shared-axes `subplots` tick label visibility is now correct for top or left labels*

    - *An iterable object with labels can be passed to* `Axes.plot`
  - *Fonts and Text*
    - *Text transform can rotate text direction*
    - `matplotlib.mathtext` *now supports* overset *and* underset *LaTeX symbols*
    - math_fontfamily *parameter to change* `Text` *font family*
    - `TextArea/AnchoredText` *support* horizontalalignment
    - *PDF supports URLs on* `Text` *artists*
  - *rcParams improvements*
    - *New rcParams for dates: set converter and whether to use interval_multiples*
    - *Date formatters now respect* usetex *rcParam*
    - *Setting* image.cmap *to a* `Colormap`

* *Fully-fractional HiDPI in QtAgg*
* *wxAgg supports fullscreen toggle*

Figure and Axes creation / management

New subfigure functionality

New *figure.Figure.add_subfigure* and *figure.Figure.subfigures* functionalities allow creating virtual figures within figures. Similar nesting was previously done with nested gridspecs (see *Nested Gridspecs*). However, this did not allow localized figure artists (e.g., a colorbar or suptitle) that only pertained to each subgridspec.

The new methods *figure.Figure.add_subfigure* and *figure.Figure.subfigures* are meant to rhyme with *figure.Figure.add_subplot* and *figure.Figure.subplots* and have most of the same arguments.

See *Figure subfigures* for further details.

Note

The subfigure functionality is experimental API as of v3.4.

Single-line string notation for `subplot_mosaic`

Figure.subplot_mosaic and *pyplot.subplot_mosaic* now accept a single-line string, using semicolons to delimit rows. Namely,

```
plt.subplot_mosaic(
    """
    AB
    CC
    """)
```

may be written as the shorter:

```
plt.subplot_mosaic("AB;CC")
```

Changes to behavior of Axes creation methods (`gca`, `add_axes`, `add_subplot`)

The behavior of the functions to create new Axes (*pyplot.axes*, *pyplot.subplot*, *figure.Figure.add_axes*, *figure.Figure.add_subplot*) has changed. In the past, these functions would detect if you were attempting to create Axes with the same keyword arguments as already-existing

Axes in the current Figure, and if so, they would return the existing Axes. Now, *pyplot.axes*, *figure.Figure.add_axes*, and *figure.Figure.add_subplot* will always create new Axes. *pyplot.subplot* will continue to reuse an existing Axes with a matching subplot spec and equal *kwargs*.

Correspondingly, the behavior of the functions to get the current Axes (*pyplot.gca*, *figure.Figure.gca*) has changed. In the past, these functions accepted keyword arguments. If the keyword arguments matched an already-existing Axes, then that Axes would be returned, otherwise new Axes would be created with those keyword arguments. Now, the keyword arguments are only considered if there are no Axes at all in the current figure. In a future release, these functions will not accept keyword arguments at all.

`add_subplot`/`add_axes` gained an *axes_class* parameter

In particular, `mpl_toolkits` Axes subclasses can now be idiomatically used using, e.g., `fig.add_subplot(axes_class=mpl_toolkits.axislines.Axes)`

Subplot and subplot2grid can now work with constrained layout

`constrained_layout` depends on a single *GridSpec* for each logical layout on a figure. Previously, *pyplot.subplot* and *pyplot.subplot2grid* added a new `GridSpec` each time they were called and were therefore incompatible with `constrained_layout`.

Now `subplot` attempts to reuse the `GridSpec` if the number of rows and columns is the same as the top level GridSpec already in the figure, i.e., `plt.subplot(2, 1, 2)` will use the same GridSpec as `plt.subplot(2, 1, 1)` and the `constrained_layout=True` option to *Figure* will work.

In contrast, mixing *nrows* and *ncols* will *not* work with `constrained_layout`: `plt.subplot(2, 2, 1)` followed by `plt.subplots(2, 1, 2)` will still produce two GridSpecs, and `constrained_layout=True` will give bad results. In order to get the desired effect, the second call can specify the cells the second Axes is meant to cover: `plt.subplots(2, 2, (2, 4))`, or the more Pythonic `plt.subplot2grid((2, 2), (0, 1), rowspan=2)` can be used.

Plotting methods

`axline` supports *transform* parameter

axline now supports the *transform* parameter, which applies to the points *xy1*, *xy2*. The *slope* (if given) is always in data coordinates.

For example, this can be used with `ax.transAxes` for drawing lines with a fixed slope. In the following plot, the line appears through the same point on both Axes, even though they show different data limits.

```
fig, axs = plt.subplots(1, 2)

for i, ax in enumerate(axs):
    ax.axline((0.25, 0), slope=2, transform=ax.transAxes)
    ax.set(xlim=(i, i+5), ylim=(i, i+5))
```

New automatic labeling for bar charts

A new *Axes.bar_label* method has been added for auto-labeling bar charts.

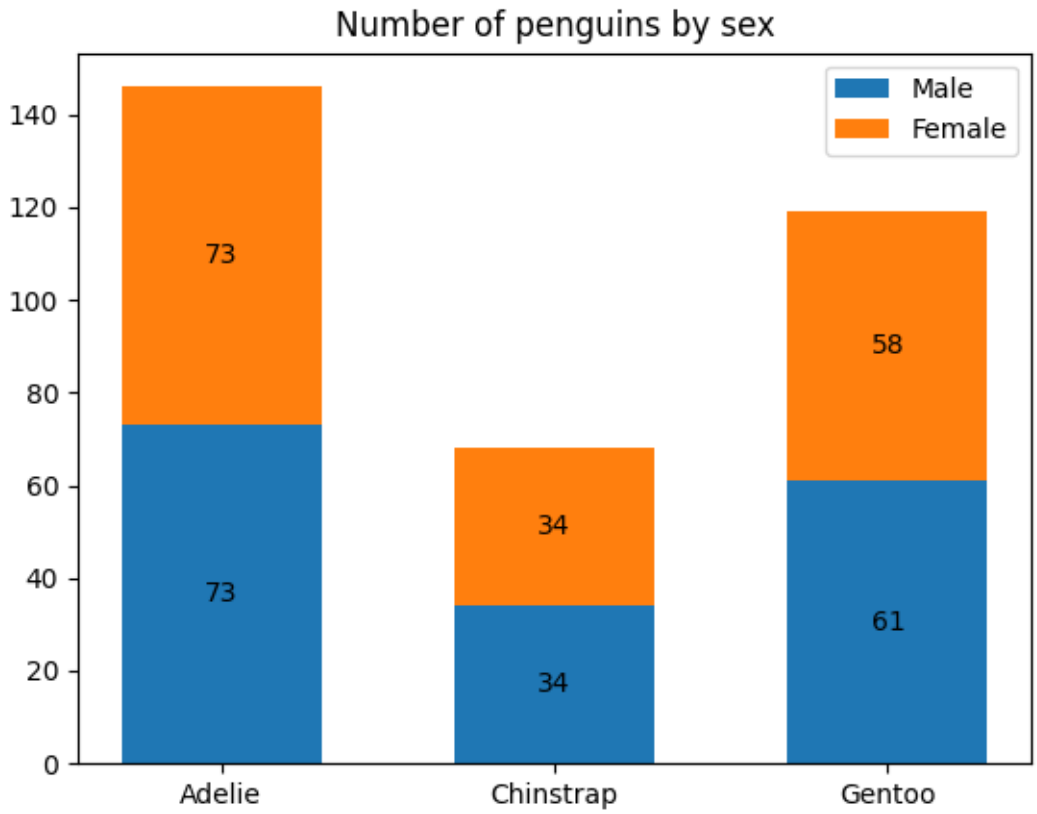

Fig. 2: Example of the new automatic labeling.

A list of hatches can be specified to `bar` and `barh`

Similar to some other rectangle properties, it is now possible to hand a list of hatch styles to *bar* and *barh* in order to create bars with different hatch styles, e.g.

Setting `BarContainer` orientation

BarContainer now accepts a new string argument *orientation*. It can be either `'vertical'` or `'horizontal'`, default is `None`.

Contour plots now default to using ScalarFormatter

Pass `fmt="%1.3f"` to the contouring call to restore the old default label format.

`Axes.errorbar` cycles non-color properties correctly

Formerly, *Axes.errorbar* incorrectly skipped the Axes property cycle if a color was explicitly specified, even if the property cycler was for other properties (such as line style). Now, *Axes.errorbar* will advance the Axes property cycle as done for *Axes.plot*, i.e., as long as all properties in the cycler are not explicitly passed.

For example, the following will cycle through the line styles:

```
x = np.arange(0.1, 4, 0.5)
y = np.exp(-x)
offsets = [0, 1]

plt.rcParams['axes.prop_cycle'] = plt.cycler('linestyle', ['-', '--'])

fig, ax = plt.subplots()
for offset in offsets:
    ax.errorbar(x, y + offset, xerr=0.1, yerr=0.3, fmt='tab:blue')
```

`errorbar` *errorevery* parameter matches *markevery*

Similar to the *markevery* parameter to *plot*, the *errorevery* parameter of *errorbar* now accept slices and NumPy fancy indexes (which must match the size of *x*).

`hexbin` supports data reference for *C* parameter

As with the *x* and *y* parameters, *Axes.hexbin* now supports passing the *C* parameter using a data reference.

```
data = {
    'a': np.random.rand(1000),
    'b': np.random.rand(1000),
    'c': np.random.rand(1000),
}

fig, ax = plt.subplots()
ax.hexbin('a', 'b', C='c', data=data, gridsize=10)
```

Support callable for formatting of Sankey labels

The `format` parameter of *`matplotlib.sankey.Sankey`* can now accept callables.

This allows the use of an arbitrary function to label flows, for example allowing the mapping of numbers to emoji.

`Axes.spines` access shortcuts

`Axes.spines` is now a dedicated container class *`Spines`* for a set of *`Spine`*s instead of an `OrderedDict`. On top of dict-like access, `Axes.spines` now also supports some `pandas.Series`-like features.

Accessing single elements by item or by attribute:

```
ax.spines['top'].set_visible(False)
ax.spines.top.set_visible(False)
```

Accessing a subset of items:

```
ax.spines[['top', 'right']].set_visible(False)
```

Accessing all items simultaneously:

```
ax.spines[:].set_visible(False)
```

New `stairs` method and `StepPatch` artist

`pyplot.stairs` and the underlying artist *`StepPatch`* provide a cleaner interface for plotting stepwise constant functions for the common case that you know the step edges. This supersedes many use cases of *`pyplot.step`*, for instance when plotting the output of `numpy.histogram`.

For both the artist and the function, the x-like edges input is one element longer than the y-like values input

See *Stairs Demo* for examples.

Added *orientation* parameter for stem plots

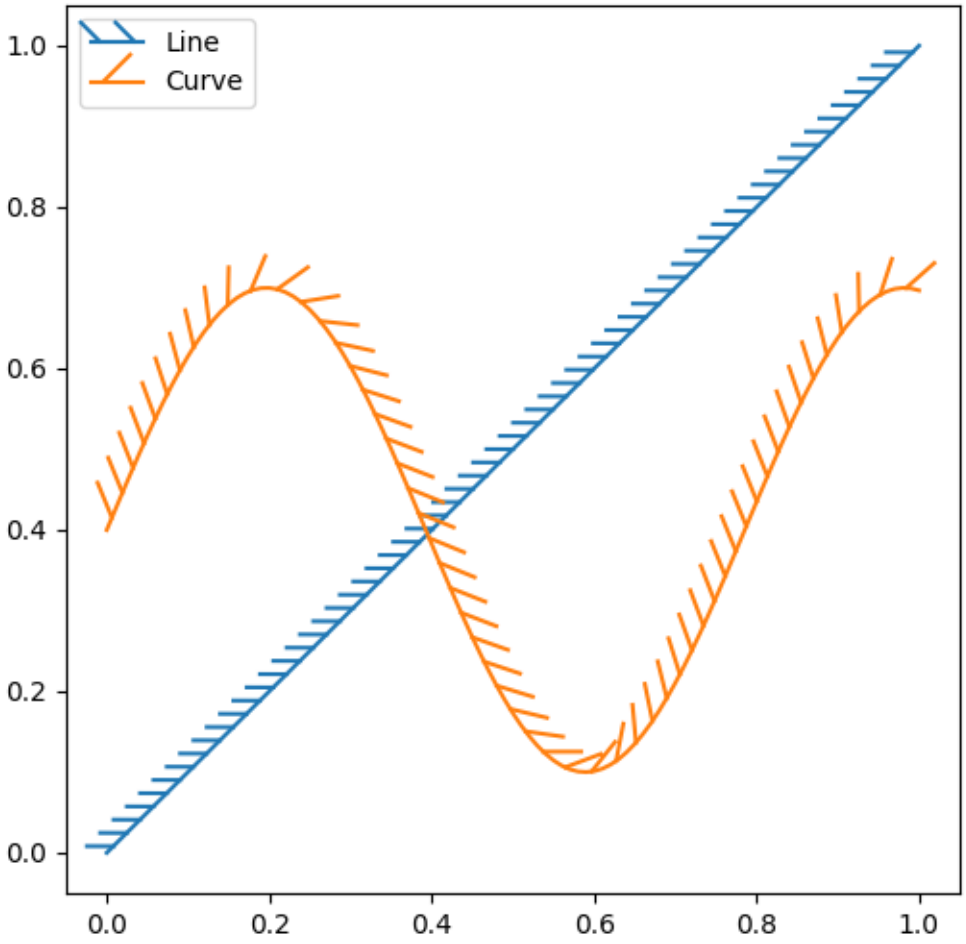
By default, stem lines are vertical. They can be changed to horizontal using the *orientation* parameter of *`Axes.stem`* or *`pyplot.stem`*:

Angles on Bracket arrow styles

Angles specified on the *Bracket* arrow styles (`]-[`, `]-`, `-[`, or `|-|` passed to *arrowstyle* parameter of *`FancyArrowPatch`*) are now applied. Previously, the *angleA* and *angleB* options were allowed, but did nothing.

`TickedStroke` patheffect

The new *`TickedStroke`* patheffect can be used to produce lines with a ticked style. This can be used to, e.g., distinguish the valid and invalid sides of the constraint boundaries in the solution space of optimizations.



Colors and colormaps

Collection color specification and mapping

Reworking the handling of color mapping and the keyword arguments for *facecolor* and *edgecolor* has resulted in three behavior changes:

1. Color mapping can be turned off by calling `Collection.set_array(None)`. Previously, this would have no effect.

2. When a mappable array is set, with `facecolor='none'` and `edgecolor='face'`, both the faces and the edges are left uncolored. Previously the edges would be color-mapped.
3. When a mappable array is set, with `facecolor='none'` and `edgecolor='red'`, the edges are red. This addresses Issue #1302. Previously the edges would be color-mapped.

Transparency (alpha) can be set as an array in collections

Previously, the alpha value controlling transparency in collections could be specified only as a scalar applied to all elements in the collection. For example, all the markers in a *scatter* plot, or all the quadrilaterals in a *pcolormesh* plot, would have the same alpha value.

Now it is possible to supply alpha as an array with one value for each element (marker, quadrilateral, etc.) in a collection.

pcolormesh has improved transparency handling by enabling snapping

Due to how the snapping keyword argument was getting passed to the Agg backend, previous versions of Matplotlib would appear to show lines between the grid edges of a mesh with transparency. This version now applies snapping by default. To restore the old behavior (e.g., for test images), you may set *rcParams["pcolormesh.snap"]* (default: `True`) to `False`.

Note that there are lines between the grid boundaries of the main plot which are not the same transparency. The colorbar also shows these lines when a transparency is added to the colormap because internally it uses pcolormesh to draw the colorbar. With snapping on by default (below), the lines at the grid boundaries disappear.

IPython representations for Colormap objects

The *matplotlib.colors.Colormap* object now has image representations for IPython / Jupyter backends. Cells returning a colormap on the last line will display an image of the colormap.

`Colormap.set_extremes` and `Colormap.with_extremes`

Because the *Colormap.set_bad*, *Colormap.set_under* and *Colormap.set_over* methods modify the colormap in place, the user must be careful to first make a copy of the colormap if setting the extreme colors e.g. for a builtin colormap.

The new `Colormap.with_extremes(bad=..., under=..., over=...)` can be used to first copy the colormap and set the extreme colors on that copy.

The new *Colormap.set_extremes* method is provided for API symmetry with *Colormap.with_extremes*, but note that it suffers from the same issue as the earlier individual setters.

Get under/over/bad colors of Colormap objects

matplotlib.colors.Colormap now has methods *get_under*, *get_over*, *get_bad* for the colors used for out-of-range and masked values.

New `cm.unregister_cmap` function

`matplotlib.cm.unregister_cmap` allows users to remove a colormap that they have previously registered.

New `CenteredNorm` for symmetrical data around a center

In cases where data is symmetrical around a center, for example, positive and negative anomalies around a center zero, *CenteredNorm* is a new norm that automatically creates a symmetrical mapping around the center. This norm is well suited to be combined with a divergent colormap which uses an unsaturated color in its center.

If the center of symmetry is different from 0, it can be set with the *vcenter* argument. To manually set the range of *CenteredNorm*, use the *halfrange* argument.

See *Colormap normalization* for an example and more details about data normalization.

New `FuncNorm` for arbitrary normalizations

The *FuncNorm* allows for arbitrary normalization using functions for the forward and inverse.

See *Colormap normalization* for an example and more details about data normalization.

GridSpec-based colorbars can now be positioned above or to the left of the main axes

... by passing `location="top"` or `location="left"` to the `colorbar()` call.

Titles, ticks, and labels

supxlabel and supylabel

It is possible to add x- and y-labels to a whole figure, analogous to *Figure.suptitle* using the new *Figure.supxlabel* and *Figure.supylabel* methods.

Shared-axes `subplots` tick label visibility is now correct for top or left labels

When calling `subplots(..., sharex=True, sharey=True)`, Matplotlib automatically hides x tick labels for Axes not in the first column and y tick labels for Axes not in the last row. This behavior is incorrect if rcParams specify that Axes should be labeled on the top (`rcParams["xtick.labeltop"] = True`) or on the right (`rcParams["ytick.labelright"] = True`).

Cases such as the following are now handled correctly (adjusting visibility as needed on the first row and last column of Axes):

```
plt.rcParams["xtick.labelbottom"] = False
plt.rcParams["xtick.labeltop"] = True
plt.rcParams["ytick.labelleft"] = False
plt.rcParams["ytick.labelright"] = True

fig, axs = plt.subplots(2, 2, sharex=True, sharey=True)
```

An iterable object with labels can be passed to `Axes.plot`

When plotting multiple datasets by passing 2D data as *y* value to *plot*, labels for the datasets can be passed as a list, the length matching the number of columns in *y*.

```
x = [1, 2, 3]

y = [[1, 2],
     [2, 5],
     [4, 9]]

plt.plot(x, y, label=['low', 'high'])
plt.legend()
```

Fonts and Text

Text transform can rotate text direction

The new *Text* parameter `transform_rotates_text` now sets whether rotations of the transform affect the text direction.

`matplotlib.mathtext` now supports *overset* and *underset* LaTeX symbols

mathtext now supports *overset* and *underset*, called as `\overset{annotation}{body}` or `\underset{annotation}{body}`, where *annotation* is the text "above" or "below" the *body*.

math_fontfamily parameter to change `Text` font family

The new *math_fontfamily* parameter may be used to change the family of fonts for each individual text element in a plot. If no parameter is set, the global value *rcParams["mathtext.fontset"]* (default: `'dejavusans'`) will be used.

`TextArea`/`AnchoredText` support *horizontalalignment*

The horizontal alignment of text in a *TextArea* or *AnchoredText* may now be specified, which is mostly effective for multiline text:

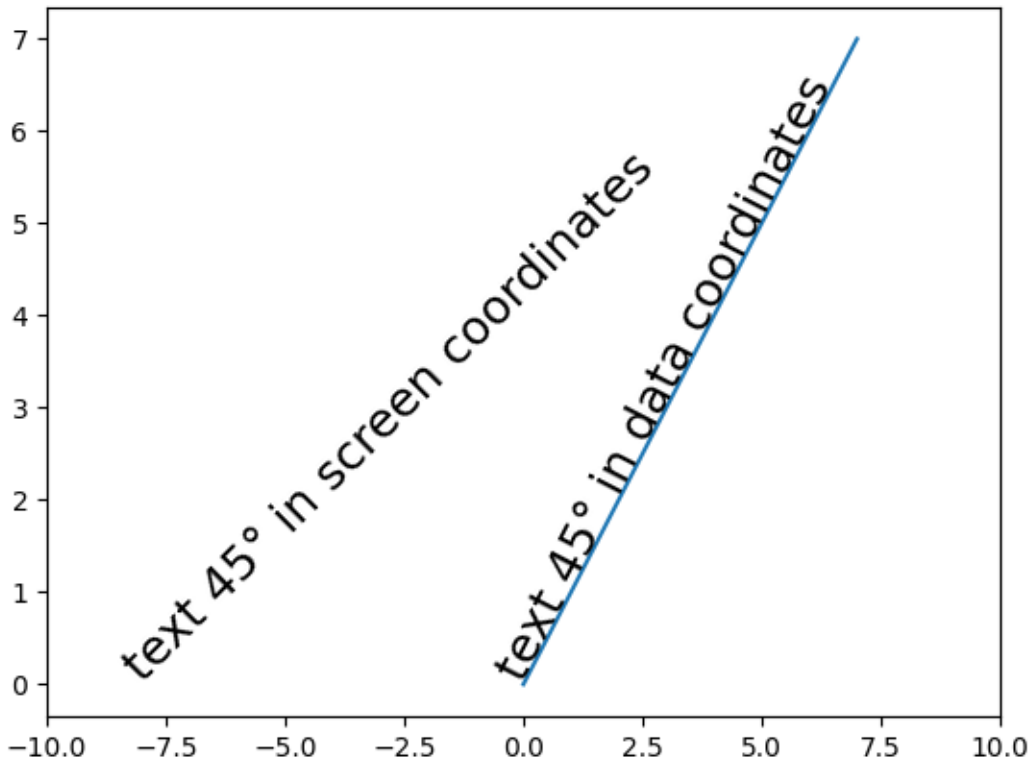


Fig. 3: Example of the new *transform_rotates_text* parameter

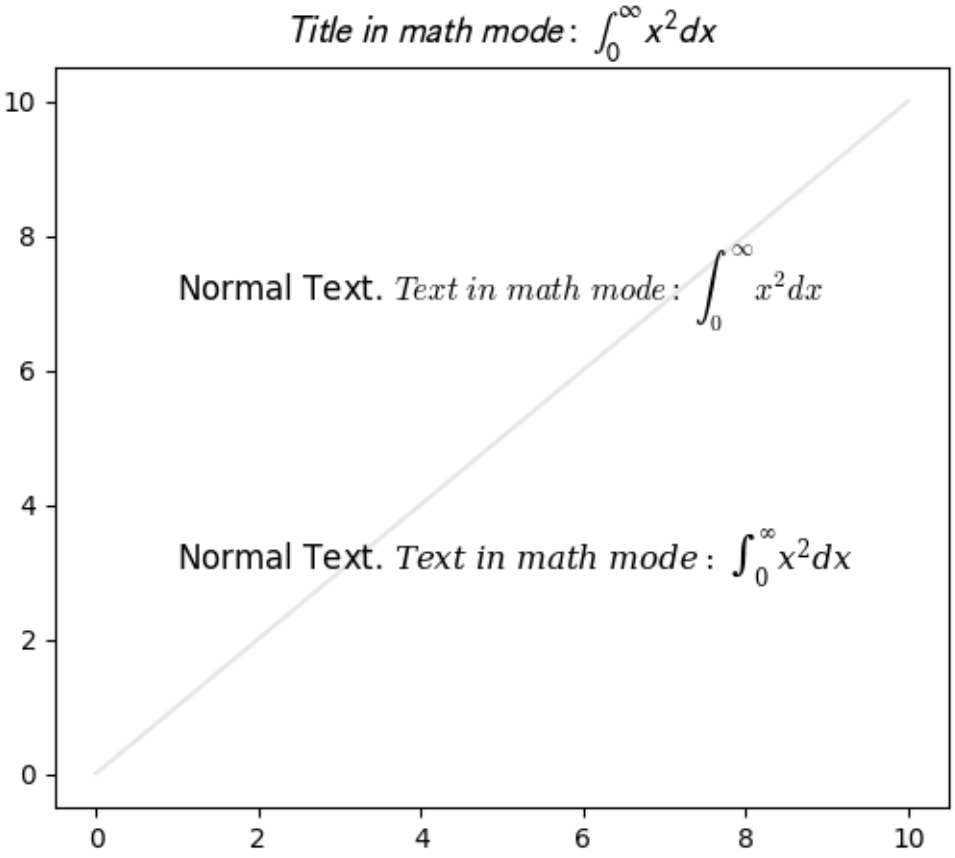

Title in math mode: $\int_0^\infty x^2 dx$
Normal Text. $Text\ in\ math\ mode: \int_0^\infty x^2 dx$
Normal Text. $Text\ in\ math\ mode: \int_0^\infty x^2 dx$
0
2
4
6
8
10

PDF supports URLs on `Text` artists

URLs on *text.Text* artists (i.e., from *Artist.set_url*) will now be saved in PDF files.

rcParams improvements

New rcParams for dates: set converter and whether to use interval_multiples

The new *rcParams["date.converter"]* (default: `'auto'`) allows toggling between *matplotlib.dates.DateConverter* and *matplotlib.dates.ConciseDateConverter* using the strings 'auto' and 'concise' respectively.

The new *rcParams["date.interval_multiples"]* (default: `True`) allows toggling between the dates locator trying to pick ticks at set intervals (i.e., day 1 and 15 of the month), versus evenly spaced ticks that start wherever the timeseries starts:

```
dates = np.arange('2001-01-10', '2001-05-23', dtype='datetime64[D]')
y = np.sin(dates.astype(float) / 10)
fig, axs = plt.subplots(nrows=2, constrained_layout=True)

plt.rcParams['date.converter'] = 'concise'
plt.rcParams['date.interval_multiples'] = True
axs[0].plot(dates, y)

plt.rcParams['date.converter'] = 'auto'
plt.rcParams['date.interval_multiples'] = False
axs[1].plot(dates, y)
```

Date formatters now respect *usetex* rcParam

The *AutoDateFormatter* and *ConciseDateFormatter* now respect *rcParams["text.usetex"]* (default: `False`), and will thus use fonts consistent with TeX rendering of the default (non-date) formatter. TeX rendering may also be enabled/disabled by passing the *usetex* parameter when creating the formatter instance.

In the following plot, both the x-axis (dates) and y-axis (numbers) now use the same (TeX) font:

Setting *image.cmap* to a `Colormap`

It is now possible to set *rcParams["image.cmap"]* (default: `'viridis'`) to a *Colormap* instance, such as a colormap created with the new *set_extremes* above. (This can only be done from Python code, not from the `matplotlibrc` file.)

Tick and tick label colors can be set independently using rcParams

Previously, *rcParams["xtick.color"]* (default: 'black') defined both the tick color and the label color. The label color can now be set independently using *rcParams["xtick.labelcolor"]* (default: 'inherit'). It defaults to 'inherit' which will take the value from *rcParams["xtick.color"]* (default: 'black'). The same holds for ytick.[label]color. For instance, to set the ticks to light grey and the tick labels to black, one can use the following code in a script:

```
import matplotlib as mpl

mpl.rcParams['xtick.labelcolor'] = 'lightgrey'
mpl.rcParams['xtick.color'] = 'black'
mpl.rcParams['ytick.labelcolor'] = 'lightgrey'
mpl.rcParams['ytick.color'] = 'black'
```

Or by adding the following lines to the *matplotlibrc* file, or a Matplotlib style file:

```
xtick.labelcolor : lightgrey
xtick.color      : black
ytick.labelcolor : lightgrey
ytick.color      : black
```

3D Axes improvements

Errorbar method in 3D Axes

The errorbar function *Axes.errorbar* is ported into the 3D Axes framework in its entirety, supporting features such as custom styling for error lines and cap marks, control over errorbar spacing, upper and lower limit marks.

Stem plots in 3D Axes

Stem plots are now supported on 3D Axes. Much like 2D stems, *stem* supports plotting the stems in various orientations:

See also the *3D stem* demo.

3D Collection properties are now modifiable

Previously, properties of a 3D Collection that were used for 3D effects (e.g., colors were modified to produce depth shading) could not be changed after it was created.

Now it is possible to modify all properties of 3D Collections at any time.

Panning in 3D Axes

Click and drag with the middle mouse button to pan 3D Axes.

Interactive tool improvements

New `RangeSlider` widget

widgets.RangeSlider allows for creating a slider that defines a range rather than a single value.

Sliders can now snap to arbitrary values

The *Slider* UI widget now accepts arrays for *valstep*. This generalizes the previous behavior by allowing the slider to snap to arbitrary values.

Pausing and Resuming Animations

The *animation.Animation.pause* and *animation.Animation.resume* methods allow you to pause and resume animations. These methods can be used as callbacks for event listeners on UI elements so that your plots can have some playback control UI.

Sphinx extensions

`plot_directive` *caption* option

Captions were previously supported when using the `plot_directive` directive with an external source file by specifying content:

```
.. plot:: path/to/plot.py

    This is the caption for the plot.
```

The `:caption:` option allows specifying the caption for both external:

```
.. plot:: path/to/plot.py
    :caption: This is the caption for the plot.
```

and inline plots:

```
.. plot::
    :caption: This is a caption for the plot.

    plt.plot([1, 2, 3])
```

Backend-specific improvements

Consecutive rasterized draws now merged

Elements of a vector output can be individually set to rasterized, using the *rasterized* keyword argument, or *set_rasterized()*. This can be useful to reduce file sizes. For figures with multiple raster elements they are now automatically merged into a smaller number of bitmaps where this will not effect the visual output. For cases with many elements this can result in significantly smaller file sizes.

To ensure this happens do not place vector elements between raster ones.

To inhibit this merging set `Figure.suppressComposite` to True.

Support raw/rgba frame format in `FFMpegFileWriter`

When using *`FFMpegFileWriter`*, the *frame_format* may now be set to `"raw"` or `"rgba"`, which may be slightly faster than an image format, as no encoding/decoding need take place between Matplotlib and FFmpeg.

nbAgg/WebAgg support middle-click and double-click

Double click events are now supported by the nbAgg and WebAgg backends. Formerly, WebAgg would report middle-click events as right clicks, but now reports the correct button type.

nbAgg support binary communication

If the web browser and notebook support binary websockets, nbAgg will now use them for slightly improved transfer of figure display.

Indexed color for PNG images in PDF files when possible

When PNG images have 256 colors or fewer, they are converted to indexed color before saving them in a PDF. This can result in a significant reduction in file size in some cases. This is particularly true for raster data that uses a colormap but no interpolation, such as Healpy mollview plots. Currently, this is only done for RGB images.

Improved font subsettings in PDF/PS

Font subsetting in PDF and PostScript has been re-written from the embedded `ttconv` C code to Python. Some composite characters and outlines may have changed slightly. This fixes ttc subsetting in PDF, and adds support for subsetting of type 3 OTF fonts, resulting in smaller files (much smaller when using CJK fonts), and avoids running into issues with type 42 embedding and certain PDF readers such as Acrobat Reader.

Kerning added to strings in PDFs

As with text produced in the Agg backend (see *the previous what's new entry* for examples), PDFs now include kerning in text strings.

Fully-fractional HiDPI in QtAgg

Fully-fractional HiDPI (that is, HiDPI ratios that are not whole integers) was added in Qt 5.14, and is now supported by the QtAgg backend when using this version of Qt or newer.

wxAgg supports fullscreen toggle

The wxAgg backend supports toggling fullscreen using the `f` shortcut, or the manager function *FigureManagerBase.full_screen_toggle*.

9.7.2 API Changes for 3.4.2

Behaviour changes

Rename first argument to `subplot_mosaic`

Both *Figure.subplot_mosaic*, and *pyplot.subplot_mosaic* have had the first position argument renamed from *layout* to *mosaic*. This is because we are considering to consolidate *constrained_layout* and *tight_layout* keyword arguments in the Figure creation functions of *pyplot* into a single *layout* keyword argument which would collide.

As this API is provisional, we are changing this with no deprecation period.

9.7.3 API Changes for 3.4.0

- *Behaviour changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behaviour changes

Constrained layout rewrite

The layout manager `constrained_layout` was re-written with different outer constraints that should be more robust to complicated subplot layouts. User-facing changes are:

- some poorly constrained layouts will have different width/height plots than before.
- colorbars now respect the `anchor` keyword argument of *matplotlib.colorbar.make_axes*
- colorbars are wider.
- colorbars in different rows or columns line up more robustly.
- *hspace* and *wspace* options to *Figure.set_constrained_layout_pads* were twice as wide as the docs said they should be. So these now follow the docs.

This feature will remain "experimental" until the new changes have been used enough by users, so we anticipate version 3.5 or 3.6. On the other hand, `constrained_layout` is extensively tested and used in examples in the library, so using it should be safe, but layouts may not be exactly the same as more development takes place.

Details of using `constrained_layout`, and its algorithm are available at *Constrained layout guide*

`plt.subplot` re-selection without keyword arguments

The purpose of *pyplot.subplot* is to facilitate creating and re-selecting Axes in a Figure when working strictly in the implicit pyplot API. When creating new Axes it is possible to select the projection (e.g. polar, 3D, or various cartographic projections) as well as to pass additional keyword arguments through to the Axes-subclass that is created.

The first time *pyplot.subplot* is called for a given position in the Axes grid it always creates and returns a new Axes with the passed arguments and projection (defaulting to rectilinear). On subsequent calls to *pyplot.subplot* we have to determine if an existing Axes has a) equivalent parameters, in which case it should be selected as the current Axes and returned, or b) different parameters, in which case a new Axes is created and the existing Axes is removed. This leaves the question of what is "equivalent parameters".

Previously it was the case that an existing Axes subclass, except for Axes3D, would be considered equivalent to a 2D rectilinear Axes, despite having different projections, if the keyword arguments (other than *projection*) matched. Thus:

```
ax1 = plt.subplot(1, 1, 1, projection='polar')
ax2 =  plt.subplots(1, 1, 1)
ax1 is ax2
```

We are embracing this long standing behavior to ensure that in the case when no keyword arguments (of any sort) are passed to *pyplot.subplot* any existing Axes is returned, without consideration for keywords or projection used to initially create it. This will cause a change in behavior when additional keywords were passed to the original Axes:

```
ax1 = plt.subplot(111, projection='polar', theta_offset=.75)
ax2 = plt.subplots(1, 1, 1)
ax1 is ax2          # new behavior
# ax1 is not ax2    # old behavior, made a new axes

ax1 = plt.subplot(111, label='test')
ax2 = plt.subplots(1, 1, 1)
ax1 is ax2          # new behavior
# ax1 is not ax2    # old behavior, made a new axes
```

For the same reason, if there was an existing Axes that was not rectilinear, passing `projection='rectilinear'` would reuse the existing Axes

```
ax1 = plt.subplot(projection='polar')
ax2 = plt.subplot(projection='rectilinear')
ax1 is not ax2      # new behavior, makes new Axes
# ax1 is ax2        # old behavior
```

contrary to the user's request.

Previously Axes3D could not be re-selected with *pyplot.subplot* due to an unrelated bug (also fixed in Matplotlib 3.4). While Axes3D are now consistent with all other projections there is a change in behavior for

```
plt.subplot(projection='3d')  # create a 3D Axes

plt.subplot()                 # now returns existing 3D Axes, but
                              # previously created new 2D Axes

plt.subplot(projection='rectilinear')  # to get a new 2D Axes
```

`ioff` and `ion` can be used as context managers

pyplot.ion and *pyplot.ioff* may now be used as context managers to create a context with interactive mode on or off, respectively. The old behavior of calling these functions is maintained. To use the new functionality call as:

```
with plt.ioff():
   # non-interactive code
```

Locators and formatters must be in the class hierarchy

Axis locators and formatters must now be subclasses of *Locator* and *Formatter* respectively.

Date locator for DAILY interval now returns middle of month

The *matplotlib.dates.AutoDateLocator* has a default of `interval_multiples=True` that attempts to align ticks with the start of meaningful intervals like the start of the month, or start of the day, etc. That lead to approximately 140-day intervals being mapped to the first and 22nd of the month. This has now been changed so that it chooses the first and 15th of the month, which is probably what most people want.

`ScalarFormatter` *useLocale* option obeys grouping

When the *ScalarFormatter* option *useLocale* is enabled (or *rcParams["axes.formatter.use_locale"]* (default: `False`) is *True*) and the configured locale uses grouping, a separator will be added as described in `locale.format_string`.

`Axes.errorbar` cycles non-color properties correctly

Formerly, *Axes.errorbar* incorrectly skipped the Axes property cycle if a color was explicitly specified, even if the property cycler was for other properties (such as line style). Now, *Axes.errorbar* will advance the Axes property cycle as done for *Axes.plot*, i.e., as long as all properties in the cycler are not explicitly passed.

pyplot.specgram always uses origin='upper'

Previously if *rcParams["image.origin"]* (default: `'upper'`) was set to something other than `'upper'` or if the *origin* keyword argument was passed with a value other than `'upper'`, the spectrogram itself would flip, but the Axes would remain oriented for an origin value of `'upper'`, so that the resulting plot was incorrectly labelled.

Now, the *origin* keyword argument is not supported and the `image.origin` rcParam is ignored. The function *matplotlib.pyplot.specgram* is forced to use `origin='upper'`, so that the Axes are correct for the plotted spectrogram.

xunits=None and yunits=None passed as keyword arguments are treated as "no action"

Many (but not all) of the methods on *Axes* take the (undocumented) keyword arguments *xunits* and *yunits* that will update the units on the given Axis by calling *Axis.set_units* and *Axis.update_units*.

Previously if *None* was passed it would clear the value stored in `.Axis.units` which will in turn break converters which rely on the value in `.Axis.units` to work properly (notably *StrCategoryConverter*).

This changes the semantics of `ax.meth(..., xunits=None, yunits=None)` from "please clear the units" to "do the default thing as if they had not been passed" which is consistent with the standard behavior of Matplotlib keyword arguments.

If you were relying on passing `xunits=None` to plotting methods to clear the `.Axes.units` attribute, directly call *Axis.set_units* (and *Axis.update_units* if you also require the converter to be updated).

Annotations with `annotation_clip` no longer affect `tight_layout`

Previously, *text.Annotation.get_tightbbox* always returned the full *text.Annotation.get_window_extent* of the object, independent of the value of `annotation_clip`. *text.Annotation.get_tightbbox* now correctly takes this extra clipping box into account, meaning that *Annotation*s that are not drawn because of `annotation_clip` will not count towards the Axes bounding box calculations, such as those done by *tight_layout*.

This is now consistent with the API described in *Artist*, which specifies that `get_window_extent` should return the full extents and `get_tightbbox` should "account for any clipping".

Parasite Axes pcolor and pcolormesh now defaults to placing grid edges at integers, not half-integers

This is consistent with *pcolor* and *pcolormesh*.

`Colorbar` outline is now a `Spine`

The outline of *Colorbar* is now a *Spine* and drawn as one, instead of a *Polygon* drawn as an artist. This ensures it will always be drawn after (i.e., on top of) all artists, consistent with Spines on normal Axes.

`Colorbar.dividers` changes

This attribute is now always a *LineCollection* -- an empty one if `drawedges` is *False*. Its default colors and linewidth (*rcParams["axes.edgecolor"]* (default: `'black'`), *rcParams["axes.linewidth"]* (default: `0.8`)) are now resolved at instantiation time, not at draw time.

Raise or warn on registering a colormap twice

When using `matplotlib.cm.register_cmap` to register a user provided or third-party colormap it will now raise a `ValueError` if trying to over-write one of the built in colormaps and warn if trying to over write a user registered colormap. This may raise for user-registered colormaps in the future.

Consecutive rasterized draws now merged

Tracking of depth of raster draws has moved from *backend_mixed.MixedModeRenderer.start_rasterizing* and *backend_mixed.MixedModeRenderer.stop_rasterizing* into *artist.allow_rasterization*. This means the start and stop functions are only called when the rasterization actually needs to be started and stopped.

The output of vector backends will change in the case that rasterized elements are merged. This should not change the appearance of outputs.

The renders in 3rd party backends are now expected to have `self._raster_depth` and `self._rasterizing` initialized to `0` and *False* respectively.

Consistent behavior of `draw_if_interactive()` across backends

pyplot.draw_if_interactive no longer shows the window (if it was previously unshown) on the Tk and nbAgg backends, consistently with all other backends.

The Artist property *rasterized* cannot be *None* anymore

It is now a boolean only. Before the default was *None* and *Artist.set_rasterized* was documented to accept *None*. However, *None* did not have a special meaning and was treated as *False*.

Canvas's callback registry now stored on Figure

The canonical location of the *CallbackRegistry* used to handle Figure/Canvas events has been moved from the Canvas to the Figure. This change should be transparent to almost all users, however if you are swapping switching the Figure out from on top of a Canvas or visa versa you may see a change in behavior.

Harmonized key event data across backends

The different backends with key translation support, now handle "Shift" as a sometimes modifier, where the `'shift+'` prefix won't be added if a key translation was made.

In the Qt5 backend, the `matplotlib.backends.backend_qt5.SPECIAL_KEYS` dictionary contains keys that do *not* return their unicode name instead they have manually specified names. The name for `QtCore.Qt.Key_Meta` has changed to `'meta'` to be consistent with the other GUI backends.

The WebAgg backend now handles key translations correctly on non-US keyboard layouts.

In the GTK and Tk backends, the handling of non-ASCII keypresses (as reported in the KeyEvent passed to `key_press_event`-handlers) now correctly reports Unicode characters (e.g., €), and better respects NumLock on the numpad.

In the GTK and Tk backends, the following key names have changed; the new names are consistent with those reported by the Qt backends:

- The "Break/Pause" key (keysym 0xff13) is now reported as `"pause"` instead of `"break"` (this is also consistent with the X key name).
- The numpad "delete" key is now reported as `"delete"` instead of `"dec"`.

WebAgg backend no longer reports a middle click as a right click

Previously when using the WebAgg backend the event passed to a callback by `fig.canvas.mpl_connect('mouse_button_event', callback)` on a middle click would report *MouseButton.RIGHT* instead of *MouseButton.MIDDLE*.

ID attribute of XML tags in SVG files now based on SHA256 rather than MD5

Matplotlib generates unique ID attributes for various tags in SVG files. Matplotlib previously generated these unique IDs using the first 10 characters of an MD5 hash. The MD5 hashing algorithm is not available in Python on systems with Federal Information Processing Standards (FIPS) enabled. Matplotlib now uses the first 10 characters of an SHA256 hash instead. SVG files that would otherwise match those saved with earlier versions of matplotlib, will have different ID attributes.

`RendererPS.set_font` is no longer a no-op in AFM mode

RendererPS.set_font now sets the current PostScript font in all cases.

Autoscaling in Axes3D

In Matplotlib 3.2.0, autoscaling was made lazier for 2D Axes, i.e., limits would only be recomputed when actually rendering the canvas, or when the user queries the Axes limits. This performance improvement is now extended to *Axes3D*. This also fixes some issues with autoscaling being triggered unexpectedly in Axes3D.

Please see *the API change for 2D Axes* for further details.

Axes3D automatically adding itself to Figure is deprecated

New *Axes3D* objects previously added themselves to figures when they were created, unlike all other Axes classes, which lead to them being added twice if `fig.add_subplot(111, projection='3d')` was called.

This behavior is now deprecated and will warn. The new keyword argument *auto_add_to_figure* controls the behavior and can be used to suppress the warning. The default value will change to *False* in Matplotlib 3.5, and any non-*False* value will be an error in Matplotlib 3.6.

In the future, *Axes3D* will need to be explicitly added to the figure

```
fig = Figure()
# create Axes3D
ax = Axes3d(fig)
```

(continues on next page)

(continued from previous page)

```
# add to Figure
fig.add_axes(ax)
```

as needs to be done for other *axes.Axes* sub-classes. Or, a 3D projection can be made via:

```
fig.add_subplot(projection='3d')
```

`mplot3d.art3d.get_dir_vector` always returns NumPy arrays

For consistency, *get_dir_vector* now always returns NumPy arrays, even if the input is a 3-element iterable.

Changed cursive and fantasy font definitions

The Comic Sans and Comic Neue fonts were moved from the default *rcParams["font.fantasy"]* (default: `['Chicago', 'Charcoal', 'Impact', 'Western', 'xkcd script', 'fantasy']`) list to the default *rcParams["font.cursive"]* (default: `['Apple Chancery', 'Textile', 'Zapf Chancery', 'Sand', 'Script MT', 'Felipa', 'Comic Neue', 'Comic Sans MS', 'cursive']`) setting, in accordance with the CSS font families example and in order to provide a cursive font present in Microsoft's Core Fonts set.

docstring.Substitution now always dedents docstrings before string interpolation

Deprecations

Extra parameters to Axes constructor

Parameters of the Axes constructor other than *fig* and *rect* will become keyword-only in a future version.

`pyplot.gca` and `Figure.gca` keyword arguments

Passing keyword arguments to *pyplot.gca* or *figure.Figure.gca* will not be supported in a future release.

`Axis.cla`, `RadialAxis.cla`, `ThetaAxis.cla` and `Spine.cla`

These methods are deprecated in favor of the respective `clear()` methods.

Invalid hatch pattern characters are no longer ignored

When specifying hatching patterns, characters that are not recognized will raise a deprecation warning. In the future, this will become a hard error.

`imread` reading from URLs

Passing a URL to *imread()* is deprecated. Please open the URL for reading and directly use the Pillow API (`PIL.Image.open(urllib.request.urlopen(url))`, or `PIL.Image.open(io.BytesIO(requests.get(url).content))`) instead.

Subplot-related attributes and methods

Some `SubplotBase` methods and attributes have been deprecated and/or moved to *SubplotSpec*:

- `get_geometry` (use `SubplotBase.get_subplotspec` instead),
- `change_geometry` (use `SubplotBase.set_subplotspec` instead),
- `is_first_row`, `is_last_row`, `is_first_col`, `is_last_col` (use the corresponding methods on the *SubplotSpec* instance instead),
- `update_params` (now a no-op),
- `figbox` (use `ax.get_subplotspec().get_geometry(ax.figure)` instead to recompute the geometry, or `ax.get_position()` to read its current value),
- `numRows`, `numCols` (use the `nrows` and `ncols` attribute on the *GridSpec* instead).

Likewise, the `get_geometry`, `change_geometry`, `update_params`, and `figbox` methods/attributes of *SubplotDivider* have been deprecated, with similar replacements.

`is_url` and `URL_REGEX`

... are deprecated. (They were previously defined in the toplevel *matplotlib* module.)

`matplotlib.style.core` deprecations

`STYLE_FILE_PATTERN`, `load_base_library`, and `iter_user_libraries` are deprecated.

`dpi_cor` property of `FancyArrowPatch`

This parameter is considered internal and deprecated.

Passing `boxstyle="custom", bbox_transmuter=...` to `FancyBboxPatch`

In order to use a custom boxstyle, directly pass it as the *boxstyle* argument to *FancyBboxPatch*. This was previously already possible, and is consistent with custom arrow styles and connection styles.

BoxStyles are now called without passing the *mutation_aspect* parameter

Mutation aspect is now handled by the artist itself. Hence the *mutation_aspect* parameter of `BoxStyle._Base.__call__` is deprecated, and custom boxstyles should be implemented to not require this parameter (it can be left as a parameter defaulting to 1 for back-compatibility).

`ContourLabeler.get_label_coords` is deprecated

It is considered an internal helper.

Line2D and Patch no longer duplicate `validJoin` and `validCap`

Validation of joinstyle and capstyles is now centralized in `rcsetup`.

Setting a Line2D's pickradius via `set_picker` is undeprecated

This cancels the deprecation introduced in Matplotlib 3.3.0.

`MarkerStyle` is considered immutable

`MarkerStyle.set_fillstyle()` and `MarkerStyle.set_marker()` are deprecated. Create a new `MarkerStyle` with the respective parameters instead.

`MovieWriter.cleanup` is deprecated

Cleanup logic is now fully implemented in *`MovieWriter.finish`*. Third-party movie writers should likewise move the relevant cleanup logic there, as overridden `cleanup`s will no longer be called in the future.

minimumdescent parameter/property of `TextArea`

`offsetbox.TextArea` has behaved as if *minimumdescent* was always True (regardless of the value to which it was set) since Matplotlib 1.3, so the parameter/property is deprecated.

`colorbar` now warns when the mappable's Axes is different from the current Axes

Currently, *`Figure.colorbar`* and *`pyplot.colorbar`* steal space by default from the current Axes to place the colorbar. In a future version, they will steal space from the mappable's Axes instead. In preparation for this change, *`Figure.colorbar`* and *`pyplot.colorbar`* now emits a warning when the current Axes is not the same as the mappable's Axes.

Colorbar docstrings

The following globals in *`matplotlib.colorbar`* are deprecated: `colorbar_doc`, `colormap_kw_doc`, `make_axes_kw_doc`.

`ColorbarPatch` and `colorbar_factory` are deprecated

All the relevant functionality has been moved to the *`Colorbar`* class.

Backend deprecations

- `FigureCanvasBase.get_window_title` and `FigureCanvasBase.set_window_title` are deprecated. Use the corresponding methods on the FigureManager if using pyplot, or GUI-specific methods if embedding.
- The *resize_callback* parameter to `FigureCanvasTk` was never used internally and is deprecated. Tk-level custom event handlers for resize events can be added to a `FigureCanvasTk` using e.g. `get_tk_widget().bind('<Configure>', ..., True)`.
- The `key_press` and `button_press` methods of *FigureManagerBase*, which incorrectly did nothing when using `toolmanager`, are deprecated in favor of directly passing the event to the *CallbackRegistry* via `self.canvas.callbacks.process(event.name, event)`.
- `RendererAgg.get_content_extents` and `RendererAgg.tostring_rgba_minimized` are deprecated.
- `backend_pgf.TmpDirCleaner` is deprecated, with no replacement.
- `GraphicsContextPS` is deprecated. The PostScript backend now uses *GraphicsContextBase*.

wx backend cleanups

The *origin* parameter to `_FigureCanvasWxBase.gui_repaint` is deprecated with no replacement; `gui_repaint` now automatically detects the case where it is used with the wx renderer.

The `NavigationToolbar2Wx.get_canvas` method is deprecated; directly instantiate a canvas (`FigureCanvasWxAgg(frame, -1, figure)`) if needed.

Unused positional parameters to `print_<fmt>` methods are deprecated

None of the `print_<fmt>` methods implemented by canvas subclasses used positional arguments other that the first (the output filename or file-like), so these extra parameters are deprecated.

The *dpi* parameter of `FigureCanvas.print_foo` printers is deprecated

The *savefig* machinery already took care of setting the figure DPI to the desired value, so `print_foo` can directly read it from there. Not passing *dpi* to `print_foo` allows clearer detection of unused parameters passed to *savefig*.

Passing `bytes` to `FT2Font.set_text`

... is deprecated, pass `str` instead.

`ps.useafm` deprecated for mathtext

Outputting mathtext using only standard PostScript fonts has likely been broken for a while (issue #18722). In Matplotlib 3.5, the setting *rcParams["ps.useafm"]* (default: `False`) will have no effect on mathtext.

`MathTextParser("bitmap")` is deprecated

The associated APIs `MathtextBackendBitmap`, `MathTextParser.to_mask`, `MathTextParser.to_rgba`, `MathTextParser.to_png`, and `MathTextParser.get_depth` are likewise deprecated.

To convert a text string to an image, either directly draw the text to an empty *`Figure`* and save the figure using a tight bbox, as demonstrated in *Convert texts to images*, or use *`mathtext.math_to_image`*.

When using *`math_to_image`*, text color can be set with e.g.:

```
with plt.rc_context({"text.color": "tab:blue"}):
    mathtext.math_to_image(text, filename)
```

and an RGBA array can be obtained with e.g.:

```
from io import BytesIO
buf = BytesIO()
mathtext.math_to_image(text, buf, format="png")
buf.seek(0)
rgba = plt.imread(buf)
```

Deprecation of mathtext internals

The following API elements previously exposed by the *`mathtext`* module are considered to be implementation details and public access to them is deprecated:

- `Fonts` and all its subclasses,
- `FontConstantsBase` and all its subclasses,
- `Node` and all its subclasses,
- `Ship`, `ship`,
- `Error`,
- `Parser`,
- `SHRINK_FACTOR`, `GROW_FACTOR`,
- `NUM_SIZE_LEVELS`,
- `latex_to_bakoma`, `latex_to_cmex`, `latex_to_standard`,
- `stix_virtual_fonts`,
- `tex2uni`.

Deprecation of various mathtext helpers

The `MathtextBackendPdf`, `MathtextBackendPs`, `MathtextBackendSvg`, and `MathtextBackendCairo` classes from the *`mathtext`* module, as well as the corresponding `.mathtext_parser` attributes on `RendererPdf`, `RendererPS`, `RendererSVG`, and `Render-`

erCairo, are deprecated. The MathtextBackendPath class can be used to obtain a list of glyphs and rectangles in a mathtext expression, and renderer-specific logic should be directly implemented in the renderer.

StandardPsFonts.pswriter is unused and deprecated.

Widget class internals

Several *widgets.Widget* class internals have been privatized and deprecated:

- AxesWidget.cids
- Button.cnt and Button.observers
- CheckButtons.cnt and CheckButtons.observers
- RadioButtons.cnt and RadioButtons.observers
- Slider.cnt and Slider.observers
- TextBox.cnt, TextBox.change_observers and TextBox.submit_observers

3D properties on renderers

The properties of the 3D Axes that were placed on the Renderer during draw are now deprecated:

- renderer.M
- renderer.eye
- renderer.vvec
- renderer.get_axis_position

These attributes are all available via *Axes3D*, which can be accessed via self.axes on all *Artist*s.

renderer argument of do_3d_projection method for Collection3D/Patch3D

The *renderer* argument for the do_3d_projection method on Collection3D and Patch3D is no longer necessary, and passing it during draw is deprecated.

project argument of draw method for Line3DCollection

The *project* argument for the draw method on Line3DCollection is deprecated. Call *Line3DCollection.do_3d_projection* explicitly instead.

Extra positional parameters to plot_surface and plot_wireframe

Positional parameters to *plot_surface* and *plot_wireframe* other than X, Y, and Z are deprecated. Pass additional artist properties as keyword arguments instead.

`ParasiteAxesAuxTransBase` class

The functionality of that mixin class has been moved to the base `ParasiteAxesBase` class. Thus, `ParasiteAxesAuxTransBase`, `ParasiteAxesAuxTrans`, and `parasite_axes_auxtrans_class_factory` are deprecated.

In general, it is suggested to use `HostAxes.get_aux_axes` to create parasite Axes, as this saves the need of manually appending the parasite to `host.parasites` and makes sure that their `remove()` method works properly.

`AxisArtist.ZORDER` attribute

Use `AxisArtist.zorder` instead.

`GridHelperBase` invalidation

The `GridHelperBase.invalidate`, `GridHelperBase.valid`, and `axislines.Axes.invalidate_grid_helper` methods are considered internal and deprecated.

`sphinext.plot_directive.align`

... is deprecated. Use `docutils.parsers.rst.directives.images.Image.align` instead.

Deprecation-related functionality is considered internal

The module `matplotlib.cbook.deprecation` is considered internal and will be removed from the public API. This also holds for deprecation-related re-imports in `matplotlib.cbook`, i.e. `matplotlib.cbook.deprecated()`, `matplotlib.cbook.warn_deprecated()`, `matplotlib.cbook.MatplotlibDeprecationWarning` and `matplotlib.cbook.mplDeprecation`.

If needed, external users may import `MatplotlibDeprecationWarning` directly from the `matplotlib` namespace. `mplDeprecation` is only an alias of `MatplotlibDeprecationWarning` and should not be used anymore.

Removals

The following deprecated APIs have been removed:

Removed behaviour

- The "smart bounds" functionality on *`Axis`* and *`Spine`* has been deleted, and the related methods have been removed.
- Converting a string with single color characters (e.g. `'cymk'`) in *`to_rgba_array`* is no longer supported. Instead, the colors can be passed individually in a list (e.g. `['c', 'y', 'm', 'k']`).
- Returning a factor equal to `None` from `mpl_toolkits.axisartist` Locators (which are **not** the same as "standard" tick Locators), or passing a factor equal to `None` to axisartist Formatters (which are **not** the same as "standard" tick Formatters) is no longer supported. Pass a factor equal to 1 instead.

Modules

- The entire `matplotlib.testing.disable_internet` module has been removed. The pytest-remotedata package can be used instead.
- The `mpl_toolkits.axes_grid1.colorbar` module and its colorbar implementation have been removed in favor of *`matplotlib.colorbar`*.

Classes, methods and attributes

- The *`animation.MovieWriterRegistry`* methods `.set_dirty()`, `.ensure_not_dirty()`, and `.reset_available_writers()` do nothing and have been removed. The `.avail()` method has been removed; use `.list()` instead to get a list of available writers.
- The `matplotlib.artist.Artist.eventson` and `matplotlib.container.Container.eventson` attributes have no effect and have been removed.
- `matplotlib.axes.Axes.get_data_ratio_log` has been removed.
- `matplotlib.axes.SubplotBase.rowNum`; use `ax.get_subplotspec().rowspan.start` instead.
- `matplotlib.axes.SubplotBase.colNum`; use `ax.get_subplotspec().colspan.start` instead.
- `matplotlib.axis.Axis.set_smart_bounds` and `matplotlib.axis.Axis.get_smart_bounds` have been removed.
- `matplotlib.colors.DivergingNorm` has been renamed to *`TwoSlopeNorm`*.
- `matplotlib.figure.AxesStack` has been removed.
- `matplotlib.font_manager.JSONEncoder` has been removed; use *`font_manager.json_dump`* to dump a *`FontManager`* instance.
- The `matplotlib.ft2font.FT2Image` methods `.as_array()`, `.as_rgba_str()`, `.as_str()`, `.get_height()` and `.get_width()` have been removed. Convert the `FT2Image` to a NumPy array with `np.asarray` before processing it.
- `matplotlib.quiver.QuiverKey.quiverkey_doc` has been removed; use `matplotlib.quiver.QuiverKey.__init__.__doc__` instead.
- `matplotlib.spines.Spine.set_smart_bounds` and `matplotlib.spines.Spine.get_smart_bounds` have been removed.
- `matplotlib.testing.jpl_units.UnitDbl.checkUnits` has been removed; use `units not in self.allowed` instead.
- The unused `matplotlib.ticker.Locator.autoscale` method has been removed (pass the axis limits to *`Locator.view_limits`* instead). The derived methods `Locator.autoscale`, `AutoDateLocator.autoscale`, `RRuleLocator.autoscale`, `RadialLocator.autoscale`, `ThetaLocator.autoscale`, and `YearLocator.autoscale` have also been removed.

- `matplotlib.transforms.BboxBase.is_unit` has been removed; check the *Bbox* extents if needed.
- `matplotlib.transforms.Affine2DBase.matrix_from_values(...)` has been removed; use (for example) `Affine2D.from_values(...).get_matrix()` instead.
- `matplotlib.backend_bases.FigureCanvasBase.draw_cursor` has been removed.
- `matplotlib.backends.backend_gtk.ConfigureSubplotsGTK3.destroy` and `matplotlib.backends.backend_gtk.ConfigureSubplotsGTK3.init_window` methods have been removed.
- `matplotlib.backends.backend_gtk.ConfigureSubplotsGTK3.window` property has been removed.
- `matplotlib.backends.backend_macosx.FigureCanvasMac.invalidate` has been removed.
- `matplotlib.backends.backend_pgf.RendererPgf.latexManager` has been removed.
- `matplotlib.backends.backend_wx.FigureFrameWx.statusbar`, `matplotlib.backends.backend_wx.NavigationToolbar2Wx.set_status_bar`, and `matplotlib.backends.backend_wx.NavigationToolbar2Wx.statbar` have been removed. The status bar can be retrieved by calling standard wx methods (`frame.GetStatusBar()` and `toolbar.GetTopLevelParent().GetStatusBar()`).
- `matplotlib.backends.backend_wx.ConfigureSubplotsWx.configure_subplots` and `matplotlib.backends.backend_wx.ConfigureSubplotsWx.get_canvas` have been removed.
- `mpl_toolkits.axisartist.grid_finder.GridFinderBase` has been removed; use *GridFinder* instead.
- `mpl_toolkits.axisartist.axis_artist.BezierPath` has been removed; use *patches.PathPatch* instead.

Functions

- `matplotlib.backends.backend_pgf.repl_escapetext` and `matplotlib.backends.backend_pgf.repl_mathdefault` have been removed.
- `matplotlib.checkdep_ps_distiller` has been removed.
- `matplotlib.cm.revcmap` has been removed; use *Colormap.reversed* instead.
- `matplotlib.colors.makeMappingArray` has been removed.
- `matplotlib.compare_versions` has been removed; use comparison of `distutils.version.LooseVersions` instead.
- `matplotlib.dates.mx2num` has been removed.
- `matplotlib.font_manager.createFontList` has been removed; *font_manager.FontManager.addfont* is now available to register a font at a given path.

- `matplotlib.get_home` has been removed; use standard library instead.
- `matplotlib.mlab.apply_window` and `matplotlib.mlab.stride_repeat` have been removed.
- `matplotlib.rcsetup.update_savefig_format` has been removed; this just replaced `'auto'` with `'png'`, so do the same.
- `matplotlib.rcsetup.validate_animation_writer_path` has been removed.
- `matplotlib.rcsetup.validate_path_exists` has been removed; use `os.path.exists` or `pathlib.Path.exists` instead.
- `matplotlib.style.core.is_style_file` and `matplotlib.style.core.iter_style_files` have been removed.
- `matplotlib.testing.is_called_from_pytest` has been removed.
- `mpl_toolkits.mplot3d.axes3d.unit_bbox` has been removed; use *`Bbox.unit`* instead.

Arguments

- Passing more than one positional argument to *`axes.Axes.axis`* will now raise an error.
- Passing `"range"` to the *whis* parameter of *`Axes.boxplot`* and *`cbook.boxplot_stats`* to mean "the whole data range" is no longer supported.
- Passing scalars to the *where* parameter in *`axes.Axes.fill_between`* and *`axes.Axes.fill_betweenx`* is no longer accepted and non-matching sizes now raise a `ValueError`.
- The *verts* parameter to *`Axes.scatter`* has been removed; use *marker* instead.
- The *minor* parameter in *`Axis.set_ticks`* and `SecondaryAxis.set_ticks` is now keyword-only.
- *`scale.ScaleBase`*, *`scale.LinearScale`* and *`scale.SymmetricalLogScale`* now error if any unexpected keyword arguments are passed to their constructors.
- The *renderer* parameter to *`Figure.tight_layout`* has been removed; this method now always uses the renderer instance cached on the *`Figure`*.
- The *locator* parameter to *`mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase.colorbar`* has been removed in favor of its synonym *ticks* (which already existed previously, and is consistent with *`matplotlib.colorbar`*).
- The *switch_backend_warn* parameter to `matplotlib.test` has no effect and has been removed.
- The *dryrun* parameter to the various `FigureCanvas*.print_*` methods has been removed.

rcParams

- The `datapath` rcParam has been removed. Use *`matplotlib.get_data_path`* instead.
- The `mpl_toolkits.legacy_colorbar` rcParam has no effect and has been removed.
- Setting *`rcParams["boxplot.whiskers"]`* (default: `1.5`) to `"range"` is no longer valid; set it to `0, 100` instead.

- Setting *rcParams["savefig.format"]* (default: 'png') to "auto" is no longer valid; use "png" instead.
- Setting *rcParams["text.hinting"]* (default: 'force_autohint') to False or True is no longer valid; set it to "auto" or "none" respectively.

sample_data removals

The sample datasets listed below have been removed. Suggested replacements for demonstration purposes are listed in parentheses.

- None_vs_nearest-pdf.png,
- aapl.npz (use goog.npz),
- ada.png, grace_hopper.png (use grace_hopper.jpg),
- ct.raw.gz (use s1045.ima.gz),
- damodata.csv (use msft.csv).

Development changes

Increase to minimum supported versions of Python and dependencies

For Matplotlib 3.4, the *minimum supported versions* are being bumped:

Dependency	min in mpl3.3	min in mpl3.4
Python	3.6	3.7
dateutil	2.1	2.7
numpy	1.15	1.16
pyparsing	2.0.3	2.2.1

This is consistent with our *Dependency version policy* and NEP29

Qhull downloaded at build-or-sdist time

Much like FreeType, Qhull is now downloaded at build time, or upon creation of the sdist. To link against system Qhull, set the system_qhull option to True in the setup.cfg file. Note that Matplotlib now requires the re-entrant version of Qhull (qhull_r).

FigureBase class added, and Figure class made a child

The new subfigure feature motivated some re-organization of the *figure.Figure* class, so that the new *figure.SubFigure* class could have all the capabilities of a figure.

The *figure.Figure* class is now a subclass of *figure.FigureBase*, where *figure.FigureBase* contains figure-level artist addition routines, and the *figure.Figure* subclass just contains features that are unique to the outer figure.

Note that there is a new *transSubfigure* transform associated with the subfigure. This transform also exists for a `Figure` instance, and is equal to *transFigure* in that case, so code that uses the transform stack that wants to place objects on either the parent figure or one of the subfigures should use *transSubfigure*.

9.8 Version 3.3

9.8.1 What's new in Matplotlib 3.3.0 (Jul 16, 2020)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

        * *Images in SVG will no longer be blurred in some viewers*
        * *Saving SVG now supports adding metadata*
        * *Saving PDF metadata via PGF now consistent with PDF backend*
        * *NbAgg and WebAgg no longer use jQuery & jQuery UI*

Figure and Axes creation / management

Provisional API for composing semantic axes layouts from text or nested lists

The *Figure* class has a provisional method to generate complex grids of named *axes.Axes* based on nested list input or ASCII art:

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    [['.', 'histx'],
     ['histy', 'scat']]
)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
            ha='center', va='center', fontsize=36,
            color='darkgrey')
```

or as a string (with single-character Axes labels):

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
    TTE
    L.E
    """)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
            ha='center', va='center', fontsize=36,
            color='darkgrey')
```

See *Complex and semantic figure composition (subplot_mosaic)* for more details and examples.

GridSpec.subplots()

The *GridSpec* class gained a *subplots* method, so that one can write

```
fig.add_gridspec(2, 2, height_ratios=[3, 1]).subplots()
```

as an alternative to

```
fig.subplots(2, 2, gridspec_kw={"height_ratios": [3, 1]})
```

New Axes.sharex, Axes.sharey methods

These new methods allow sharing axes *immediately* after creating them. Note that behavior is indeterminate if axes are not shared immediately after creation.

For example, they can be used to selectively link some axes created all together using *subplot_mosaic*:

```
fig = plt.figure(constrained_layout=True)
axd = fig.subplot_mosaic([['.', 'histx'], ['histy', 'scat']],
                         gridspec_kw={'width_ratios': [1, 7],
                                      'height_ratios': [2, 7]})

axd['histx'].sharex(axd['scat'])
axd['histy'].sharey(axd['scat'])
```

tight_layout now supports suptitle

Previous versions did not consider *Figure.suptitle*, so it may overlap with other artists after calling *tight_layout*:

From now on, the `suptitle` will be considered:

Setting axes box aspect

It is now possible to set the aspect of an axes box directly via *set_box_aspect*. The box aspect is the ratio between axes height and axes width in physical units, independent of the data limits. This is useful to, e.g., produce a square plot, independent of the data it contains, or to have a non-image plot with the same axes dimensions next to an image plot with fixed (data-)aspect.

For use cases check out the *Axes box aspect* example.

Colors and colormaps

Turbo colormap

Turbo is an improved rainbow colormap for visualization, created by the Google AI team for computer vision and machine learning. Its purpose is to display depth and disparity data. Please see the Google AI Blog for further details.

`colors.BoundaryNorm` supports *extend* keyword argument

BoundaryNorm now has an *extend* keyword argument, analogous to *extend* in *contourf*. When set to 'both', 'min', or 'max', it maps the corresponding out-of-range values to *Colormap* lookup-table indices near the appropriate ends of their range so that the colors for out-of range values are adjacent to, but distinct from, their in-range neighbors. The colorbar inherits the *extend* argument from the norm, so with `extend='both'`, for example, the colorbar will have triangular extensions for out-of-range values with colors that differ from adjacent in-range colors.

Text color for legend labels

The text color of legend labels can now be set by passing a parameter `labelcolor` to *legend*. The `labelcolor` keyword can be:

- A single color (either a string or RGBA tuple), which adjusts the text color of all the labels.
- A list or tuple, allowing the text color of each label to be set individually.
- `linecolor`, which sets the text color of each label to match the corresponding line color.
- `markerfacecolor`, which sets the text color of each label to match the corresponding marker face color.
- `markeredgecolor`, which sets the text color of each label to match the corresponding marker edge color.

Pcolor and Pcolormesh now accept `shading='nearest'` and `'auto'`

Previously *axes.Axes.pcolor* and *axes.Axes.pcolormesh* handled the situation where x and y have the same (respective) size as C by dropping the last row and column of C, and x and y are regarded as the edges of the remaining rows and columns in C. However, many users want x and y centered on the rows and columns of C.

To accommodate this, `shading='nearest'` and `shading='auto'` are new allowed strings for the *shading* keyword argument. `'nearest'` will center the color on x and y if x and y have the same dimensions as C (otherwise an error will be thrown). `shading='auto'` will choose 'flat' or 'nearest' based on the size of X, Y, C.

If `shading='flat'` then X, and Y should have dimensions one larger than C. If X and Y have the same dimensions as C, then the previous behavior is used and the last row and column of C are dropped, and a DeprecationWarning is emitted.

Users can also specify this by the new *rcParams["pcolor.shading"]* (default: `'auto'`) in their `.matplotlibrc` or via *rcParams*.

See *pcolormesh* for examples.

Titles, ticks, and labels

Align labels to Axes edges

set_xlabel, *set_ylabel* and `ColorbarBase.set_label` support a parameter `loc` for simplified positioning. For the xlabel, the supported values are 'left', 'center', or 'right'. For the ylabel, the supported values are 'bottom', 'center', or 'top'.

The default is controlled via *rcParams["xaxis.labellocation"]* (default: `'center'`) and *rcParams["yaxis.labellocation"]* (default: `'center'`); the Colorbar label takes the rcParam based on its orientation.

Allow tick formatters to be set with str or function inputs

set_major_formatter and *set_minor_formatter* now accept `str` or function inputs in addition to *Formatter* instances. For a `str` a *StrMethodFormatter* is automatically generated and used. For a function a *FuncFormatter* is automatically generated and used. In other words,

```
ax.xaxis.set_major_formatter('{x} km')
ax.xaxis.set_minor_formatter(lambda x, pos: str(x-5))
```

are shortcuts for:

```
import matplotlib.ticker as mticker

ax.xaxis.set_major_formatter(mticker.StrMethodFormatter('{x} km'))
ax.xaxis.set_minor_formatter(
    mticker.FuncFormatter(lambda x, pos: str(x-5))
```

`Axes.set_title` gains a *y* keyword argument to control auto positioning

set_title tries to auto-position the title to avoid any decorators on the top x-axis. This is not always desirable so now *y* is an explicit keyword argument of *set_title*. It defaults to *None* which means to use auto-positioning. If a value is supplied (i.e. the pre-3.0 default was `y=1.0`) then auto-positioning is turned off. This can also be set with the new rcParameter *rcParams["axes.titley"]* (default: `None`).

Offset text is now set to the top when using `axis.tick_top()`

Solves the issue that the power indicator (e.g., 1e4) stayed on the bottom, even if the ticks were on the top.

Set zorder of contour labels

clabel now accepts a *zorder* keyword argument making it easier to set the *zorder* of contour labels. If not specified, the default *zorder* of clabels used to always be 3 (i.e. the default *zorder* of *Text*) irrespective of the *zorder* passed to *contour*/*contourf*. The new default *zorder* for clabels has been changed to (`2 + zorder` passed to *contour* / *contourf*).

Other changes

New `Axes.axline` method

A new *axline* method has been added to draw infinitely long lines that pass through two points.

```
fig, ax = plt.subplots()

ax.axline((.1, .1), slope=5, color='C0', label='by slope')
```

(continues on next page)

(continued from previous page)

```
ax.axline((.1, .2), (.8, .7), color='C3', label='by points')

ax.legend()
```

`imshow` now coerces 3D arrays with depth 1 to 2D

Starting from this version arrays of size MxNx1 will be coerced into MxN for displaying. This means commands like `plt.imshow(np.random.rand(3, 3, 1))` will no longer return an error message that the image shape is invalid.

Better control of `Axes.pie` normalization

Previously, *`Axes.pie`* would normalize its input *x* if `sum(x) > 1`, but would do nothing if the sum were less than 1. This can be confusing, so an explicit keyword argument *normalize* has been added. By default, the old behavior is preserved.

By passing *normalize*, one can explicitly control whether any rescaling takes place or whether partial pies should be created. If normalization is disabled, and `sum(x) > 1`, then an error is raised.

Dates use a modern epoch

Matplotlib converts dates to days since an epoch using *`dates.date2num`* (via *`matplotlib.units`*). Previously, an epoch of `0000-12-31T00:00:00` was used so that `0001-01-01` was converted to 1.0. An epoch so distant in the past meant that a modern date was not able to preserve microseconds because 2000 years times the 2^(-52) resolution of a 64-bit float gives 14 microseconds.

Here we change the default epoch to the more reasonable UNIX default of `1970-01-01T00:00:00` which for a modern date has 0.35 microsecond resolution. (Finer resolution is not possible because we rely on `datetime.datetime` for the date locators). Access to the epoch is provided by *`get_epoch`*, and there is a new *`rcParams["date.epoch"]`* (default: `'1970-01-01T00:00:00'`) rcParam. The user may also call *`set_epoch`*, but it must be set *before* any date conversion or plotting is used.

If you have data stored as ordinal floats in the old epoch, you can convert them to the new ordinal using the following formula:

```
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31
↪'))
```

Lines now accept `MarkerStyle` instances as input

Similar to *`scatter`*, *`plot`* and *`Line2D`* now accept *`MarkerStyle`* instances as input for the *marker* parameter:

```
plt.plot(..., marker=matplotlib.markers.MarkerStyle("D"))
```

Fonts

Simple syntax to select fonts by absolute path

Fonts can now be selected by passing an absolute `pathlib.Path` to the *font* keyword argument of *`Text`*.

Improved font weight detection

Matplotlib is now better able to determine the weight of fonts from their metadata, allowing to differentiate between fonts within the same family more accurately.

rcParams improvements

`matplotlib.rc_context` can be used as a decorator

`matplotlib.rc_context` can now be used as a decorator (technically, it is now implemented as a `contextlib.contextmanager`), e.g.,

```
@rc_context({"lines.linewidth": 2})
def some_function(...):
    ...
```

rcParams for controlling default "raise window" behavior

The new config option *`rcParams["figure.raise_window"]`* (default: `True`) allows disabling of the raising of the plot window when calling *`show`* or *`pause`*. The `MacOSX` backend is currently not supported.

Add generalized `mathtext.fallback` to rcParams

New *`rcParams["mathtext.fallback"]`* (default: `'cm'`) rcParam. Takes "cm", "stix", "stixsans" or "none" to turn fallback off. The rcParam *mathtext.fallback_to_cm* is deprecated, but if used, will override new fallback.

Add `contour.linewidth` to rcParams

The new config option *`rcParams["contour.linewidth"]`* (default: `None`) allows to control the default line width of contours as a float. When set to `None`, the line widths fall back to *`rcParams["lines.linewidth"]`* (default: `1.5`). The config value is overridden as usual by the *linewidths* argument passed to *`contour`* when it is not set to `None`.

3D Axes improvements

`Axes3D` no longer distorts the 3D plot to match the 2D aspect ratio

Plots made with *Axes3D* were previously stretched to fit a square bounding box. As this stretching was done after the projection from 3D to 2D, it resulted in distorted images if non-square bounding boxes were used. As of 3.3, this no longer occurs.

Currently, modes of setting the aspect (via *set_aspect*) in data space are not supported for Axes3D but may be in the future. If you want to simulate having equal aspect in data space, set the ratio of your data limits to match the value of *get_box_aspect*. To control these ratios use the *set_box_aspect* method which accepts the ratios as a 3-tuple of X:Y:Z. The default aspect ratio is 4:4:3.

3D axes now support minor ticks

```
ax = plt.figure().add_subplot(projection='3d')

ax.scatter([0, 1, 2], [1, 3, 5], [30, 50, 70])

ax.set_xticks([0.25, 0.75, 1.25, 1.75], minor=True)
ax.set_xticklabels(['a', 'b', 'c', 'd'], minor=True)

ax.set_yticks([1.5, 2.5, 3.5, 4.5], minor=True)
ax.set_yticklabels(['A', 'B', 'C', 'D'], minor=True)

ax.set_zticks([35, 45, 55, 65], minor=True)
ax.set_zticklabels([r'$\alpha$', r'$\beta$', r'$\delta$', r'$\gamma$'],
                   minor=True)

ax.tick_params(which='major', color='C0', labelcolor='C0', width=5)
ax.tick_params(which='minor', color='C1', labelcolor='C1', width=3)
```

Home/Forward/Backward buttons now work with 3D axes

Interactive tool improvements

More consistent toolbar behavior across backends

Toolbar features are now more consistent across backends. The history buttons will auto-disable when there is no further action in a direction. The pan and zoom buttons will be marked active when they are in use.

In NbAgg and WebAgg, the toolbar buttons are now grouped similarly to other backends. The WebAgg toolbar now uses the same icons as other backends.

Toolbar icons are now styled for dark themes

On dark themes, toolbar icons will now be inverted. When using the GTK3Agg backend, toolbar icons are now symbolic, and both foreground and background colors will follow the theme. Tooltips should also behave correctly.

Cursor text now uses a number of significant digits matching pointing precision

Previously, the x/y position displayed by the cursor text would usually include far more significant digits than the mouse pointing precision (typically one pixel). This is now fixed for linear scales.

GTK / Qt zoom rectangle now black and white

This makes it visible even over a dark background.

Event handler simplifications

The *backend_bases.key_press_handler* and *backend_bases.button_press_handler* event handlers can now be directly connected to a canvas with `canvas.mpl_connect("key_press_event", key_press_handler)` and `canvas.mpl_connect("button_press_event", button_press_handler)`, rather than having to write wrapper functions that fill in the (now optional) *canvas* and *toolbar* parameters.

Functions to compute a Path's size

Various functions were added to *BezierSegment* and *Path* to allow computation of the shape/size of a *Path* and its composite Bezier curves.

In addition to the fixes below, *BezierSegment* has gained more documentation and usability improvements, including properties that contain its dimension, degree, control_points, and more.

Better interface for Path segment iteration

iter_bezier iterates through the *BezierSegment*'s that make up the Path. This is much more useful typically than the existing *iter_segments* function, which returns the absolute minimum amount of information possible to reconstruct the Path.

Fixed bug that computed a Path's Bbox incorrectly

Historically, *get_extents* has always simply returned the Bbox of a curve's control points, instead of the Bbox of the curve itself. While this is a correct upper bound for the path's extents, it can differ dramatically from the Path's actual extents for non-linear Bezier curves.

Backend-specific improvements

`savefig()` gained a *backend* keyword argument

The *backend* keyword argument to `savefig` can now be used to pick the rendering backend without having to globally set the backend; e.g., one can save PDFs using the pgf backend with `savefig("file.pdf", backend="pgf")`.

The SVG backend can now render hatches with transparency

The SVG backend now respects the hatch stroke alpha. Useful applications are, among others, semi-transparent hatches as a subtle way to differentiate columns in bar plots.

SVG supports URLs on more artists

URLs on more artists (i.e., from *Artist.set_url*) will now be saved in SVG files, namely, `Ticks` and `Line2Ds` are now supported.

Images in SVG will no longer be blurred in some viewers

A style is now supplied to images without interpolation (`imshow(..., interpolation='none')` so that SVG image viewers will no longer perform interpolation when rendering themselves.

Saving SVG now supports adding metadata

When saving SVG files, metadata can now be passed which will be saved in the file using Dublin Core and RDF. A list of valid metadata can be found in the documentation for *FigureCanvasSVG.print_svg*.

Saving PDF metadata via PGF now consistent with PDF backend

When saving PDF files using the PGF backend, passed metadata will be interpreted in the same way as with the PDF backend. Previously, this metadata was only accepted by the PGF backend when saving a multi-page PDF with *backend_pgf.PdfPages*, but is now allowed when saving a single figure, as well.

NbAgg and WebAgg no longer use jQuery & jQuery UI

Instead, they are implemented using vanilla JavaScript. Please report any issues with browsers.

9.8.2 API Changes for 3.3.1

Deprecations

Reverted deprecation of `num2epoch` and `epoch2num`

These two functions were deprecated in 3.3.0, and did not return an accurate Matplotlib datenum relative to the new Matplotlib epoch handling (*get_epoch* and *rcParams["date.epoch"]* (default: `'1970-01-01T00:00:00'`)). This version reverts the deprecation.

Functions `epoch2num` and `dates.julian2num` use `date.epoch` rcParam

Now `epoch2num` and (undocumented) `julian2num` return floating point days since *get_epoch* as set by *rcParams["date.epoch"]* (default: `'1970-01-01T00:00:00'`), instead of floating point days since the old epoch of "0000-12-31T00:00:00". If needed, you can translate from the new to old values as `old = new + mdates.date2num(np.datetime64('0000-12-31'))`

9.8.3 API Changes for 3.3.0

- *Behaviour changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behaviour changes

`Formatter.fix_minus`

`Formatter.fix_minus` now performs hyphen-to-unicode-minus replacement whenever *`rcParams["axes.unicode_minus"]`* (default: `True`) is True; i.e. its behavior matches the one of `ScalarFormatter.fix_minus` (*`ScalarFormatter`* now just inherits that implementation).

This replacement is now used by the `format_data_short` method of the various builtin formatter classes, which affects the cursor value in the GUI toolbars.

`FigureCanvasBase` now always has a `manager` attribute, which may be None

Previously, it did not necessarily have such an attribute. A check for `hasattr(figure.canvas, "manager")` should now be replaced by `figure.canvas.manager is not None` (or `getattr(figure.canvas, "manager", None) is not None` for back-compatibility).

`cbook.CallbackRegistry` now propagates exceptions when no GUI event loop is running

`cbook.CallbackRegistry` now defaults to propagating exceptions thrown by callbacks when no interactive GUI event loop is running. If a GUI event loop *is* running, *`cbook.CallbackRegistry`* still defaults to just printing a traceback, as unhandled exceptions can make the program completely `abort()` in that case.

`Axes.locator_params()` validates `axis` parameter

`axes.Axes.locator_params` used to accept any value for `axis` and silently did nothing, when passed an unsupported value. It now raises a `ValueError`.

`Axis.set_tick_params()` validates `which` parameter

`Axis.set_tick_params` (and the higher level *`axes.Axes.tick_params`* and *`pyplot.tick_params`*) used to accept any value for `which` and silently did nothing, when passed an unsupported value. It now raises a `ValueError`.

`Axis.set_ticklabels()` must match `FixedLocator.locs`

If an axis is using a *ticker.FixedLocator*, typically set by a call to *Axis.set_ticks*, then the number of ticklabels supplied must match the number of locations available (`FixedFormattor.locs`). If not, a `ValueError` is raised.

`backend_pgf.LatexManager.latex`

`backend_pgf.LatexManager.latex` is now created with `encoding="utf-8"`, so its `stdin`, `stdout`, and `stderr` attributes are utf8-encoded.

`pyplot.xticks()` and `pyplot.yticks()`

Previously, passing labels without passing the ticks to either *pyplot.xticks* and *pyplot.yticks* would result in:

```
TypeError: object of type 'NoneType' has no len()
```

It now raises a `TypeError` with a proper description of the error.

Setting the same property under multiple aliases now raises a TypeError

Previously, calling e.g. `plot(..., color=somecolor, c=othercolor)` would emit a warning because `color` and `c` actually map to the same Artist property. This now raises a TypeError.

`FileMovieWriter` temporary frames directory

FileMovieWriter now defaults to writing temporary frames in a temporary directory, which is always cleared at exit. In order to keep the individual frames saved on the filesystem, pass an explicit *frame_prefix*.

`Axes.plot` no longer accepts *x* and *y* being both 2D and with different numbers of columns

Previously, calling *Axes.plot* e.g. with *x* of shape `(n, 3)` and *y* of shape `(n, 2)` would plot the first column of *x* against the first column of *y*, the second column of *x* against the second column of *y*, **and** the first column of *x* against the third column of *y*. This now raises an error instead.

`Text.update_from` now copies usetex state from the source Text

`stem` now defaults to `use_line_collection=True`

This creates the stem plot as a *LineCollection* rather than individual *Line2D* objects, greatly improving performance.

rcParams color validator is now stricter

Previously, rcParams entries whose values were color-like accepted "spurious" extra letters or characters in the "middle" of the string, e.g. `"(0, 1a, '0.5')"` would be interpreted as `(0, 1, 0.5)`. These extra characters (including the internal quotes) now cause a ValueError to be raised.

`SymLogNorm` now has a *base* parameter

Previously, *SymLogNorm* had no *base* keyword argument, and defaulted to `base=np.e` whereas the documentation said it was `base=10`. In preparation to make the default 10, calling *SymLogNorm* without the new *base* keyword argument emits a deprecation warning.

`errorbar` now color cycles when only errorbar color is set

Previously setting the *ecolor* would turn off automatic color cycling for the plot, leading to the the lines and markers defaulting to whatever the first color in the color cycle was in the case of multiple plot calls.

`rcsetup.validate_color_for_prop_cycle` now always raises TypeError for bytes input

It previously raised `TypeError`, **except** when the input was of the form `b"C[number]"` in which case it raised a ValueError.

`FigureCanvasPS.print_ps` and `FigureCanvasPS.print_eps` no longer apply edgecolor and facecolor

These methods now assume that the figure edge and facecolor have been correctly applied by *FigureCanvasBase.print_figure*, as they are normally called through it.

This behavior is consistent with other figure saving methods (*FigureCanvasAgg.print_png*, *FigureCanvasPdf.print_pdf*, *FigureCanvasSVG.print_svg*).

`pyplot.subplot()` now raises TypeError when given an incorrect number of arguments

This is consistent with other signature mismatch errors. Previously a ValueError was raised.

Shortcut for closing all figures

Shortcuts for closing all figures now also work for the classic toolbar. There is no default shortcut any more because unintentionally closing all figures by a key press might happen too easily. You can configure the shortcut yourself using *rcParams["keymap.quit_all"]* (default: `[]`).

Autoscale for arrow

Calling ax.arrow() will now autoscale the axes.

`set_tick_params(label1On=False)` now also makes the offset text (if any) invisible

... because the offset text can rarely be interpreted without tick labels anyways.

`Axes.annotate` and `pyplot.annotate` parameter name changed

The parameter `s` to *Axes.annotate* and *pyplot.annotate* is renamed to `text`, matching *Annotation*.

The old parameter name remains supported, but support for it will be dropped in a future Matplotlib release.

`font_manager.json_dump` now locks the font manager dump file

... to prevent multiple processes from writing to it at the same time.

`pyplot.rgrids` and `pyplot.thetagrids` now act as setters also when called with only kwargs

Previously, keyword arguments were silently ignored when no positional arguments were given.

`Axis.get_minorticklabels` and `Axis.get_majorticklabels` now returns plain list

Previously, *Axis.get_minorticklabels* and *Axis.get_majorticklabels* returns silent_list. Their return type is now changed to normal list. *get_xminorticklabels*, *get_yminorticklabels*, *get_zminorticklabels*, *Axis.get_ticklabels*, *get_xmajorticklabels*, *get_ymajorticklabels* and *get_zmajorticklabels* methods will be affected by this change.

Default slider formatter

The default method used to format *Slider* values has been changed to use a *ScalarFormatter* adapted the slider values limits. This should ensure that values are displayed with an appropriate number of significant digits even if they are much smaller or much bigger than 1. To restore the old behavior, explicitly pass a "%1.2f" as the *valfmt* parameter to *Slider*.

Add *normalize* keyword argument to `Axes.pie`

`pie()` used to draw a partial pie if the sum of the values was < 1. This behavior is deprecated and will change to always normalizing the values to a full pie by default. If you want to draw a partial pie, please pass `normalize=False` explicitly.

`table.CustomCell` is now an alias for `table.Cell`

All the functionality of `CustomCell` has been moved to its base class *Cell*.

wx Timer interval

Setting the timer interval on a not-yet-started `TimerWx` won't start it anymore.

"step"-type histograms default to the zorder of `Line2D`

This ensures that they go above gridlines by default. The old `zorder` can be kept by passing it as a keyword argument to *`Axes.hist`*.

`Legend` and `OffsetBox` visibility

`Legend` and *`OffsetBox`* subclasses (*`PaddedBox`*, *`AnchoredOffsetbox`*, and *`AnnotationBbox`*) no longer directly keep track of the visibility of their underlying *`Patch`* artist, but instead pass that flag down to the *`Patch`*.

`Legend` and `Table` no longer allow invalid locations

This affects legends produced on an Axes (*`Axes.legend`* and *`pyplot.legend`*) and on a Figure (*`Figure.legend`* and *`pyplot.figlegend`*). Figure legends also no longer accept the unsupported `'best'` location. Previously, invalid Axes locations would use `'best'` and invalid Figure locations would used `'upper right'`.

Passing Line2D's *drawstyle* together with *linestyle* is removed

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is also an alias for `drawstyle`.

Upper case color strings

Support for passing single-letter colors (one of "rgbcmykw") as UPPERCASE characters is removed; these colors are now case-sensitive (lowercase).

tight/constrained_layout no longer worry about titles that are too wide

tight_layout and *constrained_layout* shrink axes to accommodate "decorations" on the axes. However, if an xlabel or title is too long in the x direction, making the axes smaller in the x-direction doesn't help. The behavior of both has been changed to ignore the width of the title and xlabel and the height of the ylabel in the layout logic.

This also means there is a new keyword argument for *`axes.Axes.get_tightbbox`* and *`axis.Axis.get_tightbbox`*: `for_layout_only`, which defaults to *False*, but if *True* returns a bounding box using the rules above.

`rcParams["savefig.facecolor"]` (default: `'auto'`) and `rcParams["savefig.edgecolor"]` (default: `'auto'`) now default to "auto"

This newly allowed value for *`rcParams["savefig.facecolor"]`* (default: `'auto'`) and *`rcParams["savefig.edgecolor"]`* (default: `'auto'`), as well as the *facecolor* and *edgecolor* parameters to *`Figure.savefig`*, means "use whatever facecolor and edgecolor the figure current has".

When using a single dataset, `Axes.hist` no longer wraps the added artist in a `silent_list`

When *Axes.hist* is called with a single dataset, it adds to the axes either a *BarContainer* object (when `histtype="bar"` or `"barstacked"`), or a *Polygon* object (when `histype="step"` or `"stepfilled"`) -- the latter being wrapped in a list-of-one-element. Previously, either artist would be wrapped in a *silent_list*. This is no longer the case: the *BarContainer* is now returned as is (this is an API breaking change if you were directly relying on the concrete `list` API; however, *BarContainer* inherits from `tuple` so most common operations remain available), and the list-of-one *Polygon* is returned as is. This makes the `repr` of the returned artist more accurate: it is now

```
<BarContainer object of 10 artists>  # "bar", "barstacked"
[<matplotlib.patches.Polygon object at 0xdeadbeef>]  # "step",
 ↪"stepfilled"
```

instead of

```
<a list of 10 Patch objects>  # "bar", "barstacked"
<a list of 1 Patch objects>  # "step", "stepfilled"
```

When *Axes.hist* is called with multiple artists, it still wraps its return value in a *silent_list*, but uses more accurate type information

```
<a list of 3 BarContainer objects>  # "bar", "barstacked"
<a list of 3 List[Polygon] objects>  # "step", "stepfilled"
```

instead of

```
<a list of 3 Lists of Patches objects>  # "bar", "barstacked"
<a list of 3 Lists of Patches objects>  # "step", "stepfilled"
```

Qt and wx backends no longer create a status bar by default

The coordinates information is now displayed in the toolbar, consistently with the other backends. This is intended to simplify embedding of Matplotlib in larger GUIs, where Matplotlib may control the toolbar but not the status bar.

`rcParams["text.hinting"]` (default: `'force_autohint'`) now supports names mapping to FreeType flags

rcParams["text.hinting"] (default: `'force_autohint'`) now supports the values "default", "no_autohint", "force_autohint", and "no_hinting", which directly map to the FreeType flags FT_LOAD_DEFAULT, etc. The old synonyms (respectively "either", "native", "auto", and "none") are still supported, but their use is discouraged. To get normalized values, use *backend_agg.get_hinting_flag*, which returns integer flag values.

`cbook.get_sample_data` auto-loads numpy arrays

When *`cbook.get_sample_data`* is used to load a npy or npz file and the keyword-only parameter `np_load` is True, the file is automatically loaded using `numpy.load`. `np_load` defaults to False for backwards compatibility, but will become True in a later release.

`get_text_width_height_descent` now checks `ismath` rather than `rcParams["text.usetex"]` (default: `False`)

... to determine whether a string should be passed to the usetex machinery or not. This allows single strings to be marked as not-usetex even when the rcParam is True.

`Axes.vlines`, `Axes.hlines`, `pyplot.vlines` and `pyplot.hlines` *colors* parameter default change

The *colors* parameter will now default to *`rcParams["lines.color"]`* (default: `'C0'`), while previously it defaulted to 'k'.

Aggressively autoscale clim in `ScalerMappable` classes

Previously some plotting methods would defer autoscaling until the first draw if only one of the *vmin* or *vmax* keyword arguments were passed (*`Axes.scatter`*, *`Axes.hexbin`*, *`Axes.imshow`*, *`Axes.pcolorfast`*) but would scale based on the passed data if neither was passed (independent of the *norm* keyword arguments). Other methods (*`Axes.pcolor`*, *`Axes.pcolormesh`*) always autoscaled base on the initial data.

All of the plotting methods now resolve the unset *vmin* or *vmax* at the initial call time using the data passed in.

If you were relying on exactly one of the *vmin* or *vmax* remaining unset between the time when the method is called and the first time the figure is rendered you get back the old behavior by manually setting the relevant limit back to `None`

```
cm_obj.norm.vmin = None
# or
cm_obj.norm.vmax = None
```

which will be resolved during the draw process.

Deprecations

`figure.add_axes()` without arguments

Calling `fig.add_axes()` with no arguments currently does nothing. This call will raise an error in the future. Adding a free-floating axes needs a position rectangle. If you want a figure-filling single axes, use `add_subplot()` instead.

backend_wx.DEBUG_MSG

backend_wx.DEBUG_MSG is deprecated. The wx backends now use regular logging.

Colorbar.config_axis()

Colorbar.config_axis() is considered internal. Its use is deprecated.

NonUniformImage.is_grayscale and PcolorImage.is_grayscale

These attributes are deprecated, for consistency with AxesImage.is_grayscale, which was removed back in Matplotlib 2.0.0. (Note that previously, these attributes were only available *after rendering the image*).

den parameter and attribute to mpl_toolkits.axisartist.angle_helper

For all locator classes defined in *mpl_toolkits.axisartist.angle_helper*, the den parameter has been renamed to nbins, and the den attribute deprecated in favor of its (preexisting) synonym nbins, for consistency with locator classes defined in *matplotlib.ticker*.

backend_pgf.LatexManager.latex_stdin_utf8

backend_pgf.LatexManager.latex is now created with encoding="utf-8", so its stdin attribute is already utf8-encoded; the latex_stdin_utf8 attribute is thus deprecated.

Flags containing "U" passed to cbook.to_filehandle and cbook.open_file_cm

Please remove "U" from flags passed to *cbook.to_filehandle* and *cbook.open_file_cm*. This is consistent with their removal from open in Python 3.9.

PDF and PS character tracking internals

The used_characters attribute and track_characters and merge_used_characters methods of *RendererPdf*, *PdfFile*, and *RendererPS* are deprecated.

Case-insensitive capstyles and joinstyles

Please pass capstyles ("miter", "round", "bevel") and joinstyles ("butt", "round", "projecting") as lowercase.

Passing raw data to register_cmap()

Passing raw data via parameters *data* and *lut* to matplotlib.cm.register_cmap() is deprecated. Instead, explicitly create a *LinearSegmentedColormap* and pass it via the *cmap* parameter: register_cmap(cmap=LinearSegmentedColormap(name, data, lut)).

`DateFormatter.illegal_s`

This attribute is unused and deprecated.

`widgets.TextBox.params_to_disable`

This attribute is deprecated.

Revert deprecation *min, *max keyword arguments to `set_x/y/zlim_3d()`

These keyword arguments were deprecated in 3.0, alongside with the respective parameters in `set_xlim()` / `set_ylim()`. The deprecations of the 2D versions were already reverted in 3.1.

`cbook.local_over_kwdict`

This function is deprecated. Use *`cbook.normalize_kwargs`* instead.

Passing both singular and plural *colors*, *linewidths*, *linestyles* to `Axes.eventplot`

Passing e.g. both *linewidth* and *linewidths* will raise a TypeError in the future.

Setting `text.latex.preamble` or `pdf.preamble` rcParams to non-strings

These rcParams should be set to string values. Support for None (meaning the empty string) and lists of strings (implicitly joined with newlines) is deprecated.

Parameters *norm* and *vmin*/*vmax* should not be used simultaneously

Passing parameters *norm* and *vmin*/*vmax* simultaneously to functions using colormapping such as `scatter()` and `imshow()` is deprecated. Instead of `norm=LogNorm(), vmin=min_val, vmax=max_val` pass `norm=LogNorm(min_val, max_val)`. *vmin* and *vmax* should only be used without setting *norm*.

Effectless parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar`

The *cmap* and *norm* parameters of *`Figure.colorbar`* and *`matplotlib.colorbar.Colorbar`* have no effect because they are always overridden by the mappable's colormap and norm; they are thus deprecated. Likewise, passing the *alpha*, *boundaries*, *values*, *extend*, or *filled* parameters with a *`ContourSet`* mappable, or the *alpha* parameter with an *`Artist`* mappable, is deprecated, as the mappable would likewise override them.

`args_key` and `exec_key` attributes of builtin `MovieWriters`

These attributes are deprecated.

Unused parameters

The following parameters do not have any effect and are deprecated:

- arbitrary keyword arguments to `StreamplotSet`
- parameter *quantize* of *`Path.cleaned()`*
- parameter *s* of *`AnnotationBbox.get_fontsize()`*
- parameter *label* of *`Tick`*

Passing *props* to `Shadow`

The parameter *props* of *`Shadow`* is deprecated. Use keyword arguments instead.

`Axes.update_datalim_bounds`

This method is deprecated. Use `ax.dataLim.set(Bbox.union([ax.dataLim, bounds]))` instead.

`{,Symmetrical}LogScale.{,Inverted}LogTransform`

`LogScale.LogTransform`, `LogScale.InvertedLogTransform`, `SymmetricalScale.SymmetricalTransform` and `SymmetricalScale.InvertedSymmetricalTransform` are deprecated. Directly access the transform classes from the *`scale`* module.

`TexManager.cachedir`, `TexManager.rgba_arrayd`

Use *`matplotlib.get_cachedir()`* instead for the former; there is no replacement for the latter.

Setting `Line2D`'s pickradius via `Line2D.set_picker`

Setting a *`Line2D`*'s pickradius (i.e. the tolerance for pick events and containment checks) via *`Line2D.set_picker`* is deprecated. Use *`Line2D.set_pickradius`* instead.

`Line2D.set_picker` no longer sets the artist's custom-contain() check.

`Artist.set_contains`, `Artist.get_contains`

Setting a custom method overriding *`Artist.contains`* is deprecated. There is no replacement, but you may still customize pick events using *`Artist.set_picker`*.

`Colorbar` methods

The `on_mappable_changed` and `update_bruteforce` methods of *`Colorbar`* are deprecated; both can be replaced by calls to *`update_normal`*.

`OldScalarFormatter`, `IndexFormatter` and `IndexDateFormatter`

These formatters are deprecated. Their functionality can be implemented using e.g. *`FuncFormatter`*.

`OldAutoLocator`

This ticker is deprecated.

required, *forbidden* and *allowed* parameters of `cbook.normalize_kwargs`

These parameters are deprecated.

The `TTFPATH` and `AFMPATH` environment variables

Support for the (undocumented) `TTFPATH` and `AFMPATH` environment variables is deprecated. Additional fonts may be registered using `matplotlib.font_manager.fontManager.addfont()`.

`matplotlib.compat`

This module is deprecated.

`matplotlib.backends.qt_editor.formsubplottool`

This module is deprecated. Use `matplotlib.backends.backend_qt5.SubplotToolQt` instead.

AVConv animation writer deprecated

The `AVConvBase`, `AVConvWriter` and `AVConvFileWriter` classes, and the associated `animation.avconv_path` and `animation.avconv_args` rcParams are deprecated.

Debian 8 (2015, EOL 06/2020) and Ubuntu 14.04 (EOL 04/2019) were the last versions of Debian and Ubuntu to ship avconv. It remains possible to force the use of avconv by using the ffmpeg-based writers with *`rcParams["animation.ffmpeg_path"]`* (default: `'ffmpeg'`) set to "avconv".

log/symlog scale base, ticks, and nonpos specification

`semilogx`, *`semilogy`*, *`loglog`*, *`LogScale`*, and *`SymmetricalLogScale`* used to take keyword arguments that depends on the axis orientation ("basex" vs "basey", "subsx" vs "subsy", "nonposx" vs "nonposy"); these parameter names are now deprecated in favor of "base", "subs", "nonpositive". This deprecation also affects e.g. `ax.set_yscale("log", basey=...)` which must now be spelled `ax.set_yscale("log", base=...)`.

The change from "nonpos" to "nonpositive" also affects *`LogTransform`*, *`InvertedLogTransform`*, *`SymmetricalLogTransform`*, etc.

To use *different* bases for the x-axis and y-axis of a *`loglog`* plot, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

`DraggableBase.artist_picker`

This method is deprecated. If you previously reimplemented it in a subclass, set the artist's picker instead with *`Artist.set_picker`*.

clear_temp parameter and attribute of `FileMovieWriter`

The *clear_temp* parameter and attribute of *`FileMovieWriter`* is deprecated. In the future, files placed in a temporary directory (using `frame_prefix=None`, the default) will be cleared; files placed elsewhere will not.

Deprecated rcParams validators

The following validators, defined in *`rcsetup`*, are deprecated: `validate_fontset`, `validate_mathtext_default`, `validate_alignment`, `validate_svg_fonttype`, `validate_pgf_texsystem`, `validate_movie_frame_fmt`, `validate_axis_locator`, `validate_movie_html_fmt`, `validate_grid_axis`, `validate_axes_titlelocation`, `validate_toolbar`, `validate_ps_papersize`, `validate_legend_loc`, `validate_bool_maybe_none`, `validate_hinting`, `validate_movie_writer`, `validate_webagg_address`, `validate_nseq_float`, `validate_nseq_int`. To test whether an rcParam value would be acceptable, one can test e.g. `rc = RcParams(); rc[k] = v` raises an exception.

Stricter rcParam validation

`rcParams["axes.axisbelow"]` (default: `'line'`) currently normalizes all strings starting with "line" (case-insensitive) to the option "line". This is deprecated; in a future version only the exact string "line" (case-sensitive) will be supported.

`add_subplot()` validates its inputs

In particular, for `add_subplot(rows, cols, index)`, all parameters must be integral. Previously strings and floats were accepted and converted to int. This will now emit a deprecation warning.

Toggling axes navigation from the keyboard using "a" and digit keys

Axes navigation can still be toggled programmatically using *`Axes.set_navigate`*.

The following related APIs are also deprecated: `backend_tools.ToolEnableAllNavigation`, `backend_tools.ToolEnableNavigation`, and `rcParams["keymap.all_axes"]`.

`matplotlib.test(recursionlimit=...)`

The *recursionlimit* parameter of `matplotlib.test` is deprecated.

mathtext glues

The *copy* parameter of `mathtext.Glue` is deprecated (the underlying glue spec is now immutable). `mathtext.GlueSpec` is deprecated.

Signatures of `Artist.draw` and `matplotlib.axes.Axes.draw`

The *inframe* parameter to *matplotlib.axes.Axes.draw* is deprecated. Use *Axes.redraw_in_frame* instead.

Not passing the *renderer* parameter to *matplotlib.axes.Axes.draw* is deprecated. Use `axes.draw_artist(axes)` instead.

These changes make the signature of the `draw(artist.draw(renderer))` method consistent across all artists; thus, additional parameters to *Artist.draw* are deprecated.

`DraggableBase.on_motion_blit`

This method is deprecated. *DraggableBase.on_motion* now handles both the blitting and the non-blitting cases.

Passing the dash offset as None

Fine control of dash patterns can be achieved by passing an `(offset, (on-length, off-length, on-length, off-length, ...))` pair as the linestyle property of *Line2D* and *LineCollection*. Previously, certain APIs would accept `offset = None` as a synonym for `offset = 0`, but this was never universally implemented, e.g. for vector output. Support for `offset = None` is deprecated, set the offset to 0 instead.

`RendererCairo.fontweights`, `RendererCairo.fontangles`

... are deprecated.

`autofmt_xdate(which=None)`

This is deprecated, use its more explicit synonym, `which="major"`, instead.

JPEG options

The *quality*, *optimize*, and *progressive* keyword arguments to *savefig*, which were only used when saving to JPEG, are deprecated. The `savefig.jpeg_quality` rcParam is likewise deprecated.

Such options should now be directly passed to Pillow using `savefig(..., pil_kwargs={"quality": ..., "optimize": ..., "progressive": ...})`.

dviread.Encoding

This class was (mostly) broken and is deprecated.

Axis and Locator pan and zoom

The unused pan and zoom methods of *Axis* and *Locator* are deprecated. Panning and zooming are now implemented using the start_pan, drag_pan, and end_pan methods of *Axes*.

Passing None to various Axes subclass factories

Support for passing None as base class to axes.subplot_class_factory, axes_grid1.parasite_axes.host_axes_class_factory, axes_grid1.parasite_axes.host_subplot_class_factory, axes_grid1.parasite_axes.parasite_axes_class_factory, and axes_grid1.parasite_axes.parasite_axes_auxtrans_class_factory is deprecated. Explicitly pass the correct base Axes class instead.

axes_rgb

In *mpl_toolkits.axes_grid1.axes_rgb*, imshow_rgb is deprecated (use ax.imshow(np.dstack([r, g, b])) instead); RGBAxesBase is deprecated (use RGBAxes instead); RGBAxes.add_RGB_to_figure is deprecated (it was an internal helper).

Substitution.from_params

This method is deprecated. If needed, directly assign to the params attribute of the Substitution object.

PGF backend cleanups

The *dummy* parameter of *RendererPgf* is deprecated.

GraphicsContextPgf is deprecated (use *GraphicsContextBase* instead).

set_factor method of mpl_toolkits.axisartist locators

The set_factor method of *mpl_toolkits.axisartist* locators (which are different from "standard" Matplotlib tick locators) is deprecated.

widgets.SubplotTool callbacks and axes

The funcleft, funcright, funcbottom, functop, funcwspace, and funchspace methods of *widgets.SubplotTool* are deprecated.

The axleft, axright, axbottom, axtop, axwspace, and axhspace attributes of *widgets.SubplotTool* are deprecated. Access the ax attribute of the corresponding slider, if needed.

mathtext `Glue` helper classes

The `Fil`, `Fill`, `Filll`, `NegFil`, `NegFill`, `NegFilll`, and `SsGlue` classes in the *matplotlib.mathtext* module are deprecated. As an alternative, directly construct glue instances with `Glue("fil")`, etc.

NavigationToolbar2._init_toolbar

Overriding this method to initialize third-party toolbars is deprecated. Instead, the toolbar should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which *required* `_init_toolbar` to be overridden), a fully empty implementation (`def _init_toolbar(self): pass`) may be kept and will not trigger the deprecation warning.

NavigationToolbar2QT.parent and .basedir

These attributes are deprecated. In order to access the parent window, use `toolbar.canvas.parent()`. Once the deprecation period is elapsed, it will also be accessible as `toolbar.parent()`. The base directory to the icons is `os.path.join(mpl.get_data_path(), "images")`.

NavigationToolbar2QT.ctx

This attribute is deprecated.

NavigationToolbar2Wx attributes

The `prevZoomRect`, `retinaFix`, `savedRetinaImage`, `wxoverlay`, `zoomAxes`, `zoomStartX`, and `zoomStartY` attributes are deprecated.

NavigationToolbar2.press and .release

These methods were called when pressing or releasing a mouse button, but *only* when an interactive pan or zoom was occurring (contrary to what the docs stated). They are deprecated; if you write a backend which needs to customize such events, please directly override `press_pan`/`press_zoom`/`release_pan`/`release_zoom` instead.

FigureCanvasGTK3._renderer_init

Overriding this method to initialize renderers for GTK3 canvases is deprecated. Instead, the renderer should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which *required* `_renderer_init` to be overridden), a fully empty implementation (`def _renderer_init(self): pass`) may be kept and will not trigger the deprecation warning.

Path helpers in `bezier`

`bezier.make_path_regular` is deprecated. Use `Path.cleaned()` (or `Path.cleaned(curves=True)`, etc.) instead (but note that these methods add a `STOP` code at the end of the path).

`bezier.concatenate_paths` is deprecated. Use `Path.make_compound_path()` instead.

`animation.html_args` rcParam

The unused `animation.html_args` rcParam and `animation.HTMLWriter.args_key` attribute are deprecated.

`text.latex.preview` rcParam

This rcParam, which controlled the use of the preview.sty LaTeX package to align TeX string baselines, is deprecated, as Matplotlib's own dvi parser now computes baselines just as well as preview.sty.

`SubplotSpec.get_rows_columns`

This method is deprecated. Use the `GridSpec.nrows`, `GridSpec.ncols`, `SubplotSpec.rowspan`, and `SubplotSpec.colspan` properties instead.

Qt4-based backends

The qt4agg and qt4cairo backends are deprecated. Qt4 has reached its end-of-life in 2015 and there are no releases for recent versions of Python. Please consider switching to Qt5.

fontdict and *minor* parameters of `Axes.set_xticklabels` and `Axes.set_yticklabels` will become keyword-only

All parameters of `Figure.subplots` except *nrows* and *ncols* will become keyword-only

This avoids typing e.g. `subplots(1, 1, 1)` when meaning `subplot(1, 1, 1)`, but actually getting `subplots(1, 1, sharex=1)`.

`RendererWx.get_gc`

This method is deprecated. Access the `gc` attribute directly instead.

add_all parameter in `axes_grid`

The *add_all* parameter of *axes_grid1.axes_grid.Grid*, *axes_grid1.axes_grid.ImageGrid*, *axes_grid1.axes_rgb.make_rgb_axes* and *axes_grid1.axes_rgb.RGBAxes* is deprecated. Axes are now always added to the parent figure, though they can be later removed with `ax.remove()`.

`BboxBase.inverse_transformed`

`.BboxBase.inverse_transformed` is deprecated (call *BboxBase.transformed* on the *inverted()* transform instead).

orientation of `eventplot()` and `EventCollection`

Setting the *orientation* of an `eventplot()` or *EventCollection* to "none" or None is deprecated; set it to "horizontal" instead. Moreover, the two orientations ("horizontal" and "vertical") will become case-sensitive in the future.

minor kwarg to `Axis.get_ticklocs` will become keyword-only

Passing this argument positionally is deprecated.

Case-insensitive properties

Normalization of upper or mixed-case property names to lowercase in *Artist.set* and *Artist.update* is deprecated. In the future, property names will be passed as is, allowing one to pass names such as *patchA* or *UVC*.

`ContourSet.ax`, `Quiver.ax`

These attributes are deprecated in favor of `ContourSet.axes` and `Quiver.axes`, for consistency with other artists.

`Locator.refresh()` and associated methods

`Locator.refresh()` is deprecated. This method was called at certain places to let locators update their internal state, typically based on the axis limits. Locators should now always consult the axis limits when called, if needed.

The associated helper methods `NavigationToolbar2.draw()` and `ToolViewsPositions.refresh_locators()` are deprecated, and should be replaced by calls to `draw_idle()` on the corresponding canvas.

`ScalarMappable` checkers

The `add_checker` and `check_update` methods and `update_dict` attribute of *ScalarMappable* are deprecated.

`pyplot.tight_layout` and `ColorbarBase` parameters will become keyword-only

All parameters of *pyplot.tight_layout* and all parameters of `ColorbarBase` except for the first (*ax*) will become keyword-only, consistently with *Figure.tight_layout* and `Colorbar`, respectively.

`Axes.pie` radius and startangle

Passing `None` as either the `radius` or `startangle` of an *`Axes.pie`* is deprecated; use the explicit defaults of 1 and 0, respectively, instead.

`AxisArtist.dpi_transform`

... is deprecated. Scale `Figure.dpi_scale_trans` by 1/72 to achieve the same effect.

`offset_position` property of `Collection`

The `offset_position` property of *`Collection`* is deprecated. In the future, *`Collection`*s will always behave as if `offset_position` is set to "screen" (the default).

Support for passing `offset_position="data"` to the `draw_path_collection` of all renderer classes is deprecated.

`transforms.AffineDeltaTransform` can be used as a replacement. This API is experimental and may change in the future.

`testing.compare.make_external_conversion_command`

... is deprecated.

`epoch2num` and `num2epoch` are deprecated

These are unused and can be easily reproduced by other date tools. *`get_epoch`* will return Matplotlib's epoch.

`axes_grid1.CbarAxes` attributes

The `cbid` and `locator` attribute are deprecated. Use `mappable.colorbar_cid` and `colorbar.locator`, as for standard colorbars.

`qt_compat.is_pyqt5`

This function is deprecated in prevision of the future release of PyQt6. The Qt version can be checked using `QtCore.qVersion()`.

Reordering of parameters by `Artist.set`

In a future version, `Artist.set` will apply artist properties in the order in which they are given. This only affects the interaction between the *color*, *edgecolor*, *facecolor*, and, for *`Collection`*s, *alpha* properties: the *color* property now needs to be passed first in order not to override the other properties. This is consistent with e.g. *`Artist.update`*, which did not reorder the properties passed to it.

Passing multiple keys as a single comma-separated string or multiple arguments to `ToolManager.update_keymap`

This is deprecated; pass keys as a list of strings instead.

Statusbar classes and attributes

The `statusbar` attribute of *FigureManagerBase*, `StatusbarBase` and all its subclasses, and `StatusBarWx`, are deprecated, as messages are now displayed in the toolbar instead.

`ismath` parameter of `draw_tex`

The `ismath` parameter of the `draw_tex` method of all renderer classes is deprecated (as a call to `draw_tex` -- not to be confused with `draw_text`! -- means that the entire string should be passed to the `usetex` machinery anyways). Likewise, the text machinery will no longer pass the `ismath` parameter when calling `draw_tex` (this should only matter for backend implementers).

Passing `ismath="TeX!"` to *RendererAgg.get_text_width_height_descent* is deprecated. Pass `ismath="TeX"` instead, consistently with other low-level APIs which support the values True, False, and "TeX" for `ismath`.

`matplotlib.ttconv`

This module is deprecated.

Stricter PDF metadata keys in PGF

Saving metadata in PDF with the PGF backend currently normalizes all keys to lowercase, unlike the PDF backend, which only accepts the canonical case. This is deprecated; in a future version, only the canonically cased keys listed in the PDF specification (and the *PdfPages* documentation) will be accepted.

Qt modifier keys

The `MODIFIER_KEYS`, `SUPER`, `ALT`, `CTRL`, and `SHIFT` global variables of the `matplotlib.backends.backend_qt4agg`, `matplotlib.backends.backend_qt4cairo`, *matplotlib.backends.backend_qt5agg* and *matplotlib.backends.backend_qt5cairo* modules are deprecated.

`TexManager`

The `TexManager.serif`, `TexManager.sans_serif`, `TexManager.cursive` and `TexManager.monospace` attributes are deprecated.

Removals

The following deprecated APIs have been removed:

Modules

- `backends.qt_editor.formlayout` (use the formlayout module available on PyPI instead).

Classes, methods and attributes

- `artist.Artist.aname` property (no replacement)
- `axis.Axis.iter_ticks` (no replacement)
- Support for custom backends that do not provide a `backend_bases.GraphicsContextBase.set_hatch_color` method
- `backend_bases.RendererBase.strip_math()` (use `cbook.strip_math()` instead)
- `backend_wx.debug_on_error()` (no replacement)
- `backend_wx.raise_msg_to_str()` (no replacement)
- `backend_wx.fake_stderr` (no replacement)
- `backend_wx.MenuButtonWx` (no replacement)
- `backend_wx.PrintoutWx` (no replacement)
- `_backend_tk.NavigationToolbar2Tk.set_active()` (no replacement)
- `backend_ps.PsBackendHelper.gs_exe` property (no replacement)
- `backend_ps.PsBackendHelper.gs_version` property (no replacement)
- `backend_ps.PsBackendHelper.supports_ps2write` property (no replacement)
- `backend_ps.RendererPS.afmfontd` property (no replacement)
- `backend_ps.GraphicsContextPS.shouldstroke` property (no replacement)
- `backend_gtk3.FileChooserDialog` (no replacement)
- `backend_gtk3.SaveFigureGTK3.get_filechooser()` (no replacement)
- `backend_gtk3.NavigationToolbar2GTK3.get_filechooser()` (no replacement)
- `backend_gtk3cairo.FigureManagerGTK3Cairo` (use `backend_gtk3.FigureManagerGTK3` instead)
- `backend_pdf.RendererPdf.afm_font_cache` property (no replacement)
- `backend_pgf.LatexManagerFactory` (no replacement)
- `backend_qt5.NavigationToolbar2QT.buttons` property (no replacement)
- `backend_qt5.NavigationToolbar2QT.adj_window` property (no replacement)
- `bezier.find_r_to_boundary_of_closedpath()` (no replacement)
- `cbook.dedent()` (use `inspect.cleandoc` instead)
- `cbook.get_label()` (no replacement)

- `cbook.is_hashable()` (use `isinstance(..., collections.abc.Hashable)` instead)
- `cbook.iterable()` (use `numpy.iterable()` instead)
- `cbook.safezip()` (no replacement)
- `colorbar.ColorbarBase.get_cmap` (use `ScalarMappable.get_cmap` instead)
- `colorbar.ColorbarBase.set_cmap` (use `ScalarMappable.set_cmap` instead)
- `colorbar.ColorbarBase.get_clim` (use `ScalarMappable.get_clim` instead)
- `colorbar.ColorbarBase.set_clim` (use `ScalarMappable.set_clim` instead)
- `colorbar.ColorbarBase.set_norm` (use `ScalarMappable.set_norm` instead)
- `dates.seconds()` (no replacement)
- `dates.minutes()` (no replacement)
- `dates.hours()` (no replacement)
- `dates.weeks()` (no replacement)
- `dates.strpdate2num` and `dates.bytespdate2num` (use `time.strptime` or `dateutil.parser.parse` or *`dates.datestr2num`* instead)
- `docstring.Appender` (no replacement)
- `docstring.dedent()` (use `inspect.getdoc` instead)
- `docstring.copy_dedent()` (use `docstring.copy()` and `inspect.getdoc` instead)
- `font_manager.OSXInstalledFonts()` (no replacement)
- `image.BboxImage.interp_at_native` property (no replacement)
- `lines.Line2D.verticalOffset` property (no replacement)
- `matplotlib.checkdep_dvipng` (no replacement)
- `matplotlib.checkdep_ghostscript` (no replacement)
- `matplotlib.checkdep_pdftops` (no replacement)
- `matplotlib.checkdep_inkscape` (no replacement)
- `matplotlib.get_py2exe_datafiles` (no replacement)
- `matplotlib.tk_window_focus` (use `rcParams['tk.window_focus']` instead)
- `mlab.demean()` (use `mlab.detrend_mean()` instead)
- `path.get_paths_extents()` (use `path.get_path_collection_extents()` instead)
- `path.Path.has_nonfinite()` (use `not np.isfinite(self.vertices).all()` instead)
- `projections.process_projection_requirements()` (no replacement)

- `pyplot.plotfile()` (Instead, load the data using `pandas.read_csv` or `numpy.loadtxt` or similar and use regular pyplot functions to plot the loaded data.)
- `quiver.Quiver.color()` (use `Quiver.get_facecolor()` instead)
- `quiver.Quiver.keyvec` property (no replacement)
- `quiver.Quiver.keytext` property (no replacement)
- `rcsetup.validate_qt4()` (no replacement)
- `rcsetup.validate_qt5()` (no replacement)
- `rcsetup.validate_verbose()` (no replacement)
- `rcsetup.ValidateInterval` (no replacement)
- `scale.LogTransformBase` (use `scale.LogTransform` instead)
- `scale.InvertedLogTransformBase` (use `scale.InvertedLogTransform` instead)
- `scale.Log10Transform` (use `scale.LogTransform` instead)
- `scale.InvertedLog10Transform` (use `scale.InvertedLogTransform` instead)
- `scale.Log2Transform` (use `scale.LogTransform` instead)
- `scale.InvertedLog2Transform` (use `scale.InvertedLogTransform` instead)
- `scale.NaturalLogTransform` (use `scale.LogTransform` instead)
- `scale.InvertedNaturalLogTransform` (use `scale.InvertedLogTransform` instead)
- `scale.get_scale_docs()` (no replacement)
- `sphinxext.plot_directive.plot_directive()` (use the class `PlotDirective` instead)
- `sphinxext.mathmpl.math_directive()` (use the class `MathDirective` instead)
- `spines.Spine.is_frame_like()` (no replacement)
- `testing.decorators.switch_backend()` (use `@pytest.mark.backend` decorator instead)
- `text.Text.is_math_text()` (use `cbook.is_math_text()` instead)
- `text.TextWithDash()` (use `text.Annotation` instead)
- `textpath.TextPath.is_math_text()` (use `cbook.is_math_text()` instead)
- `textpath.TextPath.text_get_vertices_codes()` (use `textpath.text_to_path.get_text_path()` instead)
- `textpath.TextToPath.glyph_to_path()` (use `font.get_path()` and manual translation of the vertices instead)
- `ticker.OldScalarFormatter.pprint_val()` (no replacement)
- `ticker.ScalarFormatter.pprint_val()` (no replacement)

- `ticker.LogFormatter.pprint_val()` (no replacement)
- `ticker.decade_down()` (no replacement)
- `ticker.decade_up()` (no replacement)
- `Tick` properties `gridOn`, `tick1On`, `tick2On`, `label1On`, `label2On` (use `set_visible()` / `get_visible()` on `Tick.gridline`, `Tick.tick1line`, `Tick.tick2line`, `Tick.label1`, `Tick.label2` instead)
- `widgets.SpanSelector.buttonDown` property (no replacement)
- `mplot3d.proj3d.line2d()` (no replacement)
- `mplot3d.proj3d.line2d_dist()` (no replacement)
- `mplot3d.proj3d.line2d_seg_dist()` (no replacement)
- `mplot3d.proj3d.mod()` (use `numpy.linalg.norm` instead)
- `mplot3d.proj3d.proj_transform_vec()` (no replacement)
- `mplot3d.proj3d.proj_transform_vec_clip()` (no replacement)
- `mplot3d.proj3d.vec_pad_ones()` (no replacement)
- `mplot3d.proj3d.proj_trans_clip_points()` (no replacement)
- `mplot3d.art3d.norm_angle()` (no replacement)
- `mplot3d.art3d.norm_text_angle()` (no replacement)
- `mplot3d.art3d.path_to_3d_segment()` (no replacement)
- `mplot3d.art3d.paths_to_3d_segments()` (no replacement)
- `mplot3d.art3d.path_to_3d_segment_with_codes()` (no replacement)
- `mplot3d.art3d.paths_to_3d_segments_with_codes()` (no replacement)
- `mplot3d.art3d.get_patch_verts()` (no replacement)
- `mplot3d.art3d.get_colors()` (no replacement)
- `mplot3d.art3d.zalpha()` (no replacement)
- `mplot3d.axis3d.get_flip_min_max()` (no replacement)
- `mplot3d.axis3d.Axis.get_tick_positions()` (no replacement)
- `axisartist.axis_artist.UnimplementedException` (no replacement)
- `axisartist.axislines.SimpleChainedObjects` (use `axis_grid1.mpl_axes.SimpleChainedObjects` instead)
- `axisartist.axislines.Axes.AxisDict` (use `axis_grid1.mpl_axes.Axes.AxisDict` instead)

Arguments

- `Axes.text()`/`pyplot.text()` do not support the parameter `withdash` anymore. Use `Axes.annotate()` and `pyplot.annotate()` instead.
- The first parameter of *matplotlib.use* has been renamed from `arg` to `backend` (only relevant if you pass by keyword).
- The parameter `warn` of *matplotlib.use* has been removed. A failure to switch the backend will now always raise an `ImportError` if `force` is set; catch that error if necessary.
- All parameters of *matplotlib.use* except the first one are now keyword-only.
- The unused parameters `shape` and `imlim` of *imshow()* are now removed. All parameters beyond `extent` are now keyword-only.
- The unused parameter `interp_at_native` of *BboxImage* has been removed.
- The parameter `usetex` of *TextToPath.get_text_path* has been removed. Use `is_math='TeX'` instead.
- The parameter `block` of `show()` is now keyword-only, and arbitrary arguments or keyword arguments are no longer accepted.
- The parameter `frameon` of *Figure.savefig* has been removed. Use `facecolor="none"` to get a transparent background.
- Passing a `wx.EvtHandler` as the first argument to `backend_wx.TimerWx` is not supported anymore; the signature of `TimerWx` is now consistent with *TimerBase*.
- The `manage_xticks` parameter of *boxplot* and *bxp* has been renamed to `manage_ticks`.
- The `normed` parameter of *hist2d* has been renamed to `density`.
- The `s` parameter of *Annotation* has been renamed to `text`.
- For all functions in *bezier* that supported a `tolerance` parameter, this parameter has been renamed to `tolerance`.
- `axis("normal")` is not supported anymore. Use the equivalent `axis("auto")` instead.
- `axis()` does not accept arbitrary keyword arguments anymore.
- `Axis.set_ticklabels()` does not accept arbitrary positional arguments other than `ticklabels`.
- `mpl_toolkits.mplot3d.art3d.Poly3DCollection.set_zsort` does not accept the value `True` anymore. Pass the equivalent value 'average' instead.
- *AnchoredText* no longer accepts `horizontalalignment` or `verticalalignment` keyword arguments.
- *ConnectionPatch* no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.
- *FancyArrowPatch* no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.

- *TextPath* no longer accepts arbitrary positional or keyword arguments.
- *MaxNLocator.set_params()* no longer accepts arbitrary keyword arguments.
- *pie* no longer accepts and squeezes non-1D inputs; pass 1D input to the `x` argument.
- Passing (n, 1)-shaped error arrays to *Axes.errorbar()* is no longer supported; pass a 1D array instead.

rcParams

- The `text.latex.unicode` rcParam has been removed, with no replacement. Matplotlib now always supports unicode in usetex.
- The `savefig.frameon` rcParam has been removed. Set *rcParams["savefig.facecolor"]* (default: `'auto'`) to "none" to get a transparent background.
- The `pgf.debug`, `verbose.fileo` and `verbose.verbose.level` rcParams, which had no effect, have been removed.
- Support for setting *rcParams["mathtext.default"]* (default: `'it'`) to "circled" has been removed.

Environment variables

- `MATPLOTLIBDATA` (no replacement).

mathtext

- The `\stackrel` command (which behaved differently from its LaTeX version) has been removed. Use `\genfrac` instead.
- The `\mathcircled` command has been removed. Directly use Unicode characters, such as `'\N{CIRCLED LATIN CAPITAL LETTER A}'`, instead.

Development changes

Matplotlib now requires numpy>=1.15

Matplotlib now uses Pillow to save and read pngs

The builtin png encoder and decoder has been removed, and Pillow is now a dependency. Note that when reading 16-bit RGB(A) images, Pillow truncates them to 8-bit precision, whereas the old builtin decoder kept the full precision.

The deprecated wx backend (not wxagg!) now always uses wx's builtin jpeg and tiff support rather than relying on Pillow for writing these formats; this behavior is consistent with wx's png output.

9.9 Version 3.2

9.9.1 What's new in Matplotlib 3.2 (Mar 04, 2020)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.2 (Mar 04, 2020)*
  - *Unit converters recognize subclasses*
  - `imsave` *accepts metadata and PIL options*
  - `cbook.normalize_kwargs`
  - `FontProperties` *accepts* `os.PathLike`
  - *Gouraud-shading alpha channel in PDF backend*
  - *Kerning adjustments now use correct values*
  - *bar3d lightsource shading*
  - *Shifting errorbars*
  - *Improvements in Logit scale ticker and formatter*
  - *rcParams for axes title location and color*
  - *3-digit and 4-digit hex colors*
  - *Added support for RGB(A) images in pcolorfast*

Unit converters recognize subclasses

Unit converters now also handle instances of subclasses of the class they have been registered for.

`imsave` accepts metadata and PIL options

`imsave` has gained support for the `metadata` and `pil_kwargs` parameters. These parameters behave similarly as for the *`Figure.savefig()`* method.

`cbook.normalize_kwargs`

`cbook.normalize_kwargs` now presents a convenient interface to normalize artist properties (e.g., from "lw" to "linewidth"):

```
>>> cbook.normalize_kwargs({"lw": 1}, Line2D)
{"linewidth": 1}
```

The first argument is the mapping to be normalized, and the second argument can be an artist class or an artist instance (it can also be a mapping in a specific format; see the function's docstring for details).

`FontProperties` accepts `os.PathLike`

The *fname* argument to *`FontProperties`* can now be an `os.PathLike`, e.g.

```
>>> FontProperties(fname=pathlib.Path("/path/to/font.ttf"))
```

Gouraud-shading alpha channel in PDF backend

The pdf backend now supports an alpha channel in Gouraud-shaded triangle meshes.

Kerning adjustments now use correct values

Due to an error in how kerning adjustments were applied, previous versions of Matplotlib would under-correct kerning. This version will now correctly apply kerning (for fonts supported by FreeType). To restore the old behavior (e.g., for test images), you may set *`rcParams["text.kerning_factor"]`* (default: `0`) to 6 (instead of 0). Other values have undefined behavior.

Note how the spacing between characters is uniform between their bounding boxes (above). With corrected kerning (below), slanted characters (e.g., AV or VA) will be spaced closer together, as well as various other character pairs, depending on font support (e.g., T and e, or the period after the W).

bar3d lightsource shading

`bar3d()` now supports lighting from different angles when the *shade* parameter is `True`, which can be configured using the `lightsource` parameter.

Shifting errorbars

Previously, *`errorbar()`* accepted a keyword argument *errorevery* such that the command `plt.errorbar(x, y, yerr, errorevery=6)` would add error bars to datapoints `x[::6], y[::6]`.

`errorbar()` now also accepts a tuple for *errorevery* such that `plt.errorbar(x, y, yerr, errorevery=(start, N))` adds error bars to points `x[start::N], y[start::N]`.

Improvements in Logit scale ticker and formatter

Introduced in version 1.5, the logit scale didn't have an appropriate ticker and formatter. Previously, the location of ticks was not zoom dependent, too many labels were displayed causing overlapping which broke readability, and label formatting did not adapt to precision.

Starting from this version, the logit locator has nearly the same behavior as the locator for the log scale or the linear scale, depending on used zoom. The number of ticks is controlled. Some minor labels are displayed adaptively as sublabels in log scale. Formatting is adapted for probabilities and the precision adapts to the scale.

rcParams for axes title location and color

Two new rcParams have been added: *rcParams["axes.titlelocation"]* (default: 'center') denotes the default axes title alignment, and *rcParams["axes.titlecolor"]* (default: 'auto') the default axes title color.

Valid values for axes.titlelocation are: left, center, and right. Valid values for axes.titlecolor are: auto or a color. Setting it to auto will fall back to previous behaviour, which is using the color in text.color.

3-digit and 4-digit hex colors

Colors can now be specified using 3-digit or 4-digit hex colors, shorthand for the colors obtained by duplicating each character, e.g. #123 is equivalent to #112233 and #123a is equivalent to #112233aa.

Added support for RGB(A) images in pcolorfast

Axes.pcolorfast now accepts 3D images (RGB or RGBA) arrays.

9.9.2 API Changes for 3.2.0

- *Behavior changes*
- *Deprecations*
- *Removals*
- *Development changes*

Behavior changes

Reduced default value of rcParams["axes.formatter.limits"] (default: [-5, 6])

Changed the default value of *rcParams["axes.formatter.limits"]* (default: [-5, 6]) from -7, 7 to -5, 6 for better readability.

matplotlib.colorbar.Colorbar uses un-normalized axes for all mappables

Before 3.0, *matplotlib.colorbar.Colorbar* (*colorbar*) normalized all axes limits between 0 and 1 and had custom tickers to handle the labelling of the colorbar ticks. After 3.0, colorbars constructed from mappables that were *not* contours were constructed with axes that had limits between vmin and vmax of the mappable's norm, and the tickers were made children of the normal axes tickers.

This version of Matplotlib extends that to mappables made by contours, and allows the axes to run between the lowest boundary in the contour and the highest.

Code that worked around the normalization between 0 and 1 will need to be modified.

MovieWriterRegistry

MovieWriterRegistry now always checks the availability of the writer classes before returning them. If one wishes, for example, to get the first available writer, without performing the availability check on subsequent writers, it is now possible to iterate over the registry, which will yield the names of the available classes.

Autoscaling

Matplotlib used to recompute autoscaled limits after every plotting (`plot()`, `bar()`, etc.) call. It now only does so when actually rendering the canvas, or when the user queries the Axes limits. This is a major performance improvement for plots with a large number of artists.

In particular, this means that artists added manually with *Axes.add_line*, *Axes.add_patch*, etc. will be taken into account by the autoscale, even without an explicit call to *Axes.autoscale_view*.

In some cases, this can result in different limits being reported. If this is an issue, consider triggering a draw with `fig.canvas.draw()`.

Autoscaling has also changed for artists that are based on the *Collection* class. Previously, the method that calculates the automatic limits *Collection.get_datalim* tried to take into account the size of objects in the collection and make the limits large enough to not clip any of the object, i.e., for *Axes.scatter* it would make the limits large enough to not clip any markers in the scatter. This is problematic when the object size is specified in physical space, or figure-relative space, because the transform from physical units to data limits requires knowing the data limits, and becomes invalid when the new limits are applied. This is an inverse problem that is theoretically solvable (if the object is physically smaller than the axes), but the extra complexity was not deemed worth it, particularly as the most common use case is for markers in scatter that are usually small enough to be accommodated by the default data limit margins.

While the new behavior is algorithmically simpler, it is conditional on properties of the *Collection* object:

1. `offsets = None`, `transform` is a child of `Axes.transData`: use the paths for the automatic limits (i.e. for *LineCollection* in *Axes.streamplot*).
2. `offsets != None`, and `offset_transform` is child of `Axes.transData`:
   a) `transform` is child of `Axes.transData`: use the `path + offset` for limits (i.e., for *Axes.bar*).
   b) `transform` is not a child of `Axes.transData`: just use the offsets for the limits (i.e. for scatter)
3. otherwise return a null *Bbox*.

While this seems complicated, the logic is simply to use the information from the object that are in data space for the limits, but not information that is in physical units.

log-scale bar() / hist() autolimits

The autolimits computation in *bar* and *hist* when the axes already uses log-scale has changed to match the computation when the axes is switched to log-scale after the call to *bar* and *hist*, and when calling `bar(..., log=True)` / `hist(..., log=True)`: if there are at least two different bar heights, add

the normal axes margins to them (in log-scale); if there is only a single bar height, expand the axes limits by one order of magnitude around it and then apply axes margins.

Axes labels spanning multiple rows/columns

`Axes.label_outer` now correctly keep the x labels and tick labels visible for Axes spanning multiple rows, as long as they cover the last row of the Axes grid. (This is consistent with keeping the y labels and tick labels visible for Axes spanning multiple columns as long as they cover the first column of the Axes grid.)

The `Axes.is_last_row` and `Axes.is_last_col` methods now correctly return True for Axes spanning multiple rows, as long as they cover the last row or column respectively. Again this is consistent with the behavior for axes covering the first row or column.

The `Axes.rowNum` and `Axes.colNum` attributes are deprecated, as they only refer to the first grid cell covered by the Axes. Instead, use the new `ax.get_subplotspec().rowspan` and `ax.get_subplotspec().colspan` properties, which are `range` objects indicating the whole span of rows and columns covered by the subplot.

(Note that all methods and attributes mentioned here actually only exist on the `Subplot` subclass of *Axes*, which is used for grid-positioned Axes but not for Axes positioned directly in absolute coordinates.)

The *GridSpec* class gained the `nrows` and `ncols` properties as more explicit synonyms for the parameters returned by `GridSpec.get_geometry`.

Locators

When more than *Locator.MAXTICKS* ticks are generated, the behavior of *Locator.raise_if_exceeds* changed from raising a RuntimeError to emitting a log at WARNING level.

nonsingular Locators

`Locator.nonsingular` (introduced in mpl 3.1), `DateLocator.nonsingular`, and `AutoDateLocator.nonsingular` now returns a range `v0, v1` with `v0 <= v1`. This behavior is consistent with the implementation of `nonsingular` by the `LogLocator` and `LogitLocator` subclasses.

get_data_ratio

`Axes.get_data_ratio` now takes the axes scale into account (linear, log, logit, etc.) before computing the y-to-x ratio. This change allows fixed aspects to be applied to any combination of x and y scales.

Artist sticky edges

Previously, the `sticky_edges` attribute of artists was a list of values such that if an axis limit coincides with a sticky edge, it would not be expanded by the axes margins (this is the mechanism that e.g. prevents margins from being added around images).

`sticky_edges` now have an additional effect on margins application: even if an axis limit did not coincide with a sticky edge, it cannot *cross* a sticky edge through margin application -- instead, the margins will only expand the axis limit until it bumps against the sticky edge.

This change improves the margins of axes displaying a *streamplot*:

- if the streamplot goes all the way to the edges of the vector field, then the axis limits are set to match exactly the vector field limits (whereas they would sometimes be off by a small floating point error previously).
- if the streamplot does not reach the edges of the vector field (e.g., due to the use of `start_points` and `maxlength`), then margins expansion will not cross the vector field limits anymore.

This change is also used internally to ensure that polar plots don't display negative *r* values unless the user really passes in a negative value.

`gid` in svg output

Previously, if a figure, axis, legend or some other artists had a custom `gid` set (e.g. via `.set_gid()`), this would not be reflected in the svg output. Instead a default gid, like `figure_1` would be shown. This is now fixed, such that e.g. `fig.set_gid("myfigure")` correctly shows up as `<g id="myfigure">` in the svg file. If you relied on the gid having the default format, you now need to make sure not to set the `gid` parameter of the artists.

Fonts

Font weight guessing now first checks for the presence of the FT_STYLE_BOLD_FLAG before trying to match substrings in the font name. In particular, this means that Times New Roman Bold is now correctly detected as bold, not normal weight.

Color-like checking

matplotlib.colors.is_color_like used to return True for all string representations of floats. However, only those with values in 0-1 are valid colors (representing grayscale values). *is_color_like* now returns False for string representations of floats outside 0-1.

Default image interpolation

Images displayed in Matplotlib previously used nearest-neighbor interpolation, leading to aliasing effects for downscaling and non-integer upscaling.

New default for *rcParams["image.interpolation"]* (default: `'auto'`) is the new option "antialiased". `imshow(A, interpolation='antialiased')` will apply a Hanning filter when resampling the data in A for display (or saving to file) *if* the upsample rate is less than a factor of three, and not an integer; downsampled data is always smoothed at resampling.

To get the old behavior, set *rcParams["image.interpolation"]* (default: `'auto'`) to the old default "nearest" (or specify the `interpolation` kwarg of *Axes.imshow*)

To always get the anti-aliasing behavior, no matter what the up/down sample rate, set *rcParams["image.interpolation"]* (default: `'auto'`) to "hanning" (or one of the other filters available).

Note that the "hanning" filter was chosen because it has only a modest performance penalty. Anti-aliasing can be improved with other filters.

rcParams

When using *RendererSVG* with `rcParams["svg.image_inline"] == True`, externally written images now use a single counter even if the `renderer.basename` attribute is overwritten, rather than a counter per basename.

This change will only affect you if you used `rcParams["svg.image_inline"] = True` (the default is False) *and* manually modified `renderer.basename`.

Changed the default value of *rcParams["axes.formatter.limits"]* (default: `[-5, 6]`) from -7, 7 to -5, 6 for better readability.

add_subplot()

Figure.add_subplot() and *pyplot.subplot()* do not accept a *figure* keyword argument anymore. It only used to work anyway if the passed figure was `self` or the current figure, respectively.

indicate_inset()

In <= 3.1.0, *indicate_inset* and *indicate_inset_zoom* were documented as returning a 4-tuple of *ConnectionPatch*, where in fact they returned a 4-length list.

They now correctly return a 4-tuple. *indicate_inset* would previously raise an error if the optional *inset_ax* was not supplied; it now completes successfully, and returns *None* instead of the tuple of `ConnectionPatch`.

PGF backend

The pgf backend's get_canvas_width_height now returns the canvas size in display units rather than in inches, which it previously did. The new behavior is the correct one given the uses of `get_canvas_width_height` in the rest of the codebase.

The pgf backend now includes images using `\includegraphics` instead of `\pgfimage` if the version of `graphicx` is recent enough to support the `interpolate` option (this is detected automatically).

cbook

The default value of the "obj_type" parameter to `cbook.warn_deprecated` has been changed from "attribute" (a default that was never used internally) to the empty string.

Testing

The test suite no longer turns on the Python fault handler by default. Set the standard `PYTHONFAULTHANDLER` environment variable to do so.

Backend `supports_blit`

Backends do not need to explicitly define the flag `supports_blit` anymore. This is only relevant for backend developers. Backends had to define the flag `supports_blit`. This is not needed anymore because the blitting capability is now automatically detected.

Exception changes

Various APIs that raised a `ValueError` for incorrectly typed inputs now raise `TypeError` instead: *backend_bases.GraphicsContextBase.set_clip_path*, `blocking_input.BlockingInput.__call__`, `matplotlib.cm.register_cmap`, *dviread.DviFont*, *rcsetup.validate_hatch*, `.rcsetup.validate_animation_writer_path`, *spines.Spine*, many classes in the *matplotlib.transforms* module and *matplotlib.tri* package, and Axes methods that take a `norm` parameter.

If extra kwargs are passed to *LogScale*, `TypeError` will now be raised instead of `ValueError`.

mplot3d auto-registration

mpl_toolkits.mplot3d is always registered by default now. It is no longer necessary to import mplot3d to create 3d axes with

```
ax = fig.add_subplot(111, projection="3d")
```

`SymLogNorm` now has a *base* parameter

Previously, *SymLogNorm* had no *base* keyword argument and the base was hard-coded to `base=np.e`. This was inconsistent with the default behavior of *SymmetricalLogScale* (which defaults to `base=10`) and the use of the word "decade" in the documentation.

In preparation for changing the default base to 10, calling *SymLogNorm* without the new *base* keyword argument emits a deprecation warning.

Deprecations

`matplotlib.use`

The `warn` parameter to *matplotlib.use()* is deprecated (catch the `ImportError` emitted on backend switch failure and reemit a warning yourself if so desired).

plotfile

`.pyplot.plotfile` is deprecated in favor of separately loading and plotting the data. Use pandas or NumPy to load data, and pandas or matplotlib to plot the resulting data.

axes and axis

Setting `Axis.major.locator`, `Axis.minor.locator`, `Axis.major.formatter` or `Axis.minor.formatter` to an object that is not a subclass of *Locator* or *Formatter* (respectively) is deprecated. Note that these attributes should usually be set using *Axis.set_major_locator*, *Axis.set_minor_locator*, etc. which already raise an exception when an object of the wrong class is passed.

Passing more than one positional argument or unsupported keyword arguments to *axis()* is deprecated (such arguments used to be silently ignored).

`minor` argument will become keyword-only

Using the parameter `minor` to `get_*ticks()` / `set_*ticks()` as a positional parameter is deprecated. It will become keyword-only in future versions.

`axes_grid1`

The `mpl_toolkits.axes_grid1.colorbar` module and its colorbar implementation are deprecated in favor of *`matplotlib.colorbar`*, as the former is essentially abandoned and the latter is a more featureful replacement with a nearly compatible API (for example, the following additional keywords are supported: `panchor`, `extendfrac`, `extendrect`).

The main differences are:

- Setting the ticks on the colorbar is done by calling `colorbar.set_ticks` rather than `colorbar.cbar_axis.set_xticks` or `colorbar.cbar_axis.set_yticks`; the `locator` parameter to `colorbar()` is deprecated in favor of its synonym `ticks` (which already existed previously, and is consistent with *`matplotlib.colorbar`*).
- The colorbar's long axis is accessed with `colorbar.xaxis` or `colorbar.yaxis` depending on the orientation, rather than `colorbar.cbar_axis`.
- The default ticker is no longer `MaxNLocator(5)`, but a `_ColorbarAutoLocator`.
- Overdrawing multiple colorbars on top of one another in a single Axes (e.g. when using the `cax` attribute of *`ImageGrid`* elements) is not supported; if you previously relied on the second colorbar being drawn over the first, you can call `cax.cla()` to clear the axes before drawing the second colorbar.

During the deprecation period, the `mpl_toolkits.legacy_colorbar` rcParam can be set to True to use `mpl_toolkits.axes_grid1.colorbar` in *`mpl_toolkits.axes_grid1`* code with a deprecation warning (the default), or to False to use `matplotlib.colorbar`.

Passing a `pad` size of `None` (the default) as a synonym for zero to the `append_axes`, `new_horizontal` and `new_vertical` methods of *`axes_grid1.axes_divider.AxesDivider`* is deprecated. In a future release, the default value of `None` will mean "use *`rcParams["figure.subplot.wspace"]`* (default: `0.2`) or *`rcParams["figure.subplot.hspace"]`* (default: `0.2`)" (depending on the orientation). Explicitly pass `pad=0` to keep the old behavior.

Axes3D

`mplot3d.axis3d.get_flip_min_max` is deprecated.

`axes3d.unit_bbox` is deprecated (use `Bbox.unit` instead).

`axes3d.Axes3D.w_xaxis`, `.w_yaxis`, and `.w_zaxis` are deprecated (use `.xaxis`, `.yaxis`, and `.zaxis` instead).

matplotlib.cm

`cm.revcmap` is deprecated. Use *Colormap.reversed* to reverse a colormap.

`cm.datad` no longer contains entries for reversed colormaps in their "unconverted" form.

axisartist

`mpl_toolkits.axisartist.grid_finder.GridFinderBase` is deprecated (its only use is to be inherited by the *GridFinder* class which just provides more defaults in the constructor and directly sets the transforms, so `GridFinderBase`'s methods were just moved to *GridFinder*).

`axisartist.axis_artist.BezierPath` is deprecated (use *patches.PathPatch* to draw arbitrary Paths).

`AxisArtist.line` is now a *patches.PathPatch* instance instead of a `BezierPath` instance.

Returning a factor equal to None from axisartist Locators (which are **not** the same as "standard" tick Locators), or passing a factor equal to None to axisartist Formatters (which are **not** the same as "standard" tick Formatters) is deprecated. Pass a factor equal to 1 instead.

For the *mpl_toolkits.axisartist.axis_artist.AttributeCopier* class, the constructor and the `set_ref_artist` method, and the *default_value* parameter of `get_attribute_from_ref_artist`, are deprecated.

Deprecation of the constructor means that classes inheriting from *AttributeCopier* should no longer call its constructor.

Locators

The unused `Locator.autoscale` method is deprecated (pass the axis limits to *Locator.view_limits* instead).

Animation

The following methods and attributes of the *MovieWriterRegistry* class are deprecated: `set_dirty`, `ensure_not_dirty`, `reset_available_writers`, `avail`.

smart_bounds()

The "smart_bounds" functionality is deprecated. This includes `Axis.set_smart_bounds()`, `Axis.get_smart_bounds()`, `Spine.set_smart_bounds()`, and `Spine.get_smart_bounds()`.

boxplot()

Setting the `whis` parameter of *Axes.boxplot* and *cbook.boxplot_stats* to "range" to mean "the whole data range" is deprecated; set it to (0, 100) (which gets interpreted as percentiles) to achieve the same effect.

fill_between()

Passing scalars to parameter *where* in `fill_between()` and `fill_betweenx()` is deprecated. While the documentation already states that *where* must be of the same size as *x* (or *y*), scalars were accepted and broadcasted to the size of *x*. Non-matching sizes will raise a `ValueError` in the future.

scatter()

Passing the *verts* parameter to *axes.Axes.scatter* is deprecated; use the *marker* parameter instead.

tight_layout()

The `renderer` parameter to *Figure.tight_layout* is deprecated; this method now always uses the renderer instance cached on the *Figure*.

rcParams

The `rcsetup.validate_animation_writer_path` function is deprecated.

Setting *rcParams["savefig.format"]* (default: `'png'`) to "auto" is deprecated; use its synonym "png" instead.

Setting *rcParams["text.hinting"]* (default: `'force_autohint'`) to True or False is deprecated; use their synonyms "auto" or "none" instead.

`rcsetup.update_savefig_format` is deprecated.

`rcsetup.validate_path_exists` is deprecated (use `os.path.exists` to check whether a path exists).

`rcsetup.ValidateInterval` is deprecated.

Dates

`dates.mx2num` is deprecated.

TK

`NavigationToolbar2Tk.set_active` is deprecated, as it has no (observable) effect.

WX

`FigureFrameWx.statusbar` and `NavigationToolbar2Wx.statbar` are deprecated. The status bar can be retrieved by calling standard wx methods (`frame.GetStatusBar()` and `toolbar.GetTopLevelParent().GetStatusBar()`).

`backend_wx.ConfigureSubplotsWx.configure_subplots` and `backend_wx.ConfigureSubplotsWx.get_canvas` are deprecated.

PGF

`backend_pgf.repl_escapetext` and `backend_pgf.repl_mathdefault` are deprecated.

`RendererPgf.latexManager` is deprecated.

FigureCanvas

`FigureCanvasBase.draw_cursor` (which has never done anything and has never been overridden in any backend) is deprecated.

`FigureCanvasMac.invalidate` is deprecated in favor of its synonym, `FigureCanvasMac.draw_idle`.

The `dryrun` parameter to the various `FigureCanvasFoo.print_foo` methods is deprecated.

QuiverKey doc

`quiver.QuiverKey.quiverkey_doc` is deprecated; use `quiver.QuiverKey.__init__.__doc__` instead.

matplotlib.mlab

`mlab.apply_window` and `mlab.stride_repeat` are deprecated.

Fonts

`font_manager.JSONEncoder` is deprecated. Use *font_manager.json_dump* to dump a *FontManager* instance.

`font_manager.createFontList` is deprecated. *font_manager.FontManager.addfont* is now available to register a font at a given path.

The `as_str`, `as_rgba_str`, `as_array`, `get_width` and `get_height` methods of `matplotlib.ft2font.FT2Image` are deprecated. Convert the `FT2Image` to a NumPy array with `np.asarray` before processing it.

Colors

The function `matplotlib.colors.makeMappingArray` is not considered part of the public API any longer. Thus, it's deprecated.

Using a string of single-character colors as a color sequence (e.g. "rgb") is deprecated. Use an explicit list instead.

Scales

Passing unsupported keyword arguments to *ScaleBase*, and its subclasses *LinearScale* and *SymmetricalLogScale*, is deprecated and will raise a `TypeError` in 3.3.

If extra keyword arguments are passed to *LogScale*, `TypeError` will now be raised instead of `ValueError`.

Testing

The `matplotlib.testing.disable_internet` module is deprecated. Use (for example) pytest-remotedata instead.

Support in *`matplotlib.testing`* for nose-based tests is deprecated (a deprecation is emitted if using e.g. the decorators from that module while both 1) matplotlib's conftests have not been called and 2) nose is in `sys.modules`).

`testing.is_called_from_pytest` is deprecated.

During the deprecation period, to force the generation of nose base tests, import nose first.

The *switch_backend_warn* parameter to `matplotlib.test` has no effect and is deprecated.

`testing.jpl_units.UnitDbl.UnitDbl.checkUnits` is deprecated.

`DivergingNorm` renamed to `TwoSlopeNorm`

`DivergingNorm` was a misleading name; although the norm was developed with the idea that it would likely be used with diverging colormaps, the word 'diverging' does not describe or evoke the norm's mapping function. Since that function is monotonic, continuous, and piece-wise linear with two segments, the norm has been renamed to *`TwoSlopeNorm`*

Misc

`matplotlib.get_home` is deprecated (use e.g. `os.path.expanduser("~")`) instead.

`matplotlib.compare_versions` is deprecated (use comparison of `distutils.version.LooseVersions` instead).

`matplotlib.checkdep_ps_distiller` is deprecated.

`matplotlib.figure.AxesStack` is considered private API and will be removed from the public API in future versions.

`BboxBase.is_unit` is deprecated (check the Bbox extents if needed).

`Affine2DBase.matrix_from_values(...)` is deprecated. Use (for example) `Affine2D.from_values(...).get_matrix()` instead.

`style.core.is_style_file` and `style.core.iter_style_files` are deprecated.

The `datapath` rcParam

Use *`get_data_path`* instead. (The rcParam is deprecated because it cannot be meaningfully set by an end user.) The rcParam had no effect from 3.2.0, but was deprecated only in 3.2.1. In 3.2.1+ if `'datapath'` is set in a `matplotlibrc` file it will be respected, but this behavior will be removed in 3.3.

Removals

The `matplotlib.testing.determinism` module, which exposes no public API, has been deleted.

The following API elements have been removed:

- `backend_gtk3.PIXELS_PER_INCH`
- `backend_pgf.re_escapetext`, `backend_pgf.re_mathdefault`.
- the `matplotlib.backends.tkagg`, `matplotlib.backends.windowing`, `matplotlib.backends.wx_compat`, and `matplotlib.compat.subprocess` modules
- `RcParams.msg_depr`, `RcParams.msg_depr_ignore`, `RcParams.msg_depr_set`, `RcParams.msg_obsolete`, `RcParams.msg_backend_obsolete`
- `afm.parse_afm` (use `afm.AFM` instead)
- `axes.Axes.mouseover_set`
- `backend_cairo.ArrayWrapper`, `backend_cairo.RendererCairo.convert_path`
- `backend_gtk3.FileChooserDialog.sorted_filetypes` (use `sorted(self.filetypes.items())` instead)
- `backend_pgf.get_texcommand`
- `backend_pdf.PdfFile.texFontMap`
- `backend_ps.get_bbox`
- `backend_qt.FigureCanvasQt.keyAutoRepeat` (use `event.guiEvent.isAutoRepeat` instead), `backend_qt.error_msg_qt`, `backend_qt.exception_handler`
- `backend_wx.FigureCanvasWx.macros`
- `backends.pylab_setup`
- `cbook.Bunch` (use `types.SimpleNamespace` instead), `cbook.Locked`, `cbook.unicode_safe`, `cbook.is_numlike` (use `isinstance(..., numbers.Number)` instead), `cbook.mkdirs` (use `os.makedirs(..., exist_ok=True)` instead), `cbook.GetRealpathAndStat` (use `cbook.get_realpath_and_stat` instead), `cbook.listFiles`
- `container.Container.set_remove_method`
- `contour.ContourLabeler.cl`, `contour.ContourLabeler.cl_xy`, `contour.ContourLabeler.cl_cvalues` (use `labelTexts`, `labelXYs`, `labelCValues` instead)
- `dates.DateFormatter.strftime`, `dates.DateFormatter.strftime_pre_1900`
- `font_manager.TempCache`, `font_manager.FontManager.ttffiles`, `font_manager.FontManager.afmfiles`
- `mathtext.unichr_safe` (use `chr` instead)
- `patches.YAArrow` (use `patches.FancyArrowPatch` instead)

- `sphinxext.plot_directive.remove_coding`
- `table.Table.get_child_artists`
- `testing.compare.compare_float`, `testing.decorators.CleanupTest`, `testing.decorators.ImageComparisonTest`, `testing.decorators.skip_if_command_unavailable`, support for nose-based tests
- `text.Annotation.arrow` (use `text.Annotation.arrow_patch` instead)
- `textpath.TextToPath.tex_font_map`
- `ticker.Base`, `ticker.closeto`, `ticker.nearest_long`
- `axes_grid1.axes_divider.LocatableAxesBase`, `axes_grid1.axes_divider.locatable_axes_factory`, `axes_grid1.axes_divider.Axes` (use `axes_grid1.mpl_axes.Axes` instead), `axes_grid1.axes_divider.LocatableAxes` (use `axes_grid1.mpl_axes.Axes` instead)
- `axisartist.axes_divider.Axes`, `axisartist.axes_divider.LocatableAxes` (use `axisartist.axislines.Axes` instead)
- the *normed* keyword argument to `hist` (use *density* instead)
- passing `(verts, 0)` or `(..., 3)` when specifying a marker to specify a path or a circle, respectively (instead, use `verts` or `"o"`, respectively)
- the `examples.directory` rcParam

The following members of `matplotlib.backends.backend_pdf.PdfFile` were removed:

- `nextObject`
- `nextFont`
- `nextAlphaState`
- `nextHatch`
- `nextImage`
- `alphaStateObject`

The `required_interactive_framework` attribute of backend modules introduced in Matplotlib 3.0 has been moved to the `FigureCanvas` class, in order to let it be inherited by third-party canvas subclasses and to make it easier to know what interactive framework is required by a canvas class.

`backend_qt4.FigureCanvasQT5`, which is an alias for `backend_qt5.FigureCanvasQT` (but only exists under that name in `backend_qt4`), has been removed.

Development changes

Windows build

Previously, when building the `matplotlib._png` extension, the build script would add "png" and "z" to the extensions `.libraries` attribute (if pkg-config information is not available, which is in particular the case on Windows).

In particular, this implies that the Windows build would look up files named `png.lib` and `z.lib`; but neither libpng upstream nor zlib upstream provides these files by default. (On Linux, this would look up `libpng.so` and `libz.so`, which are indeed standard names.)

Instead, on Windows, we now look up `libpng16.lib` and `zlib.lib`, which *are* the upstream names for the shared libraries (as of libpng 1.6.x).

For a statically-linked build, the upstream names are `libpng16_static.lib` and `zlibstatic.lib`; one still needs to manually rename them if such a build is desired.

Packaging DLLs

Previously, it was possible to package Windows DLLs into the Matplotlib wheel (or sdist) by copying them into the source tree and setting the `package_data.dlls` entry in `setup.cfg`.

DLLs copied in the source tree are now always packaged; the `package_data.dlls` entry has no effect anymore. If you do not want to include the DLLs, don't copy them into the source tree.

9.10 Version 3.1

9.10.1 What's new in Matplotlib 3.1 (May 18, 2019)

For a list of all of the issues and pull requests since the last revision, see the *GitHub statistics for 3.10.8 (Nov 12, 2025)*.

Table of Contents

- *What's new in Matplotlib 3.1 (May 18, 2019)*
  - *New Features*
    - `ConciseDateFormatter`
    - *Secondary x/y Axis support*
    - `FuncScale` *for arbitrary axes scales*
    - *Legend for scatter*
    - *Matplotlib no longer requires framework app build on MacOSX backend*
  - *Figure, FigureCanvas, and Backends*
    - *Figure.frameon is now a direct proxy for the Figure patch visibility state*
    - pil_kwargs *argument added to savefig*
    - *Add* `inaxes` *method to* `FigureCanvasBase`
    - *cairo backend defaults to pycairo instead of cairocffi*
  - *Axes and Artists*
    - *axes_grid1 and axisartist Axes no longer draw spines twice*

        - *Return type of ArtistInspector.get_aliases changed*
        - `ConnectionPatch` *accepts arbitrary transforms*
        - *mplot3d Line3D now allows {set,get}_data_3d*
        - `Axes3D.voxels` *now shades the resulting voxels*
    - *Axis and Ticks*
        - *Added* `Axis.get_inverted` *and* `Axis.set_inverted`
        - *Adjust default minor tick spacing*
        - `EngFormatter` *now accepts* usetex, useMathText *as keyword only arguments*
    - *Animation and Interactivity*
        - *Support for forward/backward mouse buttons*
        - progress_callback *argument to* `save()`
        - *Add* `cache_frame_data` *keyword-only argument into* `animation.FuncAnimation`
        - *Endless Looping GIFs with PillowWriter*
        - *Adjusted* `matplotlib.widgets.Slider` *to have vertical orientation*
        - *Improved formatting of image values under cursor when a colorbar is present*
        - *MouseEvent button attribute is now an IntEnum*
    - *Configuration, Install, and Development*
        - *The MATPLOTLIBRC environment variable can now point to any "file" path*
        - *Allow LaTeX code* `pgf.preamble` *and* `text.latex.preamble` *in MATPLOTLIBRC file*
        - *New logging API*

New Features

`ConciseDateFormatter`

The automatic date formatter used by default can be quite verbose. A new formatter can be accessed that tries to make the tick labels appropriately concise.

Secondary x/y Axis support

A new method provides the ability to add a second axis to an existing axes via `Axes.secondary_xaxis` and `Axes.secondary_yaxis`. See *Secondary Axis* for examples.

`FuncScale` for arbitrary axes scales

A new *`FuncScale`* class was added (and *`FuncTransform`*) to allow the user to have arbitrary scale transformations without having to write a new subclass of *`ScaleBase`*. This can be accessed by:

```
ax.set_yscale('function', functions=(forward, inverse))
```

where `forward` and `inverse` are callables that return the scale transform and its inverse. See the last example in *Scales overview*.

Legend for scatter

A new method for creating legends for scatter plots has been introduced. Previously, in order to obtain a legend for a *`scatter()`* plot, one could either plot several scatters, each with an individual label, or create proxy artists to show in the legend manually. Now, *`PathCollection`* provides a method *`legend_elements()`* to obtain the handles and labels for a scatter plot in an automated way. This makes creating a legend for a scatter plot as easy as

An example can be found in *Automated legend creation*.

Matplotlib no longer requires framework app build on MacOSX backend

Previous versions of matplotlib required a Framework build of python to work. The app type was updated to no longer require this, so the MacOSX backend should work with non-framework python.

This also adds support for the MacOSX backend for PyPy3.

Figure, FigureCanvas, and Backends

Figure.frameon is now a direct proxy for the Figure patch visibility state

Accessing `Figure.frameon` (including via `get_frameon` and `set_frameon` now directly forwards to the visibility of the underlying Rectangle artist (`Figure.patch.get_frameon`, `Figure.patch.set_frameon`).

pil_kwargs argument added to savefig

Matplotlib uses Pillow to handle saving to the JPEG and TIFF formats. The *`savefig()`* function gained a *pil_kwargs* keyword argument, which can be used to forward arguments to Pillow's `PIL.Image.Image.save`.

The *pil_kwargs* argument can also be used when saving to PNG. In that case, Matplotlib also uses Pillow's `PIL.Image.Image.save` instead of going through its own builtin PNG support.

Add `inaxes` method to `FigureCanvasBase`

The *`FigureCanvasBase`* class has now an *`inaxes`* method to check whether a point is in an axes and returns the topmost axes, else None.

cairo backend defaults to pycairo instead of cairocffi

This leads to faster import/runtime performance in some cases. The backend will fall back to cairocffi in case pycairo isn't available.

Axes and Artists

axes_grid1 and axisartist Axes no longer draw spines twice

Previously, spines of *axes_grid1* and *axisartist* Axes would be drawn twice, leading to a "bold" appearance. This is no longer the case.

Return type of ArtistInspector.get_aliases changed

ArtistInspector.get_aliases previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`.

This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.

`ConnectionPatch` accepts arbitrary transforms

Alternatively to strings like `"data"` or `"axes fraction"`, *ConnectionPatch* now accepts any *Transform* as input for the *coordsA* and *coordsB* arguments. This allows to draw lines between points defined in different user defined coordinate systems. Also see *Using ConnectionPatch*.

mplot3d Line3D now allows {set,get}_data_3d

Lines created with the 3d projection in mplot3d can now access the data using *get_data_3d()* which returns a tuple of array_likes containing the (x, y, z) data. The equivalent *set_data_3d* can be used to modify the data of an existing Line3D.

`Axes3D.voxels` now shades the resulting voxels

The *Axes3D.voxels* method now takes a *shade* parameter that defaults to `True`. This shades faces based on their orientation, behaving just like the matching parameters to *plot_trisurf()* and *bar3d()*. The plot below shows how this affects the output.

Axis and Ticks

Added `Axis.get_inverted` and `Axis.set_inverted`

The *Axis.get_inverted* and *Axis.set_inverted* methods query and set whether the axis uses "inverted" orientation (i.e. increasing to the left for the x-axis and to the bottom for the y-axis).

They perform tasks similar to *Axes.xaxis_inverted*, *Axes.yaxis_inverted*, *Axes.invert_xaxis*, and *Axes.invert_yaxis*, with the specific difference that *Axis.set_inverted* makes it easier to set the inversion of an axis regardless of whether it had previously been inverted before.

Adjust default minor tick spacing

Default minor tick spacing was changed from 0.625 to 0.5 for major ticks spaced 2.5 units apart.

`EngFormatter` now accepts *usetex*, *useMathText* as keyword only arguments

A public API has been added to *`EngFormatter`* to control how the numbers in the ticklabels will be rendered. By default, *useMathText* evaluates to *`rcParams["axes.formatter.use_mathtext"]`* (default: `False`) and *usetex* evaluates to *`rcParams["text.usetex"]`* (default: `False`).

If either is `True` then the numbers will be encapsulated by `$` signs. When using `TeX` this implies that the numbers will be shown in TeX's math font. When using mathtext, the `$` signs around numbers will ensure Unicode rendering (as implied by mathtext). This will make sure that the minus signs in the ticks are rendered as the Unicode minus (U+2212) when using mathtext (without relying on the *`fix_minus`* method).

Animation and Interactivity

Support for forward/backward mouse buttons

Figure managers now support a `button_press` event for mouse buttons, similar to the `key_press` events. This allows binding actions to mouse buttons (see *`MouseButton`*) The first application of this mechanism is support of forward/backward mouse buttons in figures created with the Qt5 backend.

progress_callback argument to `save()`

The method *`Animation.save`* gained an optional *progress_callback* argument to notify the saving progress.

Add `cache_frame_data` keyword-only argument into `animation.FuncAnimation`

`matplotlib.animation.FuncAnimation` has been caching frame data by default; however, this caching is not ideal in certain cases e.g. When *`FuncAnimation`* needs to be only drawn(not saved) interactively and memory required by frame data is quite large. By adding *cache_frame_data* keyword-only argument, users can now disable this caching; thereby, this new argument provides a fix for issue #8528.

Endless Looping GIFs with PillowWriter

We acknowledge that most people want to watch a GIF more than once. Saving an animation as a GIF with PillowWriter now produces an endless looping GIF.

Adjusted `matplotlib.widgets.Slider` to have vertical orientation

The *`matplotlib.widgets.Slider`* widget now takes an optional argument *orientation* which indicates the direction (`'horizontal'` or `'vertical'`) that the slider should take.

Improved formatting of image values under cursor when a colorbar is present

When a colorbar is present, its formatter is now used to format the image values under the mouse cursor in the status bar. For example, for an image displaying the values 10,000 and 10,001, the statusbar will now (using default settings) display the values as `10000` and `10001`), whereas both values were previously displayed as `1e+04`.

MouseEvent button attribute is now an IntEnum

The `button` attribute of *`MouseEvent`* instances can take the values None, 1 (left button), 2 (middle button), 3 (right button), "up" (scroll), and "down" (scroll). For better legibility, the 1, 2, and 3 values are now represented using the `enum.IntEnum` class *`matplotlib.backend_bases.MouseButton`*, with the values *`MouseButton.LEFT`* (`== 1`), *`MouseButton.MIDDLE`* (`== 2`), and *`MouseButton.RIGHT`* (`== 3`).

Configuration, Install, and Development

The MATPLOTLIBRC environment variable can now point to any "file" path

This includes device files; in particular, on Unix systems, one can set `MATPLOTLIBRC` to `/dev/null` to ignore the user's matplotlibrc file and fall back to Matplotlib's defaults.

As a reminder, if `MATPLOTLIBRC` points to a directory, Matplotlib will try to load the matplotlibrc file from `$MATPLOTLIBRC/matplotlibrc`.

Allow LaTeX code `pgf.preamble` and `text.latex.preamble` in MATPLOTLIBRC file

Previously, the rc file keys *`rcParams["pgf.preamble"]`* (default: `''`) and *`rcParams["text.latex.preamble"]`* (default: `''`) were parsed using commas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to.

New logging API

`matplotlib.set_loglevel` / *`pyplot.set_loglevel`* can be called to display more (or less) detailed logging output.

9.10.2 API Changes for 3.1.1

- *Behavior changes*

Behavior changes

Locator.nonsingular return order

`Locator.nonsingular` (introduced in mpl 3.1) now returns a range `v0, v1` with `v0 <= v1`. This behavior is consistent with the implementation of `nonsingular` by the `LogLocator` and `LogitLocator` subclasses.

9.10.3 API Changes for 3.1.0

- *Behavior changes*
- *`pgi` support dropped*
- *rcParam changes*
- *Exception changes*
- *Removals*
- `matplotlib.mlab` *removals*
- `pylab` *removals*
- *mplot3d changes*
- *Testing*
- *Dependency changes*
- *Mathtext changes*
- *Signature deprecations*
- *Changes in parameter names*
- *Class/method/attribute deprecations*
- *Undeprecations*
- *New features*
- *Invalid inputs*

Behavior changes

Matplotlib.use

Switching backends via `matplotlib.use` is now allowed by default, regardless of whether `matplotlib.pyplot` has been imported. If the user tries to switch from an already-started interactive backend to a different interactive backend, an `ImportError` will be raised.

Invalid points in PathCollections

PathCollections created with *scatter* now keep track of invalid points. Previously, points with nonfinite (infinite or nan) coordinates would not be included in the offsets (as returned by *PathCollection.get_offsets*) of a *PathCollection* created by *scatter*, and points with nonfinite values (as specified by the *c* kwarg) would not be included in the array (as returned by *PathCollection.get_array*)

Such points are now included, but masked out by returning a masked array.

If the *plotnonfinite* kwarg to *scatter* is set, then points with nonfinite values are plotted using the bad color of the *collections.PathCollection*'s colormap (as set by *colors.Colormap.set_bad()*).

Alpha blending in imshow of RBGA input

The alpha-channel of RBGA images is now re-sampled independently of RGB channels. While this is a bug fix, it does change the output and may result in some down-stream image comparison tests to fail.

Autoscaling

On log-axes where a single value is plotted at a "full" decade (1, 10, 100, etc.), the autoscaling now expands the axis symmetrically around that point, instead of adding a decade only to the right.

Log-scaled axes

When the default *LogLocator* would generate no ticks for an axis (e.g., an axis with limits from 0.31 to 0.39) or only a single tick, it now instead falls back on the linear *AutoLocator* to pick reasonable tick positions.

`Figure.add_subplot` with no arguments

Calling *Figure.add_subplot()* with no positional arguments used to do nothing; this now is equivalent to calling `add_subplot(111)` instead.

`bxp` and rcparams

bxp now respects *rcParams["boxplot.boxprops.linewidth"]* (default: `1.0`) even when *patch_artist* is set. Previously, when the *patch_artist* parameter was set, *bxp* would ignore *rcParams["boxplot.boxprops.linewidth"]* (default: `1.0`). This was an oversight -- in particular, *boxplot* did not ignore it.

Major/minor tick collisions

Minor ticks that collide with major ticks are now hidden by default. Previously, certain locator classes (*LogLocator*, *AutoMinorLocator*) contained custom logic to avoid emitting tick locations that collided with major ticks when they were used as minor locators. This logic has now moved to the *Axis* class, and is used regardless of the locator class. You can control this behavior via the *remove_overlapping_locs* attribute on *Axis*.

If you were relying on both the major and minor tick labels to appear on the same tick, you may need to update your code. For example, the following snippet

```
import numpy as np
import matplotlib.dates as mdates
import matplotlib.pyplot as plt

t = np.arange("2018-11-03", "2018-11-06", dtype="datetime64")
x = np.random.rand(len(t))

fig, ax = plt.subplots()
ax.plot(t, x)
ax.xaxis.set(
    major_locator=mdates.DayLocator(),
    major_formatter=mdates.DateFormatter("\n%a"),
    minor_locator=mdates.HourLocator((0, 6, 12, 18)),
    minor_formatter=mdates.DateFormatter("%H:%M"),
)
# disable removing overlapping locations
ax.xaxis.remove_overlapping_locs = False
plt.show()
```

labeled days using major ticks, and hours and minutes using minor ticks and added a newline to the major ticks labels to avoid them crashing into the minor tick labels. Setting the *remove_overlapping_locs* property (also accessible via *set_remove_overlapping_locs* / *get_remove_overlapping_locs* and *setp*) disables removing overlapping tick locations.

The major tick labels could also be adjusted include hours and minutes, as the minor ticks are gone, so the `major_formatter` would be:

```
mdates.DateFormatter("%H:%M\n%a")
```

usetex support

Previously, if *rcParams["text.usetex"]* (default: `False`) was True, then constructing a *TextPath* on a non-mathtext string with `usetex=False` would rely on the mathtext parser (but not on usetex support!) to parse the string. The mathtext parser is not invoked anymore, which may cause slight changes in glyph positioning.

get_window_extents

matplotlib.axes.Axes.get_window_extent used to return a bounding box that was slightly larger than the axes, presumably to take into account the ticks that may be on a spine. However, it was not scaling the tick sizes according to the dpi of the canvas, and it did not check if the ticks were visible, or on the spine.

Now *matplotlib.axes.Axes.get_window_extent* just returns the axes extent with no padding for ticks.

This affects *matplotlib.axes.Axes.get_tightbbox* in cases where there are outward ticks with no tick labels, and it also removes the (small) pad around axes in that case.

spines.Spine.get_window_extent now takes into account ticks that are on the spine.

Sankey

Previously, *Sankey.add* would only accept a single string as the *labels* argument if its length is equal to the number of flows, in which case it would use one character of the string for each flow.

The behavior has been changed to match the documented one: when a single string is passed, it is used to label all the flows.

`FontManager` scores

font_manager.FontManager.score_weight is now more strict with its inputs. Previously, when a weight string was passed to *font_manager.FontManager.score_weight*,

- if the weight was the string representation of an integer, it would be converted to that integer,
- otherwise, if the weight was not a standard weight name, it would be silently replaced by a value of 500 ("normal" weight).

font_manager.FontManager.score_weight now raises an exception on such inputs.

Text alignment

Text alignment was previously incorrect, in particular for multiline text objects with large descenders (i.e. subscripts) and rotated text. These have been fixed and made more consistent, but could make old code that has compensated for this no longer have the correct alignment.

Upper case color strings

Support for passing single-letter colors (one of "rgbcmykw") as UPPERCASE characters is deprecated; these colors will become case-sensitive (lowercase) after the deprecation period has passed.

The goal is to decrease the number of ambiguous cases when using the `data` keyword to plotting methods; e.g. `plot("X", "Y", data={"X": ..., "Y": ...})` will not warn about "Y" possibly being a color anymore after the deprecation period has passed.

Degenerate limits

When bounds passed to *set_xlim* are degenerate (i.e. the lower and upper value are equal), the method used to "expand" the bounds now matches the expansion behavior of autoscaling when the plot contains a single x-value, and should in particular produce nicer limits for non-linear scales.

`plot` format string parsing

In certain cases, *plot* would previously accept format strings specifying more than one linestyle (e.g. `"---."` which specifies both `"--"` and `"-."`); only use one of them would be used. This now raises a `ValueError` instead.

HTMLWriter

The HTMLWriter constructor is more strict: it no longer normalizes unknown values of *default_mode* to 'loop', but errors out instead.

AFM parsing

In accordance with the AFM spec, the AFM parser no longer truncates the `UnderlinePosition` and `UnderlineThickness` fields to integers.

The `Notice` field (which can only be publicly accessed by the deprecated `afm.parse_afm` API) is no longer decoded to a `str`, but instead kept as `bytes`, to support non-conformant AFM files that use non-ASCII characters in that field.

`Artist.set` keyword normalisation

`Artist.set` now normalizes keywords before sorting them. Previously it sorted its keyword arguments in reverse alphabetical order (with a special-case to put `color` at the end) before applying them.

It now normalizes aliases (and, as above, emits a warning on duplicate properties) before doing the sorting (so `c` goes to the end too).

`Axes.tick_params` argument checking

Previously *`Axes.tick_params`* silently did nothing when an invalid *axis* parameter was supplied. This behavior has been changed to raise a `ValueError` instead.

`Axes.hist` output

Input that consists of multiple empty lists will now return a list of histogram values for each one of the lists. For example, an input of `[[],[]]` will return 2 lists of histogram values. Previously, a single list was returned.

`backend_bases.TimerBase.remove_callback` future signature change

Currently, `backend_bases.TimerBase.remove_callback(func, *args, **kwargs)` removes a callback previously added by `backend_bases.Timer.add_callback(func, *args, **kwargs)`, but if `*args, **kwargs` is not passed in (i.e., `TimerBase.remove_callback(func)`), then the first callback with a matching `func` is removed, regardless of whether it was added with or without `*args, **kwargs`.

In a future version, *`TimerBase.remove_callback`* will always use the latter behavior (not consider `*args, **kwargs`); to specifically consider them, add the callback as a `functools.partial` object

```
cb = timer.add_callback(functools.partial(func, *args, **kwargs))
# ...
# later
timer.remove_callback(cb)
```

TimerBase.add_callback was modified to return *func* to simplify the above usage (previously it returned None); this also allows using it as a decorator.

The new API is modelled after `atexit.register` / `atexit.unregister`.

`StemContainer` performance increase

StemContainer objects can now store a *LineCollection* object instead of a list of *Line2D* objects for stem lines plotted using *stem*. This gives a very large performance boost to displaying and moving *stem* plots.

This will become the default behaviour in Matplotlib 3.3. To use it now, the *use_line_collection* keyword argument to *stem* can be set to `True`

```
ax.stem(..., use_line_collection=True)
```

Individual line segments can be extracted from the *LineCollection* using *get_segments()*. See the *LineCollection* documentation for other methods to retrieve the collection properties.

`ColorbarBase` inheritance

matplotlib.colorbar.ColorbarBase is no longer a subclass of *cm.ScalarMappable*. This inheritance lead to a confusing situation where the *cm.ScalarMappable* passed to *matplotlib.colorbar.Colorbar* (*colorbar*) had a `set_norm` method, as did the colorbar. The colorbar is now purely a follower to the *ScalarMappable* norm and colormap, and the old inherited methods `matplotlib.colorbar.ColorbarBase.set_norm`, `matplotlib.colorbar.ColorbarBase.set_cmap`, `matplotlib.colorbar.ColorbarBase.set_clim` are deprecated, as are the getter versions of those calls. To set the norm associated with a colorbar do `colorbar.mappable.set_norm()` etc.

FreeType and libpng search paths

The `MPLBASEDIRLIST` environment variables and `basedirlist` entry in `setup.cfg` have no effect anymore. Instead, if building in situations where FreeType or libpng are not in the compiler or linker's default path, set the standard environment variables `CFLAGS`/`LDFLAGS` on Linux or OSX, or `CL`/`LINK` on Windows, to indicate the relevant paths.

See details in *Installation*.

Setting artist properties twice or more in the same call

Setting the same artist property multiple time via aliases is deprecated. Previously, code such as

```
plt.plot([0, 1], c="red", color="blue")
```

would emit a warning indicating that `c` and `color` are aliases of one another, and only keep the `color` kwarg. This behavior has been deprecated; in a future version, this will raise a TypeError, similar to Python's behavior when a keyword argument is passed twice

```
plt.plot([0, 1], c="red", c="blue")
```

This warning is raised by *normalize_kwargs*.

Path code types

Path code types like `Path.MOVETO` are now `np.uint8` instead of `int` `Path.STOP`, `Path.MOVETO`, `Path.LINETO`, `Path.CURVE3`, `Path.CURVE4` and `Path.CLOSEPOLY` are now of the type `Path.code_type` (`np.uint8` by default) instead of plain `int`. This makes their type match the array value type of the `Path.codes` array.

LaTeX code in matplotlibrc file

Previously, the rc file keys `pgf.preamble` and `text.latex.preamble` were parsed using commas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to. Passing a list containing non-strings now fails, instead of coercing the results to strings.

`Axes.spy`

The method *Axes.spy* now raises a `TypeError` for the keyword arguments *interpolation* and *linestyle* instead of silently ignoring them.

Furthermore, *Axes.spy* spy does now allow for an *extent* argument (was silently ignored so far).

A bug with `Axes.spy(..., origin='lower')` is fixed. Previously this flipped the data but not the y-axis resulting in a mismatch between axes labels and actual data indices. Now, *origin='lower'* flips both the data and the y-axis labels.

Boxplot tick methods

The *manage_xticks* parameter of *boxplot* and *bxp* has been renamed (with a deprecation period) to *manage_ticks*, to take into account the fact that it manages either x or y ticks depending on the *vert* parameter.

When `manage_ticks=True` (the default), these methods now attempt to take previously drawn boxplots into account when setting the axis limits, ticks, and tick labels.

MouseEvents

MouseEvents now include the event name in their `str()`. Previously they contained the prefix "MPL MouseEvent".

RGBA buffer return type

FigureCanvasAgg.buffer_rgba and *RendererAgg.buffer_rgba* now return a memoryview The `buffer_rgba` method now allows direct access to the renderer's underlying buffer (as a `(m, n, 4)`-shape memoryview) rather than copying the data to a new bytestring. This is consistent with the behavior on Py2, where a buffer object was returned.

`matplotlib.font_manager.win32InstalledFonts` return type

`matplotlib.font_manager.win32InstalledFonts` returns an empty list instead of None if no fonts are found.

`Axes.fmt_xdata` and `Axes.fmt_ydata` error handling

Previously, if the user provided a `Axes.fmt_xdata` or `Axes.fmt_ydata` function that raised a `TypeError` (or set them to a non-callable), the exception would be silently ignored and the default formatter be used instead. This is no longer the case; the exception is now propagated out.

Deprecation of redundant `Tick` attributes

The `gridOn`, `tick1On`, `tick2On`, `label1On`, and `label2On` *Tick* attributes have been deprecated. Directly get and set the visibility on the underlying artists, available as the `gridline`, `tick1line`, `tick2line`, `label1`, and `label2` attributes.

The `label` attribute, which was an alias for `label1`, has been deprecated.

Subclasses that relied on setting the above visibility attributes needs to be updated; see e.g. `examples/api/skewt.py`.

Passing a Line2D's drawstyle together with the linestyle is deprecated

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is now an alias for `drawstyle`.

`pgi` support dropped

Support for `pgi` in the GTK3 backends has been dropped. `pgi` is an alternative implementation to `PyGObject`. `PyGObject` should be used instead.

rcParam changes

Removed

The following deprecated rcParams have been removed:

- `text.dvipnghack`
- `nbagg.transparent` (use *rcParams["figure.facecolor"]* (default: `'white'`) instead)
- `plugins.directory`

- `axes.hold`
- `backend.qt4` and `backend.qt5` (set the *`QT_API`* environment variable instead)

Deprecated

The associated validator functions `rcsetup.validate_qt4` and `validate_qt5` are deprecated.

The `verbose.fileo` and `verbose.level` rcParams have been deprecated. These have had no effect since the switch from Matplotlib's old custom Verbose logging to the stdlib's `logging` module. In addition the `rcsetup.validate_verbose` function is deprecated.

The `text.latex.unicode` rcParam now defaults to `True` and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported). Moreover, the underlying implementation now uses `\usepackage[utf8]{inputenc}` instead of `\usepackage{ucs}\usepackage[utf8x]{inputenc}`.

Exception changes

- `mpl_toolkits.axes_grid1.axes_size.GetExtentHelper` now raises `ValueError` for invalid directions instead of `KeyError`.
- Previously, subprocess failures in the animation framework would raise either in a `RuntimeError` or a `ValueError` depending on when the error occurred. They now raise a `subprocess.CalledProcessError` with attributes set as documented by the exception class.
- In certain cases, Axes methods (and pyplot functions) used to raise a `RuntimeError` if they were called with a `data` kwarg and otherwise mismatched arguments. They now raise a `TypeError` instead.
- *`Axes.streamplot`* does not support irregularly gridded `x` and `y` values. So far, it used to silently plot an incorrect result. This has been changed to raise a `ValueError` instead.
- The `streamplot.Grid` class, which is internally used by streamplot code, also throws a `ValueError` when irregularly gridded values are passed in.

Removals

The following deprecated APIs have been removed:

Classes and methods

- `Verbose` (replaced by python logging library)
- `artist.Artist.hitlist` (no replacement)
- `artist.Artist.is_figure_set` (use `artist.figure is not None` instead)
- `axis.Axis.unit_data` (use `axis.Axis.units` instead)
- `backend_bases.FigureCanvasBase.onRemove` (no replacement) `backend_bases.FigureManagerBase.show_popup` (this never did anything)
- `backend_wx.SubplotToolWx` (no replacement)

- `backend_wx.Toolbar` (use `backend_wx.NavigationToolbar2Wx` instead)
- `cbook.align_iterators` (no replacement)
- `contour.ContourLabeler.get_real_label_width` (no replacement)
- `legend.Legend.draggable` (use *`legend.Legend.set_draggable()`* instead)
- `texmanager.TexManager.postscriptd`, `texmanager.TexManager.pscnt`, `texmanager.TexManager.make_ps`, `texmanager.TexManager.get_ps_bbox` (no replacements)

Arguments

- The *fig* kwarg to *`GridSpec.get_subplot_params`* and *`GridSpecFromSubplotSpec.get_subplot_params`* (use the argument *figure* instead)
- Passing 'box-forced' to *`Axes.set_adjustable`* (use 'box' instead)
- Support for the strings 'on'/'true'/'off'/'false' to mean `True` / `False` (directly use `True` / `False` instead). The following functions are affected:
  - *`axes.Axes.grid`*
  - *`Axes3D.grid`*
  - *`Axis.set_tick_params`*
  - *`pyplot.box`*
- Using *`pyplot.axes`* with an *`axes.Axes`* type argument (use *`pyplot.sca`* instead)

Other

The following miscellaneous API elements have been removed

- svgfont support (in *`rcParams["svg.fonttype"]`* (default: `'path'`))
- Logging is now done with the standard python `logging` library. `matplotlib.verbose` and the command line switches `--verbose-LEVEL` have been removed.

  To control the logging output use:

```
import logging
logger = logging.getLogger('matplotlib')
logger.setLevel(logging.INFO)
# configure log handling: Either include it into your ``logging``␣
 ↪hierarchy,
# e.g. by configuring a root looger using ``logging.
 ↪basicConfig()``,
# or add a standalone handler to the matplotlib logger:
logger.addHandler(logging.StreamHandler())
```

- `__version__numpy__`

- `collections.CIRCLE_AREA_FACTOR`
- `font_manager.USE_FONTCONFIG`
- `font_manager.cachedir`

`matplotlib.mlab` removals

Lots of code inside the *`matplotlib.mlab`* module which was deprecated in Matplotlib 2.2 has been removed. See below for a list:

- `mlab.exp_safe` (use `numpy.exp` instead)
- `mlab.amap`
- `mlab.logspace` (use `numpy.logspace` instead)
- `mlab.rms_flat`
- `mlab.l1norm` (use `numpy.linalg.norm(a, ord=1)` instead)
- `mlab.l2norm` (use `numpy.linalg.norm(a, ord=2)` instead)
- `mlab.norm_flat` (use `numpy.linalg.norm(a.flat, ord=2)` instead)
- `mlab.frange` (use `numpy.arange` instead)
- `mlab.identity` (use `numpy.identity` instead)
- `mlab.base_repr`
- `mlab.binary_repr`
- `mlab.ispower2`
- `mlab.log2` (use `numpy.log2` instead)
- `mlab.isvector`
- `mlab.movavg`
- `mlab.safe_isinf` (use `numpy.isinf` instead)
- `mlab.safe_isnan` (use `numpy.isnan` instead)
- `mlab.cohere_pairs` (use `scipy.signal.coherence` instead)
- `mlab.entropy` (use `scipy.stats.entropy` instead)
- `mlab.normpdf` (use `scipy.stats.norm.pdf` instead)
- `mlab.find` (use `np.nonzero(np.ravel(condition))` instead)
- `mlab.longest_contiguous_ones`
- `mlab.longest_ones`
- `mlab.PCA`
- `mlab.prctile` (use `numpy.percentile` instead)
- `mlab.prctile_rank`

- mlab.center_matrix
- mlab.rk4 (use scipy.integrate.ode instead)
- mlab.bivariate_normal
- mlab.get_xyz_where
- mlab.get_sparse_matrix
- mlab.dist (use numpy.hypot instead)
- mlab.dist_point_to_segment
- mlab.griddata (use scipy.interpolate.griddata)
- mlab.less_simple_linear_interpolation (use numpy.interp)
- mlab.slopes
- mlab.stineman_interp
- mlab.segments_intersect
- mlab.fftsurr
- mlab.offset_line
- mlab.quad2cubic
- mlab.vector_lengths
- mlab.distances_along_curve
- mlab.path_length
- mlab.cross_from_above
- mlab.cross_from_below
- mlab.contiguous_regions (use *cbook.contiguous_regions* instead)
- mlab.is_closed_polygon
- mlab.poly_between
- mlab.poly_below
- mlab.inside_poly
- mlab.csv2rec
- mlab.rec2csv (use numpy.recarray.tofile instead)
- mlab.rec2text (use numpy.recarray.tofile instead)
- mlab.rec_summarize
- mlab.rec_join
- mlab.recs_join
- mlab.rec_groupby

- `mlab.rec_keep_fields`
- `mlab.rec_drop_fields`
- `mlab.rec_append_fields`
- `mlab.csvformat_factory`
- `mlab.get_formatd`
- `mlab.FormatDatetime` (use `datetime.datetime.strftime` instead)
- `mlab.FormatDate` (use `datetime.date.strftime` instead)
- `mlab.FormatMillions`, `mlab.FormatThousands`, `mlab.FormatPercent`, `mlab.FormatBool`, `mlab.FormatInt`, `mlab.FormatFloat`, `mlab.FormatFormatStr`, `mlab.FormatString`, `mlab.FormatObj`
- `mlab.donothing_callback`

`pylab` removals

Lots of code inside the *`matplotlib.mlab`* module which was deprecated in Matplotlib 2.2 has been removed. This means the following functions are no longer available in the *`pylab`* module:

- `amap`
- `base_repr`
- `binary_repr`
- `bivariate_normal`
- `center_matrix`
- `csv2rec` (use `numpy.recarray.tofile` instead)
- `dist` (use `numpy.hypot` instead)
- `dist_point_to_segment`
- `distances_along_curve`
- `entropy` (use `scipy.stats.entropy` instead)
- `exp_safe` (use `numpy.exp` instead)
- `fftsurr`
- `find` (use `np.nonzero(np.ravel(condition))` instead)
- `frange` (use `numpy.arange` instead)
- `get_sparse_matrix`
- `get_xyz_where`
- `griddata` (use `scipy.interpolate.griddata` instead)
- `identity` (use `numpy.identity` instead)

- `inside_poly`
- `is_closed_polygon`
- `ispower2`
- `isvector`
- `l1norm` (use `numpy.linalg.norm(a, ord=1)` instead)
- `l2norm` (use `numpy.linalg.norm(a, ord=2)` instead)
- `log2` (use `numpy.log2` instead)
- `longest_contiguous_ones`
- `longest_ones`
- `movavg`
- `norm_flat` (use `numpy.linalg.norm(a.flat, ord=2)` instead)
- `normpdf` (use `scipy.stats.norm.pdf` instead)
- `path_length`
- `poly_below`
- `poly_between`
- `prctile` (use `numpy.percentile` instead)
- `prctile_rank`
- `rec2csv` (use `numpy.recarray.tofile` instead)
- `rec_append_fields`
- `rec_drop_fields`
- `rec_join`
- `rk4` (use `scipy.integrate.ode` instead)
- `rms_flat`
- `segments_intersect`
- `slopes`
- `stineman_interp`
- `vector_lengths`

mplot3d changes

Voxel shading

`Axes3D.voxels` now shades the resulting voxels; for more details see What's new. The previous behavior can be achieved by passing

```
ax.voxels(..., shade=False)
```

Equal aspect axes disabled

Setting the aspect on 3D axes previously returned non-sensical results (e.g. see #1077). Calling `ax.set_aspect('equal')` or `ax.set_aspect(num)` on a 3D axes now raises a `NotImplementedError`.

`Poly3DCollection.set_zsort`

`Poly3DCollection.set_zsort` no longer silently ignores invalid inputs, or `False` (which was always broken). Passing `True` to mean `"average"` is deprecated.

Testing

The `--no-network` flag to `tests.py` has been removed (no test requires internet access anymore). If it is desired to disable internet access both for old and new versions of Matplotlib, use `tests.py -m 'not network'` (which is now a no-op).

The image comparison test decorators now skip (rather than xfail) the test for uncomparable formats. The affected decorators are *`image_comparison`* and *`check_figures_equal`*. The deprecated `ImageComparisonTest` class is likewise changed.

Dependency changes

NumPy

Matplotlib 3.1 now requires NumPy>=1.11.

ghostscript

Support for ghostscript 8.60 (released in 2007) has been removed. The oldest supported version of ghostscript is now 9.0 (released in 2010).

Mathtext changes

- In constructs such as `"$1~2$"`, mathtext now interprets the tilde as a space, consistently with TeX (this was previously a parse error).

Deprecations

- The `\stackrel` mathtext command has been deprecated (it behaved differently from LaTeX's `\stackrel`. To stack two mathtext expressions, use `\genfrac{left-delim}{right-delim}{fraction-bar-thickness}{}{top}{bottom}`.
- The `\mathcircled` mathtext command (which is not a real TeX command) is deprecated. Directly use unicode characters (e.g. `"\N{CIRCLED LATIN CAPITAL LETTER A}"` or `"\u24b6"`) instead.

- Support for setting *rcParams["mathtext.default"]* (default: 'it') to circled is deprecated.

Signature deprecations

The following signature related behaviours are deprecated:

- The *withdash* keyword argument to *Axes.text()*. Consider using *Axes.annotate()* instead.
- Passing (n, 1)-shaped error arrays to *Axes.errorbar()*, which was not documented and did not work for n = 2. Pass a 1D array instead.
- The *frameon* keyword argument to *savefig* and the savefig.frameon rcParam. To emulate frameon = False, set *facecolor* to fully transparent ("none", or (0, 0, 0, 0)).
- Passing a non-1D (typically, (n, 1)-shaped) input to *Axes.pie*. Pass a 1D array instead.
- The *TextPath* constructor used to silently drop ignored arguments; this behavior is deprecated.
- The *usetex* parameter of *TextToPath.get_text_path* is deprecated and folded into the *ismath* parameter, which can now take the values False, True, and "TeX", consistently with other low-level text processing functions.
- Passing 'normal' to *axes.Axes.axis()* is deprecated, use ax.axis('auto') instead.
- Passing the *block* argument of *pyplot.show* positionally is deprecated; it should be passed by keyword.
- When using the nbagg backend, *pyplot.show* used to silently accept and ignore all combinations of positional and keyword arguments. This behavior is deprecated.
- The unused *shape* and *imlim* parameters to *Axes.imshow* are deprecated. To avoid triggering the deprecation warning, the *filternorm*, *filterrad*, *resample*, and *url* arguments should be passed by keyword.
- The *interp_at_native* parameter to *BboxImage*, which has had no effect since Matplotlib 2.0, is deprecated.
- All arguments to the matplotlib.cbook.deprecation.deprecated decorator and matplotlib.cbook.deprecation.warn_deprecated function, except the first one (the version where the deprecation occurred), are now keyword-only. The goal is to avoid accidentally setting the "message" argument when the "name" (or "alternative") argument was intended, as this has repeatedly occurred in the past.
- The arguments of *matplotlib.testing.compare.calculate_rms* have been renamed from expectedImage, actualImage, to expected_image, actual_image.
- Passing positional arguments to *Axis.set_ticklabels* beyond *ticklabels* itself has no effect, and support for them is deprecated.
- Passing shade=None to *plot_surface* is deprecated. This was an unintended implementation detail with the same semantics as shade=False. Please use the latter code instead.
- *matplotlib.ticker.MaxNLocator* and its *set_params* method will issue a warning on unknown keyword arguments instead of silently ignoring them. Future versions will raise an error.

Changes in parameter names

- The *arg* parameter to *matplotlib.use* has been renamed to *backend*.

  This will only affect cases where that parameter has been set as a keyword argument. The common usage pattern as a positional argument `matplotlib.use('Qt5Agg')` is not affected.

- The *normed* parameter to *Axes.hist2d* has been renamed to *density*.
- The *s* parameter to *Annotation* (and indirectly *Axes.annotate*) has been renamed to *text*.
- The *tolerence* parameter to *bezier.find_bezier_t_intersecting_with_closedpath*, *bezier.split_bezier_intersecting_with_closedpath*, `bezier.find_r_to_boundary_of_closedpath`, *bezier.split_path_inout* and *bezier.check_if_parallel* has been renamed to *tolerance*.

In each case, the old parameter name remains supported (it cannot be used simultaneously with the new name), but support for it will be dropped in Matplotlib 3.3.

Class/method/attribute deprecations

Support for custom backends that do not provide a *GraphicsContextBase.set_hatch_color* method is deprecated. We suggest that custom backends let their `GraphicsContext` class inherit from *GraphicsContextBase*, to at least provide stubs for all required methods.

- `spine.Spine.is_frame_like`

This has not been used in the codebase since its addition in 2009.

- `axis3d.Axis.get_tick_positions`

  This has never been used internally, there is no equivalent method exists on the 2D Axis classes, and despite the similar name, it has a completely different behavior from the 2D Axis' `axis.Axis.get_ticks_position` method.

- `.backend_pgf.LatexManagerFactory`
- `mpl_toolkits.axisartist.axislines.SimpleChainedObjects`
- `mpl_toolkits.Axes.AxisDict`

Internal Helper Functions

- `checkdep_dvipng`
- `checkdep_ghostscript`
- `checkdep_pdftops`
- `checkdep_inkscape`
- `ticker.decade_up`
- `ticker.decade_down`
- `cbook.dedent`
- `docstring.Appender`

- `docstring.dedent`
- `docstring.copy_dedent`

Use the standard library's docstring manipulation tools instead, such as `inspect.cleandoc` and `inspect.getdoc`.

- `matplotlib.scale.get_scale_docs()`
- `matplotlib.pyplot.get_scale_docs()`

These are considered internal and will be removed from the public API in a future version.

- `projections.process_projection_requirements`
- `backend_ps.PsBackendHelper`
- `backend_ps.ps_backend_helper`,
- `cbook.iterable`
- `cbook.get_label`
- `cbook.safezip` Manually check the lengths of the inputs instead, or rely on NumPy to do it.
- `cbook.is_hashable` Use `isinstance(..., collections.abc.Hashable)` instead.
- The `.backend_bases.RendererBase.strip_math`. Use *`cbook.strip_math`* instead.

Multiple internal functions that were exposed as part of the public API of *`mpl_toolkits.mplot3d`* are deprecated,

mpl_toolkits.mplot3d.art3d

- `mpl_toolkits.mplot3d.art3d.norm_angle`
- `mpl_toolkits.mplot3d.art3d.norm_text_angle`
- `mpl_toolkits.mplot3d.art3d.path_to_3d_segment`
- `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments`
- `mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes`
- `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes`
- `mpl_toolkits.mplot3d.art3d.get_patch_verts`
- `mpl_toolkits.mplot3d.art3d.get_colors`
- `mpl_toolkits.mplot3d.art3d.zalpha`

mpl_toolkits.mplot3d.proj3d

- `mpl_toolkits.mplot3d.proj3d.line2d`
- `mpl_toolkits.mplot3d.proj3d.line2d_dist`
- `mpl_toolkits.mplot3d.proj3d.line2d_seg_dist`
- `mpl_toolkits.mplot3d.proj3d.mod`
- `mpl_toolkits.mplot3d.proj3d.proj_transform_vec`

- `mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip`
- `mpl_toolkits.mplot3d.proj3d.vec_pad_ones`
- `mpl_toolkits.mplot3d.proj3d.proj_trans_clip_points`

If your project relies on these functions, consider vendoring them.

Font Handling

- `backend_pdf.RendererPdf.afm_font_cache`
- `backend_ps.RendererPS.afmfontd`
- `font_manager.OSXInstalledFonts`
- `.TextToPath.glyph_to_path` (Instead call `font.get_path()` and manually transform the path.)

Date related functions

- `dates.seconds()`
- `dates.minutes()`
- `dates.hours()`
- `dates.weeks()`
- `dates.strpdate2num`
- `dates.bytespdate2num`

These are brittle in the presence of locale changes. Use standard datetime parsers such as `time.strptime` or `dateutil.parser.parse`, and additionally call *`matplotlib.dates.date2num`* if you need to convert to Matplotlib's internal datetime representation; or use `dates.datestr2num`.

Axes3D

- `.axes3d.Axes3D.w_xaxis`
- `.axes3d.Axes3D.w_yaxis`
- `.axes3d.Axes3D.w_zaxis`

Use `axes3d.Axes3D.xaxis`, `axes3d.Axes3D.yaxis` and `axes3d.Axes3D.zaxis` instead.

Testing

- `matplotlib.testing.decorators.switch_backend` decorator

Test functions should use `pytest.mark.backend`, and the mark will be picked up by the `matplotlib.testing.conftest.mpl_test_settings` fixture.

Quiver

- `.color` attribute of *`Quiver`* objects

Instead, use (as for any *`Collection`*) the `get_facecolor` method. Note that setting to the `.color` attribute did not update the quiver artist, whereas calling `set_facecolor` does.

GUI / backend details

- `.get_py2exe_datafiles`
- `.tk_window_focus`
- `.backend_gtk3.FileChooserDialog`
- `.backend_gtk3.NavigationToolbar2GTK3.get_filechooser`
- `.backend_gtk3.SaveFigureGTK3.get_filechooser`
- `.NavigationToolbar2QT.adj_window` attribute. This is unused and always `None`.
- `.backend_wx.IDLE_DELAY` global variable This is unused and only relevant to the now removed wx "idling" code (note that as it is a module-level global, no deprecation warning is emitted when accessing it).
- `mlab.demean`
- `backend_gtk3cairo.FigureCanvasGTK3Cairo`,
- `backend_wx.debug_on_error`, `backend_wx.fake_stderr`, `backend_wx.raise_msg_to_str`, `backend_wx.MenuButtonWx`, `backend_wx.PrintoutWx`,
- `matplotlib.backends.qt_editor.formlayout` module

This module is a vendored, modified version of the official formlayout module available on PyPI. Install that module separately if you need it.

- `GraphicsContextPS.shouldstroke`

Transforms / scales

- `LogTransformBase`
- `Log10Transform`
- `Log2Transform`,
- `NaturalLogTransformLog`
- `InvertedLogTransformBase`
- `InvertedLog10Transform`
- `InvertedLog2Transform`
- `InvertedNaturalLogTransform`

These classes defined in *matplotlib.scale* are deprecated. As a replacement, use the general *LogTransform* and *InvertedLogTransform* classes, whose constructors take a *base* argument.

Locators / Formatters

- `OldScalarFormatter.pprint_val`
- `ScalarFormatter.pprint_val`
- `LogFormatter.pprint_val`

These are helper methods that do not have a consistent signature across formatter classes.

Path tools

- `path.get_paths_extents`

Use *get_path_collection_extents* instead.

- `.Path.has_nonfinite` attribute

Use `not np.isfinite(path.vertices).all()` instead.

- `.bezier.find_r_to_boundary_of_closedpath` function is deprecated

This has always returned None instead of the requested radius.

Text

- `text.TextWithDash`
- `Text.is_math_text`
- `TextPath.is_math_text`
- `TextPath.text_get_vertices_codes` (As an alternative, construct a new `TextPath` object.)

Unused attributes

- `NavigationToolbar2QT.buttons`
- `Line2D.verticalOffset`
- `Quiver.keytext`
- `Quiver.keyvec`
- `SpanSelector.buttonDown`

These are unused and never updated.

Sphinx extensions

- `matplotlib.sphinxext.mathmpl.math_directive`
- `matplotlib.sphinxext.plot_directive.plot_directive`

This is because the `matplotlib.sphinxext.mathmpl` and `matplotlib.sphinxext.plot_directive` interfaces have changed from the (Sphinx-)deprecated function-based interface to a class-based interface; this should not affect end users.

- `mpl_toolkits.axisartist.axis_artist.UnimplementedException`

Environmental Variables

- The `MATPLOTLIBDATA` environment variable

Axis

- `Axis.iter_ticks`

This only served as a helper to the private `Axis._update_ticks`

Undeprecations

The following API elements have been un-deprecated:

- The *obj_type* keyword argument to the `matplotlib.cbook.deprecation.deprecated` decorator.
- *xmin*, *xmax* keyword arguments to *Axes.set_xlim* and *ymin*, *ymax* keyword arguments to *Axes.set_ylim*

New features

`Text` now has a `c` alias for the `color` property

For consistency with *Line2D*, the *Text* class has gained the `c` alias for the `color` property. For example, one can now write

```
ax.text(.5, .5, "foo", c="red")
```

`Cn` colors now support `n>=10`

It is now possible to go beyond the tenth color in the property cycle using `Cn` syntax, e.g.

```
plt.plot([1, 2], color="C11")
```

now uses the 12th color in the cycle.

Note that previously, a construct such as:

```
plt.plot([1, 2], "C11")
```

would be interpreted as a request to use color `C1` and marker `1` (an "inverted Y"). To obtain such a plot, one should now use

```
plt.plot([1, 2], "1C1")
```

(so that the first "1" gets correctly interpreted as a marker specification), or, more explicitly:

```
plt.plot([1, 2], marker="1", color="C1")
```

New `Formatter.format_ticks` method

The *`Formatter`* class gained a new *`format_ticks`* method, which takes the list of all tick locations as a single argument and returns the list of all formatted values. It is called by the axis tick handling code and, by default, first calls *`set_locs`* with all locations, then repeatedly calls `Formatter.__call__` for each location.

Tick-handling code in the codebase that previously performed this sequence (*`set_locs`* followed by repeated `Formatter.__call__`) have been updated to use *`format_ticks`*.

`format_ticks` is intended to be overridden by *`Formatter`* subclasses for which the formatting of a tick value depends on other tick values, such as *`ConciseDateFormatter`*.

Added support for RGB(A) images in pcolorfast

pcolorfast now accepts 3D images (RGB or RGBA) arrays if the X and Y specifications allow image or pcolorimage rendering; they remain unsupported by the more general quadmesh rendering

Invalid inputs

Passing invalid locations to *`legend`* and *`table`* used to fallback on a default location. This behavior is deprecated and will throw an exception in a future version.

`offsetbox.AnchoredText` is unable to handle the *horizontalalignment* or *verticalalignment* kwargs, and used to ignore them with a warning. This behavior is deprecated and will throw an exception in a future version.

Passing steps less than 1 or greater than 10 to *`MaxNLocator`* used to result in undefined behavior. It now throws a `ValueError`.

The signature of the (private) `Axis._update_ticks` has been changed to not take the renderer as argument anymore (that argument is unused).

9.11 Version 3.0

9.11.1 What's new in Matplotlib 3.0 (Sep 18, 2018)

Improved default backend selection

The default backend no longer must be set as part of the build process. Instead, at run time, the builtin backends are tried in sequence until one of them imports.

Headless Linux servers (identified by the DISPLAY environment variable not being defined) will not select a GUI backend.

Cyclic colormaps

Two new colormaps named 'twilight' and 'twilight_shifted' have been added. These colormaps start and end on the same color, and have two symmetric halves with equal lightness, but diverging color. Since they wrap around, they are a good choice for cyclic data such as phase angles, compass directions, or time of day. Like *viridis* and *cividis*, *twilight* is perceptually uniform and colorblind friendly.

Ability to scale axis by a fixed order of magnitude

To scale an axis by a fixed order of magnitude, set the *scilimits* argument of *Axes.ticklabel_format* to the same (non-zero) lower and upper limits. Say to scale the y axis by a million (1e6), use

```
ax.ticklabel_format(style='sci', scilimits=(6, 6), axis='y')
```

The behavior of `scilimits=(0, 0)` is unchanged. With this setting, Matplotlib will adjust the order of magnitude depending on the axis values, rather than keeping it fixed. Previously, setting `scilimits=(m, m)` was equivalent to setting `scilimits=(0, 0)`.

Add `AnchoredDirectionArrows` feature to mpl_toolkits

A new mpl_toolkits class *AnchoredDirectionArrows* draws a pair of orthogonal arrows to indicate directions on a 2D plot. A minimal working example takes in the transformation object for the coordinate system (typically ax.transAxes), and arrow labels. There are several optional parameters that can be used to alter layout. For example, the arrow pairs can be rotated and the color can be changed. By default the labels and arrows have the same color, but the class may also pass arguments for customizing arrow and text layout, these are passed to *matplotlib.textpath.TextPath* and *matplotlib.patches.FancyArrowPatch*. Location, length and width for both arrow tail and head can be adjusted, the direction arrows and labels can have a frame. Padding and separation parameters can be adjusted.

Add `minorticks_on()/off()` methods for colorbar

A new method `ColorbarBase.minorticks_on` has been added to correctly display minor ticks on a colorbar. This method doesn't allow the minor ticks to extend into the regions beyond vmin and vmax when the *extend* keyword argument (used while creating the colorbar) is set to 'both', 'max' or 'min'. A complementary method `ColorbarBase.minorticks_off` has also been added to remove the minor ticks on the colorbar.

Colorbar ticks can now be automatic

The number of ticks placed on colorbars was previously appropriate for a large colorbar, but looked bad if the colorbar was made smaller (i.e. via the *shrink* keyword argument). This has been changed so that the number of ticks is now responsive to how large the colorbar is.

Don't automatically rename duplicate file names

Previously, when saving a figure to a file using the GUI's save dialog box, if the default filename (based on the figure window title) already existed on disk, Matplotlib would append a suffix (e.g. `Figure_1-1.png`), preventing the dialog from prompting to overwrite the file. This behaviour has been removed. Now if the file name exists on disk, the user is prompted whether or not to overwrite it. This eliminates guesswork, and allows intentional overwriting, especially when the figure name has been manually set using `figure.canvas.set_window_title()`.

Legend now has a *title_fontsize* keyword argument (and rcParam)

The title for a *`Figure.legend`* and *`Axes.legend`* can now have its font size set via the *title_fontsize* keyword argument. There is also a new *`rcParams["legend.title_fontsize"]`* (default: `None`). Both default to `None`, which means the legend title will have the same font size as the axes default font size (*not* the legend font size, set by the *fontsize* keyword argument or *`rcParams["legend.fontsize"]`* (default: `'medium'`)).

Support for axes.prop_cycle property *markevery* in rcParams

The Matplotlib `rcParams` settings object now supports configuration of the attribute *`rcParams["axes.prop_cycle"]`* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) with cyclers using the *markevery* Line2D object property.

Multi-page PDF support for pgf backend

The pgf backend now also supports multi-page PDF files.

```
from matplotlib.backends.backend_pgf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf') as pdf:
    # page 1
    plt.plot([2, 1, 3])
    pdf.savefig()

    # page 2
    plt.cla()
    plt.plot([3, 1, 2])
    pdf.savefig()
```

Pie charts are now circular by default

We acknowledge that the majority of people do not like egg-shaped pies. Therefore, an axes to which a pie chart is plotted will be set to have equal aspect ratio by default. This ensures that the pie appears circular independent on the axes size or units. To revert to the previous behaviour set the axes' aspect ratio to automatic by using `ax.set_aspect("auto")` or `plt.axis("auto")`.

Add `ax.get_gridspec` to `SubplotBase`

New method `SubplotBase.get_gridspec` is added so that users can easily get the gridspec that went into making an axes:

```
import matplotlib.pyplot as plt

fig, axs = plt.subplots(3, 2)
gs = axs[0, -1].get_gridspec()

# remove the last column
for ax in axs[:,-1].flatten():
  ax.remove()

# make a subplot in last column that spans rows.
ax = fig.add_subplot(gs[:, -1])
plt.show()
```

Axes titles will no longer overlap xaxis

Previously an axes title had to be moved manually if an xaxis overlapped (usually when the xaxis was put on the top of the axes). Now, the title will be automatically moved above the xaxis and its decorators (including the xlabel) if they are at the top.

If desired, the title can still be placed manually. There is a slight kludge; the algorithm checks if the y-position of the title is 1.0 (the default), and moves if it is. If the user places the title in the default location (i.e. `ax.title.set_position(0.5, 1.0)`), the title will still be moved above the xaxis. If the user wants to avoid this, they can specify a number that is close (i.e. `ax.title.set_position(0.5, 1.01)`) and the title will not be moved via this algorithm.

New convenience methods for GridSpec

There are new convenience methods for *gridspec.GridSpec* and *gridspec.GridSpecFromSubplotSpec*. Instead of the former we can now call *Figure.add_gridspec* and for the latter *SubplotSpec.subgridspec*.

```
import matplotlib.pyplot as plt

fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

Figure has an `add_artist` method

A method *`add_artist`* has been added to the *`Figure`* class, which allows artists to be added directly to a figure. E.g.

```
circ = plt.Circle((.7, .5), .05)
fig.add_artist(circ)
```

In case the added artist has no transform set previously, it will be set to the figure transform (`fig.transFigure`). This new method may be useful for adding artists to figures without axes or to easily position static elements in figure coordinates.

`:math:` directive renamed to `:mathmpl:`

The `:math:` rst role provided by *`matplotlib.sphinxext.mathmpl`* has been renamed to `:mathmpl:` to avoid conflicting with the `:math:` role that Sphinx 1.8 provides by default. (`:mathmpl:` uses Matplotlib to render math expressions to images embedded in html, whereas Sphinx uses MathJax.)

When using Sphinx<1.8, both names (`:math:` and `:mathmpl:`) remain available for backwards-compatibility.

9.11.2 API Changes for 3.0.1

`matplotlib.tight_layout.auto_adjust_subplotpars` can return `None` now if the new subplotparams will collapse axes to zero width or height. This prevents `tight_layout` from being executed. Similarly `matplotlib.tight_layout.get_tight_layout_figure` will return None.

To improve import (startup) time, private modules are now imported lazily. These modules are no longer available at these locations:

- `matplotlib.backends.backend_agg._png`
- `matplotlib.contour._contour`
- `matplotlib.image._png`
- `matplotlib.mathtext._png`
- `matplotlib.testing.compare._png`
- `matplotlib.texmanager._png`
- `matplotlib.tri.triangulation._tri`
- `matplotlib.tri.triangulation._qhull`
- `matplotlib.tri.tricontour._tri`
- `matplotlib.tri.trifinder._tri`

9.11.3 API Changes for 3.0.0

Drop support for python 2

Matplotlib 3 only supports python 3.5 and higher.

Changes to backend loading

Failure to load backend modules (`macosx` on non-framework builds and `gtk3` when running headless) now raises `ImportError` (instead of `RuntimeError` and `TypeError`, respectively).

Third-party backends that integrate with an interactive framework are now encouraged to define the `required_interactive_framework` global value to one of the following values: "qt5", "qt4", "gtk3", "wx", "tk", or "macosx". This information will be used to determine whether it is possible to switch from a backend to another (specifically, whether they use the same interactive framework).

`Axes.hist2d` now uses `pcolormesh` instead of `pcolorfast`

`Axes.hist2d` now uses *`pcolormesh`* instead of *`pcolorfast`*, which will improve the handling of log-axes. Note that the returned *image* now is of type *`QuadMesh`* instead of *`AxesImage`*.

`matplotlib.axes.Axes.get_tightbbox` now includes all artists

For Matplotlib 3.0, *all* artists are now included in the bounding box returned by *`matplotlib.axes.Axes.get_tightbbox`*.

`matplotlib.axes.Axes.get_tightbbox` adds a new kwarg `bbox_extra_artists` to manually specify the list of artists on the axes to include in the tight bounding box calculation.

Layout tools like *`Figure.tight_layout`*, `constrained_layout`, and `fig.savefig('fname.png', bbox_inches="tight")` use *`matplotlib.axes.Axes.get_tightbbox`* to determine the bounds of each axes on a figure and adjust spacing between axes.

In Matplotlib 2.2 `get_tightbbox` started to include legends made on the axes, but still excluded some other artists, like text that may overspill an axes. This has been expanded to include *all* artists.

This new default may be overridden in either of three ways:

1. Make the artist to be excluded a child of the figure, not the axes. E.g., call `fig.legend()` instead of `ax.legend()` (perhaps using *`get_legend_handles_labels`* to gather handles and labels from the parent axes).
2. If the artist is a child of the axes, set the artist property `artist.set_in_layout(False)`.
3. Manually specify a list of artists in the new kwarg `bbox_extra_artists`.

`Text.set_text` with string argument `None` sets string to empty

`Text.set_text` when passed a string value of `None` would set the string to `"None"`, so subsequent calls to *`Text.get_text`* would return the ambiguous `"None"` string.

This change sets text objects passed `None` to have empty strings, so that *`Text.get_text`* returns an empty string.

`Axes3D.get_xlim`, `get_ylim` and `get_zlim` now return a tuple

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

`font_manager.list_fonts` now follows the platform's casefolding semantics

i.e., it behaves case-insensitively on Windows only.

`bar` / `barh` no longer accepts `left` / `bottom` as first named argument

These arguments were renamed in 2.0 to `x` / `y` following the change of the default alignment from `edge` to `center`.

Different exception types for undocumented options

- Passing `style='comma'` to *`ticklabel_format()`* was never supported. It now raises `ValueError` like all other unsupported styles, rather than `NotImplementedError`.
- Passing the undocumented `xmin` or `xmax` arguments to *`set_xlim()`* would silently override the `left` and `right` arguments. *`set_ylim()`* and the 3D equivalents (e.g. *`set_zlim`*) had a corresponding problem. A `TypeError` will be raised if they would override the earlier limit arguments. In 3.0 these were kwargs were deprecated, but in 3.1 the deprecation was undone.

Improved call signature for `Axes.margins`

`Axes.margins` and *`Axes3D.margins`* no longer accept arbitrary keywords. `TypeError` will therefore be raised if unknown kwargs are passed; previously they would be silently ignored.

If too many positional arguments are passed, `TypeError` will be raised instead of `ValueError`, for consistency with other call-signature violations.

`Axes3D.margins` now raises `TypeError` instead of emitting a deprecation warning if only two positional arguments are passed. To supply only `x` and `y` margins, use keyword arguments.

Explicit arguments instead of *args, **kwargs

PEP 3102 describes keyword-only arguments, which allow Matplotlib to provide explicit call signatures - where we previously used `*args, **kwargs` and `kwargs.pop`, we can now expose named arguments. In some places, unknown kwargs were previously ignored but now raise `TypeError` because `**kwargs` has been removed.

- *`matplotlib.axes.Axes.stem()`* no longer accepts unknown keywords, and raises `TypeError` instead of emitting a deprecation.
- *`matplotlib.axes.Axes.stem()`* now raises TypeError when passed unhandled positional arguments. If two or more arguments are passed (ie X, Y, [linefmt], ...) and Y cannot be cast to an array, an error will be raised instead of treating X as Y and Y as linefmt.
- *`mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`* raises `TypeError` instead of `Exception` when passed unknown kwargs.

Cleanup decorators and test classes no longer destroy warnings filter on exit

The decorators and classes in matplotlib.testing.decorators no longer destroy the warnings filter on exit. Instead, they restore the warnings filter that existed before the test started using `warnings.catch_warnings`.

Non-interactive FigureManager classes are now aliases of FigureManagerBase

The `FigureManagerPdf`, `FigureManagerPS`, and `FigureManagerSVG` classes, which were previously empty subclasses of *`FigureManagerBase`* (i.e., not adding or overriding any attribute or method), are now direct aliases for *`FigureManagerBase`*.

Change to the output of `image.thumbnail`

When called with `preview=False`, *`image.thumbnail`* previously returned an figure whose canvas class was set according to the output file extension. It now returns a figure whose canvas class is the base *`FigureCanvasBase`* (and relies on *`FigureCanvasBase.print_figure`*) to handle the canvas switching properly).

As a side effect of this change, *`image.thumbnail`* now also supports .ps, .eps, and .svgz output.

`FuncAnimation` now draws artists according to their zorder when blitting

`FuncAnimation` now draws artists returned by the user- function according to their zorder when using blitting, instead of using the order in which they are being passed. However, note that only zorder of passed artists will be respected, as they are drawn on top of any existing artists (see #11369).

Contour color autoscaling improvements

Selection of contour levels is now the same for contour and contourf; previously, for contour, levels outside the data range were deleted. (Exception: if no contour levels are found within the data range, the `levels` attribute is replaced with a list holding only the minimum of the data range.)

When contour is called with levels specified as a target number rather than a list, and the 'extend' kwarg is used, the levels are now chosen such that some data typically will fall in the extended range.

When contour is called with a *`LogNorm`* or a *`LogLocator`*, it will now select colors using the geometric mean rather than the arithmetic mean of the contour levels.

Streamplot last row and column fixed

A bug was fixed where the last row and column of data in *`streamplot`* were being dropped.

Changed default `AutoDateLocator` kwarg *interval_multiples* to `True`

The default value of the tick locator for dates, *`dates.AutoDateLocator`* kwarg *interval_multiples* was set to `False` which leads to not-nice looking automatic ticks in many instances. The much nicer `interval_multiples=True` is the new default. See below to get the old behavior back:

`Axes.get_position` now returns actual position if aspect changed

Axes.get_position used to return the original position unless a draw had been triggered or *Axes.apply_aspect* had been called, even if the kwarg *original* was set to `False`. Now *Axes.apply_aspect* is called so `ax.get_position()` will return the new modified position. To get the old behavior use `ax.get_position(original=True)`.

The ticks for colorbar now adjust for the size of the colorbar

Colorbar ticks now adjust for the size of the colorbar if the colorbar is made from a mappable that is not a contour or doesn't have a BoundaryNorm, or boundaries are not specified. If boundaries, etc are specified, the colorbar maintains the original behavior.

Colorbar for log-scaled hexbin

When using *hexbin* and plotting with a logarithmic color scale, the colorbar ticks are now correctly log scaled. Previously the tick values were linear scaled log(number of counts).

PGF backend now explicitly makes black text black

Previous behavior with the pgf backend was for text specified as black to actually be the default color of whatever was rendering the pgf file (which was of course usually black). The new behavior is that black text is black, regardless of the default color. However, this means that there is no way to fall back on the default color of the renderer.

Blacklisted rcparams no longer updated by `rcdefaults`, `rc_file_defaults`, `rc_file`

The rc modifier functions *rcdefaults*, *rc_file_defaults* and *rc_file* now ignore rcParams in the `matplotlib.style.core.STYLE_BLACKLIST` set. In particular, this prevents the `backend` and `interactive` rcParams from being incorrectly modified by these functions.

`CallbackRegistry` now stores callbacks using stdlib's `weakref.WeakMethod`s

In particular, this implies that `CallbackRegistry.callbacks[signal]` is now a mapping of callback ids to `weakref.WeakMethod`s (i.e., they need to be first called with no arguments to retrieve the method itself).

Changes regarding the text.latex.unicode rcParam

The rcParam now defaults to True and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported).

Moreover, the underlying implementation now uses `\usepackage[utf8]{inputenc}` instead of `\usepackage{ucs}\usepackage[utf8x]{inputenc}`.

Return type of ArtistInspector.get_aliases changed

`ArtistInspector.get_aliases` previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`.

This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.

Removed `pytz` as a dependency

Since `dateutil` and `pytz` both provide time zones, and matplotlib already depends on `dateutil`, matplotlib will now use `dateutil` time zones internally and drop the redundant dependency on `pytz`. While `dateutil` time zones are preferred (and currently recommended in the Python documentation), the explicit use of `pytz` zones is still supported.

Deprecations

Modules

The following modules are deprecated:

- `matplotlib.compat.subprocess`. This was a python 2 workaround, but all the functionality can now be found in the python 3 standard library `subprocess`.
- `matplotlib.backends.wx_compat`. Python 3 is only compatible with wxPython 4, so support for wxPython 3 or earlier can be dropped.

Classes, methods, functions, and attributes

The following classes, methods, functions, and attributes are deprecated:

- `RcParams.msg_depr`, `RcParams.msg_depr_ignore`, `RcParams.msg_depr_set`, `RcParams.msg_obsolete`, `RcParams.msg_backend_obsolete`
- `afm.parse_afm`
- `backend_pdf.PdfFile.texFontMap`
- `backend_pgf.get_texcommand`
- `backend_ps.get_bbox`
- `backend_qt5.FigureCanvasQT.keyAutoRepeat` (directly check `event.guiEvent.isAutoRepeat()` in the event handler to decide whether to handle autorepeated key presses).
- `backend_qt5.error_msg_qt`, `backend_qt5.exception_handler`
- `backend_wx.FigureCanvasWx.macros`
- `backends.pylab_setup`
- `cbook.GetRealpathAndStat`, `cbook.Locked`
- `cbook.is_numlike` (use `isinstance(..., numbers.Number)` instead), `cbook.listFiles`, `cbook.unicode_safe`
- `container.Container.set_remove_method`,
- `contour.ContourLabeler.cl`, `.cl_xy`, and `.cl_cvalues`
- `dates.DateFormatter.strftime_pre_1900`, `dates.DateFormatter.strftime`
- `font_manager.TempCache`

- `image._ImageBase.iterpnames`, use the `interpolation_names` property instead. (this affects classes that inherit from `_ImageBase` including *FigureImage*, *BboxImage*, and *AxesImage*)
- `mathtext.unichr_safe` (use `chr` instead)
- `patches.Polygon.xy`
- `table.Table.get_child_artists` (use `get_children` instead)
- `testing.compare.ImageComparisonTest`, `testing.compare.compare_float`
- `testing.decorators.CleanupTest`, `testing.decorators.skip_if_command_unavailable`
- `FigureCanvasQT.keyAutoRepeat` (directly check `event.guiEvent.isAutoRepeat()` in the event handler to decide whether to handle autorepeated key presses)
- `FigureCanvasWx.macros`
- `_ImageBase.iterpnames`, use the `interpolation_names` property instead. (this affects classes that inherit from `_ImageBase` including *FigureImage*, *BboxImage*, and *AxesImage*)
- `patches.Polygon.xy`
- `texmanager.dvipng_hack_alpha`
- `text.Annotation.arrow`
- **`Legend.draggable()`, in favor of *`Legend.set_draggable()`***

  (`Legend.draggable` may be reintroduced as a property in future releases)
- `textpath.TextToPath.tex_font_map`
- `matplotlib.cbook.deprecation.mplDeprecation` will be removed in future versions. It is just an alias for `matplotlib.cbook.deprecation.MatplotlibDeprecationWarning`. Please use `matplotlib.cbook.MatplotlibDeprecationWarning` directly if necessary.
- The `matplotlib.cbook.Bunch` class has been deprecated. Instead, use `types.SimpleNamespace` from the standard library which provides the same functionality.
- `Axes.mouseover_set` is now a frozenset, and deprecated. Directly manipulate the artist's `.mouseover` attribute to change their mouseover status.

The following keyword arguments are deprecated:

- passing `verts` to `Axes.scatter` (use `marker` instead)
- passing `obj_type` to `cbook.deprecated`

The following call signatures are deprecated:

- passing a `wx.EvtHandler` as first argument to `backend_wx.TimerWx`

rcParams

The following rcParams are deprecated:

- `examples.directory` (use `datapath` instead)
- `pgf.debug` (the pgf backend relies on logging)
- `text.latex.unicode` (always True now)

marker styles

- Using `(n, 3)` as marker style to specify a circle marker is deprecated. Use `"o"` instead.
- Using `([(x0, y0), (x1, y1), ...], 0)` as marker style to specify a custom marker path is deprecated. Use `[(x0, y0), (x1, y1), ...]` instead.

Deprecation of `LocatableAxes` in toolkits

The `LocatableAxes` classes in toolkits have been deprecated. The base *`Axes`* classes provide the same functionality to all subclasses, thus these mixins are no longer necessary. Related functions have also been deprecated. Specifically:

- `mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase`: no specific replacement; use any other `Axes`-derived class directly instead.
- `mpl_toolkits.axes_grid1.axes_divider.locatable_axes_factory`: no specific replacement; use any other `Axes`-derived class directly instead.
- `mpl_toolkits.axes_grid1.axes_divider.Axes`: use *`mpl_toolkits.axes_grid1.mpl_axes.Axes`* directly.
- `mpl_toolkits.axes_grid1.axes_divider.LocatableAxes`: use *`mpl_toolkits.axes_grid1.mpl_axes.Axes`* directly.
- `mpl_toolkits.axisartist.axes_divider.Axes`: use *`mpl_toolkits.axisartist.axislines.Axes`* directly.
- `mpl_toolkits.axisartist.axes_divider.LocatableAxes`: use *`mpl_toolkits.axisartist.axislines.Axes`* directly.

Removals

Hold machinery

Setting or unsetting `hold` (*deprecated in version 2.0*) has now been completely removed. Matplotlib now always behaves as if `hold=True`. To clear an axes you can manually use *`cla()`*, or to clear an entire figure use *`clear()`*.

Removal of deprecated backends

Deprecated backends have been removed:

- GTKAgg
- GTKCairo
- GTK
- GDK

Deprecated APIs

The following deprecated API elements have been removed:

- The deprecated methods `knownfailureif` and `remove_text` have been removed from *matplotlib.testing.decorators*.
- The entire contents of `testing.noseclasses` have also been removed.
- `matplotlib.checkdep_tex`, `matplotlib.checkdep_xmllint`
- `backend_bases.IdleEvent`
- `cbook.converter`, `cbook.tostr`, `cbook.todatetime`, `cbook.todate`, `cbook.tofloat`, `cbook.toint`, `cbook.unique`, `cbook.is_string_like`, `cbook.is_sequence_of_strings`, `cbook.is_scalar`, `cbook.soundex`, `cbook.dict_delall`, `cbook.get_split_ind`, `cbook.wrap`, `cbook.get_recursive_filelist`, `cbook.pieces`, `cbook.exception_to_str`, `cbook.allequal`, `cbook.alltrue`, `cbook.onetrue`, `cbook.allpairs`, `cbook.finddir`, `cbook.reverse_dict`, `cbook.restrict_dict`, `cbook.issubclass_safe`, `cbook.recursive_remove`, `cbook.unmasked_index_ranges`, `cbook.Null`, `cbook.RingBuffer`, `cbook.Sorter`, `cbook.Xlator`,
- `font_manager.weight_as_number`, `font_manager.ttfdict_to_fnames`
- `pyplot.colors`, `pyplot.spectral`
- `rcsetup.validate_negative_linestyle`, `rcsetup.validate_negative_linestyle_legacy`,
- `testing.compare.verifiers`, `testing.compare.verify`
- `testing.decorators.knownfailureif`, `testing.decorators.ImageComparisonTest.remove_text`
- `tests.assert_str_equal`, `tests.test_tinypages.file_same`
- `texmanager.dvipng_hack_alpha`,
- `_AxesBase.axesPatch`, `_AxesBase.set_color_cycle`, `_AxesBase.get_cursor_props`, `_AxesBase.set_cursor_props`
- `_ImageBase.iterpnames`
- `FigureCanvasBase.start_event_loop_default`;
- `FigureCanvasBase.stop_event_loop_default`;

- `Figure.figurePatch`,
- `FigureCanvasBase.dynamic_update`, `FigureCanvasBase.idle_event`, `FigureCanvasBase.get_linestyle`, `FigureCanvasBase.set_linestyle`
- `FigureCanvasQTAggBase`
- `FigureCanvasQTAgg.blitbox`
- `FigureCanvasTk.show` (alternative: `FigureCanvasTk.draw`)
- `FigureManagerTkAgg` (alternative: `FigureManagerTk`)
- `NavigationToolbar2TkAgg` (alternative: `NavigationToolbar2Tk`)
- `backend_wxagg.Toolbar` (alternative: `backend_wxagg.NavigationToolbar2WxAgg`)
- `RendererAgg.debug()`
- passing non-numbers to `EngFormatter.format_eng`
- passing `frac` to `PolarAxes.set_theta_grids`
- any mention of idle events

The following API elements have been removed:

- `backend_cairo.HAS_CAIRO_CFFI`
- `sphinxext.sphinx_version`

Proprietary sphinx directives

The matplotlib documentation used the proprietary sphinx directives `.. htmlonly::`, and `.. latexonly::`. These have been replaced with the standard sphinx directives `.. only:: html` and `.. only:: latex`. This change will not affect any users. Only downstream package maintainers, who have used the proprietary directives in their docs, will have to switch to the sphinx directives.

lib/mpl_examples symlink

The symlink from lib/mpl_examples to ../examples has been removed. This is not installed as an importable package and should not affect end users, however this may require down-stream packagers to adjust. The content is still available top-level examples directory.

9.12 Version 2.2

9.12.1 What's new in Matplotlib 2.2 (Mar 06, 2018)

Constrained Layout Manager

> **Warning**
>
> Constrained Layout is **experimental**. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period.

A new method to automatically decide spacing between subplots and their organizing `GridSpec` instances has been added. It is meant to replace the venerable `tight_layout` method. It is invoked via a new `constrained_layout=True` kwarg to *`Figure`* or *`subplots`*.

There are new *`rcParams`* for this package, and spacing can be more finely tuned with the new *`set_constrained_layout_pads`*.

Features include:

- Automatic spacing for subplots with a fixed-size padding in inches around subplots and all their decorators, and space between as a fraction of subplot size between subplots.
- Spacing for *`suptitle`*, and colorbars that are attached to more than one axes.
- Nested *`GridSpec`* layouts using *`GridSpecFromSubplotSpec`*.

For more details and capabilities please see the new tutorial: *Constrained layout guide*

Note the new API to access this:

New `plt.figure` and `plt.subplots` kwarg: `constrained_layout`

`figure()` and *`subplots()`* can now be called with `constrained_layout=True` kwarg to enable constrained_layout.

New `ax.set_position` behaviour

`Axes.set_position` now makes the specified axis no longer responsive to `constrained_layout`, consistent with the idea that the user wants to place an axis manually.

Internally, this means that old `ax.set_position` calls *inside* the library are changed to private `ax._set_position` calls so that `constrained_layout` will still work with these axes.

New `figure` kwarg for `GridSpec`

In order to facilitate `constrained_layout`, `GridSpec` now accepts a `figure` keyword. This is backwards compatible, in that not supplying this will simply cause `constrained_layout` to not operate on the subplots organized by this `GridSpec` instance. Routines that use `GridSpec` (e.g. `fig.subplots`) have been modified to pass the figure to `GridSpec`.

xlabels and ylabels can now be automatically aligned

Subplot axes `ylabels` can be misaligned horizontally if the tick labels are very different widths. The same can happen to `xlabels` if the ticklabels are rotated on one subplot (for instance). The new methods on the *`Figure`* class: *`Figure.align_xlabels`* and *`Figure.align_ylabels`* will now align these labels horizontally or vertically. If the user only wants to align some axes, a list of axes can be passed. If no list is passed, the algorithm looks at all the labels on the figure.

Only labels that have the same subplot locations are aligned. i.e. the ylabels are aligned only if the subplots are in the same column of the subplot layout.

Alignment is persistent and automatic after these are called.

A convenience wrapper *`Figure.align_labels`* calls both functions at once.

Axes legends now included in tight_bbox

Legends created via `ax.legend` can sometimes overspill the limits of the axis. Tools like `fig.tight_layout()` and `fig.savefig(bbox_inches='tight')` would clip these legends. A change was made to include them in the `tight` calculations.

Cividis colormap

A new dark blue/yellow colormap named 'cividis' was added. Like viridis, cividis is perceptually uniform and colorblind friendly. However, cividis also goes a step further: not only is it usable by colorblind users, it should actually look effectively identical to colorblind and non-colorblind users. For more details see Nuñez J, Anderton C, and Renslow R: "Optimizing colormaps with consideration for color vision deficiency to enable accurate interpretation of scientific data".

New style colorblind-friendly color cycle

A new style defining a color cycle has been added, tableau-colorblind10, to provide another option for colorblind-friendly plots. A demonstration of this new style can be found in the reference of style sheets. To load this color cycle in place of the default one:

```
import matplotlib.pyplot as plt
plt.style.use('tableau-colorblind10')
```

Support for numpy.datetime64

Matplotlib has supported `datetime.datetime` dates for a long time in *`matplotlib.dates`*. We now support `numpy.datetime64` dates as well. Anywhere that `datetime.datetime` could be used, `numpy.datetime64` can be used. eg:

```
time = np.arange('2005-02-01', '2005-02-02', dtype='datetime64[h]')
plt.plot(time)
```

Writing animations with Pillow

It is now possible to use Pillow as an animation writer. Supported output formats are currently gif (Pillow>=3.4) and webp (Pillow>=5.0). Use e.g. as

```
from __future__ import division

from matplotlib import pyplot as plt
from matplotlib.animation import FuncAnimation, PillowWriter

fig, ax = plt.subplots()
line, = plt.plot([0, 1])
```

(continues on next page)

(continued from previous page)

```
def animate(i):
    line.set_ydata([0, i / 20])
    return [line]

anim = FuncAnimation(fig, animate, 20, blit=True)
anim.save("movie.gif", writer=PillowWriter(fps=24))
plt.show()
```

Slider UI widget can snap to discrete values

The slider UI widget can take the optional argument *valstep*. Doing so forces the slider to take on only discrete values, starting from *valmin* and counting up to *valmax* with steps of size *valstep*.

If *closedmax*==*True*, then the slider will snap to *valmax* as well.

`capstyle` and `joinstyle` attributes added to `Collection`

The *Collection* class now has customizable `capstyle` and `joinstyle` attributes. This allows the user for example to set the `capstyle` of errorbars.

pad kwarg added to ax.set_title

The method *Axes.set_title* now has a *pad* kwarg, that specifies the distance from the top of an axes to where the title is drawn. The units of *pad* is points, and the default is the value of the (already-existing) *rcParams["axes.titlepad"]* (default: `6.0`).

Comparison of 2 colors in Matplotlib

As the colors in Matplotlib can be specified with a wide variety of ways, the *matplotlib.colors.same_color* method has been added which checks if two *colors* are the same.

Autoscaling a polar plot snaps to the origin

Setting the limits automatically in a polar plot now snaps the radial limit to zero if the automatic limit is nearby. This means plotting from zero doesn't automatically scale to include small negative values on the radial axis.

The limits can still be set manually in the usual way using *set_ylim*.

PathLike support

On Python 3.6+, *savefig*, *imsave*, *imread*, and animation writers now accept `os.PathLike`s as input.

`Axes.tick_params` can set gridline properties

Tick objects hold gridlines as well as the tick mark and its label. *Axis.set_tick_params*, *Axes.tick_params* and *pyplot.tick_params* now have keyword arguments 'grid_color', 'grid_alpha', 'grid_linewidth', and 'grid_linestyle' for overriding the defaults in *rcParams*: 'grid.color', etc.

`Axes.imshow` clips RGB values to the valid range

When *Axes.imshow* is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

Properties in `matplotlibrc` to place xaxis and yaxis tick labels

Introducing four new boolean properties in `matplotlibrc` for default positions of xaxis and yaxis tick labels, namely, *rcParams["xtick.labeltop"]* (default: `False`), *rcParams["xtick.labelbottom"]* (default: `True`), *rcParams["ytick.labelright"]* (default: `False`) and *rcParams["ytick.labelleft"]* (default: `True`). These can also be changed in rcParams.

PGI bindings for gtk3

The GTK3 backends can now use PGI instead of PyGObject. PGI is a fairly incomplete binding for GObject, thus its use is not recommended; its main benefit is its availability on Travis (thus allowing CI testing for the gtk3agg and gtk3cairo backends).

The binding selection rules are as follows: - if `gi` has already been imported, use it; else - if `pgi` has already been imported, use it; else - if `gi` can be imported, use it; else - if `pgi` can be imported, use it; else - error out.

Thus, to force usage of PGI when both bindings are installed, import it first.

Cairo rendering for Qt, WX, and Tk canvases

The new `Qt4Cairo`, `Qt5Cairo`, `WXCairo`, and `TkCairo` backends allow Qt, Wx, and Tk canvases to use Cairo rendering instead of Agg.

Added support for QT in new ToolManager

Now it is possible to use the ToolManager with Qt5 For example:

```
import matplotlib

matplotlib.use('QT5AGG')
matplotlib.rcParams['toolbar'] = 'toolmanager'
import matplotlib.pyplot as plt

plt.plot([1,2,3])
plt.show()
```

Treat the new Tool classes experimental for now, the API will likely change and perhaps the rcParam as well

The main example *Tool Manager* shows more details, just adjust the header to use QT instead of GTK3

TkAgg backend reworked to support PyPy

PyPy can now plot using the TkAgg backend, supported on PyPy 5.9 and greater (both PyPy for python 2.7 and PyPy for python 3.5).

Python logging library used for debug output

Matplotlib has in the past (sporadically) used an internal verbose-output reporter. This version converts those calls to using the standard python `logging` library.

Support for the old *rcParams* `verbose.level` and `verbose.fileo` is dropped.

The command-line options `--verbose-helpful` and `--verbose-debug` are still accepted, but deprecated. They are now equivalent to setting `logging.INFO` and `logging.DEBUG`.

The logger's root name is `matplotlib` and can be accessed from programs as:

```
import logging
mlog = logging.getLogger('matplotlib')
```

Instructions for basic usage are in *Troubleshooting* and for developers in *Contributing guide*.

Improved `repr` for `Transforms`

*Transform*s now indent their `repr`s in a more legible manner:

```
In [1]: l, = plt.plot([]); l.get_transform()
Out[1]:
CompositeGenericTransform(
   TransformWrapper(
      BlendedAffine2D(
            IdentityTransform(),
            IdentityTransform())),
   CompositeGenericTransform(
      BboxTransformFrom(
            TransformedBbox(
               Bbox(x0=-0.05500000000000001, y0=-0.05500000000000001,␣
 ↪x1=0.05500000000000001, y1=0.05500000000000001),
               TransformWrapper(
                  BlendedAffine2D(
                        IdentityTransform(),
                        IdentityTransform())))),
      BboxTransformTo(
            TransformedBbox(
               Bbox(x0=0.125, y0=0.10999999999999999, x1=0.9, y1=0.88),
               BboxTransformTo(
                  TransformedBbox(
                        Bbox(x0=0.0, y0=0.0, x1=6.4, y1=4.8),
                        Affine2D(
                           [[ 100.    0.    0.]
```

(continues on next page)

(continued from previous page)

```
                                [   0.  100.    0.]
                                [   0.    0.    1.]]))))))))
```

9.12.2 API Changes in 2.2.0

New dependency

kiwisolver is now a required dependency to support the new constrained_layout, see *Constrained layout guide* for more details.

Deprecations

Classes, functions, and methods

The unused and untested `Artist.onRemove` and `Artist.hitlist` methods have been deprecated.

The now unused `mlab.less_simple_linear_interpolation` function is deprecated.

The unused `ContourLabeler.get_real_label_width` method is deprecated.

The unused `FigureManagerBase.show_popup` method is deprecated. This introduced in e945059b327d42a99938b939a1be867fa023e7ba in 2005 but never built out into any of the backends.

`backend_tkagg.AxisMenu` is deprecated, as it has become unused since the removal of "classic" toolbars.

Changed function signatures

kwarg `fig` to *`GridSpec.get_subplot_params`* is deprecated, use `figure` instead.

Using *`pyplot.axes`* with an *`Axes`* as argument is deprecated. This sets the current axes, i.e. it has the same effect as *`pyplot.sca`*. For clarity `plt.sca(ax)` should be preferred over `plt.axes(ax)`.

Using strings instead of booleans to control grid and tick visibility is deprecated. Using `"on"`, `"off"`, `"true"`, or `"false"` to control grid and tick visibility has been deprecated. Instead, use normal booleans (`True`/`False`) or boolean-likes. In the future, all non-empty strings may be interpreted as `True`.

When given 2D inputs with non-matching numbers of columns, *`plot`* currently cycles through the columns of the narrower input, until all the columns of the wider input have been plotted. This behavior is deprecated; in the future, only broadcasting (1 column to *n* columns) will be performed.

rcparams

The `backend.qt4` and `backend.qt5` rcParams were deprecated in version 2.2. In order to force the use of a specific Qt binding, either import that binding first, or set the `QT_API` environment variable.

Deprecation of the `nbagg.transparent` rcParam. To control transparency of figure patches in the nbagg (or any other) backend, directly set `figure.patch.facecolor`, or the `figure.facecolor` rcParam.

Deprecated `Axis.unit_data`

Use `Axis.units` (which has long existed) instead.

Removals

Function Signatures

Contouring no longer supports `legacy` corner masking. The deprecated `ContourSet.vmin` and `ContourSet.vmax` properties have been removed.

Passing `None` instead of `"none"` as format to *`errorbar`* is no longer supported.

The `bgcolor` keyword argument to `Axes` has been removed.

Modules, methods, and functions

The `matplotlib.finance`, `mpl_toolkits.exceltools` and `mpl_toolkits.gtktools` modules have been removed. `matplotlib.finance` remains available at https://github.com/matplotlib/mpl_finance.

The `mpl_toolkits.mplot3d.art3d.iscolor` function has been removed.

The `Axes.get_axis_bgcolor`, `Axes.set_axis_bgcolor`, `Bbox.update_from_data`, `Bbox.update_datalim_numerix`, `MaxNLocator.bin_boundaries` methods have been removed.

`mencoder` can no longer be used to encode animations.

The unused `FONT_SCALE` and `fontd` attributes of the *`RendererSVG`* class have been removed.

colormaps

The `spectral` colormap has been removed. The `Vega*` colormaps, which were aliases for the `tab*` colormaps, have been removed.

rcparams

The following deprecated rcParams have been removed:

- `axes.color_cycle` (see `axes.prop_cycle`),
- `legend.isaxes`,
- `svg.embed_char_paths` (see `svg.fonttype`),
- `text.fontstyle`, `text.fontangle`, `text.fontvariant`, `text.fontweight`, `text.fontsize` (renamed to `text.style`, etc.),
- `tick.size` (renamed to `tick.major.size`).

Only accept string-like for Categorical input

Do not accept mixed string / float / int input, only strings are valid categoricals.

Removal of unused imports

Many unused imports were removed from the codebase. As a result, trying to import certain classes or functions from the "wrong" module (e.g. *Figure* from *matplotlib.backends.backend_agg* instead of *matplotlib.figure*) will now raise an ImportError.

Axes3D.get_xlim, get_ylim and get_zlim now return a tuple

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

Exception type changes

If *MovieWriterRegistry* can't find the requested *MovieWriter*, a more helpful RuntimeError message is now raised instead of the previously raised KeyError.

matplotlib.tight_layout.auto_adjust_subplotpars now raises ValueError instead of RuntimeError when sizes of input lists don't match

Figure.set_figwidth and Figure.set_figheight default *forward* to True

matplotlib.figure.Figure.set_figwidth and *matplotlib.figure.Figure.set_figheight* had the keyword argument forward=False by default, but *figure.Figure.set_size_inches* now defaults to forward=True. This makes these functions consistent.

Do not truncate svg sizes to nearest point

There is no reason to size the SVG out put in integer points, change to out putting floats for the *height*, *width*, and *viewBox* attributes of the *svg* element.

Fontsizes less than 1 pt are clipped to be 1 pt.

FreeType doesn't allow fonts to get smaller than 1 pt, so all Agg backends were silently rounding up to 1 pt. PDF (other vector backends?) were letting us write fonts that were less than 1 pt, but they could not be placed properly because position information comes from FreeType. This change makes it so no backends can use fonts smaller than 1 pt, consistent with FreeType and ensuring more consistent results across backends.

Changes to Qt backend class MRO

To support both Agg and cairo rendering for Qt backends all of the non-Agg specific code previously in backend_qt5agg.FigureCanvasQTAggBase has been moved to backend_qt5.FigureCanvasQT so it can be shared with the cairo implementation. The FigureCanvasQTAggBase.paintEvent, FigureCanvasQTAggBase.blit, and FigureCanvasQTAggBase.print_figure methods have moved to FigureCanvasQTAgg.paintEvent, FigureCanvasQTAgg.blit, and FigureCanvasQTAgg.print_figure. The first two methods assume that the instance is also a QWidget so to use FigureCanvasQTAggBase it was required to multiple inherit from a QWidget sub-class.

Having moved all of its methods either up or down the class hierarchy `FigureCanvasQTAggBase` has been deprecated. To do this without warning and to preserve as much API as possible, `.backend_qt5agg.FigureCanvasQTAggBase` now inherits from `backend_qt5.FigureCanvasQTAgg`.

The MRO for `FigureCanvasQTAgg` and `FigureCanvasQTAggBase` used to be

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

and

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

respectively. They are now

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_agg.FigureCanvasAgg,

`axes.Axes.imshow` clips RGB values to the valid range

When *`axes.Axes.imshow`* is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

GTKAgg and GTKCairo backends deprecated

The GTKAgg and GTKCairo backends have been deprecated. These obsolete backends allow figures to be rendered via the GTK+ 2 toolkit. They are untested, known to be broken, will not work with Python 3, and their use has been discouraged for some time. Instead, use the `GTK3Agg` and `GTK3Cairo` backends for rendering to GTK+ 3 windows.

9.13 Version 2.1

9.13.1 What's new in Matplotlib 2.1.0 (Oct 7, 2017)

Documentation

The examples have been migrated to use sphinx gallery. This allows better mixing of prose and code in the examples, provides links to download the examples as both a Python script and a Jupyter notebook, and improves the thumbnail galleries. The examples have been re-organized into *Tutorials* and a *Examples*.

Many docstrings and examples have been clarified and improved.

New features

String categorical values

All plotting functions now support string categorical values as input. For example:

```
data = {'apples': 10, 'oranges': 15, 'lemons': 5, 'limes': 20}
fig, ax = plt.subplots()
ax.bar(data.keys(), data.values(), color='lightgray')
```

Interactive JS widgets for animation

Jake Vanderplas' JSAnimation package has been merged into Matplotlib. This adds to Matplotlib the *`HTMLWriter`* class for generating a JavaScript HTML animation, suitable for the IPython notebook. This can be activated by default by setting the `animation.html` rc parameter to `jshtml`. One can also call the *`to_jshtml`* method to manually convert an animation. This can be displayed using IPython's `HTML` display class:

```
from IPython.display import HTML
HTML(animation.to_jshtml())
```

The *HTMLWriter* class can also be used to generate an HTML file by asking for the `html` writer.

Enhancements to polar plot

The polar axes transforms have been greatly re-factored to allow for more customization of view limits and tick labelling. Additional options for view limits allow for creating an annulus, a sector, or some combination of the two.

The *set_rorigin()* method may be used to provide an offset to the minimum plotting radius, producing an annulus.

The *set_theta_zero_location()* method now has an optional `offset` argument. This argument may be used to further specify the zero location based on the given anchor point.

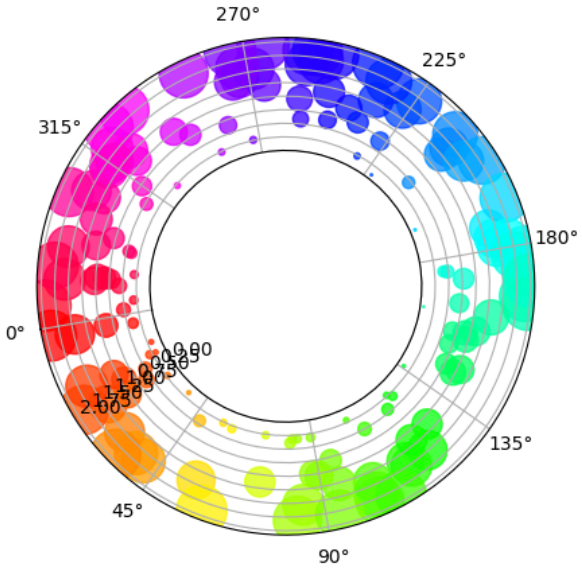

Fig. 4: Polar Offset Demo

The *set_thetamin()* and *set_thetamax()* methods may be used to limit the range of angles plotted, producing sectors of a circle.

Previous releases allowed plots containing negative radii for which the negative values are simply used as labels, and the real radius is shifted by the configured minimum. This release also allows negative radii to be used for grids and ticks, which were previously silently ignored.

Radial ticks have been modified to be parallel to the circular grid line, and angular ticks have been modified to be parallel to the grid line. It may also be useful to rotate tick *labels* to match the boundary. Calling `ax.tick_params(rotation='auto')` will enable the new behavior: radial tick labels will be parallel to the circular grid line, and angular tick labels will be perpendicular to the grid line (i.e., parallel to the outer boundary). Additionally, tick labels now obey the padding settings that previously only

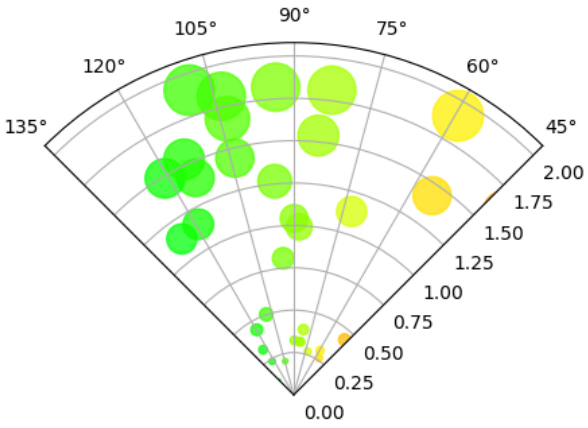

Fig. 5: Polar Sector Demo

worked on Cartesian plots. Consequently, the `frac` argument to *`PolarAxes.set_thetagrids`* is no longer applied. Tick padding can be modified with the `pad` argument to *`Axes.tick_params`* or *`Axis.set_tick_params`*.

`Figure` class now has `subplots` method

The *`Figure`* class now has a *`subplots()`* method which behaves the same as *`pyplot.subplots()`* but on an existing figure.

Metadata savefig keyword argument

`savefig()` now accepts `metadata` as a keyword argument. It can be used to store key/value pairs in the image metadata.

- 'png' with Agg backend
- 'pdf' with PDF backend (see *`writeInfoDict()`* for a list of supported keywords)
- 'eps' and 'ps' with PS backend (only 'Creator' key is accepted)

```
plt.savefig('test.png', metadata={'Software': 'My awesome software'})
```

Busy Cursor

The interactive GUI backends will now change the cursor to busy when Matplotlib is rendering the canvas.

PolygonSelector

A *PolygonSelector* class has been added to *matplotlib.widgets*. See *Select indices from a collection using polygon selector* for details.

Added matplotlib.ticker.PercentFormatter

The new *PercentFormatter* formatter has some nice features like being able to convert from arbitrary data scales to percents, a customizable percent symbol and either automatic or manual control over the decimal points.

Reproducible PS, PDF and SVG output

The SOURCE_DATE_EPOCH environment variable can now be used to set the timestamp value in the PS and PDF outputs. See source date epoch.

Alternatively, calling savefig with metadata={'CreationDate': None} will omit the timestamp altogether for the PDF backend.

The reproducibility of the output from the PS and PDF backends has so far been tested using various plot elements but only default values of options such as {ps,pdf}.fonttype that can affect the output at a low level, and not with the mathtext or usetex features. When Matplotlib calls external tools (such as PS distillers or LaTeX) their versions need to be kept constant for reproducibility, and they may add sources of nondeterminism outside the control of Matplotlib.

For SVG output, the svg.hashsalt rc parameter has been added in an earlier release. This parameter changes some random identifiers in the SVG file to be deterministic. The downside of this setting is that if more than one file is generated using deterministic identifiers and they end up as parts of one larger document, the identifiers can collide and cause the different parts to affect each other.

These features are now enabled in the tests for the PDF and SVG backends, so most test output files (but not all of them) are now deterministic.

Orthographic projection for mplot3d

Axes3D now accepts proj_type keyword argument and has a method *set_proj_type()*. The default option is 'persp' as before, and supplying 'ortho' enables orthographic view.

Compare the z-axis which is vertical in orthographic view, but slightly skewed in the perspective view.

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.set_proj_type('persp')
ax1.set_title('Perspective (default)')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
```

(continues on next page)

(continued from previous page)

```
ax2.set_proj_type('ortho')
ax2.set_title('Orthographic')

plt.show()
```

`voxels` function for mplot3d

Axes3D now has a *voxels* method, for visualizing boolean 3D data. Uses could include plotting a sparse 3D heat map, or visualizing a volumetric model.

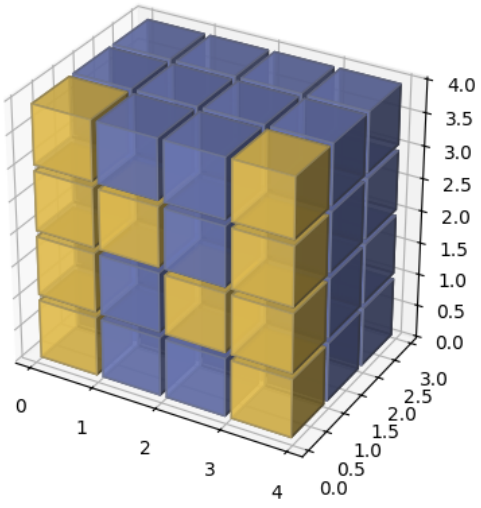

Fig. 6: Voxel Demo

Improvements

CheckButtons widget `get_status` function

A *get_status()* method has been added to the *matplotlib.widgets.CheckButtons* class. This `get_status` method allows user to query the status (True/False) of all of the buttons in the `CheckButtons` object.

Add `fill_bar` argument to `AnchoredSizeBar`

The `mpl_toolkits` class *AnchoredSizeBar* now has an additional `fill_bar` argument, which makes the size bar a solid rectangle instead of just drawing the border of the rectangle. The default is `None`, and whether or not the bar will be filled by default depends on the value of `size_vertical`. If `size_vertical` is nonzero, `fill_bar` will be set to `True`. If `size_vertical` is zero then

`fill_bar` will be set to `False`. If you wish to override this default behavior, set `fill_bar` to `True` or `False` to unconditionally always or never use a filled patch rectangle for the size bar.

```
import matplotlib.pyplot as plt
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredSizeBar

fig, ax = plt.subplots(figsize=(3, 3))

bar0 = AnchoredSizeBar(ax.transData, 0.3, 'unfilled', loc='lower left',
                       frameon=False, size_vertical=0.05, fill_
 ↪bar=False)
ax.add_artist(bar0)
bar1 = AnchoredSizeBar(ax.transData, 0.3, 'filled', loc='lower right',
                       frameon=False, size_vertical=0.05, fill_
 ↪bar=True)
ax.add_artist(bar1)

plt.show()
```

Annotation can use a default arrow style

Annotations now use the default arrow style when setting `arrowprops={}`, rather than no arrow (the new behavior actually matches the documentation).

Barbs and Quiver Support Dates

When using the *`quiver()`* and *`barbs()`* plotting methods, it is now possible to pass dates, just like for other methods like *`plot()`*. This also allows these functions to handle values that need unit-conversion applied.

Hexbin default line color

The default `linecolor` keyword argument for *`hexbin()`* is now `'face'`, and supplying `'none'` now prevents lines from being drawn around the hexagons.

Figure.legend() can be called without arguments

Calling *`Figure.legend()`* can now be done with no arguments. In this case a legend will be created that contains all the artists on all the axes contained within the figure.

Multiple legend keys for legend entries

A legend entry can now contain more than one legend key. The extended *`HandlerTuple`* class now accepts two parameters: `ndivide` divides the legend area in the specified number of sections; `pad` changes the padding between the legend keys.

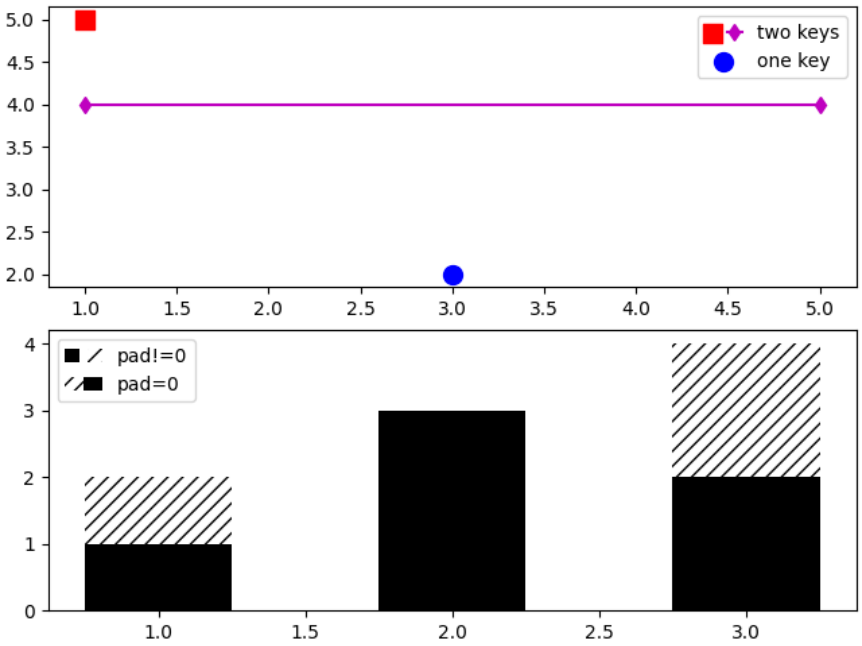

Fig. 7: Multiple Legend Keys

New parameter *clear* for `figure()`

When the pyplot's function *figure()* is called with a `num` parameter, a new window is only created if no existing window with the same value exists. A new bool parameter *clear* was added for explicitly clearing its existing contents. This is particularly useful when utilized in interactive sessions. Since *subplots()* also accepts keyword arguments from *figure()*, it can also be used there:

```
import matplotlib.pyplot as plt

fig0 = plt.figure(num=1)
fig0.suptitle("A fancy plot")
print("fig0.texts: ", [t.get_text() for t in fig0.texts])

fig1 = plt.figure(num=1, clear=False)  # do not clear contents of␣
↪window
fig1.text(0.5, 0.5, "Really fancy!")
print("fig0 is fig1: ",  fig0 is fig1)
print("fig1.texts: ", [t.get_text() for t in fig1.texts])

fig2, ax2 = plt.subplots(2, 1, num=1, clear=True)  # clear contents
print("fig0 is fig2: ",  fig0 is fig2)
print("fig2.texts: ", [t.get_text() for t in fig2.texts])

# The output:
# fig0.texts:  ['A fancy plot']
# fig0 is fig1:  True
```

(continues on next page)

(continued from previous page)

```
# fig1.texts:  ['A fancy plot', 'Really fancy!']
# fig0 is fig2:  True
# fig2.texts:  []
```

Specify minimum value to format as scalar for `LogFormatterMathtext`

LogFormatterMathtext now includes the option to specify a minimum value exponent to format as a scalar (i.e., 0.001 instead of 10^{-3}).

New quiverkey angle keyword argument

Plotting a *quiverkey()* now admits the `angle` keyword argument, which sets the angle at which to draw the key arrow.

Colormap reversed method

The methods *matplotlib.colors.LinearSegmentedColormap.reversed()* and *matplotlib.colors.ListedColormap.reversed()* return a reversed instance of the Colormap. This implements a way for any Colormap to be reversed.

`artist.setp` (and `pyplot.setp`) accept a *file* argument

The argument is keyword-only. It allows an output file other than `sys.stdout` to be specified. It works exactly like the *file* argument to `print`.

`streamplot` streamline generation more configurable

The starting point, direction, and length of the stream lines can now be configured. This allows to follow the vector field for a longer time and can enhance the visibility of the flow pattern in some use cases.

`Axis.set_tick_params` now responds to *rotation*

Bulk setting of tick label rotation is now possible via *tick_params()* using the *rotation* keyword.

```
ax.tick_params(which='both', rotation=90)
```

Ticklabels are turned off instead of being invisible

Internally, the *Tick*'s `matplotlib.axis.Tick.label1On` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, *tick_params()* needs to be used, e.g.

```
ax.tick_params(labelbottom=True)
```

Shading in 3D bar plots

A new `shade` parameter has been added the 3D *`bar`* plotting method. The default behavior remains to shade the bars, but now users have the option of setting `shade` to `False`.

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

x = np.arange(2)
y = np.arange(3)
x2d, y2d = np.meshgrid(x, y)
x, y = x2d.ravel(), y2d.ravel()
z = np.zeros_like(x)
dz = x + y

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.bar3d(x, y, z, 1, 1, dz, shade=True)
ax1.set_title('Shading On')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
ax2.bar3d(x, y, z, 1, 1, dz, shade=False)
ax2.set_title('Shading Off')

plt.show()
```

New `which` Parameter for `autofmt_xdate`

A `which` parameter now exists for the method *`autofmt_xdate()`*. This allows a user to format `major`, `minor` or `both` tick labels selectively. The default behavior will rotate and align the `major` tick labels.

```
fig.autofmt_xdate(bottom=0.2, rotation=30, ha='right', which='minor')
```

New Figure Parameter for `subplot2grid`

A `fig` parameter now exists for the function *`subplot2grid()`*. This allows a user to specify the figure where the subplots will be created. If `fig` is `None` (default) then the method will use the current figure retrieved by *`gcf()`*.

```
subplot2grid(shape, loc, rowspan=1, colspan=1, fig=myfig)
```

Interpolation in `fill_betweenx`

The `interpolate` parameter now exists for the method *`fill_betweenx()`*. This allows a user to interpolate the data and fill the areas in the crossover points, similarly to *`fill_between()`*.

New keyword argument `sep` for EngFormatter

A new `sep` keyword argument has been added to *`EngFormatter`* and provides a means to define the string that will be used between the value and its unit. The default string is `" "`, which preserves the former behavior. Additionally, the separator is now present between the value and its unit even in the absence of SI prefix. There was formerly a bug that was causing strings like `"3.14V"` to be returned instead of the expected `"3.14 V"` (with the default behavior).

Extend `MATPLOTLIBRC` behavior

The environmental variable can now specify the full file path or the path to a directory containing a `matplotlibrc` file.

`density` kwarg to hist

The *`hist()`* method now prefers `density` to `normed` to control if the histogram should be normalized, following a change upstream to NumPy. This will reduce confusion as the behavior has always been that the integral of the histogram is 1 (rather than sum or maximum value).

Internals

New TransformedPatchPath caching object

A newly added *`TransformedPatchPath`* provides a means to transform a *`Patch`* into a *`Path`* via a *`Transform`* while caching the resulting path. If neither the patch nor the transform have changed, a cached copy of the path is returned.

This class differs from the older *`TransformedPath`* in that it is able to refresh itself based on the underlying patch while the older class uses an immutable path.

Abstract base class for movie writers

The new *`AbstractMovieWriter`* class defines the API required by a class that is to be used as the `writer` in the *`matplotlib.animation.Animation.save()`* method. The existing *`MovieWriter`* class now derives from the new abstract base class.

Stricter validation of line style rcParams

The validation of rcParams that are related to line styles (`lines.linestyle`, `boxplot.*.linestyle`, `grid.linestyle` and `contour.negative_linestyle`) now effectively checks that the values are valid line styles. Strings like `'dashed'` or `'--'` are accepted, as well as even-length sequences of on-off ink like `[1, 1.65]`. In this latter case, the offset value is handled internally and should *not* be provided by the user.

The new validation scheme replaces the former one used for the `contour.negative_linestyle` rcParams, that was limited to `'solid'` and `'dashed'` line styles.

The validation is case-insensitive. The following are now valid:

```
grid.linestyle             : (1, 3)    # loosely dotted grid lines
contour.negative_linestyle : dashdot   # previously only solid or dashed
```

pytest

The automated tests have been switched from nose to pytest.

Performance

Path simplification updates

Line simplification controlled by the `path.simplify` and `path.simplify_threshold` parameters has been improved. You should notice better rendering performance when plotting large amounts of data (as long as the above parameters are set accordingly). Only the line segment portion of paths will be simplified -- if you are also drawing markers and experiencing problems with rendering speed, you should consider using the `markevery` option to *`plot`*. See the *Performance* section in the usage tutorial for more information.

The simplification works by iteratively merging line segments into a single vector until the next line segment's perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter. Thus, higher values of `path.simplify_threshold` result in quicker rendering times. If you are plotting just to explore data and not for publication quality, pixel perfect plots, then a value of `1.0` can be safely used. If you want to make sure your plot reflects your data *exactly*, then you should set `path.simplify` to false and/or `path.simplify_threshold` to `0`. Matplotlib currently defaults to a conservative value of `1/9`, smaller values are unlikely to cause any visible differences in your plots.

Implement intersects_bbox in c++

`intersects_bbox()` has been implemented in c++ which improves the performance of automatically placing the legend.

9.13.2 API Changes in 2.1.2

`Figure.legend` no longer checks for repeated lines to ignore

`matplotlib.figure.Figure.legend` used to check if a line had the same label as an existing legend entry. If it also had the same line color or marker color legend didn't add a new entry for that line. However,

the list of conditions was incomplete, didn't handle RGB tuples, didn't handle linewidths or linestyles etc.

This logic did not exist in *axes.Axes.legend*. It was included (erroneously) in Matplotlib 2.1.1 when the legend argument parsing was unified PR #9324. This change removes that check in *axes.Axes.legend* again to restore the old behavior.

This logic has also been dropped from *Figure.legend*, where it was previously undocumented. Repeated lines with the same label will now each have an entry in the legend. If you do not want the duplicate entries, don't add a label to the line, or prepend the label with an underscore.

9.13.3 API Changes in 2.1.1

Default behavior of log scales reverted to clip <= 0 values

The change it 2.1.0 to mask in logscale by default had more disruptive changes than anticipated and has been reverted, however the clipping is now done in a way that fixes the issues that motivated changing the default behavior to `'mask'`.

As a side effect of this change, error bars which go negative now work as expected on log scales.

9.13.4 API Changes in 2.1.0

Default behavior of log scales changed to mask <= 0 values

Calling *matplotlib.axes.Axes.set_xscale* or *matplotlib.axes.Axes.set_yscale* now uses 'mask' as the default method to handle invalid values (as opposed to 'clip'). This means that any values <= 0 on a log scale will not be shown.

Previously they were clipped to a very small number and shown.

`matplotlib.cbook.CallbackRegistry.process()` suppresses exceptions by default

Matplotlib uses instances of *CallbackRegistry* as a bridge between user input event from the GUI and user callbacks. Previously, any exceptions raised in a user call back would bubble out of the `process` method, which is typically in the GUI event loop. Most GUI frameworks simple print the traceback to the screen and continue as there is not always a clear method of getting the exception back to the user. However PyQt5 now exits the process when it receives an un-handled python exception in the event loop. Thus, *process()* now suppresses and prints tracebacks to stderr by default.

What *process()* does with exceptions is now user configurable via the `exception_handler` attribute and kwarg. To restore the previous behavior pass `None`

```
cb = CallbackRegistry(exception_handler=None)
```

A function which take and `Exception` as its only argument may also be passed

```
def maybe_reraise(exc):
    if isinstance(exc, RuntimeError):
        pass
    else:
        raise exc
```

(continues on next page)

(continued from previous page)

```
cb = CallbackRegistry(exception_handler=maybe_reraise)
```

Improved toggling of the axes grids

The `g` key binding now switches the states of the `x` and `y` grids independently (by cycling through all four on/off combinations).

The new `G` key binding switches the states of the minor grids.

Both bindings are disabled if only a subset of the grid lines (in either direction) is visible, to avoid making irreversible changes to the figure.

Ticklabels are turned off instead of being invisible

Internally, the *Tick*'s `~matplotlib.axis.Tick.label1On` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, *tick_params()* needs to be used, e.g.

```
ax.tick_params(labelbottom=True)
```

Removal of warning on empty legends

pyplot.legend used to issue a warning when no labeled artist could be found. This warning has been removed.

More accurate legend autopositioning

Automatic positioning of legends now prefers using the area surrounded by a *Line2D* rather than placing the legend over the line itself.

Cleanup of stock sample data

The sample data of stocks has been cleaned up to remove redundancies and increase portability. The `AAPL.dat.gz`, `INTC.dat.gz` and `aapl.csv` files have been removed entirely and will also no longer be available from *matplotlib.cbook.get_sample_data*. If a CSV file is required, we suggest using the `msft.csv` that continues to be shipped in the sample data. If a NumPy binary file is acceptable, we suggest using one of the following two new files. The `aapl.npy.gz` and `goog.npy` files have been replaced by `aapl.npz` and `goog.npz`, wherein the first column's type has changed from `datetime.date` to `numpy.datetime64` for better portability across Python versions. Note that Matplotlib does not fully support `numpy.datetime64` as yet.

Updated qhull to 2015.2

The version of qhull shipped with Matplotlib, which is used for Delaunay triangulation, has been updated from version 2012.1 to 2015.2.

Improved Delaunay triangulations with large offsets

Delaunay triangulations now deal with large x,y offsets in a better way. This can cause minor changes to any triangulations calculated using Matplotlib, i.e. any use of *matplotlib.tri.Triangulation* that requests that a Delaunay triangulation is calculated, which includes *matplotlib.pyplot.tricontour*, *matplotlib.pyplot.tricontourf*, *matplotlib.pyplot.tripcolor*, *matplotlib.pyplot.triplot*, `matplotlib.mlab.griddata` and *mpl_toolkits.mplot3d.axes3d.Axes3D.plot_trisurf*.

Use `backports.functools_lru_cache` instead of `functools32`

It's better maintained and more widely used (by pylint, jaraco, etc).

`cbook.is_numlike` only performs an instance check

`matplotlib.cbook.is_numlike` now only checks that its argument is an instance of `(numbers.Number, np.Number)`. In particular, this means that arrays are now not num-like.

Elliptical arcs now drawn between correct angles

The *matplotlib.patches.Arc* patch is now correctly drawn between the given angles.

Previously a circular arc was drawn and then stretched into an ellipse, so the resulting arc did not lie between *theta1* and *theta2*.

`-d$backend` no longer sets the backend

It is no longer possible to set the backend by passing `-d$backend` at the command line. Use the `MPLBACKEND` environment variable instead.

Path.intersects_bbox always treats the bounding box as filled

Previously, when `Path.intersects_bbox` was called with `filled` set to `False`, it would treat both the path and the bounding box as unfilled. This behavior was not well documented and it is usually not the desired behavior, since bounding boxes are used to represent more complex shapes located inside the bounding box. This behavior has now been changed: when `filled` is `False`, the path will be treated as unfilled, but the bounding box is still treated as filled. The old behavior was arguably an implementation bug.

When `Path.intersects_bbox` is called with `filled` set to `True` (the default value), there is no change in behavior. For those rare cases where `Path.intersects_bbox` was called with `filled` set to `False` and where the old behavior is actually desired, the suggested workaround is to call `Path.intersects_path` with a rectangle as the path:

```
from matplotlib.path import Path
from matplotlib.transforms import Bbox, BboxTransformTo
rect = Path.unit_rectangle().transformed(BboxTransformTo(bbox))
result = path.intersects_path(rect, filled=False)
```

WX no longer calls generates `IdleEvent` events or calls `idle_event`

Removed unused private method `_onIdle` from `FigureCanvasWx`.

The `IdleEvent` class and `FigureCanvasBase.idle_event` method will be removed in 2.2

Correct scaling of `magnitude_spectrum()`

The functions *matplotlib.mlab.magnitude_spectrum()* and *matplotlib.pyplot.magnitude_spectrum()* implicitly assumed the sum of windowing function values to be one. In Matplotlib and Numpy the standard windowing functions are scaled to have maximum value of one, which usually results in a sum of the order of n/2 for a n-point signal. Thus the amplitude scaling `magnitude_spectrum()` was off by that amount when using standard windowing functions (Bug 8417). Now the behavior is consistent with *matplotlib.pyplot.psd()* and `scipy.signal.welch()`. The following example demonstrates the new and old scaling:

```
import matplotlib.pyplot as plt
import numpy as np

tau, n = 10, 1024  # 10 second signal with 1024 points
T = tau/n  # sampling interval
t = np.arange(n)*T

a = 4  # amplitude
x = a*np.sin(40*np.pi*t)  # 20 Hz sine with amplitude a

# New correct behavior: Amplitude at 20 Hz is a/2
plt.magnitude_spectrum(x, Fs=1/T, sides='onesided', scale='linear')

# Original behavior: Amplitude at 20 Hz is (a/2)*(n/2) for a Hanning␣
 ↪window
w = np.hanning(n)  # default window is a Hanning window
plt.magnitude_spectrum(x*np.sum(w), Fs=1/T, sides='onesided', scale=
 ↪'linear')
```

Change to signatures of `bar()` & `barh()`

For 2.0 the *default value of *align** changed to `'center'`. However this caused the signature of *bar()* and *barh()* to be misleading as the first parameters were still *left* and *bottom* respectively:

```
bar(left, height, *, align='center', **kwargs)
barh(bottom, width, *, align='center', **kwargs)
```

despite behaving as the center in both cases. The methods now take `*args, **kwargs` as input and are documented to have the primary signatures of:

```
bar(x, height, *, align='center', **kwargs)
barh(y, width, *, align='center', **kwargs)
```

Passing *left* and *bottom* as keyword arguments to *bar()* and *barh()* respectively will warn. Support will be removed in Matplotlib 3.0.

Font cache as json

The font cache is now saved as json, rather than a pickle.

Invalid (Non-finite) Axis Limit Error

When using *set_xlim()* and *set_ylim()*, passing non-finite values now results in a `ValueError`. The previous behavior resulted in the limits being erroneously reset to `(-0.001, 0.001)`.

`scatter` and `Collection` offsets are no longer implicitly flattened

Collection (and thus both 2D *scatter* and 3D *scatter*) no longer implicitly flattens its offsets. As a consequence, `scatter`'s `x` and `y` arguments can no longer be 2+-dimensional arrays.

Deprecations

`GraphicsContextBase`'s `linestyle` property.

The `GraphicsContextBase.get_linestyle` and `GraphicsContextBase.set_linestyle` methods, which had no effect, have been deprecated. All of the backends Matplotlib ships use `GraphicsContextBase.get_dashes` and `GraphicsContextBase.set_dashes` which are more general. Third-party backends should also migrate to the `*_dashes` methods.

`NavigationToolbar2.dynamic_update`

Use *draw_idle* method on the `Canvas` instance instead.

Testing

`matplotlib.testing.noseclasses` is deprecated and will be removed in 2.3

`EngFormatter` *num* arg as string

Passing a string as *num* argument when calling an instance of *matplotlib.ticker.EngFormatter* is deprecated and will be removed in 2.3.

`mpl_toolkits.axes_grid` module

All functionally from `mpl_toolkits.axes_grid` can be found in either *mpl_toolkits.axes_grid1* or *mpl_toolkits.axisartist*. Axes classes from `mpl_toolkits.axes_grid` based on `Axis` from *mpl_toolkits.axisartist* can be found in *mpl_toolkits.axisartist*.

`Axes` collision in `Figure.add_axes`

Adding an axes instance to a figure by using the same arguments as for a previous axes instance currently reuses the earlier instance. This behavior has been deprecated in Matplotlib 2.1. In a future version, a *new* instance will always be created and returned. Meanwhile, in such a situation, a deprecation warning is raised by `matplotlib.figure.AxesStack`.

This warning can be suppressed, and the future behavior ensured, by passing a *unique* label to each axes instance. See the docstring of *`add_axes()`* for more information.

Additional details on the rationale behind this deprecation can be found in #7377 and #9024.

Former validators for `contour.negative_linestyle`

The former public validation functions `validate_negative_linestyle` and `validate_negative_linestyle_legacy` will be deprecated in 2.1 and may be removed in 2.3. There are no public functions to replace them.

`cbook`

Many unused or near-unused *`matplotlib.cbook`* functions and classes have been deprecated: `converter`, `tostr`, `todatetime`, `todate`, `tofloat`, `toint`, `unique`, `is_string_like`, `is_sequence_of_strings`, `is_scalar`, `Sorter`, `Xlator`, `soundex`, `Null`, `dict_delall`, `RingBuffer`, `get_split_ind`, `wrap`, `get_recursive_filelist`, `pieces`, `exception_to_str`, `allequal`, `alltrue`, `onetrue`, `allpairs`, `finddir`, `reverse_dict`, `restrict_dict`, `issubclass_safe`, `recursive_remove`, `unmasked_index_ranges`.

Code Removal

qt4_compat.py

Moved to `qt_compat.py`. Renamed because it now handles Qt5 as well.

Previously Deprecated methods

The `GraphicsContextBase.set_graylevel`, `FigureCanvasBase.onHilite` and `mpl_toolkits.axes_grid1.mpl_axes.Axes.toggle_axisline` methods have been removed.

The `ArtistInspector.findobj` method, which was never working due to the lack of a `get_children` method, has been removed.

The deprecated `point_in_path`, `get_path_extents`, `point_in_path_collection`, `path_intersects_path`, `convert_path_to_polygons`, `cleanup_path` and `clip_path_to_rect` functions in the `matplotlib.path` module have been removed. Their functionality remains exposed as methods on the `Path` class.

The deprecated `Artist.get_axes` and `Artist.set_axes` methods have been removed

The `matplotlib.backends.backend_ps.seq_allequal` function has been removed. Use `np.array_equal` instead.

The deprecated `matplotlib.rcsetup.validate_maskedarray`, `matplotlib.rcsetup.deprecate_savefig_extension` and `matplotlib.rcsetup.validate_tkpythoninspect` functions, and associated `savefig.extension` and `tk.pythoninspect` rcparams entries have been removed.

The keyword argument *resolution* of *`matplotlib.projections.polar.PolarAxes`* has been removed. It has deprecation with no effect from version *0.98.x*.

`Axes.set_aspect("normal")`

Support for setting an `Axes`'s aspect to `"normal"` has been removed, in favor of the synonym `"auto"`.

`shading` kwarg to `pcolor`

The `shading` kwarg to *`pcolor`* has been removed. Set `edgecolors` appropriately instead.

Functions removed from the `lines` module

The *`matplotlib.lines`* module no longer imports the `pts_to_prestep`, `pts_to_midstep` and `pts_to_poststep` functions from *`matplotlib.cbook`*.

PDF backend functions

The methods `embedTeXFont` and `tex_font_mapping` of *`matplotlib.backends.backend_pdf.PdfFile`* have been removed. It is unlikely that external users would have called these methods, which are related to the font system internal to the PDF backend.

matplotlib.delaunay

Remove the delaunay triangulation code which is now handled by Qhull via *`matplotlib.tri`*.

9.14 Version 2.0

9.14.1 What's new in Matplotlib 2.0 (Jan 17, 2017)

> **Note**
>
> Matplotlib 2.0 supports Python 2.7, and 3.4+

Default style changes

The major changes in v2.0 are related to overhauling the default styles.

Changes to the default style

The most important changes in matplotlib 2.0 are the changes to the default style.

While it is impossible to select the best default for all cases, these are designed to work well in the most common cases.

A 'classic' style sheet is provided so reverting to the 1.x default values is a single line of python

```
import matplotlib.style
import matplotlib as mpl
mpl.style.use('classic')
```

See *The matplotlibrc file* for details about how to persistently and selectively revert many of these changes.

Colors, color cycles, and colormaps

Colors in default property cycle

The colors in the default property cycle have been changed from `['b', 'g', 'r', 'c', 'm', 'y', 'k']` to the category10 color palette used by Vega and d3 originally developed at Tableau.

In addition to changing the colors, an additional method to specify colors was added. Previously, the default colors were the single character short-hand notations for red, green, blue, cyan, magenta, yellow, and black. This made them easy to type and usable in the abbreviated style string in `plot`, however the new default colors are only specified via hex values. To access these colors outside of the property cycling the notation for colors `'CN'`, where `N` takes values 0-9, was added to denote the first 10 colors in *`rcParams["axes.prop_cycle"]`* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`). See *Specifying colors* for more details.

To restore the old color cycle use

```
from cycler import cycler
mpl.rcParams['axes.prop_cycle'] = cycler(color='bgrcmyk')
```

or set

```
axes.prop_cycle    : cycler('color', 'bgrcmyk')
```

in your `matplotlibrc` file.

Colormap

The new default colormap used by *matplotlib.cm.ScalarMappable* instances is 'viridis' (aka option D).

For an introduction to color theory and how 'viridis' was generated watch Nathaniel Smith and Stéfan van der Walt's talk from SciPy2015. See here for many more details about the other alternatives and the tools used to create the color map. For details on all of the colormaps available in matplotlib see *Choosing Colormaps in Matplotlib*.

The previous default can be restored using

```
mpl.rcParams['image.cmap'] = 'jet'
```

or setting

```
image.cmap    : 'jet'
```

in your `matplotlibrc` file; however this is strongly discouraged.

Interactive figures

The default interactive figure background color has changed from grey to white, which matches the default background color used when saving.

The previous defaults can be restored by

```
mpl.rcParams['figure.facecolor'] = '0.75'
```

or by setting

```
figure.facecolor : '0.75'
```

in your `matplotlibrc` file.

Grid lines

The default style of grid lines was changed from black dashed lines to thicker solid light grey lines.

The previous default can be restored by using:

```
mpl.rcParams['grid.color'] = 'k'
mpl.rcParams['grid.linestyle'] = ':'
mpl.rcParams['grid.linewidth'] = 0.5
```

or by setting:

```
grid.color       :   k       # grid color
grid.linestyle   :   :       # dotted
grid.linewidth   :   0.5     # in points
```

in your `matplotlibrc` file.

Figure size, font size, and screen dpi

The default dpi used for on-screen display was changed from 80 dpi to 100 dpi, the same as the default dpi for saving files. Due to this change, the on-screen display is now more what-you-see-is-what-you-get for saved files. To keep the figure the same size in terms of pixels, in order to maintain approximately the same size on the screen, the default figure size was reduced from 8x6 inches to 6.4x4.8 inches. As a consequence of this the default font sizes used for the title, tick labels, and axes labels were reduced to maintain their size relative to the overall size of the figure. By default the dpi of the saved image is now the dpi of the *Figure* instance being saved.

This will have consequences if you are trying to match text in a figure directly with external text.

The previous defaults can be restored by

```
mpl.rcParams['figure.figsize'] = [8.0, 6.0]
mpl.rcParams['figure.dpi'] = 80
mpl.rcParams['savefig.dpi'] = 100

mpl.rcParams['font.size'] = 12
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['figure.titlesize'] = 'medium'
```

or by setting:

```
figure.figsize   : [8.0, 6.0]
figure.dpi       : 80
savefig.dpi      : 100

font.size        : 12.0
legend.fontsize  : 'large'
figure.titlesize : 'medium'
```

In your `matplotlibrc` file.

In addition, the `forward` kwarg to *set_size_inches* now defaults to `True` to improve the interactive experience. Backend canvases that adjust the size of their bound *matplotlib.figure.Figure* must pass `forward=False` to avoid circular behavior. This default is not configurable.

Plotting functions

scatter

The following changes were made to the default behavior of *scatter*

- The default size of the elements in a scatter plot is now based on *rcParams["lines.markersize"]* (default: `6.0`) so it is consistent with `plot(X, Y, 'o')`. The old value was 20, and the new value is 36 (6^2).
- Scatter markers no longer have a black edge.
- If the color of the markers is not specified it will follow the property cycle, pulling from the 'patches' cycle on the `Axes`.

The classic default behavior of *scatter* can only be recovered through `mpl.style.use('classic')`. The marker size can be recovered via

```
mpl.rcParam['lines.markersize'] = np.sqrt(20)
```

however, this will also affect the default marker size of *plot*. To recover the classic behavior on a per-call basis pass the following kwargs:

```
classic_kwargs = {'s': 20, 'edgecolors': 'k', 'c': 'b'}
```

plot

The following changes were made to the default behavior of *plot*

- the default linewidth increased from 1 to 1.5
- the dash patterns associated with `'--'`, `':'`, and `'-.'` have changed
- the dash patterns now scale with line width

The previous defaults can be restored by setting:

```
mpl.rcParams['lines.linewidth'] = 1.0
mpl.rcParams['lines.dashed_pattern'] = [6, 6]
mpl.rcParams['lines.dashdot_pattern'] = [3, 5, 1, 5]
mpl.rcParams['lines.dotted_pattern'] = [1, 3]
mpl.rcParams['lines.scale_dashes'] = False
```

or by setting:

```
lines.linewidth   : 1.0
lines.dashed_pattern : 6, 6
lines.dashdot_pattern : 3, 5, 1, 5
lines.dotted_pattern : 1, 3
lines.scale_dashes: False
```

in your `matplotlibrc` file.

errorbar

By default, caps on the ends of errorbars are not present.

This also changes the return value of *`errorbar()`* as the list of 'caplines' will be empty by default.

The previous defaults can be restored by setting:

```
mpl.rcParams['errorbar.capsize'] = 3
```

or by setting

```
errorbar.capsize : 3
```

in your `matplotlibrc` file.

boxplot

Previously, boxplots were composed of a mish-mash of styles that were, for better for worse, inherited from Matlab. Most of the elements were blue, but the medians were red. The fliers (outliers) were black plus-symbols ('+') and the whiskers were dashed lines, which created ambiguity if the (solid and black) caps were not drawn.

For the new defaults, everything is black except for the median and mean lines (if drawn), which are set to the first two elements of the current color cycle. Also, the default flier markers are now hollow circles, which maintain the ability of the plus-symbols to overlap without obscuring data too much.

The previous defaults can be restored by setting:

```
mpl.rcParams['boxplot.flierprops.color'] = 'k'
mpl.rcParams['boxplot.flierprops.marker'] = '+'
mpl.rcParams['boxplot.flierprops.markerfacecolor'] = 'none'
mpl.rcParams['boxplot.flierprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.boxprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.linestyle'] = '--'
mpl.rcParams['boxplot.medianprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.marker'] = '^'
mpl.rcParams['boxplot.meanprops.markerfacecolor'] = 'r'
mpl.rcParams['boxplot.meanprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.meanprops.markersize'] = 6
mpl.rcParams['boxplot.meanprops.linestyle'] = '--'
mpl.rcParams['boxplot.meanprops.linewidth'] = 1.0
```

or by setting:

```
boxplot.flierprops.color:           'k'
boxplot.flierprops.marker:          '+'
boxplot.flierprops.markerfacecolor: 'none'
boxplot.flierprops.markeredgecolor: 'k'
boxplot.boxprops.color:             'b'
boxplot.whiskerprops.color:         'b'
boxplot.whiskerprops.linestyle:     '--'
boxplot.medianprops.color:          'r'
boxplot.meanprops.color:            'r'
boxplot.meanprops.marker:           '^'
boxplot.meanprops.markerfacecolor:  'r'
boxplot.meanprops.markeredgecolor:  'k'
boxplot.meanprops.markersize:        6
boxplot.meanprops.linestyle:         '--'
boxplot.meanprops.linewidth:         1.0
```

in your `matplotlibrc` file.

`fill_between` and `fill_betweenx`

`fill_between` and *`fill_betweenx`* both follow the patch color cycle.

If the facecolor is set via the `facecolors` or `color` keyword argument, then the color is not cycled.

To restore the previous behavior, explicitly pass the keyword argument `facecolors='C0'` to the method call.

Patch edges and color

Most artists drawn with a patch (`~matplotlib.axes.Axes.bar`, `~matplotlib.axes.Axes.pie`, etc) no longer have a black edge by default. The default face color is now `'C0'` instead of `'b'`.

The previous defaults can be restored by setting:

```
mpl.rcParams['patch.force_edgecolor'] = True
mpl.rcParams['patch.facecolor'] = 'b'
```

or by setting:

```
patch.facecolor        : b
patch.force_edgecolor  : True
```

in your `matplotlibrc` file.

`hexbin`

The default value of the *linecolor* keyword argument for *`hexbin`* has changed from `'none'` to `'face'`. If 'none' is now supplied, no line edges are drawn around the hexagons.

`bar` and `barh`

The default value of the `align` kwarg for both *`bar`* and *`barh`* is changed from `'edge'` to `'center'`.

To restore the previous behavior explicitly pass the keyword argument `align='edge'` to the method call.

Hatching

The color of the lines in the hatch is now determined by

- If an edge color is explicitly set, use that for the hatch color
- If the edge color is not explicitly set, use *`rcParams["hatch.color"]`* (default: `'black'`) which is looked up at artist creation time.

The width of the lines in a hatch pattern is now configurable by the rcParams *`rcParams["hatch.linewidth"]`* (default: `1.0`), which defaults to 1 point. The old behavior for the line width was different depending on backend:

- PDF: 0.1 pt
- SVG: 1.0 pt
- PS: 1 px
- Agg: 1 px

The old line width behavior cannot be restored across all backends simultaneously, but can be restored for a single backend by setting:

```
mpl.rcParams['hatch.linewidth'] = 0.1  # previous pdf hatch linewidth
mpl.rcParams['hatch.linewidth'] = 1.0  # previous svg hatch linewidth
```

The behavior of the PS and Agg backends was DPI dependent, thus:

```
mpl.rcParams['figure.dpi'] = dpi
mpl.rcParams['savefig.dpi'] = dpi  # or leave as default 'figure'
mpl.rcParams['hatch.linewidth'] = 1.0 / dpi  # previous ps and Agg␣
 ↪hatch linewidth
```

There is no direct API level control of the hatch color or linewidth.

Hatching patterns are now rendered at a consistent density, regardless of DPI. Formerly, high DPI figures would be more dense than the default, and low DPI figures would be less dense. This old behavior cannot be directly restored, but the density may be increased by repeating the hatch specifier.

Fonts

Normal text

The default font has changed from "Bitstream Vera Sans" to "DejaVu Sans". DejaVu Sans has additional international and math characters, but otherwise has the same appearance as Bitstream Vera Sans. Latin, Greek, Cyrillic, Armenian, Georgian, Hebrew, and Arabic are all supported (but right-to-left rendering is still not handled by matplotlib). In addition, DejaVu contains a sub-set of emoji symbols.

See the DejaVu Sans PDF sample for full coverage.

Math text

The default math font when using the built-in math rendering engine (mathtext) has changed from "Computer Modern" (i.e. LaTeX-like) to "DejaVu Sans". This change has no effect if the TeX backend is used (i.e. `text.usetex` is `True`).

To revert to the old behavior set the:

```
mpl.rcParams['mathtext.fontset'] = 'cm'
mpl.rcParams['mathtext.rm'] = 'serif'
```

or set:

```
mathtext.fontset: cm
mathtext.rm : serif
```

in your `matplotlibrc` file.

This `rcParam` is consulted when the text is drawn, not when the artist is created. Thus all mathtext on a given `canvas` will use the same fontset.

Legends

- By default, the number of points displayed in a legend is now 1.
- The default legend location is `'best'`, so the legend will be automatically placed in a location to minimize overlap with data.
- The legend defaults now include rounded corners, a lighter boundary, and partially transparent boundary and background.

The previous defaults can be restored by setting:

```
mpl.rcParams['legend.fancybox'] = False
mpl.rcParams['legend.loc'] = 'upper right'
mpl.rcParams['legend.numpoints'] = 2
```

(continues on next page)

(continued from previous page)

```
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['legend.framealpha'] = None
mpl.rcParams['legend.scatterpoints'] = 3
mpl.rcParams['legend.edgecolor'] = 'inherit'
```

or by setting:

```
legend.fancybox      : False
legend.loc           : upper right
legend.numpoints     : 2      # the number of points in the legend line
legend.fontsize      : large
legend.framealpha    : None    # opacity of legend frame
legend.scatterpoints : 3 # number of scatter points
legend.edgecolor     : inherit   # legend edge color ('inherit'
                                 # means it uses axes.edgecolor)
```

in your `matplotlibrc` file.

Image

Interpolation

The default interpolation method for *imshow* is now `'nearest'` and by default it resamples the data (both up and down sampling) before colormapping.

To restore the previous behavior set:

```
mpl.rcParams['image.interpolation'] = 'bilinear'
mpl.rcParams['image.resample'] = False
```

or set:

```
image.interpolation  : bilinear  # see help(imshow) for options
image.resample  : False
```

in your `matplotlibrc` file.

Colormapping pipeline

Previously, the input data was normalized, then colormapped, and then resampled to the resolution required for the screen. This meant that the final resampling was being done in color space. Because the color maps are not generally linear in RGB space, colors not in the colormap may appear in the final image. This bug was addressed by an almost complete overhaul of the image handling code.

The input data is now normalized, then resampled to the correct resolution (in normalized dataspace), and then colormapped to RGB space. This ensures that only colors from the colormap appear in the final image.

(If your viewer subsequently resamples the image, the artifact may reappear.)

The previous behavior cannot be restored.

Shading

- The default shading mode for light source shading, in `matplotlib.colors.LightSource.shade`, is now `overlay`. Formerly, it was `hsv`.

Plot layout

Auto limits

The previous auto-scaling behavior was to find 'nice' round numbers as view limits that enclosed the data limits, but this could produce bad plots if the data happened to fall on a vertical or horizontal line near the chosen 'round number' limit. The new default sets the view limits to 5% wider than the data range.

The size of the padding in the x and y directions is controlled by the `'axes.xmargin'` and `'axes.ymargin'` rcParams respectively. Whether the view limits should be 'round numbers' is controlled by *`rcParams["axes.autolimit_mode"]`* (default: `'data'`). In the original `'round_number'` mode, the view limits coincide with ticks.

The previous default can be restored by using:

```
mpl.rcParams['axes.autolimit_mode'] = 'round_numbers'
mpl.rcParams['axes.xmargin'] = 0
mpl.rcParams['axes.ymargin'] = 0
```

or setting:

```
axes.autolimit_mode: round_numbers
axes.xmargin: 0
axes.ymargin: 0
```

in your `matplotlibrc` file.

Z-order

- Ticks and grids are now plotted above solid elements such as filled contours, but below lines. To return to the previous behavior of plotting ticks and grids above lines, set `rcParams['axes.axisbelow'] = False`.

Ticks

Direction

To reduce the collision of tick marks with data, the default ticks now point outward by default. In addition, ticks are now drawn only on the bottom and left spines to prevent a porcupine appearance, and for a cleaner separation between subplots.

To restore the previous behavior set:

```
mpl.rcParams['xtick.direction'] = 'in'
mpl.rcParams['ytick.direction'] = 'in'
mpl.rcParams['xtick.top'] = True
mpl.rcParams['ytick.right'] = True
```

or set:

```
xtick.top: True
xtick.direction: in

ytick.right: True
ytick.direction: in
```

in your `matplotlibrc` file.

Number of ticks

The default *Locator* used for the x and y axis is *AutoLocator* which tries to find, up to some maximum number, 'nicely' spaced ticks. The locator now includes an algorithm to estimate the maximum number of ticks that will leave room for the tick labels. By default it also ensures that there are at least two ticks visible.

There is no way, other than using `mpl.style.use('classic')`, to restore the previous behavior as the default. On an axis-by-axis basis you may either control the existing locator via:

```
ax.xaxis.get_major_locator().set_params(nbins=9, steps=[1, 2, 5, 10])
```

or create a new *MaxNLocator*:

```
import matplotlib.ticker as mticker
ax.set_major_locator(mticker.MaxNLocator(nbins=9, steps=[1, 2, 5, 10])
```

The algorithm used by *MaxNLocator* has been improved, and this may change the choice of tick locations in some cases. This also affects *AutoLocator*, which uses `MaxNLocator` internally.

For a log-scaled axis the default locator is the *LogLocator*. Previously the maximum number of ticks was set to 15, and could not be changed. Now there is a *numticks* kwarg for setting the maximum to any integer value, to the string 'auto', or to its default value of None which is equivalent to 'auto'. With the 'auto' setting the maximum number will be no larger than 9, and will be reduced depending on the length of the axis in units of the tick font size. As in the case of the AutoLocator, the heuristic algorithm reduces the incidence of overlapping tick labels but does not prevent it.

Tick label formatting

`LogFormatter` labeling of minor ticks

Minor ticks on a log axis are now labeled when the axis view limits span a range less than or equal to the interval between two major ticks. See *`LogFormatter`* for details. The minor tick labeling is turned off when using `mpl.style.use('classic')`, but cannot be controlled independently via *`rcParams`*.

`ScalarFormatter` tick label formatting with offsets

With the default *`rcParams["axes.formatter.useoffset"]`* (default: `True`), an offset will be used when it will save 4 or more digits. This can be controlled with the new *`rcParams["axes.formatter.offset_threshold"]`* (default: `4`). To restore the previous behavior of using an offset to save 2 or more digits, use `rcParams['axes.formatter.offset_threshold'] = 2`.

`AutoDateFormatter` format strings

The default date formats are now all based on ISO format, i.e., with the slowest-moving value first. The date formatters are configurable through the `date.autoformatter.*` rcParams.

Threshold (tick interval >= than)	rcParam	classic	v2.0
365 days	`'date.autoformatter.year'`	`'%Y'`	`'%Y'`
30 days	`'date.autoformatter.month'`	`'%b %Y'`	`'%Y-%m'`
1 day	`'date.autoformatter.day'`	`'%b %d %Y'`	`'%Y-%m-%d'`
1 hour	`'date.autoformatter.hour'`	`'%H:%M:%S'`	`'%H:%M'`
1 minute	`'date.autoformatter.minute'`	`'%H:%M:%S.%f'`	`'%H:%M:%S'`
1 second	`'date.autoformatter.second'`	`'%H:%M:%S.%f'`	`'%H:%M:%S'`
1 microsecond	`'date.autoformatter.microsecond'`	`'%H:%M:%S.%f'`	`'%H:%M:%S.%f'`

Python's `%x` and `%X` date formats may be of particular interest to format dates based on the current locale.

The previous default can be restored by:

```
mpl.rcParams['date.autoformatter.year'] = '%Y'
mpl.rcParams['date.autoformatter.month'] = '%b %Y'
mpl.rcParams['date.autoformatter.day'] = '%b %d %Y'
mpl.rcParams['date.autoformatter.hour'] = '%H:%M:%S'
mpl.rcParams['date.autoformatter.minute'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.second'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.microsecond'] = '%H:%M:%S.%f'
```

or setting

```
date.autoformatter.year   : %Y
date.autoformatter.month  : %b %Y
date.autoformatter.day    : %b %d %Y
date.autoformatter.hour   : %H:%M:%S
date.autoformatter.minute : %H:%M:%S.%f
date.autoformatter.second : %H:%M:%S.%f
date.autoformatter.microsecond : %H:%M:%S.%f
```

in your `matplotlibrc` file.

mplot3d

- mplot3d now obeys some style-related rcParams, rather than using hard-coded defaults. These include:
  - xtick.major.width
  - ytick.major.width
  - xtick.color
  - ytick.color
  - axes.linewidth
  - axes.edgecolor
  - grid.color
  - grid.linewidth
  - grid.linestyle

Improved color conversion API and RGBA support

The *colors* gained a new color conversion API with full support for the alpha channel. The main public functions are *is_color_like()*, *matplotlib.colors.to_rgba()*, *matplotlib.colors.to_rgba_array()* and *to_hex()*. RGBA quadruplets are encoded in hex format as "#rrggbbaa".

A side benefit is that the Qt options editor now allows setting the alpha channel of the artists as well.

New Configuration (rcParams)

New rcparams added

Parameter	Description
rcParams["date.autoformatter.year"] (default: '%Y')	format string for 'year' scale dates
rcParams["date.autoformatter.month"] (default: '%Y-%m')	format string for 'month' scale dates
rcParams["date.autoformatter.day"] (default: '%Y-%m-%d')	format string for 'day' scale dates
rcParams["date.autoformatter.hour"] (default: '%m-%d %H')	format string for 'hour' scale times
rcParams["date.autoformatter.minute"] (default: '%d %H:%M')	format string for 'minute' scale times
rcParams["date.autoformatter.second"] (default: '%H:%M:%S')	format string for 'second' scale times
rcParams["date.autoformatter.microsecond"] (default: '%M:%S.%f')	format string for 'microsecond' scale times
rcParams["scatter.marker"] (default: 'o')	default marker for scatter plot
rcParams["svg.hashsalt"] (default: None)	see note
rcParams["xtick.top"] (default: False), *rcParams["xtick.major.top"]* (default: True) *rcParams["xtick.minor.top"]* (default: True), *rcParams["xtick.bottom"]* (default: True), *rcParams["xtick.major.bottom"]* (default: True) *rcParams["xtick.minor.bottom"]* (default: True), *rcParams["ytick.left"]* (default: True), *rcParams["ytick.minor.left"]* (default: True), *rcParams["ytick.major.left"]* (default: True) *rcParams["ytick.right"]* (default: False), *rcParams["ytick.minor.right"]* (default: True), *rcParams["ytick.major.right"]* (default: True)	Control where major and minor ticks are drawn. The global values are anded with the corresponding major/minor values. corresponding major/minor values.
rcParams["hist.bins"] (default: 10)	The default number of bins to use in *hist*. This can be an int, a list of floats, or 'auto' if numpy >= 1.11 is installed.
rcParams["lines.scale_dashes"] (default: True)	Whether the line dash patterns should scale with linewidth.
rcParams["axes.formatter.offset_threshold"] (default: 4)	Minimum number of digits saved in tick labels that triggers using an offset.

Added `svg.hashsalt` key to rcParams

If `svg.hashsalt` is `None` (which it is by default), the svg backend uses `uuid4` to generate the hash salt. If it is not `None`, it must be a string that is used as the hash salt instead of `uuid4`. This allows for deterministic SVG output.

Removed the `svg.image_noscale` rcParam

As a result of the extensive changes to image handling, the `svg.image_noscale` rcParam has been removed. The same functionality may be achieved by setting `interpolation='none'` on individual images or globally using the `image.interpolation` rcParam.

Qualitative colormaps

ColorBrewer's "qualitative" colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") were intended for discrete categorical data, with no implication of value, and therefore have been converted to `ListedColormap` instead of `LinearSegmentedColormap`, so the colors will no longer be interpolated and they can be used for choropleths, labeled image features, etc.

Axis offset label now responds to *labelcolor*

Axis offset labels are now colored the same as axis tick markers when *labelcolor* is altered.

Improved offset text choice

The default offset-text choice was changed to only use significant digits that are common to all ticks (e.g. 1231..1239 -> 1230, instead of 1231), except when they straddle a relatively large multiple of a power of ten, in which case that multiple is chosen (e.g. 1999..2001->2000).

Style parameter blacklist

In order to prevent unexpected consequences from using a style, style files are no longer able to set parameters that affect things unrelated to style. These parameters include:

```
'interactive', 'backend', 'backend.qt4', 'webagg.port',
'webagg.port_retries', 'webagg.open_in_browser', 'backend_fallback',
'toolbar', 'timezone', 'datapath', 'figure.max_open_warning',
'savefig.directory', 'tk.window_focus', 'docstring.hardcopy'
```

Change in default font

The default font used by matplotlib in text has been changed to DejaVu Sans and DejaVu Serif for the sans-serif and serif families, respectively. The DejaVu font family is based on the previous matplotlib default --Bitstream Vera-- but includes a much wider range of characters.

The default mathtext font has been changed from Computer Modern to the DejaVu family to maintain consistency with regular text. Two new options for the `mathtext.fontset` configuration parameter have been added: `dejavusans` (default) and `dejavuserif`. Both of these options use DejaVu glyphs whenever possible and fall back to STIX symbols when a glyph is not found in DejaVu. To return to the previous behavior, set the rcParam `mathtext.fontset` to `cm`.

Faster text rendering

Rendering text in the Agg backend is now less fuzzy and about 20% faster to draw.

Improvements for the Qt figure options editor

Various usability improvements were implemented for the Qt figure options editor, among which:

- Line style entries are now sorted without duplicates.
- The colormap and normalization limits can now be set for images.
- Line edits for floating values now display only as many digits as necessary to avoid precision loss. An important bug was also fixed regarding input validation using Qt5 and a locale where the decimal separator is ",".
- The axes selector now uses shorter, more user-friendly names for axes, and does not crash if there are no axes.
- Line and image entries using the default labels ("_lineX", "_imageX") are now sorted numerically even when there are more than 10 entries.

Improved image support

Prior to version 2.0, matplotlib resampled images by first applying the colormap and then resizing the result. Since the resampling was performed on the colored image, this introduced colors in the output image that didn't actually exist in the colormap. Now, images are resampled first (and entirely in floating-point, if the input image is floating-point), and then the colormap is applied.

In order to make this important change, the image handling code was almost entirely rewritten. As a side effect, image resampling uses less memory and fewer datatype conversions than before.

The experimental private feature where one could "skew" an image by setting the private member `_image_skew_coordinate` has been removed. Instead, images will obey the transform of the axes on which they are drawn.

Non-linear scales on image plots

imshow now draws data at the requested points in data space after the application of non-linear scales.

The image on the left demonstrates the new, correct behavior. The old behavior can be recreated using *pcolormesh* as demonstrated on the right.

This can be understood by analogy to plotting a histogram with linearly spaced bins with a logarithmic x-axis. Equal sized bins will be displayed as wider for small x and narrower for large x.

Support for HiDPI (Retina) displays in the NbAgg and WebAgg backends

The NbAgg and WebAgg backends will now use the full resolution of your high-pixel-density display.

Change in the default animation codec

The default animation codec has been changed from `mpeg4` to `h264`, which is more efficient. It can be set via the `animation.codec` rcParam.

Deprecated support for mencoder in animation

The use of mencoder for writing video files with mpl is problematic; switching to ffmpeg is strongly advised. All support for mencoder will be removed in version 2.2.

Boxplot Zorder Keyword Argument

The *zorder* parameter now exists for *boxplot*. This allows the zorder of a boxplot to be set in the plotting function call.

```
boxplot(np.arange(10), zorder=10)
```

Filled + and x markers

New fillable *plus* and *x* markers have been added. See the *markers* module and *marker reference* examples.

rcount and *ccount* for `plot_surface`

As of v2.0, mplot3d's *plot_surface* now accepts *rcount* and *ccount* arguments for controlling the sampling of the input data for plotting. These arguments specify the maximum number of evenly spaced samples to take from the input data. These arguments are also the new default sampling method for the function, and is considered a style change.

The old *rstride* and *cstride* arguments, which specified the size of the evenly spaced samples, become the default when 'classic' mode is invoked, and are still available for use. There are no plans for deprecating these arguments.

Streamplot Zorder Keyword Argument Changes

The `zorder` parameter for *streamplot* now has default value of `None` instead of `2`. If `None` is given as `zorder`, *streamplot* has a default `zorder` of `matplotlib.lines.Line2D.zorder`.

Extension to `matplotlib.backend_bases.GraphicsContextBase`

To support standardizing hatch behavior across the backends we ship the *matplotlib.backend_bases.GraphicsContextBase.get_hatch_color* method as added to *matplotlib.backend_bases.GraphicsContextBase*. This is only used during the render process in the backends we ship so will not break any third-party backends.

If you maintain a third-party backend which extends *GraphicsContextBase* this method is now available to you and should be used to color hatch patterns.

9.14.2 API Changes in 2.0.1

Extensions to `matplotlib.backend_bases.GraphicsContextBase`

To better support controlling the color of hatches, the method *matplotlib.backend_bases.GraphicsContextBase.set_hatch_color* was added to the expected API of `GraphicsContext` classes. Calls to this method are currently wrapped with a `try:...except Attribute:` block to preserve back-compatibility with any third-party backends which do not extend *GraphicsContextBase*.

This value can be accessed in the backends via *matplotlib.backend_bases.GraphicsContextBase.get_hatch_color* (which was added in 2.0 see *Extension to matplotlib.backend_bases.GraphicsContextBase*) and should be used to color the hatches.

In the future there may also be `hatch_linewidth` and `hatch_density` related methods added. It is encouraged, but not required that third-party backends extend *GraphicsContextBase* to make adapting to these changes easier.

`afm.get_fontconfig_fonts` returns a list of paths and does not check for existence

`afm.get_fontconfig_fonts` used to return a set of paths encoded as a `{key: 1, ...}` dict, and checked for the existence of the paths. It now returns a list and dropped the existence check, as the same check is performed by the caller (`afm.findSystemFonts`) as well.

`bar` now returns rectangles of negative height or width if the corresponding input is negative

pyplot.bar used to normalize the coordinates of the rectangles that it created, to keep their height and width positives, even if the corresponding input was negative. This normalization has been removed to permit a simpler computation of the correct *Artist.sticky_edges* to use.

Do not clip line width when scaling dashes

The algorithm to scale dashes was changed to no longer clip the scaling factor: the dash patterns now continue to shrink at thin line widths. If the line width is smaller than the effective pixel size, this may result in dashed lines turning into solid gray-ish lines. This also required slightly tweaking the default patterns for '--', ':', and '.-' so that with the default line width the final patterns would not change.

There is no way to restore the old behavior.

Deprecate 'Vega' colormaps

The "Vega" colormaps are deprecated in Matplotlib 2.0.1 and will be removed in Matplotlib 2.2. Use the "tab" colormaps instead: "tab10", "tab20", "tab20b", "tab20c".

9.14.3 API Changes in 2.0.0

Deprecation and removal

Color of Axes

The `axisbg` and `axis_bgcolor` properties on *Axes* have been deprecated in favor of `facecolor`.

GTK and GDK backends deprecated

The GDK and GTK backends have been deprecated. These obsolete backends allow figures to be rendered via the GDK API to files and GTK2 figures. They are untested and known to be broken, and their use has been discouraged for some time. Instead, use the `GTKAgg` and `GTKCairo` backends for rendering to GTK2 windows.

WX backend deprecated

The WX backend has been deprecated. It is untested, and its use has been discouraged for some time. Instead, use the `WXAgg` backend for rendering figures to WX windows.

CocoaAgg backend removed

The deprecated and not fully functional CocoaAgg backend has been removed.

`round` removed from TkAgg Backend

The TkAgg backend had its own implementation of the `round` function. This was unused internally and has been removed. Instead, use either the `round` builtin function or `numpy.around`.

'hold' functionality deprecated

The 'hold' keyword argument and all functions and methods related to it are deprecated, along with the `axes.hold` rcParams entry. The behavior will remain consistent with the default `hold=True` state that has long been in place. Instead of using a function or keyword argument (`hold=False`) to change that behavior, explicitly clear the axes or figure as needed prior to subsequent plotting commands.

`Artist.update` has return value

The methods *matplotlib.artist.Artist.set*, *matplotlib.artist.Artist.update*, and the function *matplotlib.artist.setp* now use a common codepath to look up how to update the given artist properties (either using the setter methods or an attribute/property).

The behavior of *matplotlib.artist.Artist.update* is slightly changed to return a list of the values returned from the setter methods to avoid changing the API of *matplotlib.artist.Artist.set* and *matplotlib.artist.setp*.

The keys passed into *matplotlib.artist.Artist.update* are now converted to lower case before being processed, to match the behavior of *matplotlib.artist.Artist.set* and *matplotlib.artist.setp*. This should not break any user code because there are no set methods with capitals in their names, but this puts a constraint on naming properties in the future.

`Legend` initializers gain *edgecolor* and *facecolor* keyword arguments

The *Legend* background patch (or 'frame') can have its `edgecolor` and `facecolor` determined by the corresponding keyword arguments to the *matplotlib.legend.Legend* initializer, or to any of the methods or functions that call that initializer. If left to their default values of `None`, their values will be taken from `matplotlib.rcParams`. The previously-existing `framealpha` kwarg still controls the alpha transparency of the patch.

Qualitative colormaps

Colorbrewer's qualitative/discrete colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") are now implemented as *ListedColormap* instead of *LinearSegmentedColormap*.

To use these for images where categories are specified as integers, for instance, use:

```
plt.imshow(x, cmap='Dark2', norm=colors.NoNorm())
```

Change in the `draw_image` backend API

The `draw_image` method implemented by backends has changed its interface.

This change is only relevant if the backend declares that it is able to transform images by returning `True` from `option_scale_image`. See the `draw_image` docstring for more information.

`matplotlib.ticker.LinearLocator` algorithm update

The *matplotlib.ticker.LinearLocator* is used to define the range and location of axis ticks when the user wants an exact number of ticks. `LinearLocator` thus differs from the default locator `MaxNLocator`, for which the user specifies a maximum number of intervals rather than a precise number of ticks.

The view range algorithm in `matplotlib.ticker.LinearLocator` has been changed so that more convenient tick locations are chosen. The new algorithm returns a plot view range that is a multiple of the user-requested number of ticks. This ensures tick marks will be located at whole integers more consistently. For example, when both y-axes of a``twinx`` plot use `matplotlib.ticker.LinearLocator` with the same number of ticks, their y-tick locations and grid lines will coincide.

`matplotlib.ticker.LogLocator` gains numticks kwarg

The maximum number of ticks generated by the *LogLocator* can now be controlled explicitly via setting the new 'numticks' kwarg to an integer. By default the kwarg is None which internally sets it to the 'auto' string, triggering a new algorithm for adjusting the maximum according to the axis length relative to the ticklabel font size.

`matplotlib.ticker.LogFormatter`: two new kwargs

Previously, minor ticks on log-scaled axes were not labeled by default. An algorithm has been added to the *LogFormatter* to control the labeling of ticks between integer powers of the base. The algorithm uses two parameters supplied in a kwarg tuple named 'minor_thresholds'. See the docstring for further explanation.

To improve support for axes using *SymmetricalLogLocator*, a *linthresh* keyword argument was added.

New defaults for 3D quiver function in mpl_toolkits.mplot3d.axes3d.py

Matplotlib has both a 2D and a 3D `quiver` function. These changes affect only the 3D function and make the default behavior of the 3D function match the 2D version. There are two changes:

1) The 3D quiver function previously normalized the arrows to be the same length, which makes it unusable for situations where the arrows should be different lengths and does not match the behavior of the 2D function. This normalization behavior is now controlled with the `normalize` keyword, which defaults to False.

2) The `pivot` keyword now defaults to `tail` instead of `tip`. This was done in order to match the default behavior of the 2D quiver function.

To obtain the previous behavior with the 3D quiver function, one can call the function with

```
ax.quiver(x, y, z, u, v, w, normalize=True, pivot='tip')
```

where "ax" is an `Axes3d` object created with something like

```
import mpl_toolkits.mplot3d.axes3d
ax = plt.subplot(111, projection='3d')
```

Stale figure behavior

Attempting to draw the figure will now mark it as not stale (independent if the draw succeeds). This change is to prevent repeatedly trying to re-draw a figure which is raising an error on draw. The previous behavior would only mark a figure as not stale after a full re-draw succeeded.

The spectral colormap is now nipy_spectral

The colormaps formerly known as `spectral` and `spectral_r` have been replaced by `nipy_spectral` and `nipy_spectral_r` since Matplotlib 1.3.0. Even though the colormap was deprecated in Matplotlib 1.3.0, it never raised a warning. As of Matplotlib 2.0.0, using the old names raises a deprecation warning. In the future, using the old names will raise an error.

Default install no longer includes test images

To reduce the size of wheels and source installs, the tests and baseline images are no longer included by default.

To restore installing the tests and images, use a `setup.cfg` with

```
[packages]
tests = True
toolkits_tests = True
```

in the source directory at build/install time.

9.15 Version 1.5

9.15.1 What's new in Matplotlib 1.5 (Oct 29, 2015)

Table of Contents

- *What's new in Matplotlib 1.5 (Oct 29, 2015)*
  - *Interactive OO usage*

- *Working with labeled data like pandas DataFrames*
- *Added `axes.prop_cycle` key to rcParams*
- *New Colormaps*
- *Styles*
- *Backends*
- *Configuration (rcParams)*
- *Widgets*
- *New plotting features*
- *ToolManager*
- *cbook.is_sequence_of_strings recognizes string objects*
- *New `close-figs` argument for plot directive*
- *Support for URL string arguments to `imread`*
- *Display hook for animations in the IPython notebook*
- *Prefixed pkg-config for building*

Note

matplotlib 1.5 supports Python 2.7, 3.4, and 3.5

Interactive OO usage

All *`Artist`*s now keep track of if their internal state has been changed but not reflected in the display ('stale') by a call to `draw`. It is thus possible to pragmatically determine if a given *`Figure`* needs to be re-drawn in an interactive session.

To facilitate interactive usage a `draw_all` method has been added to `pyplot` which will redraw all of the figures which are 'stale'.

To make this convenient for interactive use matplotlib now registers a function either with IPython's 'post_execute' event or with the displayhook in the standard python REPL to automatically call `plt.draw_all` just before control is returned to the REPL. This ensures that the draw command is deferred and only called once.

The upshot of this is that for interactive backends (including `%matplotlib notebook`) in interactive mode (with `plt.ion()`)

```
import matplotlib.pyplot as plt
fig, ax = plt.subplots()
ln, = ax.plot([0, 1, 4, 9, 16])
```

(continues on next page)

(continued from previous page)

```
plt.show()
ln.set_color('g')
```

will automatically update the plot to be green. Any subsequent modifications to the `Artist` objects will do likewise.

This is the first step of a larger consolidation and simplification of the pyplot internals.

Working with labeled data like pandas DataFrames

Plot methods which take arrays as inputs can now also work with labeled data and unpack such data.

This means that the following two examples produce the same plot:

Example

```
df = pandas.DataFrame({"var1":[1,2,3,4,5,6], "var2":[1,2,3,4,5,6]})
plt.plot(df["var1"], df["var2"])
```

Example

```
plt.plot("var1", "var2", data=df)
```

This works for most plotting methods, which expect arrays/sequences as inputs. `data` can be anything which supports `__getitem__` (`dict`, `pandas.DataFrame`, `h5py`, ...) to access `array` like values with string keys.

In addition to this, some other changes were made, which makes working with labeled data (ex `pandas.Series`) easier:

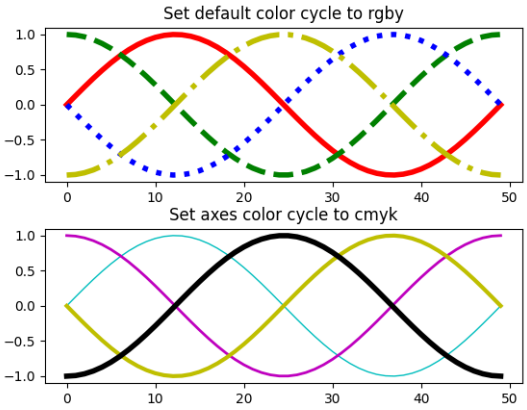
- For plotting methods with `label` keyword argument, one of the data inputs is designated as the label source. If the user does not supply a `label` that value object will be introspected for a label, currently by looking for a `name` attribute. If the value object does not have a `name` attribute but was specified by as a key into the `data` kwarg, then the key is used. In the above examples, this results in an implicit `label="var2"` for both cases.
- `plot()` now uses the index of a `Series` instead of `np.arange(len(y))`, if no `x` argument is supplied.

Added `axes.prop_cycle` key to rcParams

This is a more generic form of the now-deprecated `axes.color_cycle` param. Now, we can cycle more than just colors, but also linestyles, hatches, and just about any other artist property. Cycler notation is used for defining property cycles. Adding cyclers together will be like you are `zip`-ing together two or more property cycles together:

```
axes.prop_cycle: cycler('color', 'rgb') + cycler('lw', [1, 2, 3])
```

You can even multiply cyclers, which is like using `itertools.product` on two or more property cycles.



New Colormaps

All four of the colormaps proposed as the new default are available as `'viridis'` (the new default in 2.0), `'magma'`, `'plasma'`, and `'inferno'`

Styles

Several new styles have been added, including many styles from the Seaborn project. Additionally, in order to prep for the upcoming 2.0 style-change release, a 'classic' and 'default' style has been added. For this release, the 'default' and 'classic' styles are identical. By using them now in your scripts, you can help ensure a smooth transition during future upgrades of matplotlib, so that you can upgrade to the snazzy new defaults when you are ready!

```
import matplotlib.style
matplotlib.style.use('classic')
```

The 'default' style will give you matplotlib's latest plotting styles:

```
matplotlib.style.use('default')
```

Backends

New backend selection

The environment variable *MPLBACKEND* can now be used to set the matplotlib backend.

wx backend has been updated

The wx backend can now be used with both wxPython classic and Phoenix.

wxPython classic has to be at least version 2.8.12 and works on Python 2.x. As of May 2015 no official release of wxPython Phoenix is available but a current snapshot will work on Python 2.7+ and 3.4+.

If you have multiple versions of wxPython installed, then the user code is responsible setting the wxPython version. How to do this is explained in the comment at the beginning of the example *Embed in wx #2*.

Configuration (rcParams)

Some parameters have been added, others have been improved.

Parameter	Description
`xaxis.labelpad`, `yaxis.labelpad`	mplot3d now respects these attributes, which default to *`rcParams["axes.labelpad"]`* (default: `4.0`)
`rcParams["axes.labelpad"]` (default: `4.0`)	Default space between the axis and the label
`rcParams["errorbar.capsize"]` (default: `0.0`)	Default length of end caps on error bars
`rcParams["xtick.minor.visible"]` (default: `False`), *`rcParams["ytick.minor.visible"]`* (default: `False`)	Default visibility of minor x/y ticks
`rcParams["legend.framealpha"]` (default: `0.8`)	Default transparency of the legend frame box
`rcParams["legend.facecolor"]` (default: `'inherit'`)	Default facecolor of legend frame box (or `'inherit'` from *`rcParams["axes.facecolor"]`* (default: `'white'`))
`rcParams["legend.edgecolor"]` (default: `'0.8'`)	Default edgecolor of legend frame box (or `'inherit'` from *`rcParams["axes.edgecolor"]`* (default: `'black'`))
`rcParams["figure.titlesize"]` (default: `'large'`)	Default font size for figure suptitles
`rcParams["figure.titleweight"]` (default: `'normal'`)	Default font weight for figure suptitles
`rcParams["image.composite_image"]` (default: `True`)	Whether a vector graphics backend should composite several images into a single image or not when saving. Useful when needing to edit the files further in Inkscape or other programs.
`rcParams["markers.fillstyle"]` (default: `'full'`)	Default fillstyle of markers. Possible values are `'full'` (the default), `'left'`, `'right'`, `'bottom'`, `'top'` and `'none'`
`rcParams["toolbar"]` (default: `'toolbar2'`)	Added `'toolmanager'` as a valid value, enabling the experimental `ToolManager` feature.

Widgets

Active state of Selectors

All selectors now implement `set_active` and `get_active` methods (also called when accessing the `active` property) to properly update and query whether they are active.

Moved `ignore`, `set_active`, and `get_active` methods to base class `Widget`

Pushes up duplicate methods in child class to parent class to avoid duplication of code.

Adds enable/disable feature to MultiCursor

A MultiCursor object can be disabled (and enabled) after it has been created without destroying the object. Example:

```
multi_cursor.active = False
```

Improved RectangleSelector and new EllipseSelector Widget

Adds an *interactive* keyword which enables visible handles for manipulating the shape after it has been drawn.

Adds keyboard modifiers for:

- Moving the existing shape (default key = 'space')
- Making the shape square (default 'shift')
- Make the initial point the center of the shape (default 'control')
- Square and center can be combined

Allow Artists to Display Pixel Data in Cursor

Adds *get_cursor_data* and *format_cursor_data* methods to artists which can be used to add zdata to the cursor display in the status bar. Also adds an implementation for Images.

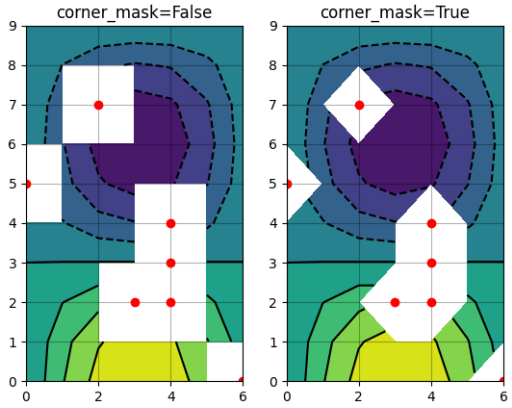
New plotting features

Auto-wrapping Text

Added the keyword argument "wrap" to Text, which automatically breaks long lines of text when being drawn. Works for any rotated text, different modes of alignment, and for text that are either labels or titles. This breaks at the `Figure`, not `Axes` edge.

Contour plot corner masking

Ian Thomas rewrote the C++ code that calculates contours to add support for corner masking. This is controlled by a new keyword argument `corner_mask` in the functions *contour()* and *contourf()*. The previous behaviour, which is now obtained using `corner_mask=False`, was for a single masked point to completely mask out all four quads touching that point. The new behaviour, obtained using `corner_mask=True`, only masks the corners of those quads touching the point; any triangular corners comprising three unmasked points are contoured as usual. If the `corner_mask` keyword argument is not specified, the default value is taken from rcParams.



Mostly unified linestyles for `Line2D`, `Patch` and `Collection`

The handling of linestyles for Lines, Patches and Collections has been unified. Now they all support defining linestyles with short symbols, like "--", as well as with full names, like "dashed". Also the definition using a dash pattern (`(0., [3., 3.])`) is supported for all methods using *`Line2D`*, *`Patch`* or *`Collection`*.

Legend marker order

Added ability to place the label before the marker in a legend box with `markerfirst` keyword

Support for legend for PolyCollection and stackplot

Added a *`legend_handler`* for *`PolyCollection`* as well as a *labels* argument to *`stackplot()`*.

Support for alternate pivots in mplot3d quiver plot

Added a `pivot` kwarg to *`quiver`* that controls the pivot point around which the quiver line rotates. This also determines the placement of the arrow head along the quiver line.

Logit Scale

Added support for the 'logit' axis scale, a nonlinear transformation

$$x- > \log 10(x/(1-x))$$

for data between 0 and 1 excluded.

Add step kwargs to fill_between

Added `step` kwarg to *`Axes.fill_between`* to allow to fill between lines drawn using the 'step' draw style. The values of `step` match those of the `where` kwarg of *`Axes.step`*. The asymmetry of the kwargs names is not ideal, but *`Axes.fill_between`* already has a `where` kwarg.

This is particularly useful for plotting pre-binned histograms.

Square Plot

Implemented square plots feature as a new parameter in the axis function. When argument 'square' is specified, equal scaling is set, and the limits are set such that `xmax-xmin == ymax-ymin`.

Updated figimage to take optional resize parameter

Added the ability to plot simple 2D-Array using `plt.figimage(X, resize=True)`. This is useful for plotting simple 2D-Array without the Axes or whitespacing around the image.

Updated Figure.savefig() can now use figure's dpi

Added support to save the figure with the same dpi as the figure on the screen using `dpi='figure'`:.

Example:

```
f = plt.figure(dpi=25)  # dpi set to 25
S = plt.scatter([1,2,3],[4,5,6])
f.savefig('output.png', dpi='figure')  # output savefig dpi set to 25␣
↪(same as figure)
```

Updated Table to control edge visibility

Added the ability to toggle the visibility of lines in Tables. Functionality added to the *pyplot.table* factory function under the keyword argument "edges". Values can be the strings "open", "closed", "horizontal", "vertical" or combinations of the letters "L", "R", "T", "B" which represent left, right, top, and bottom respectively.

Example:

```
table(..., edges="open")  # No line visible
table(..., edges="closed")  # All lines visible
table(..., edges="horizontal")  # Only top and bottom lines visible
table(..., edges="LT")  # Only left and top lines visible.
```

Zero r/cstride support in plot_wireframe

Adam Hughes added support to mplot3d's plot_wireframe to draw only row or column line plots.

Plot bar and barh with labels

Added kwarg *tick_label* to *bar* and *barh* to support plotting bar graphs with a text label for each bar.

Added center and frame kwargs to pie

These control where the center of the pie graph are and if the Axes frame is shown.

Fixed 3D filled contour plot polygon rendering

Certain cases of 3D filled contour plots that produce polygons with multiple holes produced improper rendering due to a loss of path information between *PolyCollection* and *Poly3DCollection*. A function *set_verts_and_codes()* was added to allow path information to be retained for proper rendering.

Dense colorbars are rasterized

Vector file formats (pdf, ps, svg) are efficient for many types of plot element, but for some they can yield excessive file size and even rendering artifacts, depending on the renderer used for screen display. This is a problem for colorbars that show a large number of shades, as is most commonly the case. Now, if a colorbar is showing 50 or more colors, it will be rasterized in vector backends.

DateFormatter strftime

DateFormatter's `__call__` method will format a `datetime.datetime` object with the format string passed to the formatter's constructor. This method accepts datetimes with years before 1900, unlike `datetime.datetime.strftime()`.

Artist-level {get,set}_usetex for text

Add `{get,set}_usetex` methods to *Text* objects which allow artist-level control of LaTeX rendering vs. the internal mathtex rendering.

`Axes.remove()` works as expected

As with artists added to an *Axes*, *Axes* objects can be removed from their figure via *remove()*.

API Consistency fix within Locators set_params() function

set_params() function, which sets parameters within a *Locator* type instance, is now available to all *Locator* types. The implementation also prevents unsafe usage by strictly defining the parameters that a user can set.

To use, call `set_params()` on a *Locator* instance with desired arguments:

```
loc = matplotlib.ticker.LogLocator()
# Set given attributes for loc.
loc.set_params(numticks=8, numdecs=8, subs=[2.0], base=8)
# The below will error, as there is no such parameter for LogLocator
# named foo
# loc.set_params(foo='bar')
```

Date Locators

Date Locators (derived from *DateLocator*) now implement the *tick_values* method. This is expected of all Locators derived from *Locator*.

The Date Locators can now be used easily without creating axes

```
from datetime import datetime
from matplotlib.dates import YearLocator
t0 = datetime(2002, 10, 9, 12, 10)
tf = datetime(2005, 10, 9, 12, 15)
loc = YearLocator()
values = loc.tick_values(t0, tf)
```

OffsetBoxes now support clipping

*Artist*s draw onto objects of type *OffsetBox* through *DrawingArea* and *TextArea*. The *TextArea* calculates the required space for the text and so the text is always within the bounds, for this nothing has changed.

However, *DrawingArea* acts as a parent for zero or more *Artist*s that draw on it and may do so beyond the bounds. Now child *Artist*s can be clipped to the bounds of the *DrawingArea*.

OffsetBoxes now considered by tight_layout

When *tight_layout()* or *Figure.tight_layout* or *GridSpec.tight_layout()* is called, *OffsetBox*es that are anchored outside the axes will not get chopped out. The *OffsetBox*es will also not get overlapped by other axes in case of multiple subplots.

Per-page pdf notes in multi-page pdfs (PdfPages)

Add a new method *attach_note()* to the PdfPages class, allowing the attachment of simple text notes to pages in a multi-page pdf of figures. The new note is visible in the list of pdf annotations in a viewer that has this facility (Adobe Reader, OSX Preview, Skim, etc.). Per default the note itself is kept off-page to prevent it to appear in print-outs.

PdfPages.attach_note needs to be called before *savefig* in order to be added to the correct figure.

Updated fignum_exists to take figure name

Added the ability to check the existence of a figure using its name instead of just the figure number. Example:

```
figure('figure')
fignum_exists('figure') #true
```

ToolManager

Federico Ariza wrote the new *ToolManager* that comes as replacement for *NavigationToolbar2*

ToolManager offers a new way of looking at the user interactions with the figures. Before we had the *NavigationToolbar2* with its own tools like `zoom/pan/home/save/...` and also we had the shortcuts like `yscale/grid/quit/.....` *ToolManager* relocate all those actions as Tools (located in *backend_tools*), and defines a way to access/trigger/reconfigure them.

The Toolbars are replaced by *ToolContainerBase*s that are just GUI interfaces to trigger the tools. But don't worry the default backends include a *ToolContainerBase* called `toolbar`

Note

At the moment, we release this primarily for feedback purposes and should be treated as experimental until further notice as API changes will occur. For the moment the *ToolManager* works only with the GTK3 and Tk backends. Make sure you use one of those. Port for the rest of the backends is coming soon.

To activate the *ToolManager* include the following at the top of your file

```
>>> matplotlib.rcParams['toolbar'] = 'toolmanager'
```

Interact with the ToolContainer

The most important feature is the ability to easily reconfigure the ToolContainer (aka toolbar). For example, if we want to remove the "forward" button we would just do.

```
>>> fig.canvas.manager.toolmanager.remove_tool('forward')
```

Now if you want to programmatically trigger the "home" button

```
>>> fig.canvas.manager.toolmanager.trigger_tool('home')
```

New Tools for ToolManager

It is possible to add new tools to the ToolManager

A very simple tool that prints "You're awesome" would be:

```
from matplotlib.backend_tools import ToolBase
class AwesomeTool(ToolBase):
    def trigger(self, *args, **kwargs):
        print("You're awesome")
```

To add this tool to *ToolManager*

```
>>> fig.canvas.manager.toolmanager.add_tool('Awesome', AwesomeTool)
```

If we want to add a shortcut ("d") for the tool

```
>>> fig.canvas.manager.toolmanager.update_keymap('Awesome', 'd')
```

To add it to the toolbar inside the group 'foo'

```
>>> fig.canvas.manager.toolbar.add_tool('Awesome', 'foo')
```

There is a second class of tools, "Toggleable Tools", this are almost the same as our basic tools, just that belong to a group, and are mutually exclusive inside that group. For tools derived from *ToolToggleBase* there are two basic methods *enable* and *disable* that are called automatically whenever it is toggled.

A full example is located in *Tool Manager*

cbook.is_sequence_of_strings recognizes string objects

This is primarily how pandas stores a sequence of strings

```
import pandas as pd
import matplotlib.cbook as cbook

a = np.array(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(a))  # True

a = np.array(['a', 'b', 'c'], dtype=object)
print(cbook.is_sequence_of_strings(a))  # True

s = pd.Series(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(s))  # True
```

Previously, the last two prints returned false.

New `close-figs` argument for plot directive

Matplotlib has a sphinx extension `plot_directive` that creates plots for inclusion in sphinx documents. Matplotlib 1.5 adds a new option to the plot directive - `close-figs` - that closes any previous figure windows before creating the plots. This can help avoid some surprising duplicates of plots when using `plot_directive`.

Support for URL string arguments to `imread`

The *imread()* function now accepts URL strings that point to remote PNG files. This circumvents the generation of a HTTPResponse object directly.

Display hook for animations in the IPython notebook

Animation instances gained a `_repr_html_` method to support inline display of animations in the notebook. The method used to display is controlled by the `animation.html` rc parameter, which currently supports values of `none` and `html5`. `none` is the default, performing no display. `html5` converts the animation to an h264 encoded video, which is embedded directly in the notebook.

Users not wishing to use the _repr_html_ display hook can also manually call the *to_html5_video* method to get the HTML and display using IPython's HTML display class:

```
from IPython.display import HTML
HTML(anim.to_html5_video())
```

Prefixed pkg-config for building

Handling of pkg-config has been fixed in so far as it is now possible to set it using the environment variable PKG_CONFIG. This is important if your toolchain is prefixed. This is done in a simpilar way as setting CC or CXX before building. An example follows:

```
export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config
```

9.15.2 API Changes in 1.5.3

ax.plot(..., marker=None) gives default marker

Prior to 1.5.3 keyword arguments passed to *plot* were handled in two parts -- default keyword arguments generated internal to *plot* (such as the cycled styles) and user supplied keyword arguments. The internally generated keyword arguments were passed to the *matplotlib.lines.Line2D* and the user keyword arguments were passed to ln.set(**kwargs) to update the artist after it was created. Now both sets of keyword arguments are merged and passed to *Line2D*. This change was made to allow *None* to be passed in via the user keyword arguments to mean 'do the default thing' as is the convention through out Matplotlib rather than raising an exception.

Unlike most *Line2D* setter methods *set_marker* did accept None as a valid input which was mapped to 'no marker'. Thus, by routing this marker=None through __init__ rather than set(...) the meaning of ax.plot(..., marker=None) changed from 'no markers' to 'default markers from rcparams'.

This is change is only evident if mpl.rcParams['lines.marker'] has a value other than 'None' (which is string 'None' which means 'no marker').

9.15.3 API Changes in 1.5.2

Default Behavior Changes

Changed default autorange behavior in boxplots

Prior to v1.5.2, the whiskers of boxplots would extend to the minimum and maximum values if the quartiles were all equal (i.e., Q1 = median = Q3). This behavior has been disabled by default to restore consistency with other plotting packages.

To restore the old behavior, simply set autorange=True when calling plt.boxplot.

9.15.4 API Changes in 1.5.0

Code Changes

Reversed `matplotlib.cbook.ls_mapper`, added `ls_mapper_r`

Formerly, *matplotlib.cbook.ls_mapper* was a dictionary with the long-form line-style names (`"solid"`) as keys and the short forms (`"-"`) as values. This long-to-short mapping is now done by *ls_mapper_r*, and the short-to-long mapping is done by the *ls_mapper*.

Prevent moving artists between Axes, Property-ify Artist.axes, deprecate Artist.{get,set}_axes

This was done to prevent an Artist that is already associated with an Axes from being moved/added to a different Axes. This was never supported as it causes havoc with the transform stack. The apparent support for this (as it did not raise an exception) was the source of multiple bug reports and questions on SO.

For almost all use-cases, the assignment of the axes to an artist should be taken care of by the axes as part of the `Axes.add_*` method, hence the deprecation of {get,set}_axes.

Removing the `set_axes` method will also remove the 'axes' line from the ACCEPTS kwarg tables (assuming that the removal date gets here before that gets overhauled).

Tightened input validation on 'pivot' kwarg to quiver

Tightened validation so that only {'tip', 'tail', 'mid', and 'middle'} (but any capitalization) are valid values for the *pivot* keyword argument in the *Quiver* class (and hence *axes.Axes.quiver* and *pyplot.quiver* which both fully delegate to *Quiver*). Previously any input matching 'mid.*' would be interpreted as 'middle', 'tip.*' as 'tip' and any string not matching one of those patterns as 'tail'.

The value of `Quiver.pivot` is normalized to be in the set {'tip', 'tail', 'middle'} in *Quiver*.

Reordered `Axes.get_children`

The artist order returned by *axes.Axes.get_children* did not match the one used by *axes.Axes.draw*. They now use the same order, as *axes.Axes.draw* now calls *axes.Axes.get_children*.

Changed behaviour of contour plots

The default behaviour of *contour()* and *contourf()* when using a masked array is now determined by the new keyword argument *corner_mask*, or if this is not specified then the new *rcParams["contour.corner_mask"]* (default: `True`) instead. The new default behaviour is equivalent to using `corner_mask=True`; the previous behaviour can be obtained using `corner_mask=False` or by changing the rcParam. The example https://matplotlib.org/examples/pylab_examples/contour_corner_mask.html demonstrates the difference. Use of the old contouring algorithm, which is obtained with `corner_mask='legacy'`, is now deprecated.

Contour labels may now appear in different places than in earlier versions of Matplotlib.

In addition, the keyword argument *nchunk* now applies to *contour()* as well as *contourf()*, and it subdivides the domain into subdomains of exactly *nchunk* by *nchunk* quads, whereas previously it was only roughly *nchunk* by *nchunk* quads.

The C/C++ object that performs contour calculations used to be stored in the public attribute `QuadContourSet.Cntr`, but is now stored in a private attribute and should not be accessed by end

users.

Added set_params function to all Locator types

This was a bug fix targeted at making the api for Locators more consistent.

In the old behavior, only locators of type MaxNLocator have set_params() defined, causing its use on any other Locator to raise an AttributeError *(aside: set_params(args) is a function that sets the parameters of a Locator instance to be as specified within args)*. The fix involves moving set_params() to the Locator class such that all subtypes will have this function defined.

Since each of the Locator subtypes have their own modifiable parameters, a universal set_params() in Locator isn't ideal. Instead, a default no-operation function that raises a warning is implemented in Locator. Subtypes extending Locator will then override with their own implementations. Subtypes that do not have a need for set_params() will fall back onto their parent's implementation, which raises a warning as intended.

In the new behavior, Locator instances will not raise an AttributeError when set_params() is called. For Locators that do not implement set_params(), the default implementation in Locator is used.

Disallow `None` as x or y value in ax.plot

Do not allow `None` as a valid input for the `x` or `y` args in *`axes.Axes.plot`*. This may break some user code, but this was never officially supported (ex documented) and allowing `None` objects through can lead to confusing exceptions downstream.

To create an empty line use

```
ln1, = ax.plot([], [], ...)
ln2, = ax.plot([], ...)
```

In either case to update the data in the *`Line2D`* object you must update both the `x` and `y` data.

Removed *args* and *kwargs* from `MicrosecondLocator.__call__`

The call signature of `matplotlib.dates.MicrosecondLocator.__call__` has changed from `__call__(self, *args, **kwargs)` to `__call__(self)`. This is consistent with the superclass *`Locator`* and also all the other Locators derived from this superclass.

No `ValueError` for the MicrosecondLocator and YearLocator

The *`MicrosecondLocator`* and *`YearLocator`* objects when called will return an empty list if the axes have no data or the view has no interval. Previously, they raised a `ValueError`. This is consistent with all the Date Locators.

'OffsetBox.DrawingArea' respects the 'clip' keyword argument

The call signature was `OffsetBox.DrawingArea(..., clip=True)` but nothing was done with the *clip* argument. The object did not do any clipping regardless of that parameter. Now the object can and does clip the child *`Artist`*s if they are set to be clipped.

You can turn off the clipping on a per-child basis using `child.set_clip_on(False)`.

Add salt to clipPath id

Add salt to the hash used to determine the id of the `clipPath` nodes. This is to avoid conflicts when two svg documents with the same clip path are included in the same document (see https://github.com/ipython/ipython/issues/8133 and https://github.com/matplotlib/matplotlib/issues/4349), however this means that the svg output is no longer deterministic if the same figure is saved twice. It is not expected that this will affect any users as the current ids are generated from an md5 hash of properties of the clip path and any user would have a very difficult time anticipating the value of the id.

Changed snap threshold for circle markers to inf

When drawing circle markers above some marker size (previously 6.0) the path used to generate the marker was snapped to pixel centers. However, this ends up distorting the marker away from a circle. By setting the snap threshold to inf snapping is never done on circles.

This change broke several tests, but is an improvement.

Preserve units with Text position

Previously the 'get_position' method on Text would strip away unit information even though the units were still present. There was no inherent need to do this, so it has been changed so that unit data (if present) will be preserved. Essentially a call to 'get_position' will return the exact value from a call to 'set_position'.

If you wish to get the old behaviour, then you can use the new method called 'get_unitless_position'.

New API for custom Axes view changes

Interactive pan and zoom were previously implemented using a Cartesian-specific algorithm that was not necessarily applicable to custom Axes. Three new private methods, `matplotlib.axes._base._AxesBase._get_view`, `matplotlib.axes._base._AxesBase._set_view`, and `matplotlib.axes._base._AxesBase._set_view_from_bbox`, allow for custom *Axes* classes to override the pan and zoom algorithms. Implementors of custom *Axes* who override these methods may provide suitable behaviour for both pan and zoom as well as the view navigation buttons on the interactive toolbars.

MathTex visual changes

The spacing commands in mathtext have been changed to more closely match vanilla TeX.

Improved spacing in mathtext

The extra space that appeared after subscripts and superscripts has been removed.

No annotation coordinates wrap

In #2351 for 1.4.0 the behavior of ['axes points', 'axes pixel', 'figure points', 'figure pixel'] as coordinates was change to no longer wrap for negative values. In 1.4.3 this change was reverted for 'axes points' and 'axes pixel' and in addition caused 'axes fraction' to wrap. For 1.5 the behavior has been reverted to as it was in 1.4.0-1.4.2, no wrapping for any type of coordinate.

Deprecation

Deprecated `GraphicsContextBase.set_graylevel`

The `GraphicsContextBase.set_graylevel` function has been deprecated in 1.5 and will be removed in 1.6. It has been unused. The *`GraphicsContextBase.set_foreground`* could be used instead.

deprecated idle_event

The `idle_event` was broken or missing in most backends and causes spurious warnings in some cases, and its use in creating animations is now obsolete due to the animations module. Therefore code involving it has been removed from all but the wx backend (where it partially works), and its use is deprecated. The *`animation`* module may be used instead to create animations.

`color_cycle` deprecated

In light of the new property cycling feature, the Axes method `set_color_cycle` is now deprecated. Calling this method will replace the current property cycle with one that cycles just the given colors.

Similarly, the rc parameter *axes.color_cycle* is also deprecated in lieu of the new *`rcParams["axes.prop_cycle"]`* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) parameter. Having both parameters in the same rc file is not recommended as the result cannot be predicted. For compatibility, setting *axes.color_cycle* will replace the cycler in *`rcParams["axes.prop_cycle"]`* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) with a color cycle. Accessing *axes.color_cycle* will return just the color portion of the property cycle, if it exists.

Timeline for removal has not been set.

Bundled jquery

The version of jquery bundled with the webagg backend has been upgraded from 1.7.1 to 1.11.3. If you are using the version of jquery bundled with webagg you will need to update your html files as such

```
-    <script src="_static/jquery/js/jquery-1.7.1.min.js"></script>
+    <script src="_static/jquery/js/jquery-1.11.3.min.js"></script>
```

Code Removed

Removed `Image` from main namespace

`Image` was imported from PIL/pillow to test if PIL is available, but there is no reason to keep `Image` in the namespace once the availability has been determined.

Removed `lod` from Artist

Removed the method `set_lod` and all references to the attribute `_lod` as they are not used anywhere else in the code base. It appears to be a feature stub that was never built out.

Removed threading related classes from cbook

The classes `Scheduler`, `Timeout`, and `Idle` were in cbook, but are not used internally. They appear to be a prototype for the idle event system which was not working and has recently been pulled out.

Removed *Lena* images from sample_data

The `lena.png` and `lena.jpg` images have been removed from Matplotlib's sample_data directory. The images are also no longer available from *matplotlib.cbook.get_sample_data*. We suggest using `matplotlib.cbook.get_sample_data('grace_hopper.png')` or `matplotlib.cbook.get_sample_data('grace_hopper.jpg')` instead.

Legend

Removed handling of *loc* as a positional argument to *Legend*

Legend handlers

Remove code to allow legend handlers to be callable. They must now implement a method `legend_artist`.

Axis

Removed method `set_scale`. This is now handled via a private method which should not be used directly by users. It is called via `Axes.set_{x,y}scale` which takes care of ensuring the related changes are also made to the Axes object.

finance.py

Removed functions with ambiguous argument order from finance.py

Annotation

Removed `textcoords` and `xytext` proprieties from Annotation objects.

sphinxext.ipython_*.py

Both `ipython_console_highlighting` and `ipython_directive` have been moved to IPython.

Change your import from `matplotlib.sphinxext.ipython_directive` to `IPython.sphinxext.ipython_directive` and from `matplotlib.sphinxext.ipython_directive` to `IPython.sphinxext.ipython_directive`

LineCollection.color

Deprecated in 2005, use `set_color`

remove `'faceted'` as a valid value for *shading* in `tri.tripcolor`

Use *edgecolor* instead. Added validation on *shading* to only be valid values.

Remove `faceted` kwarg from scatter

Remove support for the `faceted` kwarg. This was deprecated in d48b34288e9651ff95c3b8a071ef5ac5cf50bae7 (2008-04-18!) and replaced by `edgecolor`.

Remove `set_colorbar` method from `ScalarMappable`

Remove `set_colorbar` method, use *colorbar* attribute directly.

patheffects.svg

- remove `get_proxy_renderer` method from `AbstractPathEffect` class
- remove `patch_alpha` and `offset_xy` from `SimplePatchShadow`

Remove `testing.image_util.py`

Contained only a no-longer used port of functionality from PIL

Remove `mlab.FIFOBuffer`

Not used internally and not part of core mission of mpl.

Remove `mlab.prepca`

Deprecated in 2009.

Remove `NavigationToolbar2QTAgg`

Added no functionality over the base `NavigationToolbar2Qt`

mpl.py

Remove the module `matplotlib.mpl`. Deprecated in 1.3 by PR #1670 and commit 78ce67d161625833cacff23cfe5d74920248c5b2

9.16 Version 1.4

9.16.1 What's new in Matplotlib 1.4 (Aug 25, 2014)

Thomas A. Caswell served as the release manager for the 1.4 release.

Table of Contents

- *What's new in Matplotlib 1.4 (Aug 25, 2014)*
  - *New colormap*
  - *The nbagg backend*
  - *New plotting features*
  - *Date handling*
  - *Configuration (rcParams)*
  - *`style` package added*
  - *Backends*
  - *Text*
  - *Sphinx extensions*
  - *Legend and PathEffects documentation*
  - *Widgets*
  - *GAE integration*

Note

matplotlib 1.4 supports Python 2.6, 2.7, 3.3, and 3.4

New colormap

In heatmaps, a green-to-red spectrum is often used to indicate intensity of activity, but this can be problematic for the red/green colorblind. A new, colorblind-friendly colormap is now available at `matplotlib.cm.Wistia`. This colormap maintains the red/green symbolism while achieving deuteranopic legibility through brightness variations. See here for more information.

The nbagg backend

Phil Elson added a new backend, named "nbagg", which enables interactive figures in a live IPython notebook session. The backend makes use of the infrastructure developed for the webagg backend, which itself gives standalone server backed interactive figures in the browser, however nbagg does not require a dedicated matplotlib server as all communications are handled through the IPython Comm machinery.

As with other backends nbagg can be enabled inside the IPython notebook with:

```
import matplotlib
matplotlib.use('nbagg')
```

Once figures are created and then subsequently shown, they will placed in an interactive widget inside the notebook allowing panning and zooming in the same way as any other matplotlib backend. Because figures require a connection to the IPython notebook server for their interactivity, once the notebook is saved, each figure will be rendered as a static image - thus allowing non-interactive viewing of figures on services such as nbviewer.

New plotting features

Power-law normalization

Ben Gamari added a power-law normalization method, *PowerNorm*. This class maps a range of values to the interval [0,1] with power-law scaling with the exponent provided by the constructor's *gamma* argument. Power law normalization can be useful for, e.g., emphasizing small populations in a histogram.

Fully customizable boxplots

Paul Hobson overhauled the *boxplot()* method such that it is now completely customizable in terms of the styles and positions of the individual artists. Under the hood, *boxplot()* relies on a new function (*boxplot_stats()*), which accepts any data structure currently compatible with *boxplot()*, and returns a list of dictionaries containing the positions for each element of the boxplots. Then a second method, *bxp* is called to draw the boxplots based on the stats.

The *boxplot()* function can be used as before to generate boxplots from data in one step. But now the user has the flexibility to generate the statistics independently, or to modify the output of *boxplot_stats()* prior to plotting with *bxp*.

Lastly, each artist (e.g., the box, outliers, cap, notches) can now be toggled on or off and their styles can be passed in through individual kwargs. See the examples: *Artist customization in box plots* and *Separate calculation and plotting of boxplots*

Added a bool kwarg, `manage_xticks`, which if False disables the management of the ticks and limits on the x-axis by *bxp()*.

Support for datetime axes in 2d plots

Andrew Dawson added support for datetime axes to *contour()*, *contourf()*, *pcolormesh()* and *pcolor()*.

Support for additional spectrum types

Todd Jennings added support for new types of frequency spectrum plots: *magnitude_spectrum()*, *phase_spectrum()*, and *angle_spectrum()*, as well as corresponding functions in mlab.

He also added these spectrum types to *specgram()*, as well as adding support for linear scaling there (in addition to the existing dB scaling). Support for additional spectrum types was also added to *specgram()*.

He also increased the performance for all of these functions and plot types.

Support for detrending and windowing 2D arrays in mlab

Todd Jennings added support for 2D arrays in the *detrend_mean()*, *detrend_none()*, and *detrend()*, as well as adding `matplotlib.mlab.apply_window` which support windowing 2D arrays.

Support for strides in mlab

Todd Jennings added some functions to mlab to make it easier to use NumPy strides to create memory-efficient 2D arrays. This includes `matplotlib.mlab.stride_repeat`, which repeats an array to create a 2D array, and `matplotlib.mlab.stride_windows`, which uses a moving window to create a 2D array from a 1D array.

Formatter for new-style formatting strings

Added *StrMethodFormatter* which does the same job as *FormatStrFormatter*, but accepts new-style formatting strings instead of printf-style formatting strings

Consistent grid sizes in streamplots

streamplot() uses a base grid size of 30x30 for both `density=1` and `density=(1, 1)`. Previously a grid size of 30x30 was used for `density=1`, but a grid size of 25x25 was used for `density=(1, 1)`.

Get a list of all tick labels (major and minor)

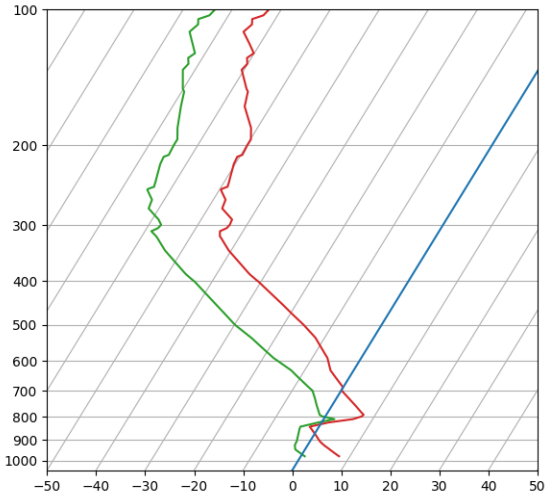
Added the kwarg 'which' to *Axes.get_xticklabels*, *Axes.get_yticklabels* and *Axis.get_ticklabels*. 'which' can be 'major', 'minor', or 'both' select which ticks to return, like *set_ticks_position*. If 'which' is `None` then the old behaviour (controlled by the bool *minor*).

Separate horizontal/vertical axes padding support in ImageGrid

The kwarg 'axes_pad' to *mpl_toolkits.axes_grid1.axes_grid.ImageGrid* can now be a tuple if separate horizontal/vertical padding is needed. This is supposed to be very helpful when you have a labelled legend next to every subplot and you need to make some space for legend's labels.

Support for skewed transformations

The *Affine2D* gained additional methods *skew* and *skew_deg* to create skewed transformations. Additionally, matplotlib internals were cleaned up to support using such transforms in *Axes*. This transform is important for some plot types, specifically the Skew-T used in meteorology.



Support for specifying properties of wedge and text in pie charts.

Added the kwargs 'wedgeprops' and 'textprops' to `pie` to accept properties for wedge and text objects in a pie. For example, one can specify wedgeprops = {'linewidth':3} to specify the width of the borders of the wedges in the pie. For more properties that the user can specify, look at the docs for the wedge and text objects.

Fixed the direction of errorbar upper/lower limits

Larry Bradley fixed the `errorbar()` method such that the upper and lower limits (*lolims*, *uplims*, *xlolims*, *xuplims*) now point in the correct direction.

More consistent add-object API for Axes

Added the Axes method `add_image` to put image handling on a par with artists, collections, containers, lines, patches, and tables.

Violin Plots

Per Parker, Gregory Kelsie, Adam Ortiz, Kevin Chan, Geoffrey Lee, Deokjae Donald Seo, and Taesu Terry Lim added a basic implementation for violin plots. Violin plots can be used to represent the distribution of sample data. They are similar to box plots, but use a kernel density estimation function to present a smooth approximation of the data sample used. The added features are:

`violin` - Renders a violin plot from a collection of statistics. `violin_stats()` - Produces a collection of statistics suitable for rendering a violin plot. `violinplot()` - Creates a violin plot from a set of sample data. This method makes use of `violin_stats()` to process the input data, and `violin_stats()` to do the actual rendering. Users are also free to modify or replace the output of `violin_stats()` in order to customize the violin plots to their liking.

This feature was implemented for a software engineering course at the University of Toronto, Scarborough,

run in Winter 2014 by Anya Tafliovich.

More *markevery* options to show only a subset of markers

Rohan Walker extended the *markevery* property in *Line2D*. You can now specify a subset of markers to show with an int, slice object, numpy fancy indexing, or float. Using a float shows markers at approximately equal display-coordinate-distances along the line.

Added size related functions to specialized `Collection`s

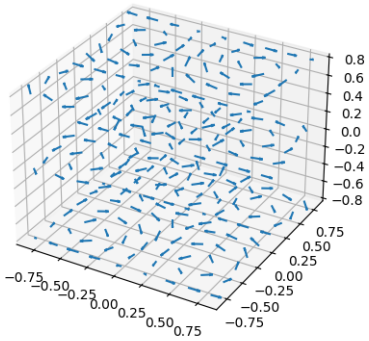
Added the `get_size` and `set_size` functions to control the size of elements of specialized collections (*AsteriskPolygonCollection* matplotlib.collections.BrokenBarHCollection *CircleCollection* *PathCollection* *PolyCollection* *RegularPolyCollection* *StarPolygonCollection*).

Fixed the mouse coordinates giving the wrong theta value in Polar graph

Added code to *transform_non_affine* to ensure that the calculated theta value was between the range of 0 and 2 * pi since the problem was that the value can become negative after applying the direction and rotation to the theta calculation.

Simple quiver plot for mplot3d toolkit

A team of students in an *Engineering Large Software Systems* course, taught by Prof. Anya Tafliovich at the University of Toronto, implemented a simple version of a quiver plot in 3D space for the mplot3d toolkit as one of their term project. This feature is documented in *quiver*. The team members are: Ryan Steve D'Souza, Victor B, xbtsw, Yang Wang, David, Caradec Bisesar and Vlad Vassilovski.



polar-plot r-tick locations

Added the ability to control the angular position of the r-tick labels on a polar plot via *set_rlabel_position*.

Date handling

n-d array support for date conversion

Andrew Dawson added support for n-d array handling to *matplotlib.dates.num2date()*, *matplotlib.dates.date2num()* and *matplotlib.dates.datestr2num()*. Support is also added to the unit conversion interfaces *matplotlib.dates.DateConverter* and *matplotlib.units.Registry*.

Configuration (rcParams)

`savefig.transparent` added

Controls whether figures are saved with a transparent background by default. Previously *savefig* always defaulted to a non-transparent background.

`axes.titleweight`

Added rcParam to control the weight of the title

`axes.formatter.useoffset` added

Controls the default value of *useOffset* in *ScalarFormatter*. If `True` and the data range is much smaller than the data average, then an offset will be determined such that the tick labels are meaningful. If `False` then the full number will be formatted in all conditions.

`nbagg.transparent` added

Controls whether nbagg figures have a transparent background. `nbagg.transparent` is `True` by default.

XDG compliance

Matplotlib now looks for configuration files (both rcparams and style) in XDG compliant locations.

`style` package added

You can now easily switch between different styles using the new `style` package:

```
>>> from matplotlib import style
>>> style.use('dark_background')
```

Subsequent plots will use updated colors, sizes, etc. To list all available styles, use:

```
>>> print style.available
```

You can add your own custom `<style name>.mplstyle` files to `~/.matplotlib/stylelib` or call `use` with a URL pointing to a file with `matplotlibrc` settings.

Note that this is an experimental feature, and the interface may change as users test out this new feature.

Backends

Qt5 backend

Martin Fitzpatrick and Tom Badran implemented a Qt5 backend. The differences in namespace locations between Qt4 and Qt5 was dealt with by shimming Qt4 to look like Qt5, thus the Qt5 implementation is the primary implementation. Backwards compatibility for Qt4 is maintained by wrapping the Qt5 implementation.

The Qt5Agg backend currently does not work with IPython's %matplotlib magic.

The 1.4.0 release has a known bug where the toolbar is broken. This can be fixed by:

```
cd path/to/installed/matplotlib
wget https://github.com/matplotlib/matplotlib/pull/3322.diff
# unix2dos 3322.diff (if on windows to fix line endings)
patch -p2 < 3322.diff
```

Qt4 backend

Rudolf Höfler changed the appearance of the subplottool. All sliders are vertically arranged now, buttons for tight layout and reset were added. Furthermore, the subplottool is now implemented as a modal dialog. It was previously a QMainWindow, leaving the SPT open if one closed the plot window.

In the figure options dialog one can now choose to (re-)generate a simple automatic legend. Any explicitly set legend entries will be lost, but changes to the curves' label, linestyle, et cetera will now be updated in the legend.

Interactive performance of the Qt4 backend has been dramatically improved under windows.

The mapping of key-signals from Qt to values matplotlib understands was greatly improved (For both Qt4 and Qt5).

Cairo backends

The Cairo backends are now able to use the cairocffi bindings which are more actively maintained than the pycairo bindings.

Gtk3Agg backend

The Gtk3Agg backend now works on Python 3.x, if the cairocffi bindings are installed.

PDF backend

Added context manager for saving to multi-page PDFs.

Text

Text URLs supported by SVG backend

The SVG backend will now render *Text* objects' url as a link in output SVGs. This allows one to make clickable text in saved figures using the url kwarg of the *Text* class.

Anchored sizebar font

Added the `fontproperties` kwarg to *AnchoredSizeBar* to control the font properties.

Sphinx extensions

The `:context:` directive in the *plot_directive* Sphinx extension can now accept an optional `reset` setting, which will cause the context to be reset. This allows more than one distinct context to be present in documentation. To enable this option, use `:context: reset` instead of `:context:` any time you want to reset the context.

Legend and PathEffects documentation

The *Legend guide* and *Path effects guide* have both been updated to better reflect the full potential of each of these powerful features.

Widgets

Span Selector

Added an option `span_stays` to the *SpanSelector* which makes the selector rectangle stay on the axes after you release the mouse.

GAE integration

Matplotlib will now run on google app engine.

9.16.2 API Changes in 1.4.x

Code changes

- A major refactoring of the axes module was made. The axes module has been split into smaller modules:
  - the `_base` module, which contains a new private `_AxesBase` class. This class contains all methods except plotting and labelling methods.
  - the *axes* module, which contains the *axes.Axes* class. This class inherits from `_AxesBase`, and contains all plotting and labelling methods.
  - the `_subplot` module, with all the classes concerning subplotting.

  There are a couple of things that do not exists in the *axes* module's namespace anymore. If you use them, you need to import them from their original location:
  - `math` -> `import math`

  - ma -> from numpy import ma
  - cbook -> from matplotlib import cbook
  - docstring -> from matplotlib import docstring
  - is_sequence_of_strings -> from matplotlib.cbook import is_sequence_of_strings
  - is_string_like -> from matplotlib.cbook import is_string_like
  - iterable -> from matplotlib.cbook import iterable
  - itertools -> import itertools
  - martist -> from matplotlib import artist as martist
  - matplotlib -> import matplotlib
  - mcoll -> from matplotlib import collections as mcoll
  - mcolors -> from matplotlib import colors as mcolors
  - mcontour -> from matplotlib import contour as mcontour
  - mpatches -> from matplotlib import patches as mpatches
  - mpath -> from matplotlib import path as mpath
  - mquiver -> from matplotlib import quiver as mquiver
  - mstack -> from matplotlib import stack as mstack
  - mstream -> from matplotlib import stream as mstream
  - mtable -> from matplotlib import table as mtable

- As part of the refactoring to enable Qt5 support, the module matplotlib.backends.qt4_compat was renamed to matplotlib.backends.qt_compat. qt4_compat is deprecated in 1.4 and will be removed in 1.5.
- The *errorbar()* method has been changed such that the upper and lower limits (*lolims*, *uplims*, *xlolims*, *xuplims*) now point in the correct direction.
- The *fmt* kwarg for *errorbar()* now supports the string 'none' to suppress drawing of a line and markers; use of the *None* object for this is deprecated. The default *fmt* value is changed to the empty string (''), so the line and markers are governed by the *plot()* defaults.
- A bug has been fixed in the path effects rendering of fonts, which now means that the font size is consistent with non-path effect fonts. See https://github.com/matplotlib/matplotlib/issues/2889 for more detail.
- The Sphinx extensions ipython_directive and ipython_console_highlighting have been moved to the IPython project itself. While they remain in Matplotlib for this release, they have been deprecated. Update your extensions in conf.py to point to IPython.sphinxext.ipython_directive instead of matplotlib.sphinxext.ipython_directive.

- In `matplotlib.finance`, almost all functions have been deprecated and replaced with a pair of functions name `*_ochl` and `*_ohlc`. The former is the 'open-close-high-low' order of quotes used previously in this module, and the latter is the 'open-high-low-close' order that is standard in finance.
- For consistency the `face_alpha` keyword to *matplotlib.patheffects.SimplePatchShadow* has been deprecated in favour of the `alpha` keyword. Similarly, the keyword `offset_xy` is now named `offset` across all *AbstractPathEffect*s. `matplotlib.patheffects._Base` has been renamed to *matplotlib.patheffects.AbstractPathEffect*. `matplotlib.patheffect.ProxyRenderer` has been renamed to *matplotlib.patheffects.PathEffectRenderer* and is now a full RendererBase subclass.
- The artist used to draw the outline of a *Figure.colorbar* has been changed from a *matplotlib.lines.Line2D* to *matplotlib.patches.Polygon*, thus `colorbar.ColorbarBase.outline` is now a *matplotlib.patches.Polygon* object.
- The legend handler interface has changed from a callable, to any object which implements the `legend_artists` method (a deprecation phase will see this interface be maintained for v1.4). See *Legend guide* for further details. Further legend changes include:
  - `matplotlib.axes.Axes._get_legend_handles` now returns a generator of handles, rather than a list.
  - The *legend()* function's *loc* positional argument has been deprecated. Use the *loc* keyword argument instead.
- The *rcParams["savefig.transparent"]* (default: `False`) has been added to control default transparency when saving figures.
- Slightly refactored the *Annotation* family. The text location in *Annotation* is now entirely handled by the underlying *Text* object so `.set_position` works as expected. The attributes *xytext* and *textcoords* have been deprecated in favor of *xyann* and *anncoords* so that *Annotation* and *AnnotationBbox* can share a common sensibly named api for getting/setting the location of the text or box.
  - *xyann* -> set the location of the annotation
  - *xy* -> set where the arrow points to
  - *anncoords* -> set the units of the annotation location
  - *xycoords* -> set the units of the point location
  - `set_position()` -> *Annotation* only set location of annotation
- *matplotlib.mlab.specgram*, *matplotlib.mlab.psd*, *matplotlib.mlab.csd*, *matplotlib.mlab.cohere*, `matplotlib.mlab.cohere_pairs`, *matplotlib.pyplot.specgram*, *matplotlib.pyplot.psd*, *matplotlib.pyplot.csd*, and *matplotlib.pyplot.cohere* now raise ValueError where they previously raised AssertionError.
- For *matplotlib.mlab.psd*, *matplotlib.mlab.csd*, *matplotlib.mlab.cohere*, `matplotlib.mlab.cohere_pairs`, *matplotlib.pyplot.specgram*, *matplotlib.pyplot.psd*, *matplotlib.pyplot.csd*, and *matplotlib.pyplot.cohere*, in cases where a shape (n, 1) array is returned, this is now converted to a (n,) array. Previously, (n, m) arrays

were averaged to an (n,) array, but (n, 1) arrays were returned unchanged. This change makes the dimensions consistent in both cases.

- Added the *rcParams["axes.formatter.useoffset"]* (default: `True`) to control the default value of *useOffset* in *ticker.ScalarFormatter*
- Added *Formatter* sub-class *StrMethodFormatter* which does the exact same thing as *FormatStrFormatter*, but for new-style formatting strings.
- Deprecated `matplotlib.testing.image_util` and the only function within, `matplotlib.testing.image_util.autocontrast`. These will be removed completely in v1.5.0.
- The `fmt` argument of *plot_date()* has been changed from `bo` to just `o`, so color cycling can happen by default.
- Removed the class `FigureManagerQTAgg` and deprecated `NavigationToolbar2QTAgg` which will be removed in 1.5.
- Removed formerly public (non-prefixed) attributes `rect` and `drawRect` from `FigureCanvasQTAgg`; they were always an implementation detail of the (preserved) `drawRectangle()` function.
- The function signatures of `matplotlib.tight_bbox.adjust_bbox` and `matplotlib.tight_bbox.process_figure_for_rasterizing` have been changed. A new *fixed_dpi* parameter allows for overriding the `figure.dpi` setting instead of trying to deduce the intended behaviour from the file format.
- Added support for horizontal/vertical axes padding to *mpl_toolkits.axes_grid1.axes_grid.ImageGrid* --- argument *axes_pad* can now be tuple-like if separate axis padding is required. The original behavior is preserved.
- Added support for skewed transforms to *matplotlib.transforms.Affine2D*, which can be created using the *skew* and *skew_deg* methods.
- Added clockwise parameter to control sectors direction in *axes.Axes.pie*
- In *matplotlib.lines.Line2D* the *markevery* functionality has been extended. Previously an integer start-index and stride-length could be specified using either a two-element-list or a two-element-tuple. Now this can only be done using a two-element-tuple. If a two-element-list is used then it will be treated as NumPy fancy indexing and only the two markers corresponding to the given indexes will be shown.
- Removed *prop* keyword argument from *mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar* call. It was passed through to the base-class `__init__` and is only used for setting padding. Now *fontproperties* (which is what is really used to set the font properties of *AnchoredSizeBar*) is passed through in place of *prop*. If *fontproperties* is not passed in, but *prop* is, then *prop* is used in place of *fontproperties*. If both are passed in, *prop* is silently ignored.
- The use of the index 0 in *pyplot.subplot* and related commands is deprecated. Due to a lack of validation, calling `plt.subplots(2, 2, 0)` does not raise an exception, but puts an axes in the _last_ position. This is due to the indexing in subplot being 1-based (to mirror MATLAB) so before indexing into the *GridSpec* object used to determine where the axes should go, 1 is subtracted off. Passing in 0 results in passing -1 to *GridSpec* which results in getting the last position back. Even though this behavior is clearly wrong and not intended, we are going through a deprecation cycle in

an abundance of caution that any users are exploiting this 'feature'. The use of 0 as an index will raise a warning in 1.4 and an exception in 1.5.

- Clipping is now off by default on offset boxes.
- Matplotlib now uses a less-aggressive call to `gc.collect(1)` when closing figures to avoid major delays with large numbers of user objects in memory.
- The default clip value of *all* pie artists now defaults to `False`.

Code removal

- Removed `mlab.levypdf`. The code raised a NumPy error (and has for a long time) and was not the standard form of the Levy distribution. `scipy.stats.levy` should be used instead

9.17 Version 1.3

9.17.1 What's new in Matplotlib 1.3 (Aug 01, 2013)

Table of Contents

- *What's new in Matplotlib 1.3 (Aug 01, 2013)*
  - *New in 1.3.1*
  - *New plotting features*
  - *Updated Axes3D.contour methods*
  - *Drawing*
  - *Text*
  - *Configuration (rcParams)*
  - *Backends*
  - *Documentation and examples*
  - *Infrastructure*

Note

matplotlib 1.3 supports Python 2.6, 2.7, 3.2, and 3.3

New in 1.3.1

1.3.1 is a micro release, primarily dealing with improved setup and handling of dependencies, and correcting and enhancing the documentation.

The following changes were made in 1.3.1 since 1.3.0.

Enhancements

- Added a context manager for creating multi-page pdfs (see *matplotlib.backends.backend_pdf.PdfPages*).
- The WebAgg backend should now have lower latency over heterogeneous Internet connections.

Bug fixes

- Histogram plots now contain the endline.
- Fixes to the Molleweide projection.
- Handling recent fonts from Microsoft and Macintosh-style fonts with non-ascii metadata is improved.
- Hatching of fill between plots now works correctly in the PDF backend.
- Tight bounding box support now works in the PGF backend.
- Transparent figures now display correctly in the Qt4Agg backend.
- Drawing lines from one subplot to another now works.
- Unit handling on masked arrays has been improved.

Setup and dependencies

- Now works with any version of pyparsing 1.5.6 or later, without displaying hundreds of warnings.
- Now works with 64-bit versions of Ghostscript on MS-Windows.
- When installing from source into an environment without Numpy, Numpy will first be downloaded and built and then used to build matplotlib.
- Externally installed backends are now always imported using a fully-qualified path to the module.
- Works with newer version of wxPython.
- Can now build with a PyCXX installed globally on the system from source.
- Better detection of Gtk3 dependencies.

Testing

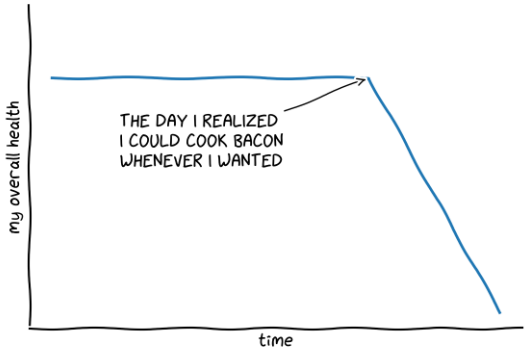
- Tests should now work in non-English locales.
- PEP8 conformance tests now report on locations of issues.

New plotting features

xkcd-style sketch plotting

To give your plots a sense of authority that they may be missing, Michael Droettboom (inspired by the work of many others in PR #1329) has added an xkcd-style sketch plotting mode. To use it, simply call *matplotlib.pyplot.xkcd* before creating your plot. For really fine control, it is also

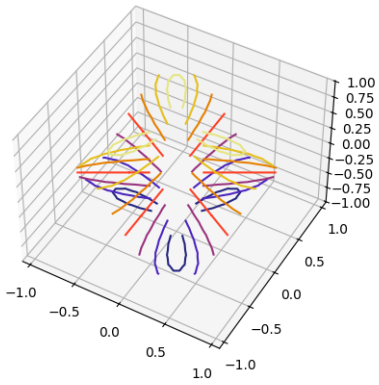
possible to modify each artist's sketch parameters individually with *matplotlib.artist.Artist.set_sketch_params()*.



"Stove Ownership" from xkcd by Randall Munroe

Updated Axes3D.contour methods

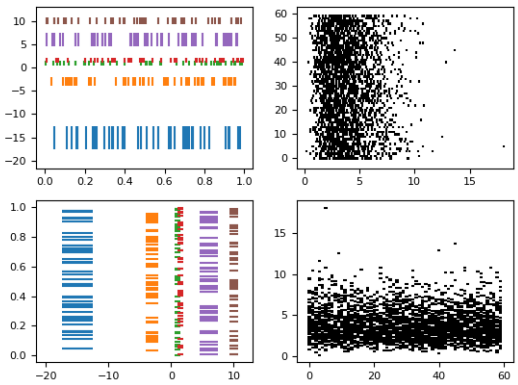
Damon McDougall updated the *tricontour()* and *tricontourf()* methods to allow 3D contour plots on arbitrary unstructured user-specified triangulations.



New eventplot plot type

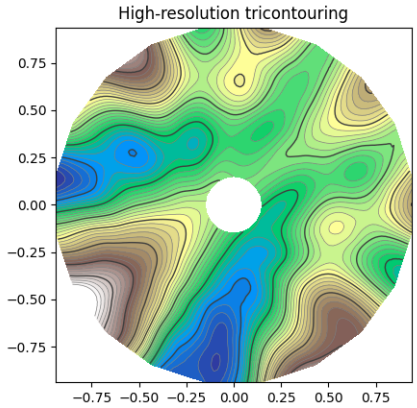
Todd Jennings added a *eventplot()* function to create multiple rows or columns of identical line segments

As part of this feature, there is a new *EventCollection* class that allows for plotting and manipulating rows or columns of identical line segments.



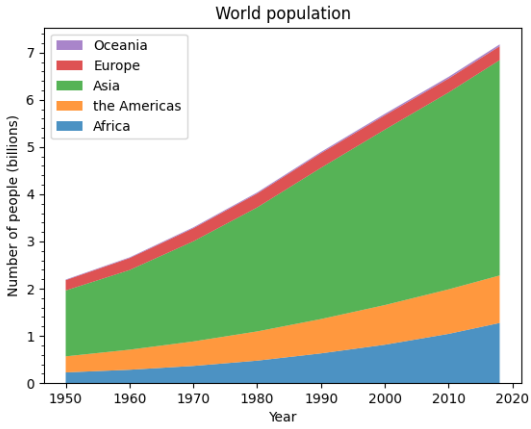
Triangular grid interpolation

Geoffroy Billotey and Ian Thomas added classes to perform interpolation within triangular grids: (`LinearTriInterpolator` and `CubicTriInterpolator`) and a utility class to find the triangles in which points lie (`TrapezoidMapTriFinder`). A helper class to perform mesh refinement and smooth contouring was also added (`UniformTriRefiner`). Finally, a class implementing some basic tools for triangular mesh improvement was added (`TriAnalyzer`).



Baselines for stackplot

Till Stensitzki added non-zero baselines to `stackplot()`. They may be symmetric or weighted.



Rectangular colorbar extensions

Andrew Dawson added a new keyword argument *extendrect* to `colorbar()` to optionally make colorbar extensions rectangular instead of triangular.

More robust boxplots

Paul Hobson provided a fix to the `boxplot()` method that prevent whiskers from being drawn inside the box for oddly distributed data sets.

Calling subplot() without arguments

A call to `subplot()` without any arguments now acts the same as `subplot(111)` or `subplot(1, 1, 1)` -- it creates one axes for the whole figure. This was already the behavior for both `axes()` and `subplots()`, and now this consistency is shared with `subplot()`.

Drawing

Independent alpha values for face and edge colors

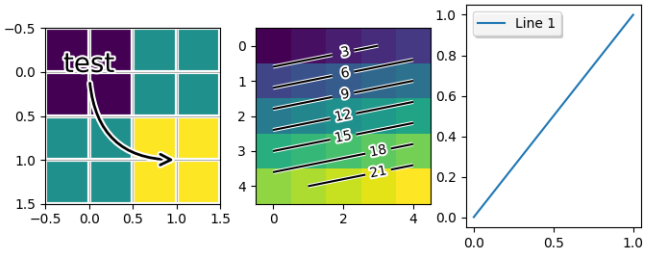
Wes Campaigne modified how `Patch` objects are drawn such that (for backends supporting transparency) you can set different alpha values for faces and edges, by specifying their colors in RGBA format. Note that if you set the alpha attribute for the patch object (e.g. using `set_alpha()` or the `alpha` keyword argument), that value will override the alpha components set in both the face and edge colors.

Path effects on lines

Thanks to Jae-Joon Lee, path effects now also work on plot lines.

Easier creation of colormap and normalizer for levels with colors

Phil Elson added the `matplotlib.colors.from_levels_and_colors()` function to easily create a colormap and normalizer for representation of discrete colors for plot types such as `matplotlib.pyplot.pcolormesh()`, with a similar interface to that of `matplotlib.pyplot.contourf`.



Full control of the background color

Wes Campaigne and Phil Elson fixed the Agg backend such that PNGs are now saved with the correct background color when `fig.patch.get_alpha()` is not 1.

Improved `bbox_inches="tight"` functionality

Passing `bbox_inches="tight"` through to *`pyplot.savefig`* now takes into account *all* artists on a figure - this was previously not the case and led to several corner cases which did not function as expected.

Initialize a rotated rectangle

Damon McDougall extended the *`Rectangle`* constructor to accept an *angle* kwarg, specifying the rotation of a rectangle in degrees.

Text

Anchored text support

The SVG and pgf backends are now able to save text alignment information to their output formats. This allows to edit text elements in saved figures, using Inkscape for example, while preserving their intended position. For SVG please note that you'll have to disable the default text-to-path conversion (`mpl.rc('svg', fonttype='none')`).

Better vertical text alignment and multi-line text

The vertical alignment of text is now consistent across backends. You may see small differences in text placement, particularly with rotated text.

If you are using a custom backend, note that the *`draw_text`* renderer method is now passed the location of the baseline, not the location of the bottom of the text bounding box.

Multi-line text will now leave enough room for the height of very tall or very low text, such as superscripts and subscripts.

Left and right side axes titles

Andrew Dawson added the ability to add axes titles flush with the left and right sides of the top of the axes using a new keyword argument *loc* to `title()`.

Improved manual contour plot label positioning

Brian Mattern modified the manual contour plot label positioning code to interpolate along line segments and find the actual closest point on a contour to the requested position. Previously, the closest path vertex was used, which, in the case of straight contours was sometimes quite distant from the requested location. Much more precise label positioning is now possible.

Configuration (rcParams)

Quickly find rcParams

Phil Elson made it easier to search for rcParameters by passing a valid regular expression to `matplotlib.RcParams.find_all()`. `matplotlib.RcParams` now also has a pretty repr and str representation so that search results are printed prettily:

```
>>> import matplotlib
>>> print(matplotlib.rcParams.find_all('\.size'))
RcParams({'font.size': 12,
          'xtick.major.size': 4,
          'xtick.minor.size': 2,
          'ytick.major.size': 4,
          'ytick.minor.size': 2})
```

`axes.xmargin` and `axes.ymargin` added to rcParams

`rcParams["axes.xmargin"]` (default: `0.05`) and `rcParams["axes.ymargin"]` (default: `0.05`) were added to configure the default margins used. Previously they were hard-coded to default to 0, default value of both rcParam values is 0.

Changes to font rcParams

The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

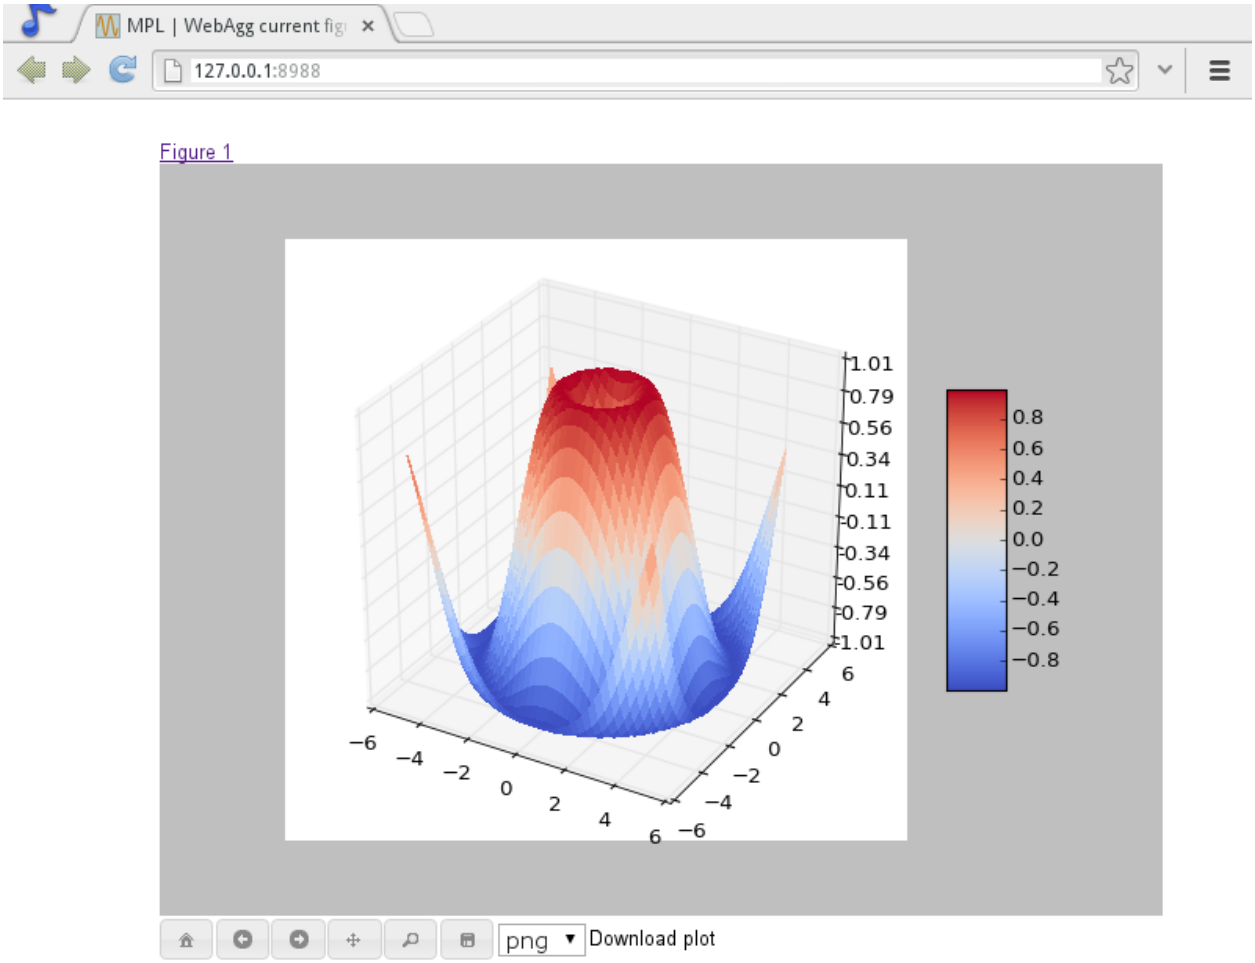
Added `savefig.jpeg_quality` rcParam

The `savefig.jpeg_quality` rcParam was added so that the user can configure the default quality used when a figure is written as a JPEG. The default quality is 95; previously, the default quality was 75. This change minimizes the artifacting inherent in JPEG images, particularly with images that have sharp changes in color as plots often do.

Backends

WebAgg backend

Michael Droettboom, Phil Elson and others have developed a new backend, WebAgg, to display figures in a web browser. It works with animations as well as being fully interactive.



Future versions of matplotlib will integrate this backend with the IPython notebook for a fully web browser based plotting frontend.

Remember save directory

Martin Spacek made the save figure dialog remember the last directory saved to. The default is configurable with the new *rcParams["savefig.directory"]* (default: `'~'`) rcParam in `matplotlibrc`.

Documentation and examples

Numpydoc docstrings

Nelle Varoquaux has started an ongoing project to convert matplotlib's docstrings to numpydoc format. See MEP10 for more information.

Example reorganization

Tony Yu has begun work reorganizing the examples into more meaningful categories. The new gallery page is the fruit of this ongoing work. See MEP12 for more information.

Examples now use subplots()

For the sake of brevity and clarity, most of the *examples* now use the newer `subplots()`, which creates a figure and one (or multiple) axes object(s) in one call. The old way involved a call to `figure()`, followed by one (or multiple) `subplot()` calls.

Infrastructure

Housecleaning

A number of features that were deprecated in 1.2 or earlier, or have not been in a working state for a long time have been removed. Highlights include removing the Qt version 3 backends, and the FltkAgg and Emf backends. See *API Changes in 1.3.x* for a complete list.

New setup script

matplotlib 1.3 includes an entirely rewritten setup script. We now ship fewer dependencies with the tarballs and installers themselves. Notably, pytz, dateutil, pyparsing and six are no longer included with matplotlib. You can either install them manually first, or let pip install them as dependencies along with matplotlib. It is now possible to not include certain subcomponents, such as the unit test data, in the install. See `setup.cfg.template` for more information.

XDG base directory support

On Linux, matplotlib now uses the XDG base directory specification to find the `matplotlibrc` configuration file. `matplotlibrc` should now be kept in `~/.config/matplotlib`, rather than `~/.matplotlib`. If your configuration is found in the old location, it will still be used, but a warning will be displayed.

Catch opening too many figures using pyplot

Figures created through `pyplot.figure` are retained until they are explicitly closed. It is therefore common for new users of matplotlib to run out of memory when creating a large series of figures in a loop without closing them.

matplotlib will now display a `RuntimeWarning` when too many figures have been opened at once. By default, this is displayed for 20 or more figures, but the exact number may be controlled using the `figure.max_open_warning` rcParam.

9.17.2 API Changes in 1.3.x

Changes in 1.3.1

It is rare that we make an API change in a micro release, however, for 1.3.1 since 1.3.0 the following change was made:

- `text.Text.cached` (used to cache font objects) has been made into a private variable. Among the obvious encapsulation benefit, this removes this confusing-looking member from the documentation.
- The method *`hist()`* now always returns bin occupancies as an array of type `float`. Previously, it was sometimes an array of type `int`, depending on the call.

Code removal

- The following items that were deprecated in version 1.2 or earlier have now been removed completely.
  - The Qt 3.x backends (`qt` and `qtagg`) have been removed in favor of the Qt 4.x backends (`qt4` and `qt4agg`).
  - The FltkAgg and Emf backends have been removed.
  - The `matplotlib.nxutils` module has been removed. Use the functionality on *`matplotlib.path.Path.contains_point`* and friends instead.
  - Instead of `axes.Axes.get_frame`, use `axes.Axes.patch`.
  - The following keyword arguments to the *`legend`* function have been renamed:
    - *pad* -> *borderpad*
    - *labelsep* -> *labelspacing*
    - *handlelen* -> *handlelength*
    - *handletextsep* -> *handletextpad*
    - *axespad* -> *borderaxespad*

    Related to this, the following rcParams have been removed:
    - `legend.pad`,
    - `legend.labelsep`,
    - `legend.handlelen`,
    - `legend.handletextsep` and
    - `legend.axespad`
  - For the *`hist`* function, instead of *width*, use *rwidth* (relative width).
  - On *`patches.Circle`*, the *resolution* keyword argument has been removed. For a circle made up of line segments, use *`patches.CirclePolygon`*.
  - The printing functions in the Wx backend have been removed due to the burden of keeping them up-to-date.
  - `mlab.liaupunov` has been removed.

  - `mlab.save`, `mlab.load`, `pylab.save` and `pylab.load` have been removed. We recommend using `numpy.savetxt` and `numpy.loadtxt` instead.
  - `widgets.HorizontalSpanSelector` has been removed. Use *widgets.SpanSelector* instead.

Code deprecation

- The CocoaAgg backend has been deprecated, with the possibility for deletion or resurrection in a future release.
- The top-level functions in *matplotlib.path* that are implemented in C++ were never meant to be public. Instead, users should use the Pythonic wrappers for them in the *path.Path* and *collections.Collection* classes. Use the following mapping to update your code:
  - `point_in_path` -> *path.Path.contains_point*
  - `get_path_extents` -> *path.Path.get_extents*
  - `point_in_path_collection` -> *collections.Collection.contains*
  - `path_in_path` -> *path.Path.contains_path*
  - `path_intersects_path` -> *path.Path.intersects_path*
  - `convert_path_to_polygons` -> *path.Path.to_polygons*
  - `cleanup_path` -> *path.Path.cleaned*
  - `points_in_path` -> *path.Path.contains_points*
  - `clip_path_to_rect` -> *path.Path.clip_to_bbox*
- `matplotlib.colors.normalize` and `matplotlib.colors.no_norm` have been deprecated in favour of *matplotlib.colors.Normalize* and *matplotlib.colors.NoNorm* respectively.
- The *ScalarMappable* class' `set_colorbar` method is now deprecated. Instead, the *matplotlib.cm.ScalarMappable.colorbar* attribute should be used. In previous Matplotlib versions this attribute was an undocumented tuple of `(colorbar_instance, colorbar_axes)` but is now just `colorbar_instance`. To get the colorbar axes it is possible to just use the `matplotlib.colorbar.ColorbarBase.ax` attribute on a colorbar instance.
- The `matplotlib.mpl` module is now deprecated. Those who relied on this module should transition to simply using `import matplotlib as mpl`.

Code changes

- *Patch* now fully supports using RGBA values for its `facecolor` and `edgecolor` attributes, which enables faces and edges to have different alpha values. If the *Patch* object's `alpha` attribute is set to anything other than `None`, that value will override any alpha-channel value in both the face and edge colors. Previously, if *Patch* had `alpha=None`, the alpha component of `edgecolor` would be applied to both the edge and face.

- The optional `isRGB` argument to *`set_foreground()`* (and the other GraphicsContext classes that descend from it) has been renamed to `isRGBA`, and should now only be set to `True` if the `fg` color argument is known to be an RGBA tuple.
- For *`Patch`*, the `capstyle` used is now `butt`, to be consistent with the default for most other objects, and to avoid problems with non-solid `linestyle` appearing solid when using a large `linewidth`. Previously, *`Patch`* used `capstyle='projecting'`.
- *`Path`* objects can now be marked as *readonly* by passing `readonly=True` to its constructor. The built-in path singletons, obtained through `Path.unit*` class methods return readonly paths. If you have code that modified these, you will need to make a deepcopy first, using either:

```
import copy
path = copy.deepcopy(Path.unit_circle())

# or

path = Path.unit_circle().deepcopy()
```

  Deep copying a *`Path`* always creates an editable (i.e. non-readonly) *`Path`*.
- The list at `Path.NUM_VERTICES` was replaced by a dictionary mapping Path codes to the number of expected vertices at *`NUM_VERTICES_FOR_CODE`*.
- To support XKCD style plots, the `matplotlib.path.cleanup_path` method's signature was updated to require a sketch argument. Users of `matplotlib.path.cleanup_path` are encouraged to use the new *`cleaned()`* Path method.
- Data limits on a plot now start from a state of having "null" limits, rather than limits in the range (0, 1). This has an effect on artists that only control limits in one direction, such as *`axes.Axes.axvline`* and *`axes.Axes.axhline`*, since their limits will no longer also include the range (0, 1). This fixes some problems where the computed limits would be dependent on the order in which artists were added to the axes.
- Fixed a bug in setting the position for the right/top spine with data position type. Previously, it would draw the right or top spine at +1 data offset.
- In *`FancyArrow`*, the default arrow head width, `head_width`, has been made larger to produce a visible arrow head. The new value of this kwarg is `head_width = 20 * width`.
- It is now possible to provide `number of levels + 1` colors in the case of `extend='both'` for contourf (or just `number of levels` colors for an extend value `min` or `max`) such that the resulting colormap's `set_under` and `set_over` are defined appropriately. Any other number of colors will continue to behave as before (if more colors are provided than levels, the colors will be unused). A similar change has been applied to contour, where `extend='both'` would expect `number of levels + 2` colors.
- A new keyword *extendrect* in *`colorbar()`* and *`ColorbarBase`* allows one to control the shape of colorbar extensions.
- The extension of *`MultiCursor`* to both vertical (default) and/or horizontal cursor implied that `self.line` is replaced by `self.vline` for vertical cursors lines and `self.hline` is added for the horizontal cursors lines.

- On POSIX platforms, the `matplotlib.cbook.report_memory` function raises `NotImplementedError` instead of `OSError` if the **`ps`** command cannot be run.
- The `matplotlib.cbook.check_output` function has been moved to `matplotlib.compat.subprocess`.

Configuration and rcParams

- On Linux, the user-specific `matplotlibrc` configuration file is now located in `~/.config/matplotlib/matplotlibrc` to conform to the XDG Base Directory Specification.
- The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.
- Removed call of *`grid()`* in `matplotlib.pyplot.plotfile`. To draw the axes grid, set the `axes.grid` rcParam to *True*, or explicitly call *`grid()`*.

9.18 Version 1.2

9.18.1 What's new in Matplotlib 1.2.2

Table of Contents

- *What's new in Matplotlib 1.2.2*
  - *Improved collections*
  - *Multiple images on same axes are correctly transparent*

Improved collections

The individual items of a collection may now have different alpha values and be rendered correctly. This also fixes a bug where collections were always filled in the PDF backend.

Multiple images on same axes are correctly transparent

When putting multiple images onto the same axes, the background color of the axes will now show through correctly.

9.18.2 What's new in Matplotlib 1.2 (Nov 9, 2012)

Table of Contents

- *What's new in Matplotlib 1.2 (Nov 9, 2012)*
  - *Python 3.x support*

- *PGF/TikZ backend*
- *Locator interface*

- *Hatching patterns in filled contour plots, with legends*
- *Known issues in the matplotlib 1.2 release*

Note

matplotlib 1.2 supports Python 2.6, 2.7, and 3.1

Python 3.x support

Matplotlib 1.2 is the first version to support Python 3.x, specifically Python 3.1 and 3.2. To make this happen in a reasonable way, we also had to drop support for Python versions earlier than 2.6.

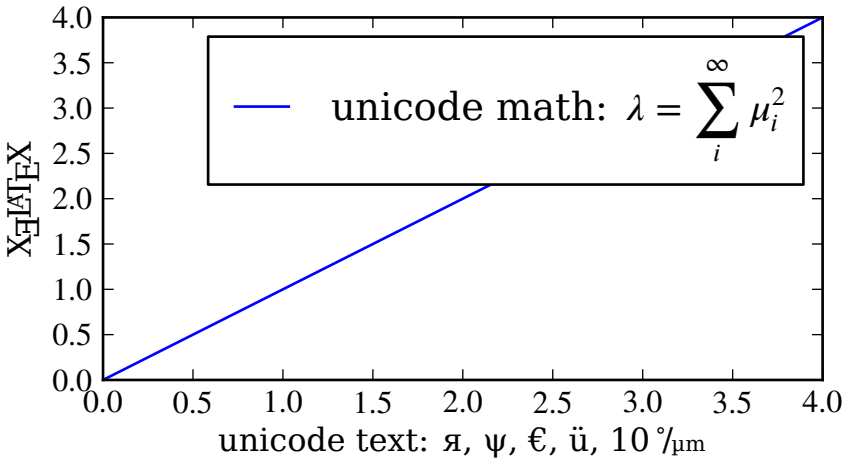
This work was done by Michael Droettboom, the Cape Town Python Users' Group, many others and supported financially in part by the SAGE project.

The following GUI backends work under Python 3.x: Gtk3Cairo, Qt4Agg, TkAgg and MacOSX. The other GUI backends do not yet have adequate bindings for Python 3.x, but continue to work on Python 2.6 and 2.7, particularly the Qt and QtAgg backends (which have been deprecated). The non-GUI backends, such as PDF, PS and SVG, work on both Python 2.x and 3.x.

Features that depend on the Python Imaging Library, such as JPEG handling, do not work, since the version of PIL for Python 3.x is not sufficiently mature.

PGF/TikZ backend

Peter Würtz wrote a backend that allows matplotlib to export figures as drawing commands for LaTeX. These can be processed by PdfLaTeX, XeLaTeX or LuaLaTeX using the PGF/TikZ package. Usage examples and documentation are found in *Text rendering with XeLaTeX/LuaLaTeX via the pgf backend*.



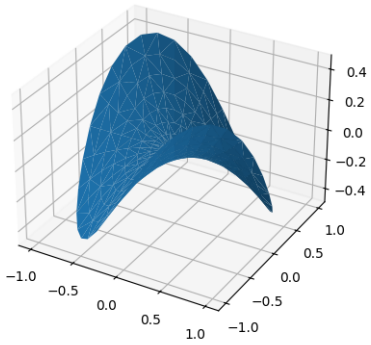
Locator interface

Philip Elson exposed the intelligence behind the tick Locator classes with a simple interface. For instance, to get no more than 5 sensible steps which span the values 10 and 19.5:

```
>>> import matplotlib.ticker as mticker
>>> locator = mticker.MaxNLocator(nbins=5)
>>> print(locator.tick_values(10, 19.5))
[ 10.  12.  14.  16.  18.  20.]
```

Tri-Surface Plots

Damon McDougall added a new plotting method for the `mplot3d` toolkit called `plot_trisurf()`.



Control the lengths of colorbar extensions

Andrew Dawson added a new keyword argument *extendfrac* to `colorbar()` to control the length of minimum and maximum colorbar extensions.

Figures are picklable

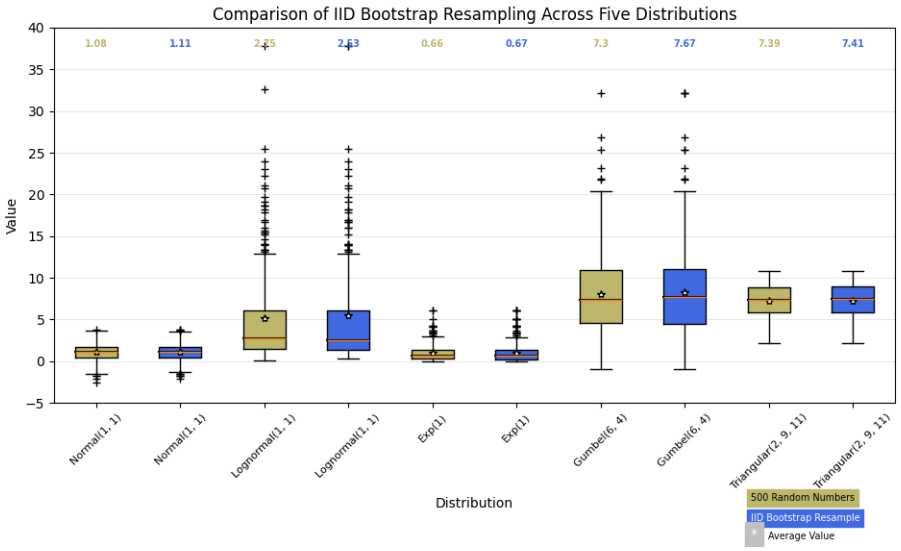
Philip Elson added an experimental feature to make figures picklable for quick and easy short-term storage of plots. Pickle files are not designed for long term storage, are unsupported when restoring a pickle saved in another matplotlib version and are insecure when restoring a pickle from an untrusted source. Having said this, they are useful for short term storage for later modification inside matplotlib.

Set default bounding box in matplotlibrc

Two new defaults are available in the matplotlibrc configuration file: `savefig.bbox`, which can be set to 'standard' or 'tight', and `savefig.pad_inches`, which controls the bounding box padding.

New Boxplot Functionality

Users can now incorporate their own methods for computing the median and its confidence intervals into the `boxplot` method. For every column of data passed to boxplot, the user can specify an accompanying median and confidence interval.



New RC parameter functionality

Matthew Emmett added a function and a context manager to help manage RC parameters: `rc_file()` and `rc_context`. To load RC parameters from a file:

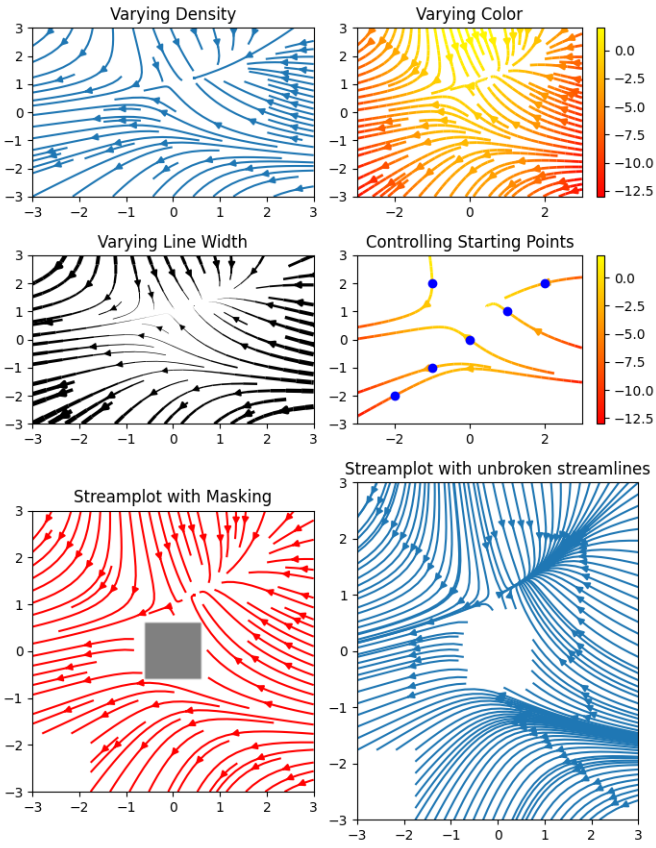
```
>>> mpl.rc_file('mpl.rc')
```

To temporarily use RC parameters:

```
>>> with mpl.rc_context(fname='mpl.rc', rc={'text.usetex': True}):
>>>     ...
```

Streamplot

Tom Flannaghan and Tony Yu have added a new *streamplot()* function to plot the streamlines of a vector field. This has been a long-requested feature and complements the existing *quiver()* function for plotting vector fields. In addition to simply plotting the streamlines of the vector field, *streamplot()* allows users to map the colors and/or line widths of the streamlines to a separate parameter, such as the speed or local intensity of the vector field.



New hist functionality

Nic Eggert added a new *stacked* kwarg to *hist()* that allows creation of stacked histograms using any of the histogram types. Previously, this functionality was only available by using the "barstacked" histogram type. Now, when `stacked=True` is passed to the function, any of the histogram types can be stacked. The "barstacked" histogram type retains its previous functionality for backwards compatibility.

Updated shipped dependencies

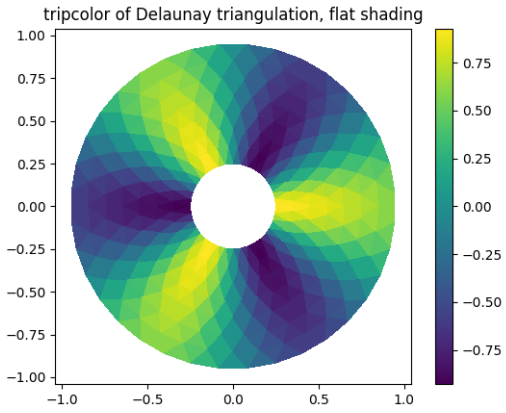
The following dependencies that ship with matplotlib and are optionally installed alongside it have been updated:

- pytz 2012d
- **dateutil 1.5 on Python 2.x,**

  and 2.1 on Python 3.x

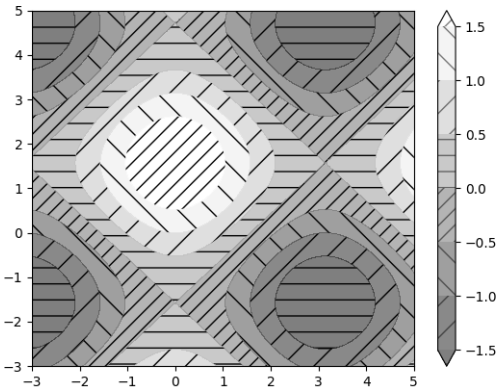
Face-centred colors in tripcolor plots

Ian Thomas extended `tripcolor()` to allow one color value to be specified for each triangular face rather than for each point in a triangulation.



Hatching patterns in filled contour plots, with legends

Phil Elson added support for hatching to `contourf()`, together with the ability to use a legend to identify contoured ranges.



Known issues in the matplotlib 1.2 release

- When using the Qt4Agg backend with IPython 0.11 or later, the save dialog will not display. This should be fixed in a future version of IPython.

9.18.3 API Changes in 1.2.x

- The `classic` option of the rc parameter `toolbar` is deprecated and will be removed in the next release.
- The `matplotlib.cbook.isvector` method has been removed since it is no longer functional.
- The `rasterization_zorder` property on *Axes* sets a zorder below which artists are rasterized. This has defaulted to -30000.0, but it now defaults to *None*, meaning no artists will be rasterized. In order to rasterize artists below a given zorder value, *set_rasterization_zorder* must be explicitly called.
- In *scatter()*, and *scatter*, when specifying a marker using a tuple, the angle is now specified in degrees, not radians.
- Using *twinx()* or *twiny()* no longer overrides the current locaters and formatters on the axes.
- In *contourf()*, the handling of the *extend* kwarg has changed. Formerly, the extended ranges were mapped after to 0, 1 after being normed, so that they always corresponded to the extreme values of the colormap. Now they are mapped outside this range so that they correspond to the special colormap values determined by the *set_under()* and *set_over()* methods, which default to the colormap end points.
- The new rc parameter `savefig.format` replaces `cairo.format` and `savefig.extension`, and sets the default file format used by *matplotlib.figure.Figure.savefig()*.
- In *pyplot.pie()* and *axes.Axes.pie()*, one can now set the radius of the pie; setting the *radius* to 'None' (the default value), will result in a pie with a radius of 1 as before.
- Use of `matplotlib.projections.projection_factory` is now deprecated in favour of axes class identification using `matplotlib.projections.process_projection_requirements` followed by direct axes class invocation (at the time of writing, functions which do this are: *add_axes()*, *add_subplot()* and *gca()*). Therefore:

```
key = figure._make_key(*args, **kwargs)
ispolar = kwargs.pop('polar', False)
projection = kwargs.pop('projection', None)
if ispolar:
    if projection is not None and projection != 'polar':
        raise ValueError('polar and projection args are␣
 ↪inconsistent')
    projection = 'polar'
ax = projection_factory(projection, self, rect, **kwargs)
key = self._make_key(*args, **kwargs)

# is now
```

(continues on next page)

(continued from previous page)

```
projection_class, kwargs, key = \
                    process_projection_requirements(self, *args,␣
 ↪**kwargs)
ax = projection_class(self, rect, **kwargs)
```

This change means that third party objects can expose themselves as Matplotlib axes by providing a `_as_mpl_axes` method. See *matplotlib.projections* for more detail.

- A new keyword *extendfrac* in *colorbar()* and *ColorbarBase* allows one to control the size of the triangular minimum and maximum extensions on colorbars.
- A new keyword *capthick* in *errorbar()* has been added as an intuitive alias to the *markeredgewidth* and *mew* keyword arguments, which indirectly controlled the thickness of the caps on the errorbars. For backwards compatibility, specifying either of the original keyword arguments will override any value provided by *capthick*.
- Transform subclassing behaviour is now subtly changed. If your transform implements a non-affine transformation, then it should override the `transform_non_affine` method, rather than the generic `transform` method. Previously transforms would define `transform` and then copy the method into `transform_non_affine`:

```
class MyTransform(mtrans.Transform):
    def transform(self, xy):
        ...
    transform_non_affine = transform
```

This approach will no longer function correctly and should be changed to:

```
class MyTransform(mtrans.Transform):
    def transform_non_affine(self, xy):
        ...
```

- Artists no longer have `x_isdata` or `y_isdata` attributes; instead any artist's transform can be interrogated with `artist_instance.get_transform().contains_branch(ax.transData)`
- Lines added to an axes now take into account their transform when updating the data and view limits. This means transforms can now be used as a pre-transform. For instance:

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.transforms as mtrans
>>> ax = plt.axes()
>>> ax.plot(range(10), transform=mtrans.Affine2D().scale(10) + ax.
 ↪transData)
>>> print(ax.viewLim)
Bbox('array([[  0.,   0.],\n       [ 90.,  90.]])')
```

- One can now easily get a transform which goes from one transform's coordinate system to another,

in an optimized way, using the new subtract method on a transform. For instance, to go from data coordinates to axes coordinates:

```
>>> import matplotlib.pyplot as plt
>>> ax = plt.axes()
>>> data2ax = ax.transData - ax.transAxes
>>> print(ax.transData.depth, ax.transAxes.depth)
3, 1
>>> print(data2ax.depth)
2
```

for versions before 1.2 this could only be achieved in a sub-optimal way, using `ax.transData + ax.transAxes.inverted()` (depth is a new concept, but had it existed it would return 4 for this example).

- `twinx` and `twiny` now returns an instance of SubplotBase if parent axes is an instance of SubplotBase.
- All Qt3-based backends are now deprecated due to the lack of py3k bindings. Qt and QtAgg backends will continue to work in v1.2.x for py2.6 and py2.7. It is anticipated that the Qt3 support will be completely removed for the next release.
- `matplotlib.colors.ColorConverter`, *`Colormap`* and *`Normalize`* now subclasses `object`
- ContourSet instances no longer have a `transform` attribute. Instead, access the transform with the `get_transform` method.

9.19 Version 1.1

9.19.1 What's new in Matplotlib 1.1 (Nov 02, 2011)

Table of Contents

- *What's new in Matplotlib 1.1 (Nov 02, 2011)*
  - *Sankey Diagrams*
  - *Animation*
  - *Tight Layout*
  - *PyQT4, PySide, and IPython*
  - *Legend*
  - *mplot3d*
  - *Numerix support removed*
  - *Markers*

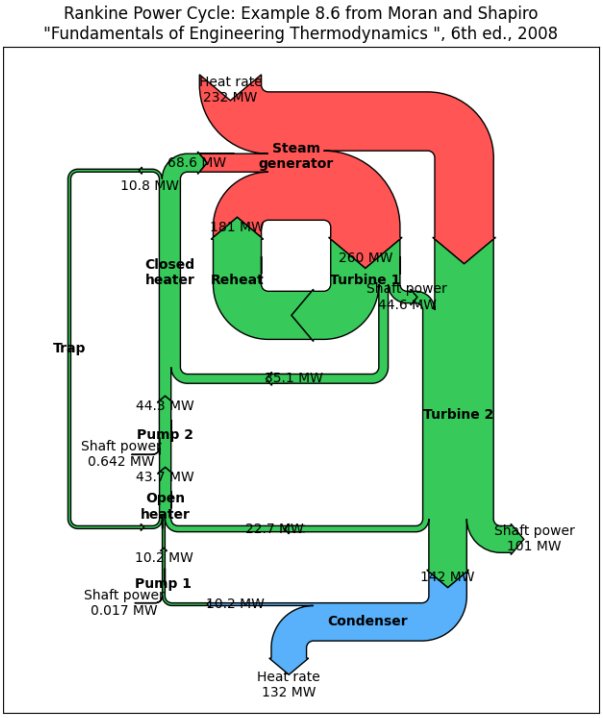
– *Other improvements*

Note

matplotlib 1.1 supports Python 2.4 to 2.7

Sankey Diagrams

Kevin Davies has extended Yannick Copin's original Sankey example into a module (`sankey`) and provided new examples (*The Sankey class*, *Long chain of connections using Sankey*, *Rankine power cycle*).



Animation

Ryan May has written a backend-independent framework for creating animated figures. The `animation` module is intended to replace the backend-specific examples formerly in the *Examples* listings. Examples using the new framework are in *Animation*; see the entrancing `double pendulum <gallery/animation/double_pendulum_sgskip.py>` which uses `matplotlib.animation.Animation.save()` to create the movie below.

This should be considered as a beta release of the framework; please try it and provide feedback.

Tight Layout

A frequent issue raised by users of matplotlib is the lack of a layout engine to nicely space out elements of the plots. While matplotlib still adheres to the philosophy of giving users complete control over the placement of plot elements, Jae-Joon Lee created the `matplotlib.tight_layout` module and introduced a new command *`tight_layout()`* to address the most common layout issues.

The usage of this functionality can be as simple as

```
plt.tight_layout()
```

and it will adjust the spacing between subplots so that the axis labels do not overlap with neighboring subplots. A *Tight layout guide* has been created to show how to use this new tool.

PyQT4, PySide, and IPython

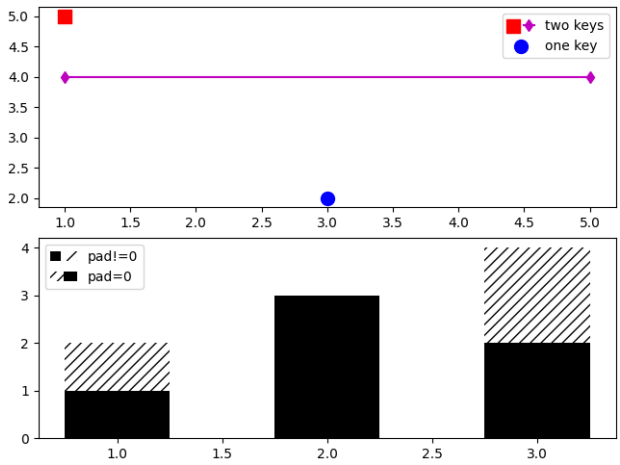
Gerald Storer made the Qt4 backend compatible with PySide as well as PyQT4. At present, however, PySide does not support the PyOS_InputHook mechanism for handling gui events while waiting for text input, so it cannot be used with the new version 0.11 of IPython. Until this feature appears in PySide, IPython users should use the PyQT4 wrapper for QT4, which remains the matplotlib default.

An rcParam entry, "backend.qt4", has been added to allow users to select PyQt4, PyQt4v2, or PySide. The latter two use the Version 2 Qt API. In most cases, users can ignore this rcParam variable; it is available to aid in testing, and to provide control for users who are embedding matplotlib in a PyQt4 or PySide app.

Legend

Jae-Joon Lee has improved plot legends. First, legends for complex plots such as *`stem()`* plots will now display correctly. Second, the 'best' placement of a legend has been improved in the presence of NANs.

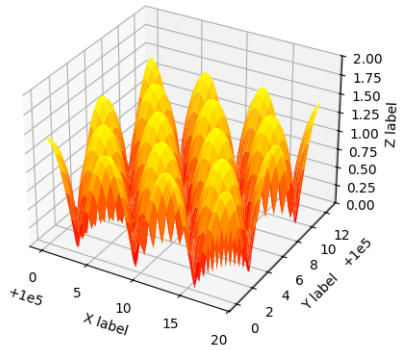
See the *Legend guide* for more detailed explanation and examples.



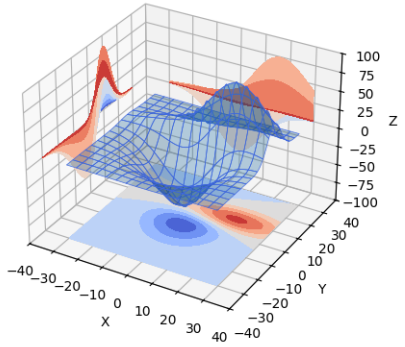
mplot3d

In continuing the efforts to make 3D plotting in matplotlib just as easy as 2D plotting, Ben Root has made several improvements to the `mplot3d` module.

- `Axes3D` has been improved to bring the class towards feature-parity with regular Axes objects
- Documentation for *The mplot3d toolkit* was significantly expanded
- Axis labels and orientation improved
- Most 3D plotting functions now support empty inputs
- Ticker offset display added:



- `contourf()` gains *zdir* and *offset* kwargs. You can now do this:



Numerix support removed

After more than two years of deprecation warnings, Numerix support has now been completely removed from matplotlib.

Markers

The list of available markers for *plot()* and *scatter()* has now been merged. While they were mostly similar, some markers existed for one function, but not the other. This merge did result in a conflict for the 'd' diamond marker. Now, 'd' will be interpreted to always mean "thin" diamond while 'D' will mean "regular" diamond.

Thanks to Michael Droettboom for this effort.

Other improvements

- Unit support for polar axes and *arrow()*
- *PolarAxes* gains getters and setters for "theta_direction", and "theta_offset" to allow for theta to go in either the clock-wise or counter-clockwise direction and to specify where zero degrees should be placed. *set_theta_zero_location()* is an added convenience function.
- Fixed error in argument handling for tri-functions such as *tripcolor()*
- `axes.labelweight` parameter added to rcParams.
- For *imshow()*, *interpolation='nearest'* will now always perform an interpolation. A "none" option has been added to indicate no interpolation at all.
- An error in the Hammer projection has been fixed.
- *clabel* for *contour()* now accepts a callable. Thanks to Daniel Hyams for the original patch.
- Jae-Joon Lee added the *HBoxDivider* and *VBoxDivider* classes.
- Christoph Gohlke reduced memory usage in *imshow()*.
- *scatter()* now accepts empty inputs.
- The behavior for 'symlog' scale has been fixed, but this may result in some minor changes to existing plots. This work was refined by ssyr.
- Peter Butterworth added named figure support to *figure()*.
- Michiel de Hoon has modified the MacOSX backend to make its interactive behavior consistent with the other backends.
- Pim Schellart added a new colormap called "cubehelix". Sameer Grover also added a colormap called "coolwarm". See it and all other colormaps *here*.
- Many bug fixes and documentation improvements.

9.19.2 API Changes in 1.1.x

- Added new *matplotlib.sankey.Sankey* for generating Sankey diagrams.
- In *imshow()*, setting *interpolation* to 'nearest' will now always mean that the nearest-neighbor interpolation is performed. If you want the no-op interpolation to be performed, choose 'none'.
- There were errors in how the tri-functions were handling input parameters that had to be fixed. If your tri-plots are not working correctly anymore, or you were working around apparent mistakes, please see issue #203 in the github tracker. When in doubt, use kwargs.

- The 'symlog' scale had some bad behavior in previous versions. This has now been fixed and users should now be able to use it without frustrations. The fixes did result in some minor changes in appearance for some users who may have been depending on the bad behavior.
- There is now a common set of markers for all plotting functions. Previously, some markers existed only for `scatter()` or just for `plot()`. This is now no longer the case. This merge did result in a conflict. The string 'd' now means "thin diamond" while 'D' will mean "regular diamond".

9.20 Version 1.0

9.20.1 What's new in Matplotlib 1.0 (Jul 06, 2010)

Table of Contents

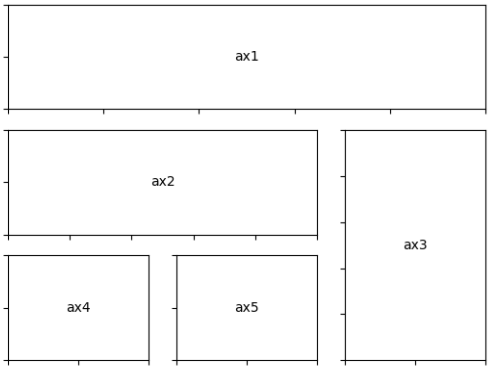
- *What's new in Matplotlib 1.0 (Jul 06, 2010)*
  - *HTML5/Canvas backend*
  - *Sophisticated subplot grid layout*
  - *Easy pythonic subplots*
  - *Contour fixes and triplot*
  - *multiple calls to show supported*
  - *mplot3d graphs can be embedded in arbitrary axes*
  - *tick_params*
  - *Lots of performance and feature enhancements*
  - *Much improved software carpentry*
  - *Bugfix marathon*

HTML5/Canvas backend

Simon Ratcliffe and Ludwig Schwardt have released an HTML5/Canvas backend for matplotlib. The backend is almost feature complete, and they have done a lot of work comparing their html5 rendered images with our core renderer Agg. The backend features client/server interactive navigation of matplotlib figures in an html5 compliant browser.

Sophisticated subplot grid layout

Jae-Joon Lee has written `gridspec`, a new module for doing complex subplot layouts, featuring row and column spans and more. See *Arranging multiple Axes in a Figure* for a tutorial overview.



Easy pythonic subplots

Fernando Perez got tired of all the boilerplate code needed to create a figure and multiple subplots when using the matplotlib API, and wrote a *subplots()* helper function. Basic usage allows you to create the figure and an array of subplots with numpy indexing (starts with 0). e.g.:

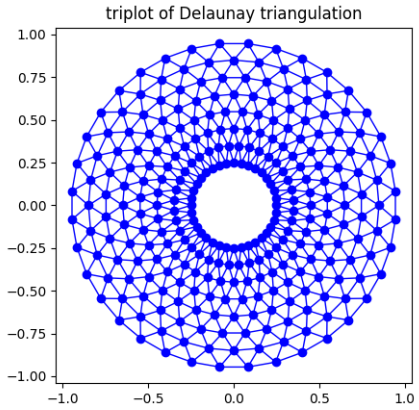
```
fig, axarr = plt.subplots(2, 2)
axarr[0,0].plot([1,2,3])   # upper, left
```

See *Multiple subplots* for several code examples.

Contour fixes and triplot

Ian Thomas has fixed a long-standing bug that has vexed our most talented developers for years. *contourf()* now handles interior masked regions, and the boundaries of line and filled contours coincide.

Additionally, he has contributed a new module *tri* and helper function *triplot()* for creating and plotting unstructured triangular grids.



multiple calls to show supported

A long standing request is to support multiple calls to `show()`. This has been difficult because it is hard to get consistent behavior across operating systems, user interface toolkits and versions. Eric Firing has done a lot of work on rationalizing show across backends, with the desired behavior to make show raise all newly created figures and block execution until they are closed. Repeated calls to show should raise newly created figures since the last call. Eric has done a lot of testing on the user interface toolkits and versions and platforms he has access to, but it is not possible to test them all, so please report problems to the mailing list and bug tracker.

mplot3d graphs can be embedded in arbitrary axes

You can now place an mplot3d graph into an arbitrary axes location, supporting mixing of 2D and 3D graphs in the same figure, and/or multiple 3D graphs in a single figure, using the "projection" keyword argument to add_axes or add_subplot. Thanks Ben Root.

tick_params

Eric Firing wrote tick_params, a convenience method for changing the appearance of ticks and tick labels. See pyplot function `tick_params()` and associated Axes method `tick_params()`.

Lots of performance and feature enhancements

- Faster magnification of large images, and the ability to zoom in to a single pixel
- Local installs of documentation work better
- Improved "widgets" -- mouse grabbing is supported
- More accurate snapping of lines to pixel boundaries
- More consistent handling of color, particularly the alpha channel, throughout the API

Much improved software carpentry

The matplotlib trunk is probably in as good a shape as it has ever been, thanks to improved software carpentry. We now have a buildbot which runs a suite of nose regression tests on every svn commit, auto-generating a set of images and comparing them against a set of known-goods, sending emails to developers on failures with a pixel-by-pixel image comparison. Releases and release bugfixes happen in branches, allowing active new feature development to happen in the trunk while keeping the release branches stable. Thanks to Andrew Straw, Michael Droettboom and other matplotlib developers for the heavy lifting.

Bugfix marathon

Eric Firing went on a bug fixing and closing marathon, closing over 100 bugs on the (now-closed) SourceForge bug tracker with help from Jae-Joon Lee, Michael Droettboom, Christoph Gohlke and Michiel de Hoon.

9.21 Version 0.x

9.21.1 List of changes to Matplotlib prior to 2015

This is a list of the changes made to Matplotlib from 2003 to 2015. For more recent changes, please refer to the *Release notes*.

2015-11-16

Levels passed to contour(f) and tricontour(f) must be in increasing order.

2015-10-21

Added TextBox widget

2015-10-21

Added get_ticks_direction()

2015-02-27

Added the rcParam 'image.composite_image' to permit users to decide whether they want the vector graphics backends to combine all images within a set of axes into a single composite image. (If images do not get combined, users can open vector graphics files in Adobe Illustrator or Inkscape and edit each image individually.)

2015-02-19

Rewrite of C++ code that calculates contours to add support for corner masking. This is controlled by the 'corner_mask' keyword in plotting commands 'contour' and 'contourf'. - IMT

2015-01-23

Text bounding boxes are now computed with advance width rather than ink area. This may result in slightly different placement of text.

2014-10-27

Allowed selection of the backend using the *MPLBACKEND* environment variable. Added documentation on backend selection methods.

2014-09-27

Overhauled *colors.LightSource*. Added *LightSource.hillshade* to allow the independent generation of illumination maps. Added new types of blending for creating more visually appealing shaded relief plots (e.g. `blend_mode="overlay"`, etc, in addition to the legacy "hsv" mode).

2014-06-10

Added Colorbar.remove()

2014-06-07

Fixed bug so radial plots can be saved as ps in py3k.

2014-06-01

Changed the fmt kwarg of errorbar to support the mpl convention that "none" means "don't draw it", and to default to the empty string, so that plotting of data points is done with the plot() function defaults. Deprecated use of the None object in place "none".

2014-05-22

Allow the linscale keyword parameter of symlog scale to be smaller than one.

2014-05-20

Added logic in FontManager to invalidate font-cache if font-family rcparams have changed.

2014-05-16

Fixed the positioning of multi-line text in the PGF backend.

2014-05-14

Added Axes.add_image() as the standard way to add AxesImage instances to Axes. This improves the consistency with add_artist(), add_collection(), add_container(), add_line(), add_patch(), and add_table().

2014-05-02

Added colorblind-friendly colormap, named 'Wistia'.

2014-04-27

Improved input clean up in Axes.{h|v}lines Coerce input into a 1D ndarrays (after dealing with units).

2014-04-27

removed un-needed cast to float in stem

2014-04-23

Updated references to "ipython -pylab" The preferred method for invoking pylab is now using the "%pylab" magic. -Chris G.

2014-04-22

Added (re-)generate a simple automatic legend to "Figure Options" dialog of the Qt4Agg backend.

2014-04-22

Added an example showing the difference between interpolation = 'none' and interpolation = 'nearest' in *imshow* when saving vector graphics files.

2014-04-22

Added violin plotting functions. See *Axes.violinplot*, *Axes.violin*, *cbook.violin_stats* and *mlab.GaussianKDE* for details.

2014-04-10

Fixed the triangular marker rendering error. The "Up" triangle was rendered instead of "Right" triangle and vice-versa.

2014-04-08

Fixed a bug in parasite_axes.py by making a list out of a generator at line 263.

2014-04-02

Added `clipon=False` to patch creation of wedges and shadows in *pie*.

2014-02-25

In backend_qt4agg changed from using update -> repaint under windows. See comment in source near `self._priv_update` for longer explanation.

2014-03-27

Added tests for pie ccw parameter. Removed pdf and svg images from tests for pie linewidth parameter.

2014-03-24

Changed the behaviour of axes to not ignore leading or trailing patches of height 0 (or width 0) while calculating the x and y axis limits. Patches having both height == 0 and width == 0 are ignored.

2014-03-24

Added bool kwarg (manage_xticks) to boxplot to enable/disable the management of the xlimits and ticks when making a boxplot. Default in True which maintains current behavior by default.

2014-03-23

Fixed a bug in projections/polar.py by making sure that the theta value being calculated when given the mouse coordinates stays within the range of 0 and 2 * pi.

2014-03-22

Added the keyword arguments wedgeprops and textprops to pie. Users can control the wedge and text properties of the pie in more detail, if they choose.

2014-03-17

Bug was fixed in append_axes from the AxesDivider class would not append axes in the right location with respect to the reference locator axes

2014-03-13

Add parameter 'clockwise' to function pie, True by default.

2014-02-28

Added 'origin' kwarg to *spy*

2014-02-27

Implemented separate horizontal/vertical axes padding to the ImageGrid in the AxesGrid toolkit

2014-02-27

Allowed markevery property of matplotlib.lines.Line2D to be, an int numpy fancy index, slice object, or float. The float behaviour turns on markers at approximately equal display-coordinate-distances along the line.

2014-02-25

In backend_qt4agg changed from using update -> repaint under windows. See comment in source near `self._priv_update` for longer explanation.

2014-01-02

triplot now returns the artist it adds and support of line and marker kwargs has been improved. GBY

2013-12-30

Made streamplot grid size consistent for different types of density argument. A 30x30 grid is now used for both density=1 and density=(1, 1).

2013-12-03

Added a pure boxplot-drawing method that allow a more complete customization of boxplots. It takes a list of dicts contains stats. Also created a function (*cbook.boxplot_stats*) that generates the stats needed.

2013-11-28

Added qhull extension module to perform Delaunay triangulation more robustly than before. It is used by tri.Triangulation (and hence all pyplot.tri* methods) and mlab.griddata. Deprecated matplotlib.delaunay module. - IMT

2013-11-05

Add power-law normalization method. This is useful for, e.g., showing small populations in a "hist2d" histogram.

2013-10-27

Added get_rlabel_position and set_rlabel_position methods to PolarAxes to control angular position of radial tick labels.

2013-10-06

Add stride-based functions to mlab for easy creation of 2D arrays with less memory.

2013-10-06

Improve window and detrend functions in mlab, particular support for 2D arrays.

2013-10-06

Improve performance of all spectrum-related mlab functions and plots.

2013-10-06

Added support for magnitude, phase, and angle spectrums to axes.specgram, and support for magnitude, phase, angle, and complex spectrums to mlab-specgram.

2013-10-06

Added magnitude_spectrum, angle_spectrum, and phase_spectrum plots, as well as magnitude_spectrum, angle_spectrum, phase_spectrum, and complex_spectrum functions to mlab

2013-07-12

Added support for datetime axes to 2d plots. Axis values are passed through Axes.convert_xunits/Axes.convert_yunits before being used by contour/contourf, pcolormesh and pcolor.

2013-07-12

Allowed matplotlib.dates.date2num, matplotlib.dates.num2date, and matplotlib.dates.datestr2num to accept n-d inputs. Also factored in support for n-d arrays to matplotlib.dates.DateConverter and matplotlib.units.Registry.

2013-06-26

Refactored the axes module: the axes module is now a folder, containing the following submodule:

- _subplots.py, containing all the subplots helper methods
- _base.py, containing several private methods and a new _AxesBase class. This _AxesBase class contains all the methods that are not directly linked to plots of the "old" Axes
- _axes.py contains the Axes class. This class now inherits from _AxesBase: it contains all "plotting" methods and labelling methods.

This refactoring should not affect the API. Only private methods are not importable from the axes module anymore.

2013-05-18

Added support for arbitrary rasterization resolutions to the SVG backend. Previously the resolution was hard coded to 72 dpi. Now the backend class takes a image_dpi argument for its constructor, adjusts the image bounding box accordingly and forwards a magnification factor to the image renderer. The code and results now resemble those of the PDF backend. - MW

2013-05-08

Changed behavior of hist when given stacked=True and normed=True. Histograms are now stacked first, then the sum is normalized. Previously, each histogram was normalized, then they were stacked.

2013-04-25

Changed all instances of:

```
from matplotlib import MatplotlibDeprecationWarning as␣
↪mplDeprecation
```

to:

```
from cbook import mplDeprecation
```

and removed the import into the matplotlib namespace in __init__.py - Thomas Caswell

2013-04-15

Added 'axes.xmargin' and 'axes.ymargin' to rpParams to set default margins on auto-scaling. - TAC

2013-04-16

Added patheffect support for Line2D objects. -JJL

2013-03-31

Added support for arbitrary unstructured user-specified triangulations to Axes3D.tricontour[f] - Damon McDougall

2013-03-19

Added support for passing *linestyle* kwarg to `step` so all `plot` kwargs are passed to the underlying `plot` call. -TAC

2013-02-25

Added classes CubicTriInterpolator, UniformTriRefiner, TriAnalyzer to matplotlib.tri module. - GBy

2013-01-23

Add 'savefig.directory' to rcParams to remember and fill in the last directory saved to for figure save dialogs - Martin Spacek

2013-01-13

Add eventplot method to axes and pyplot and EventCollection class to collections.

2013-01-08

Added two extra titles to axes which are flush with the left and right edges of the plot respectively. Andrew Dawson

2013-01-07

Add framealpha keyword argument to legend - PO

2013-01-16

Till Stensitzki added a baseline feature to stackplot

2012-12-22

Added classes for interpolation within triangular grids (LinearTriInterpolator) and to find the triangles in which points lie (TrapezoidMapTriFinder) to matplotlib.tri module. - IMT

2012-12-05

Added MatplotlibDeprecationWarning class for signaling deprecation. Matplotlib developers can use this class as follows:

```
from matplotlib import MatplotlibDeprecationWarning as␣
↪mplDeprecation
```

In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7, this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default. - PI

2012-11-27

Added the *mtext* parameter for supplying matplotlib.text.Text instances to RendererBase.draw_tex and RendererBase.draw_text. This allows backends to utilize additional text attributes, like the alignment of text elements. - pwuertz

2012-11-26

deprecate matplotlib/mpl.py, which was used only in pylab.py and is now replaced by the more suitable `import matplotlib as mpl`. - PI

2012-11-25

Make rc_context available via pyplot interface - PI

2012-11-16

plt.set_cmap no longer throws errors if there is not already an active colorable artist, such as an image, and just sets up the colormap to use from that point forward. - PI

2012-11-16

Added the function _get_rbga_face, which is identical to _get_rbg_face except it return a (r,g,b,a) tuble, to line2D. Modified Line2D.draw to use _get_rbga_face to get the markerface color so that any alpha set by markerfacecolor will respected. - Thomas Caswell

2012-11-13

Add a symmetric log normalization class to colors.py. Also added some tests for the normalization class. Till Stensitzki

2012-11-12

Make axes.stem take at least one argument. Uses a default range(n) when the first arg not provided. Damon McDougall

2012-11-09

Make plt.subplot() without arguments act as subplot(111) - PI

2012-11-08

Replaced plt.figure and plt.subplot calls by the newer, more convenient single call to plt.subplots() in the documentation examples - PI

2012-10-05

Add support for saving animations as animated GIFs. - JVDP

2012-08-11

Fix path-closing bug in patches.Polygon, so that regardless of whether the path is the initial one or was subsequently set by set_xy(), get_xy() will return a closed path if and only if get_closed() is True. Thanks to Jacob Vanderplas. - EF

2012-08-05

When a norm is passed to contourf, either or both of the vmin, vmax attributes of that norm are now respected. Formerly they were respected only if both were specified. In addition, vmin and/or vmax can now be passed to contourf directly as kwargs. - EF

2012-07-24

Contourf handles the extend kwarg by mapping the extended ranges outside the normed 0-1 range so that they are handled by colormap colors determined by the set_under and set_over methods. Previously the extended ranges were mapped to 0 or 1 so that the "under" and "over" colormap colors were ignored. This change also increases slightly the color contrast for a given set of contour levels. - EF

2012-06-24

Make use of mathtext in tick labels configurable - DSD

2012-06-05

Images loaded through PIL are now ordered correctly - CG

2012-06-02

Add new Axes method and pyplot function, hist2d. - PO

2012-05-31

Remove support for 'cairo.<format>' style of backend specification. Deprecate 'cairo.format' and 'savefig.extension' rcParams and replace with 'savefig.format'. - Martin Spacek

2012-05-29

pcolormesh now obeys the passed in "edgecolor" kwarg. To support this, the "shading" argument to pcolormesh now only takes "flat" or "gouraud". To achieve the old "faceted" behavior, pass "edgecolors='k'". - MGD

2012-05-22

Added radius kwarg to pie charts. - HH

2012-05-22

Collections now have a setting "offset_position" to select whether the offsets are given in "screen" coordinates (default, following the old behavior) or "data" coordinates. This is currently used internally to improve the performance of hexbin.

As a result, the "draw_path_collection" backend methods have grown a new argument "offset_position". - MGD

2012-05-04

Add a new argument to pie charts - startingangle - that allows one to specify the angle offset for the first wedge of the chart. - EP

2012-05-03

symlog scale now obeys the logarithmic base. Previously, it was completely ignored and always treated as base e. - MGD

2012-05-03

Allow linscalex/y keyword to symlog scale that allows the size of the linear portion relative to the logarithmic portion to be adjusted. - MGD

2012-04-14

Added new plot style: stackplot. This new feature supports stacked area plots. - Damon McDougall

2012-04-06

When path clipping changes a LINETO to a MOVETO, it also changes any CLOSEPOLY command to a LINETO to the initial point. This fixes a problem with pdf and svg where the CLOSEPOLY would then draw a line to the latest MOVETO position instead of the intended initial position. - JKS

2012-03-27

Add support to ImageGrid for placing colorbars only at one edge of each column/row. - RMM

2012-03-07

Refactor movie writing into useful classes that make use of pipes to write image data to ffmpeg or mencoder. Also improve settings for these and the ability to pass custom options. - RMM

2012-02-29

errorevery keyword added to errorbar to enable errorbar subsampling. fixes issue #600.

2012-02-28

Added plot_trisurf to the mplot3d toolkit. This supports plotting three dimensional surfaces on an irregular grid. - Damon McDougall

2012-01-23

The radius labels in polar plots no longer use a fixed padding, but use a different alignment depending on the quadrant they are in. This fixes numerical problems when (rmax - rmin) gets too small. - MGD

2012-01-08

Add axes.streamplot to plot streamlines of a velocity field. Adapted from Tom Flannaghan streamplot implementation. -TSY

2011-12-29

ps and pdf markers are now stroked only if the line width is nonzero for consistency with agg, fixes issue #621. - JKS

2011-12-27

Work around an EINTR bug in some versions of subprocess. - JKS

2011-10-25

added support for operatorname to mathtext, including the ability to insert spaces, such as $operatorname{arg,max}$ - PI

2011-08-18

Change api of Axes.get_tightbbox and add an optional keyword parameter *call_axes_locator*. - JJL

2011-07-29

A new rcParam "axes.formatter.use_locale" was added, that, when True, will use the current locale to format tick labels. This means that, for example, in the fr_FR locale, ',' will be used as a decimal separator. - MGD

2011-07-15

The set of markers available in the plot() and scatter() commands has been unified. In general, this gives more options to both than were previously available, however, there is one backward-incompatible change to the markers in scatter:

> "d" used to mean "diamond", it now means "narrow diamond". "D" can be used for a "diamond".

-MGD

2011-07-13

Fix numerical problems in symlog scale, particularly when linthresh <= 1.0. Symlog plots may look different if one was depending on the old broken behavior - MGD

2011-07-10

Fixed argument handling error in tripcolor/triplot/tricontour, issue #203. - IMT

2011-07-08

Many functions added to mplot3d.axes3d to bring Axes3D objects more feature-parity with regular Axes objects. Significant revisions to the documentation as well. - BVR

2011-07-07

Added compatibility with IPython strategy for picking a version of Qt4 support, and an rcParam for making the choice explicitly: backend.qt4. - EF

2011-07-07

Modified AutoMinorLocator to improve automatic choice of the number of minor intervals per major interval, and to allow one to specify this number via a kwarg. - EF

2011-06-28

3D versions of scatter, plot, plot_wireframe, plot_surface, bar3d, and some other functions now support empty inputs. - BVR

2011-06-22

Add set_theta_offset, set_theta_direction and set_theta_zero_location to polar axes to control the location of 0 and directionality of theta. - MGD

2011-06-22

Add axes.labelweight parameter to set font weight to axis labels - MGD.

2011-06-20

Add pause function to pyplot. - EF

2011-06-16

Added *bottom* keyword parameter for the stem command. Also, implemented a legend handler for the stem plot. - JJL

2011-06-16

Added legend.frameon rcParams. - Mike Kaufman

2011-05-31

Made backend_qt4 compatible with PySide . - Gerald Storer

2011-04-17

Disable keyboard auto-repeat in qt4 backend by ignoring key events resulting from auto-repeat. This makes constrained zoom/pan work. - EF

2011-04-14

interpolation="nearest" always interpolate images. A new mode "none" is introduced for no interpolation - JJL

2011-04-03

Fixed broken pick interface to AsteriskCollection objects used by scatter. - EF

2011-04-01

The plot directive Sphinx extension now supports all of the features in the Numpy fork of that extension. These include doctest formatting, an 'include-source' option, and a number of new configuration options. - MGD

2011-03-29

Wrapped ViewVCCachedServer definition in a factory function. This class now inherits from urllib2.HTTPSHandler in order to fetch data from github, but HTTPSHandler is not defined if python was built without SSL support. - DSD

2011-03-10

Update pytz version to 2011c, thanks to Simon Cross. - JKS

2011-03-06

Add standalone tests.py test runner script. - JKS

2011-03-06

Set edgecolor to 'face' for scatter asterisk-type symbols; this fixes a bug in which these symbols were not responding to the c kwarg. The symbols have no face area, so only the edgecolor is visible. - EF

2011-02-27

Support libpng version 1.5.x; suggestion by Michael Albert. Changed installation specification to a minimum of libpng version 1.2. - EF

2011-02-20

clabel accepts a callable as an fmt kwarg; modified patch by Daniel Hyams. - EF

2011-02-18

scatter([], []) is now valid. Also fixed issues with empty collections - BVR

2011-02-07

Quick workaround for dviread bug #3175113 - JKS

2011-02-05

Add cbook memory monitoring for Windows, using tasklist. - EF

2011-02-05

Speed up Normalize and LogNorm by using in-place operations and by using float32 for float32 inputs and for ints of 2 bytes or shorter; based on patch by Christoph Gohlke. - EF

2011-02-04

Changed imshow to use rgba as uint8 from start to finish, instead of going through an intermediate step as double precision; thanks to Christoph Gohlke. - EF

2011-01-13

Added zdir and offset arguments to contourf3d to bring contourf3d in feature parity with contour3d. - BVR

2011-01-04

Tag 1.0.1 for release at r8896

2011-01-03

Added display of ticker offset to 3d plots. - BVR

2011-01-03

Turn off tick labeling on interior subplots for pyplots.subplots when sharex/sharey is True. - JDH

2010-12-29

Implement axes_divider.HBox and VBox. -JJL

2010-11-22

Fixed error with Hammer projection. - BVR

2010-11-12

Fixed the placement and angle of axis labels in 3D plots. - BVR

2010-11-07

New rc parameters examples.download and examples.directory allow bypassing the download mechanism in get_sample_data. - JKS

2010-10-04

Fix JPEG saving bug: only accept the kwargs documented by PIL for JPEG files. - JKS

2010-09-15

Remove unused _wxagg extension and numerix.h. - EF

2010-08-25

Add new framework for doing animations with examples.- RM

2010-08-21

Remove unused and inappropriate methods from Tick classes: set_view_interval, get_minpos, and get_data_interval are properly found in the Axis class and don't need to be duplicated in XTick and YTick. - EF

2010-08-21

Change Axis.set_view_interval() so that when updating an existing interval, it respects the orientation of that interval, and can enlarge but not reduce the interval. This fixes a bug in which Axis.set_ticks

would change the view limits of an inverted axis. Whether set_ticks should be affecting the viewLim at all remains an open question. - EF

2010-08-16

Handle NaN's correctly in path analysis routines. Fixes a bug where the best location for a legend was not calculated correctly when the line contains NaNs. - MGD

2010-08-14

Fix bug in patch alpha handling, and in bar color kwarg - EF

2010-08-12

Removed all traces of numerix module after 17 months of deprecation warnings. - EF

2010-08-05

Added keyword arguments 'thetaunits' and 'runits' for polar plots. Fixed PolarAxes so that when it set default Formatters, it marked them as such. Fixed semilogx and semilogy to no longer blindly reset the ticker information on the non-log axis. Axes.arrow can now accept unitized data. - JRE

2010-08-03

Add support for MPLSETUPCFG variable for custom setup.cfg filename. Used by sage buildbot to build an mpl w/ no gui support - JDH

2010-08-01

Create directory specified by MPLCONFIGDIR if it does not exist. - ADS

2010-07-20

Return Qt4's default cursor when leaving the canvas - DSD

2010-07-06

Tagging for mpl 1.0 at r8502

2010-07-05

Added Ben Root's patch to put 3D plots in arbitrary axes, allowing you to mix 3d and 2d in different axes/subplots or to have multiple 3D plots in one figure. See examples/mplot3d/subplot3d_demo.py - JDH

2010-07-05

Preferred kwarg names in set_xlim are now 'left' and 'right'; in set_ylim, 'bottom' and 'top'; original kwargs are still accepted without complaint. - EF

2010-07-05

TkAgg and FltkAgg backends are now consistent with other interactive backends: when used in scripts from the command line (not from ipython -pylab), show blocks, and can be called more than once. - EF

2010-07-02

Modified CXX/WrapPython.h to fix "swab bug" on solaris so mpl can compile on Solaris with CXX6 in the trunk. Closes tracker bug 3022815 - JDH

2010-06-30

Added autoscale convenience method and corresponding pyplot function for simplified control of autoscaling; and changed axis, set_xlim, and set_ylim so that by default, they turn off the autoscaling on the relevant axis or axes. Therefore one can call set_xlim before plotting a line, for example, and the limits will be retained. - EF

2010-06-20

Added Axes.tick_params and corresponding pyplot function to control tick and tick label appearance after an Axes has been created. - EF

2010-06-09

Allow Axes.grid to control minor gridlines; allow Axes.grid and Axis.grid to control major and minor gridlines in the same method call. - EF

2010-06-06

Change the way we do split/dividend adjustments in finance.py to handle dividends and fix the zero division bug reported in sf bug 2949906 and 2123566. Note that volume is not adjusted because the Yahoo CSV does not distinguish between share split and dividend adjustments making it near impossible to get volume adjustment right (unless we want to guess based on the size of the adjustment or scrape the html tables, which we don't) - JDH

2010-06-06

Updated dateutil to 1.5 and pytz to 2010h.

2010-06-02

Add error_kw kwarg to Axes.bar(). - EF

2010-06-01

Fix pcolormesh() and QuadMesh to pass on kwargs as appropriate. - RM

2010-05-18

Merge mpl_toolkits.gridspec into the main tree. - JJL

2010-05-04

Improve backend_qt4 so it displays figures with the correct size - DSD

2010-04-20

Added generic support for connecting to a timer for events. This adds TimerBase, TimerGTK, TimerQT, TimerWx, and TimerTk to the backends and a new_timer() method to each backend's canvas to allow ease of creating a new timer. - RM

2010-04-20

Added margins() Axes method and pyplot function. - EF

2010-04-18

update the axes_grid documentation. -JJL

2010-04-18

Control MaxNLocator parameters after instantiation, and via Axes.locator_params method, with corresponding pyplot function. -EF

2010-04-18

Control ScalarFormatter offsets directly and via the Axes.ticklabel_format() method, and add that to pyplot. -EF

2010-04-16

Add a close_event to the backends. -RM

2010-04-06

modify axes_grid examples to use axes_grid1 and axisartist. -JJL

2010-04-06

rebase axes_grid using axes_grid1 and axisartist modules. -JJL

2010-04-06

axes_grid toolkit is split into two separate modules, axes_grid1 and axisartist. -JJL

2010-04-05

Speed up import: import pytz only if and when it is needed. It is not needed if the rc timezone is UTC. - EF

2010-04-03

Added color kwarg to Axes.hist(), based on work by Jeff Klukas. - EF

2010-03-24

refactor colorbar code so that no cla() is necessary when mappable is changed. -JJL

2010-03-22

fix incorrect rubber band during the zoom mode when mouse leaves the axes. -JJL

2010-03-21

x/y key during the zoom mode only changes the x/y limits. -JJL

2010-03-20

Added pyplot.sca() function suggested by JJL. - EF

2010-03-20

Added conditional support for new Tooltip API in gtk backend. - EF

2010-03-20

Changed plt.fig_subplot() to plt.subplots() after discussion on list, and changed its API to return axes as a numpy object array (with control of dimensions via squeeze keyword). FP.

2010-03-13

Manually brought in commits from branch:

```
------------------------------------------------------------------------
 ↪-----
r8191 | leejjoon | 2010-03-13
17:27:57 -0500 (Sat, 13 Mar 2010) | 1 line
```

fix the bug that handles for scatter are incorrectly set when dpi!=72. Thanks to Ray Speth for the bug report.

2010-03-03

Manually brought in commits from branch via diff/patch (svnmerge is broken):

```
------------------------------------------------------------------------
 ↪-----
r8175 | leejjoon | 2010-03-03
10:03:30 -0800 (Wed, 03 Mar 2010) | 1 line

fix arguments of allow_rasterization.draw_wrapper
------------------------------------------------------------------------
 ↪-----
r8174 | jdh2358 | 2010-03-03
09:15:58 -0800 (Wed, 03 Mar 2010) | 1 line

added support for favicon in docs build
------------------------------------------------------------------------
 ↪-----
r8173 | jdh2358 | 2010-03-03
08:56:16 -0800 (Wed, 03 Mar 2010) | 1 line

applied Mattias get_bounds patch
------------------------------------------------------------------------

```

2010-02-25

add annotation_demo3.py that demonstrates new functionality. -JJL

2010-02-25

refactor Annotation to support arbitrary Transform as xycoords or textcoords. Also, if a tuple of two coordinates is provided, they are interpreted as coordinates for each x and y position. -JJL

2010-02-24

Added pyplot.fig_subplot(), to create a figure and a group of subplots in a single call. This offers an easier pattern than manually making figures and calling add_subplot() multiple times. FP

2010-02-17

Added Gokhan's and Mattias' customizable keybindings patch for the toolbar. You can now set the keymap.* properties in the matplotlibrc file. Newbindings were added for toggling log scaling on the x-axis. JDH

2010-02-16

Committed TJ's filled marker patch for left|right|bottom|top|full filled markers. See examples/pylab_examples/filledmarker_demo.py. JDH

2010-02-11

Added 'bootstrap' option to boxplot. This allows bootstrap estimates of median confidence intervals. Based on an initial patch by Paul Hobson. - ADS

2010-02-06

Added setup.cfg "basedirlist" option to override setting in setupext.py "basedir" dictionary; added "gnu0" platform requested by Benjamin Drung. - EF

2010-02-06

Added 'xy' scaling option to EllipseCollection. - EF

2010-02-03

Made plot_directive use a custom PlotWarning category, so that warnings can be turned into fatal errors easily if desired. - FP

2010-01-29

Added draggable method to Legend to allow mouse drag placement. Thanks Adam Fraser. JDH

2010-01-25

Fixed a bug reported by Olle Engdegard, when using histograms with stepfilled and log=True - MM

2010-01-16

Upgraded CXX to 6.1.1 - JDH

2009-01-16

Don't create minor ticks on top of existing major ticks. Patch by Neil Crighton. -ADS

2009-01-16

Ensure three minor ticks always drawn (SF# 2924245). Patch by Neil Crighton. -ADS

2010-01-16

Applied patch by Ian Thomas to fix two contouring problems: now contourf handles interior masked regions, and the boundaries of line and filled contours coincide. - EF

2009-01-11

The color of legend patch follows the rc parameters axes.facecolor and axes.edgecolor. -JJL

2009-01-11

adjustable of Axes can be "box-forced" which allow sharing axes. -JJL

2009-01-11

Add add_click and pop_click methods in BlockingContourLabeler. -JJL

2010-01-03

Added rcParams['axes.color_cycle'] - EF

2010-01-03

Added Pierre's qt4 formlayout editor and toolbar button - JDH

2009-12-31

Add support for using math text as marker symbols (Thanks to tcb) - MGD

2009-12-31

Commit a workaround for a regression in PyQt4-4.6.{0,1} - DSD

2009-12-22

Fix cmap data for gist_earth_r, etc. -JJL

2009-12-20

spines: put spines in data coordinates, add set_bounds() call. -ADS

2009-12-18

Don't limit notch size in boxplot to q1-q3 range, as this is effectively making the data look better than it is. - ADS

2009-12-18

mlab.prctile handles even-length data, such that the median is the mean of the two middle values. - ADS

2009-12-15

Add raw-image (unsampled) support for the ps backend. - JJL

2009-12-14

Add patch_artist kwarg to boxplot, but keep old default. Convert boxplot_demo2.py to use the new patch_artist. - ADS

2009-12-06

axes_grid: reimplemented AxisArtist with FloatingAxes support. Added new examples. - JJL

2009-12-01

Applied Laurent Dufrechou's patch to improve blitting with the qt4 backend - DSD

2009-11-13

The pdf backend now allows changing the contents of a pdf file's information dictionary via PdfPages.infodict. - JKS

2009-11-12

font_manager.py should no longer cause EINTR on Python 2.6 (but will on the 2.5 version of subprocess). Also the fc-list command in that file was fixed so now it should actually find the list of fontconfig fonts. - JKS

2009-11-10

Single images, and all images in renderers with option_image_nocomposite (i.e. agg, macosx and the svg backend when rcParams['svg.image_noscale'] is True), are now drawn respecting the zorder relative to other artists. (Note that there may now be inconsistencies across backends when more than one image is drawn at varying zorders, but this change introduces correct behavior for the backends in which it's easy to do so.)

2009-10-21

Make AutoDateLocator more configurable by adding options to control the maximum and minimum number of ticks. Also add control of the intervals to be used for ticking. This does not change behavior but opens previously hard-coded behavior to runtime modification`. - RMM

2009-10-19

Add "path_effects" support for Text and Patch. See examples/pylab_examples/patheffect_demo.py -JJL

2009-10-19

Add "use_clabeltext" option to clabel. If True, clabels will be created with ClabelText class, which recalculates rotation angle of the label during the drawing time. -JJL

2009-10-16

Make AutoDateFormatter actually use any specified timezone setting.This was only working correctly when no timezone was specified. - RMM

2009-09-27

Beginnings of a capability to test the pdf backend. - JKS

2009-09-27

Add a savefig.extension rcparam to control the default filename extension used by savefig. - JKS

2009-09-21

Tagged for release 0.99.1

2009-09-20

Fix usetex spacing errors in pdf backend. - JKS

2009-09-20

Add Sphinx extension to highlight IPython console sessions, originally authored (I think) by Michael Droetboom. - FP

2009-09-20

Fix off-by-one error in dviread.Tfm, and additionally protect against exceptions in case a dvi font is missing some metrics. - JKS

2009-09-15

Implement draw_text and draw_tex method of backend_base using the textpath module. Implement draw_tex method of the svg backend. - JJL

2009-09-15

Don't fail on AFM files containing floating-point bounding boxes - JKS

2009-09-13

AxesGrid : add modified version of colorbar. Add colorbar location howto. - JJL

2009-09-07

AxesGrid : implemented axisline style. Added a demo examples/axes_grid/demo_axisline_style.py- JJL

2009-09-04

Make the textpath class as a separate module (textpath.py). Add support for mathtext and tex.- JJL

2009-09-01

Added support for Gouraud interpolated triangles. pcolormesh now accepts shading='gouraud' as an option. - MGD

2009-08-29

Added matplotlib.testing package, which contains a Nose plugin and a decorator that lets tests be marked as KnownFailures - ADS

2009-08-20

Added scaled dict to AutoDateFormatter for customized scales - JDH

2009-08-15

Pyplot interface: the current image is now tracked at the figure and axes level, addressing tracker item 1656374. - EF

2009-08-15

Docstrings are now manipulated with decorators defined in a new module, docstring.py, thanks to Jason Coombs. - EF

2009-08-14

Add support for image filtering for agg back end. See the example demo_agg_filter.py. -JJL

2009-08-09

AnnotationBbox added. Similar to Annotation, but works with OffsetBox instead of Text. See the example demo_annotation_box.py. -JJL

2009-08-07

BboxImage implemented. Two examples, demo_bboximage.py and demo_ribbon_box.py added. -JJL

2009-08-07

In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```
draw_path_collection(self, master_transform, cliprect, clippath,
                     clippath_trans, paths, all_transforms,␣
 ↪offsets,
                     offsetTrans, facecolors, edgecolors,␣
 ↪linewidths,
                     linestyles, antialiaseds, urls)
```

becomes:

```
draw_path_collection(self, gc, master_transform, paths, all_
 ↪transforms,
                     offsets, offsetTrans, facecolors, edgecolors,
                     linewidths, linestyles, antialiaseds, urls)
```

```
draw_quad_mesh(self, master_transform, cliprect, clippath,
               clippath_trans, meshWidth, meshHeight, coordinates,
               offsets, offsetTrans, facecolors, antialiased,
               showedges)
```

becomes:

```
draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
               coordinates, offsets, offsetTrans, facecolors,
               antialiased, showedges)
```

```
draw_image(self, x, y, im, bbox, clippath=None, clippath_
 ↪trans=None)
```

becomes:

```
draw_image(self, gc, x, y, im)
```

- MGD

2009-08-06

Tagging the 0.99.0 release at svn r7397 - JDH

- fixed an alpha colormapping bug posted on sf 2832575
- fix typo in axes_divider.py. use nanmin, nanmax in angle_helper.py (patch by Christoph Gohlke)
- remove dup gui event in enter/leave events in gtk
- lots of fixes for os x binaries (Thanks Russell Owen)
- attach gtk events to mpl events -- fixes sf bug 2816580
- applied sf patch 2815064 (middle button events for wx) and patch 2818092 (resize events for wx)
- fixed boilerplate.py so it doesn't break the ReST docs.
- removed a couple of cases of mlab.load
- fixed rec2csv win32 file handle bug from sf patch 2831018
- added two examples from Josh Hemann: examples/pylab_examples/barchart_demo2.py and examples/pylab_examples/boxplot_demo2.py
- handled sf bugs 2831556 and 2830525; better bar error messages and backend driver configs
- added miktex win32 patch from sf patch 2820194
- apply sf patches 2830233 and 2823885 for osx setup and 64 bit; thanks Michiel

2009-08-04

Made cbook.get_sample_data make use of the ETag and Last-Modified headers of mod_dav_svn. - JKS

2009-08-03

Add PathCollection; modify contourf to use complex paths instead of simple paths with cuts. - EF

2009-08-03

Fixed boilerplate.py so it doesn't break the ReST docs. - JKS

2009-08-03

pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary numpy arrays. - JDH

2009-07-31

Added cbook.get_sample_data for urllib enabled fetching and caching of data needed for examples. See examples/misc/sample_data_demo.py - JDH

2009-07-31

Tagging 0.99.0.rc1 at 7314 - MGD

2009-07-30

Add set_cmap and register_cmap, and improve get_cmap, to provide convenient handling of user-generated colormaps. Reorganized _cm and cm modules. - EF

2009-07-28

Quiver speed improved, thanks to tip by Ray Speth. -EF

2009-07-27

Simplify argument handling code for plot method. -EF

2009-07-25

Allow "plot(1, 2, 'r*')" to work. - EF

2009-07-22

Added an 'interp' keyword to griddata so the faster linear interpolation method can be chosen. Default is 'nn', so default behavior (using natural neighbor method) is unchanged (JSW)

2009-07-22

Improved boilerplate.py so that it generates the correct signatures for pyplot functions. - JKS

2009-07-19

Fixed the docstring of Axes.step to reflect the correct meaning of the kwargs "pre" and "post" - See SF bug https://sourceforge.net/tracker/index.php?func=detail&aid=2823304&group_id=80706&atid=560720 - JDH

2009-07-18

Fix support for hatches without color fills to pdf and svg backends. Add an example of that to hatch_demo.py. - JKS

2009-07-17

Removed fossils from swig version of agg backend. - EF

2009-07-14

initial submission of the annotation guide. -JJL

2009-07-14

axes_grid : minor improvements in anchored_artists and inset_locator. -JJL

2009-07-14

Fix a few bugs in ConnectionStyle algorithms. Add ConnectionPatch class. -JJL

2009-07-11

Added a fillstyle Line2D property for half filled markers -- see examples/pylab_examples/fillstyle_demo.py JDH

2009-07-08

Attempt to improve performance of qt4 backend, do not call qApp.processEvents while processing an event. Thanks Ole Streicher for tracking this down - DSD

2009-06-24

Add withheader option to mlab.rec2csv and changed use_mrecords default to False in mlab.csv2rec since this is partially broken - JDH

2009-06-24

backend_agg.draw_marker quantizes the main path (as in the draw_path). - JJL

2009-06-24

axes_grid: floating axis support added. - JJL

2009-06-14

Add new command line options to backend_driver.py to support running only some directories of tests - JKS

2009-06-13

partial cleanup of mlab and its importation in pylab - EF

2009-06-13

Introduce a rotation_mode property for the Text artist. See examples/pylab_examples/demo_text_rotation_mode.py -JJL

2009-06-07

add support for bz2 files per sf support request 2794556 - JDH

2009-06-06

added a properties method to the artist and inspector to return a dict mapping property name -> value; see sf feature request 2792183 - JDH

2009-06-06

added Neil's auto minor tick patch; sf patch #2789713 - JDH

2009-06-06

do not apply alpha to rgba color conversion if input is already rgba - JDH

2009-06-03

axes_grid : Initial check-in of curvelinear grid support. See examples/axes_grid/demo_curvelinear_grid.py - JJL

2009-06-01

Add set_color method to Patch - EF

2009-06-01

Spine is now derived from Patch - ADS

2009-06-01

use cbook.is_string_like() instead of isinstance() for spines - ADS

2009-06-01

cla() support for spines - ADS

2009-06-01

Removed support for gtk < 2.4. - EF

2009-05-29

Improved the animation_blit_qt4 example, which was a mix of the object-oriented and pylab interfaces. It is now strictly object-oriented - DSD

2009-05-28

Fix axes_grid toolkit to work with spine patch by ADS. - JJL

2009-05-28

Applied fbianco's patch to handle scroll wheel events in the qt4 backend - DSD

2009-05-26

Add support for "axis spines" to have arbitrary location. -ADS

2009-05-20

Add an empty matplotlibrc to the tests/ directory so that running tests will use the default set of rcparams rather than the user's config. - RMM

2009-05-19

Axis.grid(): allow use of which='major,minor' to have grid on major and minor ticks. -ADS

2009-05-18

Make psd(), csd(), and cohere() wrap properly for complex/two-sided versions, like specgram() (SF #2791686) - RMM

2009-05-18

Fix the linespacing bug of multiline text (#1239682). See examples/pylab_examples/multiline.py -JJL

2009-05-18

Add *annotation_clip* attr. for text.Annotation class. If True, annotation is only drawn when the annotated point is inside the axes area. -JJL

2009-05-17

Fix bug(#2749174) that some properties of minor ticks are not conserved -JJL

2009-05-17

applied Michiel's sf patch 2790638 to turn off gtk event loop in setupext for pygtk>=2.15.10 - JDH

2009-05-17

applied Michiel's sf patch 2792742 to speed up Cairo and macosx collections; speedups can be 20x. Also fixes some bugs in which gc got into inconsistent state

---

2008-05-17

Release 0.98.5.3 at r7107 from the branch - JDH

2009-05-13

An optional offset and bbox support in restore_bbox. Add animation_blit_gtk2.py. -JJL

2009-05-13

psfrag in backend_ps now uses baseline-alignment when preview.sty is used ((default is bottom-alignment). Also, a small API improvement in OffsetBox-JJL

2009-05-13

When the x-coordinate of a line is monotonically increasing, it is now automatically clipped at the stage of generating the transformed path in the draw method; this greatly speeds up zooming and panning when one is looking at a short segment of a long time series, for example. - EF

2009-05-11

aspect=1 in log-log plot gives square decades. -JJL

2009-05-08

clabel takes new kwarg, rightside_up; if False, labels will not be flipped to keep them rightside-up. This allows the use of clabel to make streamfunction arrows, as requested by Evan Mason. - EF

2009-05-07

'labelpad' can now be passed when setting x/y labels. This allows controlling the spacing between the label and its axis. - RMM

2009-05-06

print_ps now uses mixed-mode renderer. Axes.draw rasterize artists whose zorder smaller than rasterization_zorder. -JJL

2009-05-06

Per-artist Rasterization, originally by Eric Bruning. -JJ

2009-05-05

Add an example that shows how to make a plot that updates using data from another process. Thanks to Robert Cimrman - RMM

2009-05-05

Add Axes.get_legend_handles_labels method. - JJL

2009-05-04

Fix bug that Text.Annotation is still drawn while set to not visible. - JJL

2009-05-04

Added TJ's fill_betweenx patch - JDH

2009-05-02

Added options to plotfile based on question from Joseph Smidt and patch by Matthias Michler. - EF

2009-05-01

Changed add_artist and similar Axes methods to return their argument. - EF

2009-04-30

Incorrect eps bbox for landscape mode fixed - JJL

2009-04-28

Fixed incorrect bbox of eps output when usetex=True. - JJL

2009-04-24

Changed use of os.open* to instead use subprocess.Popen. os.popen* are deprecated in 2.6 and are removed in 3.0. - RMM

2009-04-20

Worked on axes_grid documentation. Added axes_grid.inset_locator. - JJL

2009-04-17

Initial check-in of the axes_grid toolkit. - JJL

2009-04-17

Added a support for bbox_to_anchor in offsetbox.AnchoredOffsetbox. Improved a documentation. - JJL

2009-04-16

Fixed a offsetbox bug that multiline texts are not correctly aligned. - JJL

2009-04-16

Fixed a bug in mixed mode renderer that images produced by an rasterizing backend are placed with incorrect size. - JJL

2009-04-14

Added Jonathan Taylor's Reinier Heeres' port of John Porters' mplot3d to svn trunk. Package in mpl_toolkits.mplot3d and demo is examples/mplot3d/demo.py. Thanks Reiner

2009-04-06

The pdf backend now escapes newlines and linefeeds in strings. Fixes sf bug #2708559; thanks to Tiago Pereira for the report.

2009-04-06

texmanager.make_dvi now raises an error if LaTeX failed to create an output file. Thanks to Joao Luis Silva for reporting this. - JKS

2009-04-05

_png.read_png() reads 12 bit PNGs (patch from Tobias Wood) - ADS

2009-04-04

Allow log axis scale to clip non-positive values to small positive value; this is useful for errorbars. - EF

2009-03-28

Make images handle nan in their array argument. A helper, cbook.safe_masked_invalid() was added. - EF

2009-03-25

Make contour and contourf handle nan in their Z argument. - EF

2009-03-20

Add AuxTransformBox in offsetbox.py to support some transformation. anchored_text.py example is enhanced and renamed (anchored_artists.py). - JJL

2009-03-20

Add "bar" connection style for annotation - JJL

2009-03-17

Fix bugs in edge color handling by contourf, found by Jae-Joon Lee. - EF

2009-03-14

Added 'LightSource' class to colors module for creating shaded relief maps. shading_example.py added to illustrate usage. - JSW

2009-03-11

Ensure wx version >= 2.8; thanks to Sandro Tosi and Chris Barker. - EF

2009-03-10

Fix join style bug in pdf. - JKS

2009-03-07

Add pyplot access to figure number list - EF

2009-02-28

hashing of FontProperties accounts current rcParams - JJL

2009-02-28

Prevent double-rendering of shared axis in twinx, twiny - EF

2009-02-26

Add optional bbox_to_anchor argument for legend class - JJL

2009-02-26

Support image clipping in pdf backend. - JKS

2009-02-25

Improve tick location subset choice in FixedLocator. - EF

2009-02-24

Deprecate numerix, and strip out all but the numpy part of the code. - EF

2009-02-21

Improve scatter argument handling; add an early error message, allow inputs to have more than one dimension. - EF

2009-02-16

Move plot_directive.py to the installed source tree. Add support for inline code content - MGD

2009-02-16

Move mathmpl.py to the installed source tree so it is available to other projects. - MGD

2009-02-14

Added the legend title support - JJL

2009-02-10

Fixed a bug in backend_pdf so it doesn't break when the setting pdf.use14corefonts=True is used. Added test case in unit/test_pdf_use14corefonts.py. - NGR

2009-02-08

Added a new imsave function to image.py and exposed it in the pyplot interface - GR

2009-02-04

Some reorganization of the legend code. anchored_text.py added as an example. - JJL

2009-02-04

Add extent keyword arg to hexbin - ADS

2009-02-04

Fix bug in mathtext related to dots and ldots - MGD

2009-02-03

Change default joinstyle to round - MGD

2009-02-02

Reduce number of marker XObjects in pdf output - JKS

2009-02-02

Change default resolution on polar plot to 1 - MGD

2009-02-02

Avoid malloc errors in ttconv for fonts that don't have e.g., PostName (a version of Tahoma triggered this) - JKS

2009-01-30

Remove support for pyExcelerator in exceltools -- use xlwt instead - JDH

2009-01-29

Document 'resolution' kwarg for polar plots. Support it when using pyplot.polar, not just Figure.add_axes. - MGD

2009-01-29

Rework the nan-handling/clipping/quantizing/simplification framework so each is an independent part of a pipeline. Expose the C++-implementation of all of this so it can be used from all Python backends. Add rcParam "path.simplify_threshold" to control the threshold of similarity below which vertices will be removed.

2009-01-26

Improved tight bbox option of the savefig. - JJL

2009-01-26

Make curves and NaNs play nice together - MGD

2009-01-21

Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults

2009-01-19

Fix bug in quiver argument handling. - EF

2009-01-19

Fix bug in backend_gtk: don't delete nonexistent toolbar. - EF

2009-01-16

Implement bbox_inches option for savefig. If bbox_inches is "tight", try to determine the tight bounding box. - JJL

2009-01-16

Fix bug in is_string_like so it doesn't raise an unnecessary exception. - EF

2009-01-16

Fix an infinite recursion in the unit registry when searching for a converter for a sequence of strings. Add a corresponding test. - RM

2009-01-16

Bugfix of C typedef of MPL_Int64 that was failing on Windows XP 64 bit, as reported by George Goussard on numpy mailing list. - ADS

2009-01-16

Added helper function LinearSegmentedColormap.from_list to facilitate building simple custom colomaps. See examples/pylab_examples/custom_cmap_fromlist.py - JDH

2009-01-16

Applied Michiel's patch for macosx backend to fix rounding bug. Closed sf bug 2508440 - JSW

2009-01-10

Applied Michiel's hatch patch for macosx backend and draw_idle patch for qt. Closes sf patched 2497785 and 2468809 - JDH

2009-01-10

Fix bug in pan/zoom with log coordinates. - EF

2009-01-06

Fix bug in setting of dashed negative contours. - EF

2009-01-06

Be fault tolerant when len(linestyles)>NLev in contour. - MM

2009-01-06

Added marginals kwarg to hexbin to plot marginal densities JDH

2009-01-06

Change user-visible multipage pdf object to PdfPages to avoid accidents with the file-like PdfFile. - JKS

2009-01-05

Fix a bug in pdf usetex: allow using non-embedded fonts. - JKS

2009-01-05

optional use of preview.sty in usetex mode. - JJL

2009-01-02

Allow multipage pdf files. - JKS

2008-12-31

Improve pdf usetex by adding support for font effects (slanting and extending). - JKS

2008-12-29

Fix a bug in pdf usetex support, which occurred if the same Type-1 font was used with different encodings, e.g., with Minion Pro and MnSymbol. - JKS

2008-12-20

fix the dpi-dependent offset of Shadow. - JJL

2008-12-20

fix the hatch bug in the pdf backend. minor update in docs and example - JJL

2008-12-19

Add axes_locator attribute in Axes. Two examples are added. - JJL

2008-12-19

Update Axes.legend documentation. /api/api_changes.rst is also updated to describe changes in keyword parameters. Issue a warning if old keyword parameters are used. - JJL

2008-12-18

add new arrow style, a line + filled triangles. -JJL

2008-12-18

Re-Released 0.98.5.2 from v0_98_5_maint at r6679 Released 0.98.5.2 from v0_98_5_maint at r6667

2008-12-18

Removed configobj, experimental traits and doc/mpl_data link - JDH

2008-12-18

Fix bug where a line with NULL data limits prevents subsequent data limits from calculating correctly - MGD

2008-12-17

Major documentation generator changes - MGD

2008-12-17

Applied macosx backend patch with support for path collections, quadmesh, etc... - JDH

2008-12-17

fix dpi-dependent behavior of text bbox and arrow in annotate -JJL

2008-12-17

Add group id support in artist. Two examples which demonstrate svg filter are added. -JJL

2008-12-16

Another attempt to fix dpi-dependent behavior of Legend. -JJL

2008-12-16

Fixed dpi-dependent behavior of Legend and fancybox in Text.

2008-12-16

Added markevery property to Line2D to support subsampling of markers - JDH

2008-12-15

Removed mpl_data symlink in docs. On platforms that do not support symlinks, these become copies, and the font files are large, so the distro becomes unnecessarily bloated. Keeping the mpl_examples dir because relative links are harder for the plot directive and the *.py files are not so large. - JDH

2008-12-15

Fix $ in non-math text with usetex off. Document differences between usetex on/off - MGD

2008-12-15

Fix anti-aliasing when auto-snapping - MGD

2008-12-15

Fix grid lines not moving correctly during pan and zoom - MGD

2008-12-12

Preparations to eliminate maskedarray rcParams key: its use will now generate a warning. Similarly, importing the obsolete numerix.npyma will generate a warning. - EF

2008-12-12

Added support for the numpy.histogram() weights parameter to the axes hist() method. Docs taken from numpy - MM

2008-12-12

Fixed warning in hist() with numpy 1.2 - MM

2008-12-12

Removed external packages: configobj and enthought.traits which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently, see http://code.enthought.com/pages/traits.html and http://www.voidspace.org.uk/python/configobj.html

2008-12-12

Added support to assign labels to histograms of multiple data. - MM

2008-12-11

Released 0.98.5 at svn r6573

2008-12-11

Use subprocess.Popen instead of os.popen in dviread (Windows problem reported by Jorgen Stenarson) - JKS

2008-12-10

Added Michael's font_manager fix and Jae-Joon's figure/subplot fix. Bumped version number to 0.98.5 - JDH

2008-12-09

Released 0.98.4 at svn r6536

2008-12-08

Added mdehoon's native macosx backend from sf patch 2179017 - JDH

2008-12-08

Removed the prints in the set_*style commands. Return the list of pprinted strings instead - JDH

2008-12-08

Some of the changes Michael made to improve the output of the property tables in the rest docs broke of made difficult to use some of the interactive doc helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also confused the docstrings. I added a new rc param docstring.hardcopy, to format the docstrings differently for hard copy and other use. The ArtistInspector could use a little refactoring now since there is duplication of effort between the rest out put and the non-rest output - JDH

2008-12-08

Updated spectral methods (psd, csd, etc.) to scale one-sided densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives better MatLab compatibility. -RM

2008-12-08

Fixed alignment of ticks in colorbars. -MGD

2008-12-07

drop the deprecated "new" keyword of np.histogram() for numpy 1.2 or later. -JJL

2008-12-06

Fixed a bug in svg backend that new_figure_manager() ignores keywords arguments such as figsize, etc. -JJL

2008-12-05

Fixed a bug that the handlelength of the new legend class set too short when numpoints=1 -JJL

2008-12-04

Added support for data with units (e.g., dates) to Axes.fill_between. -RM

2008-12-04

Added fancybox keyword to legend. Also applied some changes for better look, including baseline adjustment of the multiline texts so that it is center aligned. -JJL

2008-12-02

The transmuter classes in the patches.py are reorganized as subclasses of the Style classes. A few more box and arrow styles are added. -JJL

2008-12-02

Fixed a bug in the new legend class that didn't allowed a tuple of coordinate values as loc. -JJL

2008-12-02

Improve checks for external dependencies, using subprocess (instead of deprecated popen*) and distutils (for version checking) - DSD

2008-11-30

Reimplementation of the legend which supports baseline alignment, multi-column, and expand mode. - JJL

2008-12-01

Fixed histogram autoscaling bug when bins or range are given explicitly (fixes Debian bug 503148) - MM

2008-11-25

Added rcParam axes.unicode_minus which allows plain hyphen for minus when False - JDH

2008-11-25

Added scatterpoints support in Legend. patch by Erik Tollerud - JJL

2008-11-24

Fix crash in log ticking. - MGD

2008-11-20

Added static helper method BrokenHBarCollection.span_where and Axes/pyplot method fill_between. See examples/pylab/fill_between.py - JDH

2008-11-12

Add x_isdata and y_isdata attributes to Artist instances, and use them to determine whether either or both coordinates are used when updating dataLim. This is used to fix autoscaling problems that had been triggered by axhline, axhspan, axvline, axvspan. - EF

2008-11-11

Update the psd(), csd(), cohere(), and specgram() methods of Axes and the csd() cohere(), and specgram() functions in mlab to be in sync with the changes to psd(). In fact, under the hood, these all call the same core to do computations. - RM

2008-11-11

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow controlling of zero padding and returning of negative frequency components, respectively. These are added in a way that does not change the API. - RM

2008-11-10

Fix handling of c kwarg by scatter; generalize is_string_like to accept numpy and numpy.ma string array scalars. - RM and EF

2008-11-09

Fix a possible EINTR problem in dviread, which might help when saving pdf files from the qt backend. - JKS

2008-11-05

Fix bug with zoom to rectangle and twin axes - MGD

2008-10-24

Added Jae Joon's fancy arrow, box and annotation enhancements -- see examples/pylab_examples/annotation_demo2.py

2008-10-23

Autoscaling is now supported with shared axes - EF

2008-10-23

Fixed exception in dviread that happened with Minion - JKS

2008-10-21

set_xlim, ylim now return a copy of the viewlim array to avoid modify inplace surprises

2008-10-20

Added image thumbnail generating function matplotlib.image.thumbnail. See examples/misc/image_thumbnail.py - JDH

2008-10-20

Applied scatleg patch based on ideas and work by Erik Tollerud and Jae-Joon Lee. - MM

2008-10-11

Fixed bug in pdf backend: if you pass a file object for output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

2008-10-08

Add path simplification support to paths with gaps. - EF

2008-10-05

Fix problem with AFM files that don't specify the font's full name or family name. - JKS

2008-10-04

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for easy access to the set_powerlimits method of the major ScalarFormatter. - EF

2008-10-04

Experimental new kwarg borderpad to replace pad in legend, based on suggestion by Jae-Joon Lee. - EF

2008-09-27

Allow spy to ignore zero values in sparse arrays, based on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

2008-09-24

Introduce drawstyles for lines. Transparently split linestyles like 'steps--' into drawstyle 'steps' and linestyle '--'. Legends always use drawstyle 'default'. - MM

2008-09-18

Fixed quiver and quiverkey bugs (failure to scale properly when resizing) and added additional methods for determining the arrow angles - EF

2008-09-18

Fix polar interpolation to handle negative values of theta - MGD

2008-09-14

Reorganized cbook and mlab methods related to numerical calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. - DMK

2008-09-11

Fix backtick in Postscript output. - MGD

2008-09-10

[2089958] Path simplification for vector output backends Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). "path.simplify" must be set to True in matplotlibrc for this to work. - MGD

2008-09-10

Add "filled" kwarg to Path.intersects_path and Path.intersects_bbox. - MGD

2008-09-07

Changed full arrows slightly to avoid an xpdf rendering problem reported by Friedrich Hagedorn. - JKS

2008-09-07

Fix conversion of quadratic to cubic Bezier curves in PDF and PS backends. Patch by Jae-Joon Lee. - JKS

2008-09-06

Added 5-point star marker to plot command - EF

2008-09-05

Fix hatching in PS backend - MGD

2008-09-03

Fix log with base 2 - MGD

2008-09-01

Added support for bilinear interpolation in NonUniformImage; patch by Gregory Lielens. - EF

2008-08-28

Added support for multiple histograms with data of different length - MM

2008-08-28

Fix step plots with log scale - MGD

2008-08-28

Fix masked arrays with markers in non-Agg backends - MGD

2008-08-28

Fix clip_on kwarg so it actually works correctly - MGD

2008-08-25

Fix locale problems in SVG backend - MGD

2008-08-22

fix quiver so masked values are not plotted - JSW

2008-08-18

improve interactive pan/zoom in qt4 backend on windows - DSD

2008-08-11

Fix more bugs in NaN/inf handling. In particular, path simplification (which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs - MGD and EF

2008-08-03

Released 0.98.3 at svn r5947

2008-08-01

Backported memory leak fixes in _ttconv.cpp - MGD

2008-07-31

Added masked array support to griddata. - JSW

2008-07-26

Added optional C and reduce_C_function arguments to axes.hexbin(). This allows hexbin to accumulate the values of C based on the x,y coordinates and display in hexagonal bins. - ADS

2008-07-24

Deprecated (raise NotImplementedError) all the mlab2 functions from matplotlib.mlab out of concern that some of them were not clean room implementations. JDH

2008-07-24

Rewrite of a significant portion of the clabel code (class ContourLabeler) to improve inlining. - DMK

2008-07-22

Added Barbs polygon collection (similar to Quiver) for plotting wind barbs. Added corresponding helpers to Axes and pyplot as well. (examples/pylab_examples/barb_demo.py shows it off.) - RMM

2008-07-21

Added scikits.delaunay as matplotlib.delaunay. Added griddata function in matplotlib.mlab, with example (griddata_demo.py) in pylab_examples. griddata function will use mpl_toolkits._natgrid if installed. - JSW

2008-07-21

Re-introduced offset_copy that works in the context of the new transforms. - MGD

2008-07-21

Committed patch by Ryan May to add get_offsets and set_offsets to Collections base class - EF

2008-07-21

Changed the "asarray" strategy in image.py so that colormapping of masked input should work for all image types (thanks Klaus Zimmerman) - EF

2008-07-20

Rewrote cbook.delete_masked_points and corresponding unit test to support rgb color array inputs, datetime inputs, etc. - EF

2008-07-20

Renamed unit/axes_unit.py to cbook_unit.py and modified in accord with Ryan's move of delete_masked_points from axes to cbook. - EF

2008-07-18

Check for nan and inf in axes.delete_masked_points(). This should help hexbin and scatter deal with nans. - ADS

2008-07-17

Added ability to manually select contour label locations. Also added a waitforbuttonpress function. - DMK

2008-07-17

Fix bug with NaNs at end of path (thanks, Andrew Straw for the report) - MGD

2008-07-16

Improve error handling in texmanager, thanks to Ian Henry for reporting - DSD

2008-07-12

Added support for external backends with the "module://my_backend" syntax - JDH

2008-07-11

Fix memory leak related to shared axes. Grouper should store weak references. - MGD

2008-07-10

Bugfix: crash displaying fontconfig pattern - MGD

2008-07-10

Bugfix: [2013963] update_datalim_bounds in Axes not works - MGD

2008-07-10

Bugfix: [2014183] multiple imshow() causes gray edges - MGD

2008-07-09

Fix rectangular axes patch on polar plots bug - MGD

2008-07-09

Improve mathtext radical rendering - MGD

2008-07-08

Improve mathtext superscript placement - MGD

2008-07-07

Fix custom scales in pcolormesh (thanks Matthew Turk) - MGD

2008-07-03

Implemented findobj method for artist and pyplot - see examples/pylab_examples/findobj_demo.py - JDH

2008-06-30

Another attempt to fix TextWithDash - DSD

2008-06-30

Removed Qt4 NavigationToolbar2.destroy -- it appears to have been unnecessary and caused a bug reported by P. Raybaut - DSD

2008-06-27

Fixed tick positioning bug - MM

2008-06-27

Fix dashed text bug where text was at the wrong end of the dash - MGD

2008-06-26

Fix mathtext bug for expressions like $x_{leftarrow}$ - MGD

2008-06-26

Fix direction of horizontal/vertical hatches - MGD

2008-06-25

Figure.figurePatch renamed Figure.patch, Axes.axesPatch renamed Axes.patch, Axes.axesFrame renamed Axes.frame, Axes.get_frame, which returns Axes.patch, is deprecated. Examples and users guide updated - JDH

2008-06-25

Fix rendering quality of pcolor - MGD

2008-06-24

Released 0.98.2 at svn r5667 - (source only for debian) JDH

2008-06-24

Added "transparent" kwarg to savefig. - MGD

2008-06-24

Applied Stefan's patch to draw a single centered marker over a line with numpoints==1 - JDH

2008-06-23

Use splines to render circles in scatter plots - MGD

2008-06-22

Released 0.98.1 at revision 5637

2008-06-22

Removed axes3d support and replaced it with a NotImplementedError for one release cycle

2008-06-21

fix marker placement bug in backend_ps - DSD

2008-06-20

[1978629] scale documentation missing/incorrect for log - MGD

2008-06-20

Added closed kwarg to PolyCollection. Fixes bug [1994535] still missing lines on graph with svn (r 5548). - MGD

2008-06-20

Added set/get_closed method to Polygon; fixes error in hist - MM

2008-06-19

Use relative font sizes (e.g., 'medium' and 'large') in rcsetup.py and matplotlibrc.template so that text will be scaled by default when changing rcParams['font.size'] - EF

2008-06-17

Add a generic PatchCollection class that can contain any kind of patch. - MGD

2008-06-13

Change pie chart label alignment to avoid having labels overwrite the pie - MGD

2008-06-12

Added some helper functions to the mathtext parser to return bitmap arrays or write pngs to make it easier to use mathtext outside the context of an mpl figure. modified the mathpng sphinxext to use the mathtext png save functionality - see examples/api/mathtext_asarray.py - JDH

2008-06-11

Use matplotlib.mathtext to render math expressions in online docs - MGD

2008-06-11

Move PNG loading/saving to its own extension module, and remove duplicate code in _backend_agg.cpp and _image.cpp that does the same thing - MGD

2008-06-11

Numerous mathtext bugfixes, primarily related to dpi-independence - MGD

2008-06-10

Bar now applies the label only to the first patch only, and sets '_nolegend_' for the other patch labels. This lets autolegend work as expected for hist and bar - see https://sourceforge.net/tracker/index.php?func=detail&aid=1986597&group_id=80706&atid=560720 JDH

2008-06-10

Fix text baseline alignment bug. [1985420] Repair of baseline alignment in Text._get_layout. Thanks Stan West - MGD

2008-06-09

Committed Gregor's image resample patch to downsampling images with new rcparam image.resample - JDH

2008-06-09

Don't install Enthought.Traits along with matplotlib. For matplotlib developers convenience, it can still be installed by setting an option in setup.cfg while we figure decide if there is a future for the traited config - DSD

2008-06-09

Added range keyword arg to hist() - MM

2008-06-07

Moved list of backends to rcsetup.py; made use of lower case for backend names consistent; use validate_backend when importing backends subpackage - EF

2008-06-06

hist() revision, applied ideas proposed by Erik Tollerud and Olle Engdegard: make histtype='step' unfilled by default and introduce histtype='stepfilled'; use default color cycle; introduce reverse cumulative histogram; new align keyword - MM

2008-06-06

Fix closed polygon patch and also provide the option to not close the polygon - MGD

2008-06-05

Fix some dpi-changing-related problems with PolyCollection, as called by Axes.scatter() - MGD

2008-06-05

Fix image drawing so there is no extra space to the right or bottom - MGD

2006-06-04

Added a figure title command suptitle as a Figure method and pyplot command -- see examples/figure_title.py - JDH

2008-06-02

Added support for log to hist with histtype='step' and fixed a bug for log-scale stacked histograms - MM

2008-05-29

Released 0.98.0 at revision 5314

2008-05-29

matplotlib.image.imread now no longer always returns RGBA -- if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.

2008-05-29

Implement path clipping in PS backend - JDH

2008-05-29

Fixed two bugs in texmanager.py: improved comparison of dvipng versions fixed a bug introduced when get_grey method was added - DSD

2008-05-28

Fix crashing of PDFs in xpdf and ghostscript when two-byte characters are used with Type 3 fonts - MGD

2008-05-28

Allow keyword args to configure widget properties as requested in http://sourceforge.net/tracker/index.php?func=detail&aid=1866207&group_id=80706&atid=560722 - JDH

2008-05-28

Replaced '-' with u'\u2212' for minus sign as requested in http://sourceforge.net/tracker/index.php?func=detail&aid=1962574&group_id=80706&atid=560720

2008-05-28

zero width/height Rectangles no longer influence the autoscaler. Useful for log histograms with empty bins - JDH

2008-05-28

Fix rendering of composite glyphs in Type 3 conversion (particularly as evidenced in the Eunjin.ttf Korean font) Thanks Jae-Joon Lee for finding this!

2008-05-27

Rewrote the cm.ScalarMappable callback infrastructure to use cbook.CallbackRegistry rather than custom callback handling. Any users of add_observer/notify of the cm.ScalarMappable should use the cm.ScalarMappable.callbacksSM CallbackRegistry instead. JDH

2008-05-27

Fix TkAgg build on Ubuntu 8.04 (and hopefully a more general solution for other platforms, too.)

2008-05-24

Added PIL support for loading images to imread (if PIL is available) - JDH

2008-05-23

Provided a function and a method for controlling the plot color cycle. - EF

2008-05-23

Major revision of hist(). Can handle 2D arrays and create stacked histogram plots; keyword 'width' deprecated and rwidth (relative width) introduced; align='edge' changed to center of bin - MM

2008-05-22

Added support for ReST-based documentation using Sphinx. Documents are located in doc/, and are broken up into a users guide and an API reference. To build, run the make.py files. Sphinx-0.4 is needed to build generate xml, which will be useful for rendering equations with mathml, use sphinx from svn until 0.4 is released - DSD

2008-05-21

Fix segfault in TkAgg backend - MGD

2008-05-21

Fix a "local variable unreferenced" bug in plotfile - MM

2008-05-19

Fix crash when Windows cannot access the registry to determine font path [Bug 1966974, thanks Patrik Simons] - MGD

2008-05-16

removed some unneeded code w/ the python 2.4 requirement. cbook no longer provides compatibility for reversed, enumerate, set or izip. removed lib/subprocess, mpl1, sandbox/units, and the swig code. This stuff should remain on the maintenance branch for archival purposes. JDH

2008-05-16

Reorganized examples dir - JDH

2008-05-16

Added 'elinewidth' keyword arg to errorbar, based on patch by Christopher Brown - MM

2008-05-16

Added 'cumulative' keyword arg to hist to plot cumulative histograms. For normed hists, this is normalized to one - MM

2008-05-15

Fix Tk backend segfault on some machines - MGD

2008-05-14

Don't use stat on Windows (fixes font embedding problem) - MGD

2008-05-09

Fix /singlequote (') in Postscript backend - MGD

2008-05-08

Fix kerning in SVG when embedding character outlines - MGD

2008-05-07

Switched to future numpy histogram semantic in hist - MM

2008-05-06

Fix strange colors when blitting in QtAgg and Qt4Agg - MGD

2008-05-05

pass notify_axes_change to the figure's add_axobserver in the qt backends, like we do for the other backends. Thanks Glenn Jones for the report - DSD

2008-05-02

Added step histograms, based on patch by Erik Tollerud. - MM

2008-05-02

On PyQt <= 3.14 there is no way to determine the underlying Qt version. [1851364] - MGD

2008-05-02

Don't call sys.exit() when pyemf is not found [1924199] - MGD

2008-05-02

Update _subprocess.c from upstream Python 2.5.2 to get a few memory and reference-counting-related bugfixes. See bug 1949978. - MGD

2008-04-30

Added some record array editing widgets for gtk -- see examples/rec_edit*.py - JDH

2008-04-29

Fix bug in mlab.sqrtm - MM

2008-04-28

Fix bug in SVG text with Mozilla-based viewers (the symbol tag is not supported) - MGD

2008-04-27

Applied patch by Michiel de Hoon to add hexbin axes method and pyplot function - EF

2008-04-25

Enforce python >= 2.4; remove subprocess build - EF

2008-04-25

Enforce the numpy requirement at build time - JDH

2008-04-24

Make numpy 1.1 and python 2.3 required when importing matplotlib - EF

2008-04-24

Fix compilation issues on VS2003 (Thanks Martin Spacek for all the help) - MGD

2008-04-24

Fix sub/superscripts when the size of the font has been changed - MGD

2008-04-22

Use "svg.embed_char_paths" consistently everywhere - MGD

2008-04-20

Add support to MaxNLocator for symmetric axis autoscaling. - EF

2008-04-20

Fix double-zoom bug. - MM

2008-04-15

Speed up colormapping. - EF

2008-04-12

Speed up zooming and panning of dense images. - EF

2008-04-11

Fix global font rcParam setting after initialization time. - MGD

2008-04-11

Revert commits 5002 and 5031, which were intended to avoid an unnecessary call to draw(). 5002 broke saving figures before show(). 5031 fixed the problem created in 5002, but broke interactive plotting. Unnecessary call to draw still needs resolution - DSD

2008-04-07

Improve color validation in rc handling, suggested by Lev Givon - EF

2008-04-02

Allow to use both linestyle definition arguments, '-' and 'solid' etc. in plots/collections - MM

2008-03-27

Fix saving to Unicode filenames with Agg backend (other backends appear to already work...) (Thanks, Christopher Barker) - MGD

2008-03-26

Fix SVG backend bug that prevents copying and pasting in Inkscape (thanks Kaushik Ghose) - MGD

2008-03-24

Removed an unnecessary call to draw() in the backend_qt* mouseReleaseEvent. Thanks to Ted Drain - DSD

2008-03-23

Fix a pdf backend bug which sometimes caused the outermost gsave to not be balanced with a grestore. - JKS

2008-03-20

Fixed a minor bug in ContourSet._process_linestyles when len(linestyles)==Nlev - MM

2008-03-19

Changed ma import statements to "from numpy import ma"; this should work with past and future versions of numpy, whereas "import numpy.ma as ma" will work only with numpy >= 1.05, and "import numerix.npyma as ma" is obsolete now that maskedarray is replacing the earlier implementation, as of numpy 1.05.

2008-03-14

Removed an apparently unnecessary call to FigureCanvasAgg.draw in backend_qt*agg. Thanks to Ted Drain - DSD

2008-03-10

Workaround a bug in backend_qt4agg's blitting due to a buffer width/bbox width mismatch in _backend_agg's copy_from_bbox - DSD

2008-02-29

Fix class Wx toolbar pan and zoom functions (Thanks Jeff Peery) - MGD

2008-02-16

Added some new rec array functionality to mlab (rec_summarize, rec2txt and rec_groupby). See examples/rec_groupby_demo.py. Thanks to Tim M for rec2txt.

2008-02-12

Applied Erik Tollerud's span selector patch - JDH

2008-02-11

Update plotting() doc string to refer to getp/setp. - JKS

2008-02-10

Fixed a problem with square roots in the pdf backend with usetex. - JKS

2008-02-08

Fixed minor __str__ bugs so getp(gca()) works. - JKS

2008-02-05

Added getters for title, xlabel, ylabel, as requested by Brandon Kieth - EF

2008-02-05

Applied Gael's ginput patch and created examples/ginput_demo.py - JDH

2008-02-03

Expose interpnames, a list of valid interpolation methods, as an AxesImage class attribute. - EF

2008-02-03

Added BoundaryNorm, with examples in colorbar_only.py and image_masked.py. - EF

2008-02-03

Force dpi=72 in pdf backend to fix picture size bug. - JKS

2008-02-01

Fix doubly-included font problem in Postscript backend - MGD

2008-02-01

Fix reference leak in ft2font Glyph objects. - MGD

2008-01-31

Don't use unicode strings with usetex by default - DSD

2008-01-31

Fix text spacing problems in PDF backend with *some* fonts, such as STIXGeneral.

2008-01-31

Fix sqrt with radical number (broken by making [and] work below) - MGD

2008-01-27

Applied Martin Teichmann's patch to improve the Qt4 backend. Uses Qt's builtin toolbars and statusbars. See bug 1828848 - DSD

2008-01-10

Moved toolkits to mpl_toolkits, made mpl_toolkits a namespace package - JSWHIT

2008-01-10

Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-10

Fix bug displaying [and] in mathtext - MGD

2008-01-10

Fix bug when displaying a tick value offset with scientific notation. (Manifests itself as a warning that the times symbol cannot be found). - MGD

2008-01-10

Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-06

Released 0.91.2 at revision 4802

2007-12-26

Reduce too-late use of matplotlib.use() to a warning instead of an exception, for backwards compatibility - EF

2007-12-25

Fix bug in errorbar, identified by Noriko Minakawa - EF

2007-12-25

Changed masked array importing to work with the upcoming numpy 1.05 (now the maskedarray branch) as well as with earlier versions. - EF

2007-12-16

rec2csv saves doubles without losing precision. Also, it does not close filehandles passed in open. - JDH,ADS

2007-12-13

Moved rec2gtk to matplotlib.toolkits.gtktools and rec2excel to matplotlib.toolkits.exceltools - JDH

2007-12-12

Support alpha-blended text in the Agg and Svg backends - MGD

2007-12-10

Fix SVG text rendering bug. - MGD

2007-12-10

Increase accuracy of circle and ellipse drawing by using an 8-piece bezier approximation, rather than a 4-piece one. Fix PDF, SVG and Cairo backends so they can draw paths (meaning ellipses as well). - MGD

2007-12-07

Issue a warning when drawing an image on a non-linear axis. - MGD

2007-12-06

let widgets.Cursor initialize to the lower x and y bounds rather than 0,0, which can cause havoc for dates and other transforms - DSD

2007-12-06

updated references to mpl data directories for py2exe - DSD

2007-12-06

fixed a bug in rcsetup, see bug 1845057 - DSD

2007-12-05

Fix how fonts are cached to avoid loading the same one multiple times. (This was a regression since 0.90 caused by the refactoring of font_manager.py) - MGD

2007-12-05

Support arbitrary rotation of usetex text in Agg backend. - MGD

2007-12-04

Support '|' as a character in mathtext - MGD

2007-11-27

Released 0.91.1 at revision 4517

2007-11-27

Released 0.91.0 at revision 4478

2007-11-13

All backends now support writing to a file-like object, not just a regular file. savefig() can be passed a file-like object in place of a file path. - MGD

2007-11-13

Improved the default backend selection at build time: SVG -> Agg -> TkAgg -> WXAgg -> GTK -> GTKAgg. The last usable backend in this progression will be chosen in the default config file. If a backend is defined in setup.cfg, that will be the default backend - DSD

2007-11-13

Improved creation of default config files at build time for traited config package - DSD

2007-11-12

Exposed all the build options in setup.cfg. These options are read into a dict called "options" by setupext.py. Also, added "-mpl" tags to the version strings for packages provided by matplotlib. Versions provided by mpl will be identified and updated on subsequent installs - DSD

2007-11-12

Added support for STIX fonts. A new rcParam, mathtext.fontset, can be used to choose between:

'cm'

The TeX/LaTeX Computer Modern fonts

'stix'

The STIX fonts (see stixfonts.org)

'stixsans'

The STIX fonts, using sans-serif glyphs by default

'custom'

A generic Unicode font, in which case the mathtext font must be specified using mathtext.bf, mathtext.it, mathtext.sf etc.

Added a new example, stix_fonts_demo.py to show how to access different fonts and unusual symbols. - MGD

2007-11-12

Options to disable building backend extension modules moved from setup.py to setup.cfg - DSD

2007-11-09

Applied Martin Teichmann's patch 1828813: a QPainter is used in paintEvent, which has to be destroyed using the method end(). If matplotlib raises an exception before the call to end - and it does if you feed it with bad data - this method end() is never called and Qt4 will start spitting error messages

2007-11-09

Moved pyparsing back into matplotlib namespace. Don't use system pyparsing, API is too variable from one release to the next - DSD

2007-11-08

Made pylab use straight numpy instead of oldnumeric by default - EF

2007-11-08

Added additional record array utilities to mlab (rec2excel, rec2gtk, rec_join, rec_append_field, rec_drop_field) - JDH

2007-11-08

Updated pytz to version 2007g - DSD

2007-11-08

Updated pyparsing to version 1.4.8 - DSD

2007-11-08

Moved csv2rec to recutils and added other record array utilities - JDH

2007-11-08

If available, use existing pyparsing installation - DSD

2007-11-07

Removed old enthought.traits from lib/matplotlib, added Gael Varoquaux's enthought.traits-2.6b1, which is stripped of setuptools. The package is installed to site-packages if not already available - DSD

2007-11-05

Added easy access to minor tick properties; slight mod of patch by Pierre G-M - EF

2007-11-02

Committed Phil Thompson's patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

2007-11-02

Committed Phil Thompson's patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

2007-10-31

Made log color scale easier to use with contourf; automatic level generation now works. - EF

2007-10-29

TRANSFORMS REFACTORING

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is primarily an internal improvement, and the possible user-visible changes it allows are yet to come.

The transformation framework was completely rewritten in Python (with Numpy). This will make it easier to add news kinds of transformations without writing C/C++ code.

Transforms are composed into a 'transform tree', made of transforms whose value depends on other transforms (their children). When the contents of children change, their parents are automatically updated to reflect those changes. To do this an "invalidation" method is used: when children change, all of their ancestors are marked as "invalid". When the value of a transform is accessed at a later time, its value is recomputed only if it is invalid, otherwise a cached value may be used. This prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

```
full transform == non-affine + affine
```

Much of the drawing has been refactored in terms of compound paths. Therefore, many methods have been removed from the backend interface and replaced with a handful to draw compound paths. This will make updating the backends easier, since there is less to update. It also should make the backends more consistent in terms of functionality.

User visible changes:

- POLAR PLOTS: Polar plots are now interactively zoomable, and the r-axis labels can be interactively rotated. Straight line segments are now interpolated to follow the curve of the r-axis.
- Non-rectangular clipping works in more backends and with more types of objects.
- Sharing an axis across figures is now done in exactly the same way as sharing an axis between two axes in the same figure:

```
fig1 = figure()
fig2 = figure()

ax1 = fig1.add_subplot(111)
ax2 = fig2.add_subplot(111, sharex=ax1, sharey=ax1)
```

- linestyles now include steps-pre, steps-post and steps-mid. The old step still works and is equivalent to step-pre.
- Multiple line styles may be provided to a collection.

See API_CHANGES for more low-level information about this refactoring.

2007-10-24

Added ax kwarg to Figure.colorbar and pyplot.colorbar - EF

2007-10-19

Removed a gsave/grestore pair surrounding _draw_ps, which was causing a loss graphics state info (see "EPS output problem - scatter & edgecolors" on mpl-dev, 2007-10-29) - DSD

2007-10-15

Fixed a bug in patches.Ellipse that was broken for aspect='auto'. Scale free ellipses now work properly for equal and auto on Agg and PS, and they fall back on a polygonal approximation for nonlinear transformations until we convince ourselves that the spline approximation holds for nonlinear transformations. Added unit/ellipse_compare.py to compare spline with vertex approx for both aspects. JDH

2007-10-05

remove generator expressions from texmanager and mpltraits. generator expressions are not supported by python-2.3 - DSD

2007-10-01

Made matplotlib.use() raise an exception if called after backends has been imported. - EF

2007-09-30

Modified update* methods of Bbox and Interval so they work with reversed axes. Prior to this, trying to set the ticks on a reversed axis failed with an uninformative error message. - EF

2007-09-30

Applied patches to axes3d to fix index error problem - EF

2007-09-24

Applied Eike Welk's patch reported on mpl-dev on 2007-09-22 Fixes a bug with multiple plot windows in the qt backend, ported the changes to backend_qt4 as well - DSD

2007-09-21

Changed cbook.reversed to yield the same result as the python reversed builtin - DSD

2007-09-13

The usetex support in the pdf backend is more usable now, so I am enabling it. - JKS

2007-09-12

Fixed a Axes.bar unit bug - JDH

2007-09-10

Made skiprows=1 the default on csv2rec - JDH

2007-09-09

Split out the plotting part of pylab and put it in pyplot.py; removed numerix from the remaining pylab.py, which imports everything from pyplot.py. The intention is that apart from cleanups, the result of importing from pylab is nearly unchanged, but there is the new alternative of importing from pyplot to get the state-engine graphics without all the numeric functions. Numpified examples; deleted two that were obsolete; modified some to use pyplot. - EF

2007-09-08

Eliminated gd and paint backends - EF

2007-09-06

.bmp file format is now longer an alias for .raw

2007-09-07

Added clip path support to pdf backend. - JKS

2007-09-06

Fixed a bug in the embedding of Type 1 fonts in PDF. Now it doesn't crash Preview.app. - JKS

2007-09-06

Refactored image saving code so that all GUI backends can save most image types. See FILETYPES for a matrix of backends and their supported file types. Backend canvases should no longer write their own print_figure() method -- instead they should write a print_xxx method for each filetype they can output and add an entry to their class-scoped filetypes dictionary. - MGD

2007-09-05

Fixed Qt version reporting in setupext.py - DSD

2007-09-04

Embedding Type 1 fonts in PDF, and thus usetex support via dviread, sort of works. To test, enable it by renaming _draw_tex to draw_tex. - JKS

2007-09-03

Added ability of errorbar show limits via caret or arrowhead ends on the bars; patch by Manual Metz. - EF

2007-09-03

Created type1font.py, added features to AFM and FT2Font (see API_CHANGES), started work on embedding Type 1 fonts in pdf files. - JKS

2007-09-02

Continued work on dviread.py. - JKS

2007-08-16

Added a set_extent method to AxesImage, allow data extent to be modified after initial call to imshow - DSD

2007-08-14

Fixed a bug in pyqt4 subplots-adjust. Thanks to Xavier Gnata for the report and suggested fix - DSD

2007-08-13

Use pickle to cache entire fontManager; change to using font_manager module-level function findfont wrapper for the fontManager.findfont method - EF

2007-08-11

Numpification and cleanup of mlab.py and some examples - EF

2007-08-06

Removed mathtext2

2007-07-31

Refactoring of distutils scripts.

- Will not fail on the entire build if an optional Python package (e.g., Tkinter) is installed but its development headers are not (e.g., tk-devel). Instead, it will continue to build all other extensions.
- Provide an overview at the top of the output to display what dependencies and their versions were found, and (by extension) what will be built.
- Use pkg-config, when available, to find freetype2, since this was broken on Mac OS-X when using MacPorts in a non- standard location.

2007-07-30

Reorganized configuration code to work with traited config objects. The new config system is located in the matplotlib.config package, but it is disabled by default. To enable it, set NEWCONFIG=True in matplotlib.__init__.py. The new configuration system will still use the old matplotlibrc files by default. To switch to the experimental, traited configuration, set USE_TRAITED_CONFIG=True in config.__init__.py.

2007-07-29

Changed default pcolor shading to flat; added aliases to make collection kwargs agree with setter names, so updating works; related minor cleanups. Removed quiver_classic, scatter_classic, pcolor_classic. - EF

2007-07-26

Major rewrite of mathtext.py, using the TeX box layout model.

There is one (known) backward incompatible change. The font commands (cal, rm, it, tt) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of $cal{R}$ should be changed to ${cal R}$. Alternatively, you may use the new LaTeX-style font commands (mathcal, mathrm, mathit, mathtt) which do affect the following group, e.g., $mathcal{R}$.

Other new features include:

- Math may be interspersed with non-math text. Any text with an even number of $'s (non-escaped) will be sent to the mathtext parser for layout.
- Sub/superscripts are less likely to accidentally overlap.
- Support for sub/superscripts in either order, e.g., x^i_j and x_j^i are equivalent.
- Double sub/superscripts (e.g., x_i_j) are considered ambiguous and raise an exception. Use braces to disambiguate.
- $frac{x}{y}$ can be used for displaying fractions.
- $sqrt[3]{x}$ can be used to display the radical symbol with a root number and body.
- $left(frac{x}{y}right)$ may be used to create parentheses and other delimiters that automatically resize to the height of their contents.
- Spacing around operators etc. is now generally more like TeX.
- Added support (and fonts) for boldface (bf) and sans-serif (sf) symbols.
- Log-like function name shortcuts are supported. For example, $sin(x)$ may be used instead of ${rm sin}(x)$
- Limited use of kerning for the easy case (same font)

Behind the scenes, the pyparsing.py module used for doing the math parsing was updated to the latest stable version (1.4.6). A lot of duplicate code was refactored out of the Font classes.

- MGD

2007-07-19

completed numpification of most trivial cases - NN

2007-07-19

converted non-numpy relicts throughout the code - NN

2007-07-19

replaced the Python code in numerix/ by a minimal wrapper around numpy that explicitly mentions all symbols that need to be addressed for further numpification - NN

2007-07-18

make usetex respect changes to rcParams. texmanager used to only configure itself when it was created, now it reconfigures when rcParams are changed. Thank you Alexander Schmolck for contributing a patch - DSD

2007-07-17

added validation to setting and changing rcParams - DSD

2007-07-17

bugfix segfault in transforms module. Thanks Ben North for the patch. - ADS

2007-07-16

clean up some code in ticker.ScalarFormatter, use unicode to render multiplication sign in offset ticklabel - DSD

2007-07-16

fixed a formatting bug in ticker.ScalarFormatter's scientific notation (10^0 was being rendered as 10 in some cases) - DSD

2007-07-13

Add MPL_isfinite64() and MPL_isinf64() for testing doubles in (the now misnamed) MPL_isnan.h. - ADS

2007-07-13

The matplotlib._isnan module removed (use numpy.isnan) - ADS

2007-07-13

Some minor cleanups in _transforms.cpp - ADS

2007-07-13

Removed the rest of the numerix extension code detritus, numpified axes.py, and cleaned up the imports in axes.py - JDH

2007-07-13

Added legend.loc as configurable option that could in future default to 'best'. - NN

2007-07-12

Bugfixes in mlab.py to coerce inputs into numpy arrays. -ADS

2007-07-11

Added linespacing kwarg to text.Text - EF

2007-07-11

Added code to store font paths in SVG files. - MGD

2007-07-10

Store subset of TTF font as a Type 3 font in PDF files. - MGD

2007-07-09

Store subset of TTF font as a Type 3 font in PS files. - MGD

2007-07-09

Applied Paul's pick restructure pick and add pickers, sourceforge patch 1749829 - JDH

2007-07-09

Applied Allan's draw_lines agg optimization. JDH

2007-07-08

Applied Carl Worth's patch to fix cairo draw_arc - SC

2007-07-07

fixed bug 1712099: xpdf distiller on windows - DSD

2007-06-30

Applied patches to tkagg, gtk, and wx backends to reduce memory leakage. Patches supplied by Mike Droettboom; see tracker numbers 1745400, 1745406, 1745408. Also made unit/memleak_gui.py more flexible with command-line options. - EF

2007-06-30

Split defaultParams into separate file rcdefaults (together with validation code). Some heavy refactoring was necessary to do so, but the overall behavior should be the same as before. - NN

2007-06-27

Added MPLCONFIGDIR for the default location for mpl data and configuration. useful for some apache installs where HOME is not writable. Tried to clean up the logic in _get_config_dir to support non-writable HOME where are writable HOME/.matplotlib already exists - JDH

2007-06-27

Fixed locale bug reported at http://sourceforge.net/tracker/index.php?func=detail&aid=1744154&group_id=80706&a
by adding a cbook.unicode_safe function - JDH

2007-06-27

Applied Micheal's tk savefig bugfix described at http://sourceforge.net/tracker/index.php?func=detail&aid=1716732&g
Thanks Michael!

2007-06-27

Patch for get_py2exe_datafiles() to work with new directory layout. (Thanks Tocer and also Werner Bruhin.) -ADS

2007-06-27

Added a scroll event to the mpl event handling system and implemented it for backends GTK* -- other backend users/developers/maintainers, please add support for your backend. - JDH

2007-06-25

Changed default to clip=False in colors.Normalize; modified ColorbarBase for easier colormap display - EF

2007-06-13

Added maskedarray option to rc, numerix - EF

2007-06-11

Python 2.5 compatibility fix for mlab.py - EF

2007-06-10

In matplotlibrc file, use 'dashed' | 'solid' instead of a pair of floats for contour.negative_linestyle - EF

2007-06-08

Allow plot and fill fmt string to be any mpl string colorspec - EF

2007-06-08

Added gnuplot file plotfile function to pylab -- see examples/plotfile_demo.py - JDH

2007-06-07

Disable build of numarray and Numeric extensions for internal MPL use and the numerix layer. - ADS

2007-06-07

Added csv2rec to matplotlib.mlab to support automatically converting csv files to record arrays using type introspection, and turned on native datetime support using the new units support in matplotlib.dates. See examples/loadrec.py ! JDH

2007-06-07

Simplified internal code of _auto_legend_data - NN

2007-06-04

Added labeldistance arg to Axes.pie to control the raidal distance of the wedge labels - JDH

2007-06-03

Turned mathtext in SVG into single <text> with multiple <tspan> objects (easier to edit in inkscape). - NN

2007-06-02

Released 0.90.1 at revision 3352

2007-06-02

Display only meaningful labels when calling legend() without args. - NN

2007-06-02

Have errorbar follow the color cycle even if line is not plotted. Suppress plotting of errorbar caps for capsize=0. - NN

2007-06-02

Set markers to same alpha value as line. - NN

2007-06-02

Fix mathtext position in svg backend. - NN

2007-06-01

Deprecate Numeric and numarray for use as numerix. Props to Travis -- job well done. - ADS

2007-05-18

Added LaTeX unicode support. Enable with the 'text.latex.unicode' rcParam. This requires the ucs and inputenc LaTeX packages. - ADS

2007-04-23

Fixed some problems with polar -- added general polygon clipping to clip the lines and grids to the polar axes. Added support for set_rmax to easily change the maximum radial grid. Added support for polar legend - JDH

2007-04-16

Added Figure.autofmt_xdate to handle adjusting the bottom and rotating the tick labels for date plots when the ticks often overlap - JDH

2007-04-09

Beginnings of usetex support for pdf backend. -JKS

2007-04-07

Fixed legend/LineCollection bug. Added label support to collections. - EF

2007-04-06

Removed deprecated support for a float value as a gray-scale; now it must be a string, like '0.5'. Added alpha kwarg to ColorConverter.to_rgba_list. - EF

2007-04-06

Fixed rotation of ellipses in pdf backend (sf bug #1690559) -JKS

2007-04-04

More matshow tweaks; documentation updates; new method set_bounds() for formatters and locators. - EF

2007-04-02

Fixed problem with imshow and matshow of integer arrays; fixed problems with changes to color autoscaling. - EF

2007-04-01

Made image color autoscaling work correctly with a tracking colorbar; norm.autoscale now scales unconditionally, while norm.autoscale_None changes only None-valued vmin, vmax. - EF

2007-03-31

Added a qt-based subplot-adjustment dialog - DSD

2007-03-30

Fixed a bug in backend_qt4, reported on mpl-dev - DSD

2007-03-26

Removed colorbar_classic from figure.py; fixed bug in Figure.clear() in which _axobservers was not getting cleared. Modernization and cleanups. - EF

2007-03-26

Refactored some of the units support -- units now live in the respective x and y Axis instances. See also API_CHANGES for some alterations to the conversion interface. JDH

2007-03-25

Fix masked array handling in quiver.py for numpy. (Numeric and numarray support for masked arrays is broken in other ways when using quiver. I didn't pursue that.) - ADS

2007-03-23

Made font_manager.py close opened files. - JKS

2007-03-22

Made imshow default extent match matshow - EF

2007-03-22

Some more niceties for xcorr -- a maxlags option, normed now works for xcorr as well as axorr, usevlines is supported, and a zero correlation hline is added. See examples/xcorr_demo.py. Thanks Sameer for the patch. - JDH

2007-03-21

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs. Modified Axes.errorbar which uses vlines and hlines. See API_CHANGES; the return signature for these three functions is now different

2007-03-20

Refactored units support and added new examples - JDH

2007-03-19

Added Mike's units patch - JDH

2007-03-18

Matshow as an Axes method; test version matshow1() in pylab; added 'integer' Boolean kwarg to MaxNLocator initializer to force ticks at integer locations. - EF

2007-03-17

Preliminary support for clipping to paths agg - JDH

2007-03-17

Text.set_text() accepts anything convertible with '%s' - EF

2007-03-14

Add masked-array support to hist. - EF

2007-03-03

Change barh to take a kwargs dict and pass it to bar. Fixes sf bug #1669506.

2007-03-02

Add rc parameter pdf.inheritcolor, which disables all color-setting operations in the pdf backend. The idea is that you include the resulting file in another program and set the colors (both stroke and fill color) there, so you can use the same pdf file for e.g., a paper and a presentation and have them in the surrounding color. You will probably not want to draw figure and axis frames in that case, since they would be filled in the same color. - JKS

2007-02-26

Prevent building _wxagg.so with broken Mac OS X wxPython. - ADS

2007-02-23

Require setuptools for Python 2.3 - ADS

2007-02-22

WXAgg accelerator updates - KM

WXAgg's C++ accelerator has been fixed to use the correct wxBitmap constructor.

The backend has been updated to use new wxPython functionality to provide fast blit() animation without the C++ accelerator. This requires wxPython 2.8 or later. Previous versions of wxPython can use the C++ accelerator or the old pure Python routines.

setup.py no longer builds the C++ accelerator when wxPython >= 2.8 is present.

The blit() method is now faster regardless of which agg/wxPython conversion routines are used.

2007-02-21

Applied the PDF backend patch by Nicolas Grilly. This impacts several files and directories in matplotlib:

- Created the directory lib/matplotlib/mpl-data/fonts/pdfcorefonts, holding AFM files for the 14 PDF core fonts. These fonts are embedded in every PDF viewing application.
- setup.py: Added the directory pdfcorefonts to package_data.
- lib/matplotlib/__init__.py: Added the default parameter 'pdf.use14corefonts'. When True, the PDF backend uses only the 14 PDF core fonts.
- lib/matplotlib/afm.py: Added some keywords found in recent AFM files. Added a little workaround to handle Euro symbol.

- lib/matplotlib/fontmanager.py: Added support for the 14 PDF core fonts. These fonts have a dedicated cache (file pdfcorefont.cache), not the same as for other AFM files (file .afmfont.cache). Also cleaned comments to conform to CODING_GUIDE.
- lib/matplotlib/backends/backend_pdf.py: Added support for 14 PDF core fonts. Fixed some issues with incorrect character widths and encodings (works only for the most common encoding, WinAnsiEncoding, defined by the official PDF Reference). Removed parameter 'dpi' because it causes alignment issues.

-JKS (patch by Nicolas Grilly)

2007-02-17

Changed ft2font.get_charmap, and updated all the files where get_charmap is mentioned - ES

2007-02-13

Added barcode demo- JDH

2007-02-13

Added binary colormap to cm - JDH

2007-02-13

Added twiny to pylab - JDH

2007-02-12

Moved data files into lib/matplotlib so that setuptools' develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the 'fonts' and 'images' sub-directories are maintained in site-packages.) Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing - ADS

2007-02-07

Committed Rob Hetland's patch for qt4: remove references to text()/latin1(), plus some improvements to the toolbar layout - DSD

2007-02-06

Released 0.90.0 at revision 3003

2007-01-22

Extended the new picker API to text, patches and patch collections. Added support for user customizable pick hit testing and attribute tagging of the PickEvent - Details and examples in examples/pick_event_demo.py - JDH

2007-01-16

Begun work on a new pick API using the mpl event handling framework. Artists will define their own pick method with a configurable epsilon tolerance and return pick attrs. All artists that meet the tolerance threshold will fire a PickEvent with artist dependent attrs; e.g., a Line2D can set the indices attribute that shows the indices into the line that are within epsilon of the pick point. See examples/pick_event_demo.py. The implementation of pick for the remaining Artists remains to be

done, but the core infrastructure at the level of event handling is in place with a proof-of-concept implementation for Line2D - JDH

2007-01-16

src/_image.cpp: update to use Py_ssize_t (for 64-bit systems). Use return value of fread() to prevent warning messages - SC.

2007-01-15

src/_image.cpp: combine buffer_argb32() and buffer_bgra32() into a new method color_conv(format) - SC

2007-01-14

backend_cairo.py: update draw_arc() so that examples/arctest.py looks correct - SC

2007-01-12

backend_cairo.py: enable clipping. Update draw_image() so that examples/contour_demo.py looks correct - SC

2007-01-12

backend_cairo.py: fix draw_image() so that examples/image_demo.py now looks correct - SC

2007-01-11

Added Axes.xcorr and Axes.acorr to plot the cross correlation of x vs. y or the autocorrelation of x. pylab wrappers also provided. See examples/xcorr_demo.py - JDH

2007-01-10

Added "Subplot.label_outer" method. It will set the visibility of the ticklabels so that yticklabels are only visible in the first column and xticklabels are only visible in the last row - JDH

2007-01-02

Added additional kwarg documentation - JDH

2006-12-28

Improved error message for nonpositive input to log transform; added log kwarg to bar, barh, and hist, and modified bar method to behave sensibly by default when the ordinate has a log scale. (This only works if the log scale is set before or by the call to bar, hence the utility of the log kwarg.) - EF

2006-12-27

backend_cairo.py: update draw_image() and _draw_mathtext() to work with numpy - SC

2006-12-20

Fixed xpdf dependency check, which was failing on windows. Removed ps2eps dependency check. - DSD

2006-12-19

Added Tim Leslie's spectral patch - JDH

2006-12-17

Added rc param 'axes.formatter.limits' to control the default threshold for switching to scientific notation. Added convenience method Axes.ticklabel_format() for turning scientific notation on or off on either or both axes. - EF

2006-12-16

Added ability to turn control scientific notation in ScalarFormatter - EF

2006-12-16

Enhanced boxplot to handle more flexible inputs - EF

2006-12-13

Replaced calls to where() in colors.py with much faster clip() and putmask() calls; removed inappropriate uses of getmaskorNone (which should be needed only very rarely); all in response to profiling by David Cournapeau. Also fixed bugs in my 2-D array support from 12-09. - EF

2006-12-09

Replaced spy and spy2 with the new spy that combines marker and image capabilities - EF

2006-12-09

Added support for plotting 2-D arrays with plot: columns are plotted as in Matlab - EF

2006-12-09

Added linewidth kwarg to bar and barh; fixed arg checking bugs - EF

2006-12-07

Made pcolormesh argument handling match pcolor; fixed kwarg handling problem noted by Pierre GM - EF

2006-12-06

Made pcolor support vector X and/or Y instead of requiring 2-D arrays - EF

2006-12-05

Made the default Artist._transform None (rather than invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed - JDH

2006-12-03

Added LogNorm to colors.py as illustrated by examples/pcolor_log.py, based on suggestion by Jim McDonald. Colorbar modified to handle LogNorm. Norms have additional "inverse" method. - EF

2006-12-02

Changed class names in colors.py to match convention: normalize -> Normalize, no_norm -> NoNorm. Old names are still available. Changed __init__.py rc defaults to match those in matplotlibrc - EF

2006-11-22

Fixed bug in set_*lim that I had introduced on 11-15 - EF

2006-11-22

Added examples/clippedline.py, which shows how to clip line data based on view limits -- it also changes the marker style when zoomed in - JDH

2006-11-21

Some spy bug-fixes and added precision arg per Robert C's suggestion - JDH

2006-11-19

Added semi-automatic docstring generation detailing all the kwargs that functions take using the artist introspection tools; e.g., 'help text now details the scatter kwargs that control the Text properties - JDH

2006-11-17

Removed obsolete scatter_classic, leaving a stub to raise NotImplementedError; same for pcolor_classic - EF

2006-11-15

Removed obsolete pcolor_classic - EF

2006-11-15

Fixed 1588908 reported by Russel Owen; factored nonsingular method out of ticker.py, put it into transforms.py as a function, and used it in set_xlim and set_ylim. - EF

2006-11-14

Applied patch 1591716 by Ulf Larssen to fix a bug in apply_aspect. Modified and applied patch 1594894 by mdehoon to fix bugs and improve formatting in lines.py. Applied patch 1573008 by Greg Willden to make psd etc. plot full frequency range for complex inputs. - EF

2006-11-14

Improved the ability of the colorbar to track changes in corresponding image, pcolor, or contourf. - EF

2006-11-11

Fixed bug that broke Numeric compatibility; added support for alpha to colorbar. The alpha information is taken from the mappable object, not specified as a kwarg. - EF

2006-11-05

Added broken_barh function for making a sequence of horizontal bars broken by gaps -- see examples/broken_barh.py

2006-11-05

Removed lineprops and markerprops from the Annotation code and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation_demo.py - JDH

2006-11-02

Fixed a pylab subplot bug that was causing axes to be deleted with hspace or wspace equals zero in subplots_adjust - JDH

2006-10-31

Applied axes3d patch 1587359 http://sourceforge.net/tracker/index.php?func=detail&aid=1587359&group_id=80706
JDH

2006-10-26

Released 0.87.7 at revision 2835

2006-10-25

Made "tiny" kwarg in Locator.nonsingular much smaller - EF

2006-10-17

Closed sf bug 1562496 update line props dash/solid/cap/join styles - JDH

2006-10-17

Complete overhaul of the annotations API and example code - See matplotlib.text.Annotation and examples/annotation_demo.py JDH

2006-10-12

Committed Manuel Metz's StarPolygon code and examples/scatter_star_poly.py - JDH

2006-10-11

commented out all default values in matplotlibrc.template Default values should generally be taken from defaultParam in __init__.py - the file matplotlib should only contain those values that the user wants to explicitly change from the default. (see thread "marker color handling" on matplotlib-devel)

2006-10-10

Changed default comment character for load to '#' - JDH

2006-10-10

deactivated rcfile-configurability of markerfacecolor and markeredgecolor. Both are now hardcoded to the special value 'auto' to follow the line color. Configurability at run-time (using function arguments) remains functional. - NN

2006-10-07

introduced dummy argument magnification=1.0 to FigImage.make_image to satisfy unit test figimage_demo.py The argument is not yet handled correctly, which should only show up when using non-standard DPI settings in PS backend, introduced by patch #1562394. - NN

2006-10-06

add backend-agnostic example: simple3d.py - NN

2006-09-29

fix line-breaking for SVG-inline images (purely cosmetic) - NN

2006-09-29

reworked set_linestyle and set_marker markeredgecolor and markerfacecolor now default to a special value "auto" that keeps the color in sync with the line color further, the intelligence of axes.plot is cleaned up, improved and simplified. Complete compatibility cannot be guaranteed, but the new behavior should be much more predictable (see patch #1104615 for details) - NN

2006-09-29

changed implementation of clip-path in SVG to work around a limitation in inkscape - NN

2006-09-29

added two options to matplotlibrc:

- svg.image_inline
- svg.image_noscale

see patch #1533010 for details - NN

2006-09-29

axes.py: cleaned up kwargs checking - NN

2006-09-29

setup.py: cleaned up setup logic - NN

2006-09-29

setup.py: check for required pygtk versions, fixes bug #1460783 - SC

2006-09-27

Released 0.87.6 at revision 2783

2006-09-24

Added line pointers to the Annotation code, and a pylab interface. See matplotlib.text.Annotation, examples/annotation_demo.py and examples/annotation_demo_pylab.py - JDH

2006-09-18

mathtext2.py: The SVG backend now supports the same things that the AGG backend does. Fixed some bugs with rendering, and out of bounds errors in the AGG backend - ES. Changed the return values of math_parse_s_ft2font_svg to support lines (fractions etc.)

2006-09-17

Added an Annotation class to facilitate annotating objects and an examples file examples/annotation_demo.py. I want to add dash support as in TextWithDash, but haven't decided yet whether inheriting from TextWithDash is the right base class or if another approach is needed - JDH

2006-09-05

Released 0.87.5 at revision 2761

2006-09-04

Added nxutils for some numeric add-on extension code -- specifically a better/more efficient inside polygon tester (see unit/inside_poly_*.py) - JDH

2006-09-04

Made bitstream fonts the rc default - JDH

2006-08-31

Fixed alpha-handling bug in ColorConverter, affecting collections in general and contour/contourf in particular. - EF

2006-08-30

ft2font.cpp: Added draw_rect_filled method (now used by mathtext2 to draw the fraction bar) to FT2Font - ES

2006-08-29

setupext.py: wrap calls to tk.getvar() with str(). On some systems, getvar returns a Tcl_Obj instead of a string - DSD

2006-08-28

mathtext2.py: Sub/superscripts can now be complex (i.e. fractions etc.). The demo is also updated - ES

2006-08-28

font_manager.py: Added /usr/local/share/fonts to list of X11 font directories - DSD

2006-08-28

mathtext2.py: Initial support for complex fractions. Also, rendering is now completely separated from parsing. The sub/superscripts now work better. Updated the mathtext2_demo.py - ES

2006-08-27

qt backends: don't create a QApplication when backend is imported, do it when the FigureCanvasQt is created. Simplifies applications where mpl is embedded in qt. Updated embedding_in_qt* examples - DSD

2006-08-27

mathtext2.py: Now the fonts are searched in the OS font dir and in the mpl-data dir. Also env is not a dict anymore. - ES

2006-08-26

minor changes to __init__.py, mathtex2_demo.py. Added matplotlibrc key "mathtext.mathtext2" (removed the key "mathtext2") - ES

2006-08-21

mathtext2.py: Initial support for fractions Updated the mathtext2_demo.py _mathtext_data.py: removed "" from the unicode dicts mathtext.py: Minor modification (because of _mathtext_data.py)- ES

2006-08-20

Added mathtext2.py: Replacement for mathtext.py. Supports _ ^, rm, cal etc., sin, cos etc., unicode, recursive nestings, inline math mode. The only backend currently supported is Agg __init__.py: added new rc params for mathtext2 added mathtext2_demo.py example - ES

2006-08-19

Added embedding_in_qt4.py example - DSD

2006-08-11

Added scale free Ellipse patch for Agg - CM

2006-08-10

Added converters to and from julian dates to matplotlib.dates (num2julian and julian2num) - JDH

2006-08-08

Fixed widget locking so multiple widgets could share the event handling - JDH

2006-08-07

Added scale free Ellipse patch to SVG and PS - CM

2006-08-05

Re-organized imports in numerix for numpy 1.0b2 -- TEO

2006-08-04

Added draw_markers to PDF backend. - JKS

2006-08-01

Fixed a bug in postscript's rendering of dashed lines - DSD

2006-08-01

figure.py: savefig() update docstring to add support for 'format' argument. backend_cairo.py: print_figure() add support 'format' argument. - SC

2006-07-31

Don't let postscript's xpdf distiller compress images - DSD

2006-07-31

Added shallowcopy() methods to all Transformations; removed copy_bbox_transform and copy_bbox_transform_shallow from transforms.py; added offset_copy() function to transforms.py to facilitate positioning artists with offsets. See examples/transoffset.py. - EF

2006-07-31

Don't let postscript's xpdf distiller compress images - DSD

2006-07-29

Fixed numerix polygon bug reported by Nick Fotopoulos. Added inverse_numerix_xy() transform method. Made autoscale_view() preserve axis direction (e.g., increasing down).- EF

2006-07-28

Added shallow bbox copy routine for transforms -- mainly useful for copying transforms to apply offset to. - JDH

2006-07-28

Added resize method to FigureManager class for Qt and Gtk backend - CM

2006-07-28

Added subplots_adjust button to Qt backend - CM

2006-07-26

Use numerix more in collections. Quiver now handles masked arrays. - EF

2006-07-22

Fixed bug #1209354 - DSD

2006-07-22

make scatter() work with the kwarg "color". Closes bug 1285750 - DSD

2006-07-20

backend_cairo.py: require pycairo 1.2.0. print_figure() update to output SVG using cairo.

2006-07-19

Added blitting for Qt4Agg - CM

2006-07-19

Added lasso widget and example examples/lasso_demo.py - JDH

2006-07-18

Added blitting for QtAgg backend - CM

2006-07-17

Fixed bug #1523585: skip nans in semilog plots - DSD

2006-07-12

Add support to render the scientific notation label over the right-side y-axis - DSD

2006-07-11

Released 0.87.4 at revision 2558

2006-07-07

Fixed a usetex bug with older versions of latex - DSD

2006-07-07

Add compatibility for NumPy 1.0 - TEO

2006-06-29

Added a Qt4Agg backend. Thank you James Amundson - DSD

2006-06-26

Fixed a usetex bug. On Windows, usetex will process postscript output in the current directory rather than in a temp directory. This is due to the use of spaces and tildes in windows paths, which cause problems with latex. The subprocess module is no longer used. - DSD

2006-06-22

Various changes to bar(), barh(), and hist(). Added 'edgecolor' keyword arg to bar() and barh(). The x and y args in barh() have been renamed to width and bottom respectively, and their order has been swapped to maintain a (position, value) order ala matlab. left, height, width and bottom args can now all be scalars or sequences. barh() now defaults to edge alignment instead of center alignment. Added a keyword arg 'align' to bar(), barh() and hist() that controls between edge or center bar alignment. Fixed ignoring the rcParams['patch.facecolor'] for bar color in bar() and barh(). Fixed ignoring the rcParams['lines.color'] for error bar color in bar() and barh(). Fixed a bug where patches would be cleared when error bars were plotted if rcParams['axes.hold'] was False. - MAS

2006-06-22

Added support for numerix 2-D arrays as alternatives to a sequence of (x,y) tuples for specifying paths in collections, quiver, contour, pcolor, transforms. Fixed contour bug involving setting limits for colormapping. Added numpy-style all() to numerix. - EF

2006-06-20

Added custom FigureClass hook to pylab interface - see examples/custom_figure_class.py

2006-06-16

Added colormaps from gist (gist_earth, gist_stern, gist_rainbow, gist_gray, gist_yarg, gist_heat, gist_ncar) - JW

2006-06-16

Added a pointer to parent in figure canvas so you can access the container with fig.canvas.manager. Useful if you want to set the window title, e.g., in gtk fig.canvas.manager.window.set_title, though a GUI neutral method would be preferable JDH

2006-06-16

Fixed colorbar.py to handle indexed colors (i.e., norm = no_norm()) by centering each colored region on its index. - EF

2006-06-15

Added scalex and scaley to Axes.autoscale_view to support selective autoscaling just the x or y axis, and supported these command in plot so you can say plot(something, scaley=False) and just the x axis will be autoscaled. Modified axvline and axhline to support this, so for example axvline will no longer autoscale the y axis. JDH

2006-06-13

Fix so numpy updates are backward compatible - TEO

2006-06-12

Updated numerix to handle numpy restructuring of oldnumeric - TEO

2006-06-12

Updated numerix.fft to handle numpy restructuring Added ImportError to numerix.linear_algebra for numpy -TEO

2006-06-11

Added quiverkey command to pylab and Axes, using QuiverKey class in quiver.py. Changed pylab and Axes to use quiver2 if possible, but drop back to the newly-renamed quiver_classic if necessary. Modified examples/quiver_demo.py to illustrate the new quiver and quiverkey. Changed LineCollection implementation slightly to improve compatibility with PolyCollection. - EF

2006-06-11

Fixed a usetex bug for windows, running latex on files with spaces in their names or paths was failing - DSD

2006-06-09

Made additions to numerix, changes to quiver to make it work with all numeric flavors. - EF

2006-06-09

Added quiver2 function to pylab and method to axes, with implementation via a Quiver class in quiver.py. quiver2 will replace quiver before the next release; it is placed alongside it initially to facilitate testing and transition. See also examples/quiver2_demo.py. - EF

2006-06-08

Minor bug fix to make ticker.py draw proper minus signs with usetex - DSD

2006-06-06

Released 0.87.3 at revision 2432

2006-05-30

More partial support for polygons with outline or fill, but not both. Made LineCollection inherit from ScalarMappable. - EF

2006-05-29

Yet another revision of aspect-ratio handling. - EF

2006-05-27

Committed a patch to prevent stroking zero-width lines in the svg backend - DSD

2006-05-24

Fixed colorbar positioning bug identified by Helge Avlesen, and improved the algorithm; added a 'pad' kwarg to control the spacing between colorbar and parent axes. - EF

2006-05-23

Changed color handling so that collection initializers can take any mpl color arg or sequence of args; deprecated float as grayscale, replaced by string representation of float. - EF

2006-05-19

Fixed bug: plot failed if all points were masked - EF

2006-05-19

Added custom symbol option to scatter - JDH

2006-05-18

New example, multi_image.py; colorbar fixed to show offset text when the ScalarFormatter is used; FixedFormatter augmented to accept and display offset text. - EF

2006-05-14

New colorbar; old one is renamed to colorbar_classic. New colorbar code is in colorbar.py, with wrappers in figure.py and pylab.py. Fixed aspect-handling bug reported by Michael Mossey. Made backend_bases.draw_quad_mesh() run.- EF

2006-05-08

Changed handling of end ranges in contourf: replaced "clip-ends" kwarg with "extend". See docstring for details. -EF

2006-05-08

Added axisbelow to rc - JDH

2006-05-08

If using PyGTK require version 2.2+ - SC

2006-04-19

Added compression support to PDF backend, controlled by new pdf.compression rc setting. - JKS

2006-04-19

Added Jouni's PDF backend

2006-04-18

Fixed a bug that caused agg to not render long lines

2006-04-16

Masked array support for pcolormesh; made pcolormesh support the same combinations of X,Y,C dimensions as pcolor does; improved (I hope) description of grid used in pcolor, pcolormesh. - EF

2006-04-14

Reorganized axes.py - EF

2006-04-13

Fixed a bug Ryan found using usetex with sans-serif fonts and exponential tick labels - DSD

2006-04-11

Refactored backend_ps and backend_agg to prevent module-level texmanager imports. Now these imports only occur if text.usetex rc setting is true - DSD

2006-04-10

Committed changes required for building mpl on win32 platforms with visual studio. This allows wxpython blitting for fast animations. - CM

2006-04-10

Fixed an off-by-one bug in Axes.change_geometry.

2006-04-10

Fixed bug in pie charts where wedge wouldn't have label in legend. Submitted by Simon Hildebrandt. - ADS

2006-05-06

Usetex makes temporary latex and dvi files in a temporary directory, rather than in the user's current working directory - DSD

2006-04-05

Applied Ken's wx deprecation warning patch closing sf patch #1465371 - JDH

2006-04-05

Added support for the new API in the postscript backend. Allows values to be masked using nan's, and faster file creation - DSD

2006-04-05

Use python's subprocess module for usetex calls to external programs. subprocess catches when they exit abnormally so an error can be raised. - DSD

2006-04-03

Fixed the bug in which widgets would not respond to events. This regressed the twinx functionality, so I also updated subplots_adjust to update axes that share an x or y with a subplot instance. - CM

2006-04-02

Moved PBox class to transforms and deleted pbox.py; made pylab axis command a thin wrapper for Axes.axis; more tweaks to aspect-ratio handling; fixed Axes.specgram to account for the new imshow default of unit aspect ratio; made contour set the Axes.dataLim. - EF

2006-03-31

Fixed the Qt "Underlying C/C++ object deleted" bug. - JRE

2006-03-31

Applied Vasily Sulatskov's Qt Navigation Toolbar enhancement. - JRE

2006-03-31

Ported Norbert's rewriting of Halldor's stineman_interp algorithm to make it numerix compatible and added code to matplotlib.mlab. See examples/interp_demo.py - JDH

2006-03-30

Fixed a bug in aspect ratio handling; blocked potential crashes when panning with button 3; added axis('image') support. - EF

2006-03-28

More changes to aspect ratio handling; new PBox class in new file pbox.py to facilitate resizing and repositioning axes; made PolarAxes maintain unit aspect ratio. - EF

2006-03-23

Refactored TextWithDash class to inherit from, rather than delegate to, the Text class. Improves object inspection and closes bug # 1357969 - DSD

2006-03-22

Improved aspect ratio handling, including pylab interface. Interactive resizing, pan, zoom of images and plots (including panels with a shared axis) should work. Additions and possible refactoring are still likely. - EF

2006-03-21

Added another colorbrewer colormap (RdYlBu) - JSWHIT

2006-03-21

Fixed tickmarks for logscale plots over very large ranges. Closes bug # 1232920 - DSD

2006-03-21

Added Rob Knight's arrow code; see examples/arrow_demo.py - JDH

2006-03-20

Added support for masking values with nan's, using ADS's isnan module and the new API. Works for *Agg backends - DSD

2006-03-20

Added contour.negative_linestyle rcParam - ADS

2006-03-20

Added _isnan extension module to test for nan with Numeric - ADS

2006-03-17

Added Paul and Alex's support for faceting with quadmesh in sf patch 1411223 - JDH

2006-03-17

Added Charle Twardy's pie patch to support colors=None. Closes sf patch 1387861 - JDH

2006-03-17

Applied sophana's patch to support overlapping axes with toolbar navigation by toggling activation with the 'a' key. Closes sf patch 1432252 - JDH

2006-03-17

Applied Aarre's linestyle patch for backend EMF; closes sf patch 1449279 - JDH

2006-03-17

Applied Jordan Dawe's patch to support kwarg properties for grid lines in the grid command. Closes sf patch 1451661 - JDH

2006-03-17

Center postscript output on page when using usetex - DSD

2006-03-17

subprocess module built if Python <2.4 even if subprocess can be imported from an egg - ADS

2006-03-17

Added _subprocess.c from Python upstream and hopefully enabled building (without breaking) on Windows, although not tested. - ADS

2006-03-17

Updated subprocess.py to latest Python upstream and reverted name back to subprocess.py - ADS

2006-03-16

Added John Porter's 3D handling code

2006-03-16

Released 0.87.2 at revision 2150

2006-03-15

Fixed bug in MaxNLocator revealed by daigos@infinito.it. The main change is that Locator.nonsingular now adjusts vmin and vmax if they are nearly the same, not just if they are equal. A new kwarg, "tiny", sets the threshold. - EF

2006-03-14

Added import of compatibility library for newer numpy linear_algebra - TEO

2006-03-12

Extended "load" function to support individual columns and moved "load" and "save" into matplotlib.mlab so they can be used outside of pylab -- see examples/load_converter.py - JDH

2006-03-12

Added AutoDateFormatter and AutoDateLocator submitted by James Evans. Try the load_converter.py example for a demo. - ADS

2006-03-11

Added subprocess module from python-2.4 - DSD

2006-03-11

Fixed landscape orientation support with the usetex option. The backend_ps print_figure method was getting complicated, I added a _print_figure_tex method to maintain some degree of sanity - DSD

2006-03-11

Added "papertype" savefig kwarg for setting postscript papersizes. papertype and ps.papersize rc setting can also be set to "auto" to autoscale pagesizes - DSD

2006-03-09

Apply P-J's patch to make pstoeps work on windows patch report # 1445612 - DSD

2006-03-09

Make backend rc parameter case-insensitive - DSD

2006-03-07

Fixed bug in backend_ps related to C0-C6 papersizes, which were causing problems with postscript viewers. Supported page sizes include letter, legal, ledger, A0-A10, and B0-B10 - DSD

2006-03-07

Released 0.87.1

2006-03-04

backend_cairo.py: fix get_rgb() bug reported by Keith Briggs. Require pycairo 1.0.2. Support saving png to file-like objects. - SC

2006-03-03

Fixed pcolor handling of vmin, vmax - EF

2006-03-02

improve page sizing with usetex with the latex geometry package. Closes bug # 1441629 - DSD

2006-03-02

Fixed dpi problem with usetex png output. Accepted a modified version of patch # 1441809 - DSD

2006-03-01

Fixed axis('scaled') to deal with case xmax < xmin - JSWHIT

2006-03-01

Added reversed colormaps (with '_r' appended to name) - JSWHIT

2006-02-27

Improved eps bounding boxes with usetex - DSD

2006-02-27

Test svn commit, again!

2006-02-27

Fixed two dependency checking bugs related to usetex on Windows - DSD

2006-02-27

Made the rc deprecation warnings a little more human readable.

2006-02-26

Update the previous gtk.main_quit() bug fix to use gtk.main_level() - SC

2006-02-24

Implemented alpha support in contour and contourf - EF

2006-02-22

Fixed gtk main quit bug when quit was called before mainloop. - JDH

2006-02-22

Small change to colors.py to workaround apparent bug in numpy masked array module - JSWHIT

2006-02-22

Fixed bug in ScalarMappable.to_rgba() reported by Ray Jones, and fixed incorrect fix found by Jeff Whitaker - EF

2006-02-22

Released 0.87

2006-02-21

Fixed portrait/landscape orientation in postscript backend - DSD

2006-02-21

Fix bug introduced in yesterday's bug fix - SC

2006-02-20

backend_gtk.py FigureCanvasGTK.draw(): fix bug reported by David Tremouilles - SC

2006-02-20

Remove the "pygtk.require('2.4')" error from examples/embedding_in_gtk2.py - SC

2006-02-18

backend_gtk.py FigureCanvasGTK.draw(): simplify to use (rather than duplicate) the expose_event() drawing code - SC

2006-02-12

Added stagger or waterfall plot capability to LineCollection; illustrated in examples/collections.py. - EF

2006-02-11

Massive cleanup of the usetex code in the postscript backend. Possibly fixed the clipping issue users were reporting with older versions of ghostscript - DSD

2006-02-11

Added autolim kwarg to axes.add_collection. Changed collection get_verts() methods accordingly. - EF

2006-02-09

added a temporary rc parameter text.dvipnghack, to allow Mac users to get nice results with the usetex option. - DSD

2006-02-09

Fixed a bug related to setting font sizes with the usetex option. - DSD

2006-02-09

Fixed a bug related to usetex's latex code. - DSD

2006-02-09

Modified behavior of font.size rc setting. You should define font.size in pts, which will set the "medium" or default fontsize. Special text sizes like axis labels or tick labels can be given relative font sizes like small, large, x-large, etc. and will scale accordingly. - DSD

2006-02-08

Added py2exe specific datapath check again. Also added new py2exe helper function get_py2exe_datafiles for use in py2exe setup.py scripts. - CM

2006-02-02

Added box function to pylab

2006-02-02

Fixed a problem in setupext.py, tk library formatted in unicode caused build problems - DSD

2006-02-01

Dropped TeX engine support in usetex to focus on LaTeX. - DSD

2006-01-29

Improved usetex option to respect the serif, sans-serif, monospace, and cursive rc settings. Removed the font.latex.package rc setting, it is no longer required - DSD

2006-01-29

Fixed tex's caching to include font.family rc information - DSD

2006-01-29

Fixed subpixel rendering bug in *Agg that was causing uneven gridlines - JDH

2006-01-28

Added fontcmd to backend_ps's RendererPS.draw_tex, to support other font families in eps output - DSD

2006-01-28

Added MaxNLocator to ticker.py, and changed contour.py to use it by default. - EF

2006-01-28

Added fontcmd to backend_ps's RendererPS.draw_tex, to support other font families in eps output - DSD

2006-01-27

Buffered reading of matplotlibrc parameters in order to allow 'verbose' settings to be processed first (allows verbose.report during rc validation process) - DSD

2006-01-27

Removed setuptools support from setup.py and created a separate setupegg.py file to replace it. - CM

2006-01-26

Replaced the ugly datapath logic with a cleaner approach from http://wiki.python.org/moin/DistutilsInstallDataScattered. Overrides the install_data command. - CM

2006-01-24

Don't use character typecodes in cntr.c --- changed to use defined typenumbers instead. - TEO

2006-01-24

Fixed some bugs in usetex's and ps.usedistiller's dependency

2006-01-24

Added masked array support to scatter - EF

2006-01-24

Fixed some bugs in usetex's and ps.usedistiller's dependency checking - DSD

2006-01-24

Released 0.86.2

2006-01-20

Added a converters dict to pylab load to convert selected columns to float -- especially useful for files with date strings, uses a datestr2num converter - JDH

2006-01-20

Added datestr2num to matplotlib dates to convert a string or sequence of strings to a matplotlib datenum

2006-01-18

Added quadrilateral pcolormesh patch 1409190 by Alex Mont and Paul Kienzle -- this is *Agg only for now. See examples/quadmesh_demo.py - JDH

2006-01-18

Added Jouni's boxplot patch - JDH

2006-01-18

Added comma delimiter for pylab save - JDH

2006-01-12

Added Ryan's legend patch - JDH

2006-01-12

Fixed numpy / numeric to use .dtype.char to keep in SYNC with numpy SVN

2006-01-11

Released 0.86.1

2006-01-11

Fixed setup.py for win32 build and added rc template to the MANIFEST.in

2006-01-10

Added xpdf distiller option. matplotlibrc ps.usedistiller can now be none, false, ghostscript, or xpdf. Validation checks for dependencies. This needs testing, but the xpdf option should produce the highest-quality output and small file sizes - DSD

2006-01-10

For the usetex option, backend_ps now does all the LaTeX work in the os's temp directory - DSD

2006-01-10

Added checks for usetex dependencies. - DSD

2006-01-09

Released 0.86

2006-01-04

Changed to support numpy (new name for scipy_core) - TEO

2006-01-04

Added Mark's scaled axes patch for shared axis

2005-12-28

Added Chris Barker's build_wxagg patch - JDH

2005-12-27

Altered numerix/scipy to support new scipy package structure - TEO

2005-12-20

Fixed Jame's Boyles date tick reversal problem - JDH

2005-12-20

Added Jouni's rc patch to support lists of keys to set on - JDH

2005-12-12

Updated pyparsing and mathtext for some speed enhancements (Thanks Paul McGuire) and minor fixes to scipy numerix and setuptools

2005-12-12

Matplotlib data is now installed as package_data in the matplotlib module. This gets rid of checking the many possibilities in matplotlib._get_data_path() - CM

2005-12-11

Support for setuptools/pkg_resources to build and use matplotlib as an egg. Still allows matplotlib to exist using a traditional distutils install. - ADS

2005-12-03

Modified setup to build matplotlibrc based on compile time findings. It will set numerix in the order of scipy, numarray, Numeric depending on which are founds, and backend as in preference order GTKAgg, WXAgg, TkAgg, GTK, Agg, PS

2005-12-03

Modified scipy patch to support Numeric, scipy and numarray Some work remains to be done because some of the scipy imports are broken if only the core is installed. e.g., apparently we need from scipy.basic.fftpack import * rather than from scipy.fftpack import *

2005-12-03

Applied some fixes to Nicholas Young's nonuniform image patch

2005-12-01

Applied Alex Gontmakher hatch patch - PS only for now

2005-11-30

Added Rob McMullen's EMF patch

2005-11-30

Added Daishi's patch for scipy

2005-11-30

Fixed out of bounds draw markers segfault in agg

2005-11-28

Got TkAgg blitting working 100% (cross fingers) correctly. - CM

2005-11-27

Multiple changes in cm.py, colors.py, figure.py, image.py, contour.py, contour_demo.py; new _cm.py, examples/image_masked.py.

1. Separated the color table data from cm.py out into a new file, _cm.py, to make it easier to find the actual code in cm.py and to add new colormaps. Also added some line breaks to the color data dictionaries. Everything from _cm.py is imported by cm.py, so the split should be transparent.
2. Enabled automatic generation of a colormap from a list of colors in contour; see modified examples/contour_demo.py.
3. Support for imshow of a masked array, with the ability to specify colors (or no color at all) for masked regions, and for regions that are above or below the normally mapped region. See examples/image_masked.py.
4. In support of the above, added two new classes, ListedColormap, and no_norm, to colors.py, and modified the Colormap class to include common functionality. Added a clip kwarg to the normalize class. Reworked color handling in contour.py, especially in the ContourLabeller mixin.

- EF

2005-11-25

Changed text.py to ensure color is hashable. EF

2005-11-16

Released 0.85

2005-11-16

Changed the default linewidth in rc to 1.0

2005-11-16

Replaced agg_to_gtk_drawable with pure pygtk pixbuf code in backend_gtkagg. When the equivalent is doe for blit, the agg extension code will no longer be needed

2005-11-16

Added a maxdict item to cbook to prevent caches from growing w/o bounds

2005-11-15

Fixed a colorup/colordown reversal bug in finance.py -- Thanks Gilles

2005-11-15

Applied Jouni K Steppanen's boxplot patch SF patch#1349997 - JDH

2005-11-09

added axisbelow attr for Axes to determine whether ticks and such are above or below the actors

2005-11-08

Added Nicolas' irregularly spaced image patch

2005-11-08

Deprecated HorizontalSpanSelector and replaced with SpanSelection that takes a third arg, direction. The new SpanSelector supports horizontal and vertical span selection, and the appropriate min/max is returned. - CM

2005-11-08

Added lineprops dialog for gtk

2005-11-03

Added FIFOBuffer class to mlab to support real time feeds and examples/fifo_buffer.py

2005-11-01

Contributed Nickolas Young's patch for afm mathtext to support mathtext based upon the standard postscript Symbol font when ps.usetex = True.

2005-10-26

Added support for scatter legends - thanks John Gill

2005-10-20

Fixed image clipping bug that made some tex labels disappear. JDH

2005-10-14

Removed sqrt from dvipng 1.6 alpha channel mask.

2005-10-14

Added width kwarg to hist function

2005-10-10

Replaced all instances of os.rename with shutil.move

2005-10-05

Added Michael Brady's ydate patch

2005-10-04

Added rkern's texmanager patch

2005-09-25

contour.py modified to use a single ContourSet class that handles filled contours, line contours, and labels; added keyword arg (clip_ends) to contourf. Colorbar modified to work with new ContourSet object; if the ContourSet has lines rather than polygons, the colorbar will follow suit. Fixed a bug introduced in 0.84, in which contourf(...,colors=...) was broken - EF

2005-09-19

Released 0.84

2005-09-14

Added a new 'resize_event' which triggers a callback with a backend_bases.ResizeEvent object - JDH

2005-09-14

font_manager.py: removed chkfontpath from x11FontDirectory() - SC

2005-09-14

Factored out auto date locator/formatter factory code into matplotlib.date.date_ticker_factory; applies John Bryne's quiver patch.

2005-09-13

Added Mark's axes positions history patch #1286915

2005-09-09

Added support for auto canvas resizing with:

```
fig.set_figsize_inches(9,5,forward=True) # inches
```

OR:

```
fig.resize(400,300)  # pixels
```

2005-09-07

figure.py: update Figure.draw() to use the updated renderer.draw_image() so that examples/figimage_demo.py works again. examples/stock_demo.py: remove data_clipping (which no longer exists) - SC

2005-09-06

Added Eric's tick.direction patch: in or out in rc

2005-09-06

Added Martin's rectangle selector widget

2005-09-04

Fixed a logic err in text.py that was preventing rgxsuper from matching - JDH

2005-08-29

Committed Ken's wx blit patch #1275002

2005-08-26

colorbar modifications - now uses contourf instead of imshow so that colors used by contourf are displayed correctly. Added two new keyword args (cspacing and clabels) that are only relevant for ContourMappable images - JSWHIT

2005-08-24

Fixed a PS image bug reported by Darren - JDH

2005-08-23

colors.py: change hex2color() to accept unicode strings as well as normal strings. Use isinstance() instead of types.IntType etc - SC

2005-08-16

removed data_clipping line and rc property - JDH

2005-08-22

backend_svg.py: Remove redundant "x=0.0 y=0.0" from svg element. Increase svg version from 1.0 to 1.1. Add viewBox attribute to svg element to allow SVG documents to scale-to-fit into an arbitrary viewport - SC

2005-08-16

Added Eric's dot marker patch - JDH

2005-08-08

Added blitting/animation for TkAgg - CM

2005-08-05

Fixed duplicate tickline bug - JDH

2005-08-05

Fixed a GTK animation bug that cropped up when doing animations in gtk//gtkagg canvases that had widgets packed above them

2005-08-05

Added Clovis Goldemberg patch to the tk save dialog

2005-08-04

Removed origin kwarg from backend.draw_image. origin is handled entirely by the frontend now.

2005-07-03

Fixed a bug related to TeX commands in backend_ps

2005-08-03

Fixed SVG images to respect upper and lower origins.

2005-08-03

Added flipud method to image and removed it from to_str.

2005-07-29

Modified figure.figaspect to take an array or number; modified backend_svg to write utf-8 - JDH

2005-07-30

backend_svg.py: embed png image files in svg rather than linking to a separate png file, fixes bug #1245306 (thanks to Norbert Nemec for the patch) - SC

2005-07-29

Released 0.83.2

2005-07-27

Applied SF patch 1242648: minor rounding error in IndexDateFormatter in dates.py

2005-07-27

Applied sf patch 1244732: Scale axis such that circle looks like circle - JDH

2005-07-29

Improved message reporting in texmanager and backend_ps - DSD

2005-07-28

backend_gtk.py: update FigureCanvasGTK.draw() (needed due to the recent expose_event() change) so that examples/anim.py works in the usual way - SC

2005-07-26

Added new widgets Cursor and HorizontalSpanSelector to matplotlib.widgets. See examples/widgets/cursor.py and examples/widgets/span_selector.py - JDH

2005-07-26

added draw event to mpl event hierarchy -- triggered on figure.draw

2005-07-26

backend_gtk.py: allow 'f' key to toggle window fullscreen mode

2005-07-26

backend_svg.py: write "<.../>" elements all on one line and remove surplus spaces - SC

2005-07-25

backend_svg.py: simplify code by deleting GraphicsContextSVG and RendererSVG.new_gc(), and moving the gc.get_capstyle() code into RendererSVG._get_gc_props_svg() - SC

2005-07-24

backend_gtk.py: call FigureCanvasBase.motion_notify_event() on all motion-notify-events, not just ones where a modifier key or button has been pressed (fixes bug report from Niklas Volbers) - SC

2005-07-24

backend_gtk.py: modify print_figure() use own pixmap, fixing problems where print_figure() overwrites the display pixmap. return False from all button/key etc events - to allow the event to propagate further - SC

2005-07-23

backend_gtk.py: change expose_event from using set_back_pixmap(); clear() to draw_drawable() - SC

2005-07-23

backend_gtk.py: removed pygtk.require() matplotlib/__init__.py: delete 'FROZEN' and 'McPLError' which are no longer used - SC

2005-07-22

backend_gdk.py: removed pygtk.require() - SC

2005-07-21

backend_svg.py: Remove unused imports. Remove methods doc strings which just duplicate the docs from backend_bases.py. Rename draw_mathtext to _draw_mathtext. - SC

2005-07-17

examples/embedding_in_gtk3.py: new example demonstrating placing a FigureCanvas in a gtk.ScrolledWindow - SC

2005-07-14

Fixed a Windows related bug (#1238412) in texmanager - DSD

2005-07-11

Fixed color kwarg bug, setting color=1 or 0 caused an exception - DSD

2005-07-07

Added Eric's MA set_xdata Line2D fix - JDH

2005-07-06

Made HOME/.matplotlib the new config dir where the matplotlibrc file, the ttf.cache, and the tex.cache live. The new default filenames in .matplotlib have no leading dot and are not hidden. e.g., the new names are matplotlibrc tex.cache ttffont.cache. This is how ipython does it so it must be right. If old files are found, a warning is issued and they are moved to the new location. Also fixed texmanager to put all files, including temp files in ~/.matplotlib/tex.cache, which allows you to usetex in non-writable dirs.

2005-07-05

Fixed bug #1231611 in subplots adjust layout. The problem was that the text caching mechanism was not using the transformation affine in the key. - JDH

2005-07-05

Fixed default backend import problem when using API (SF bug # 1209354 - see API_CHANGES for more info - JDH

2005-07-04

backend_gtk.py: require PyGTK version 2.0.0 or higher - SC

2005-06-30

setupext.py: added numarray_inc_dirs for building against numarray when not installed in standard location - ADS

2005-06-27

backend_svg.py: write figure width, height as int, not float. Update to fix some of the pychecker warnings - SC

2005-06-23

Updated examples/agg_test.py to demonstrate curved paths and fills - JDH

2005-06-21

Moved some texmanager and backend_agg tex caching to class level rather than instance level - JDH

2005-06-20

setupext.py: fix problem where _nc_backend_gdk is installed to the wrong directory - SC

2005-06-19

Added 10.4 support for CocoaAgg. - CM

2005-06-18

Move Figure.get_width_height() to FigureCanvasBase and return int instead of float. - SC

2005-06-18

Applied Ted Drain's QtAgg patch: 1) Changed the toolbar to be a horizontal bar of push buttons instead of a QToolbar and updated the layout algorithms in the main window accordingly. This eliminates the ability to drag and drop the toolbar and detach it from the window. 2) Updated the resize algorithm in the main window to show the correct size for the plot widget as requested. This works almost correctly right now. It looks to me like the final size of the widget is off by the border of the main window but I haven't figured out a way to get that information yet. We could just add a small margin to the new size but that seems a little hacky. 3) Changed the x/y location label to be in the toolbar like the Tk backend instead of as a status line at the bottom of the widget. 4) Changed the toolbar pixmaps to use the ppm files instead of the png files. I noticed that the Tk backend buttons looked much nicer and it uses the ppm files so I switched them.

2005-06-17

Modified the gtk backend to not queue mouse motion events. This allows for live updates when dragging a slider. - CM

2005-06-17

Added starter CocoaAgg backend. Only works on OS 10.3 for now and requires PyObjC. (10.4 is high priority) - CM

2005-06-17

Upgraded pyparsing and applied Paul McGuire's suggestions for speeding things up. This more than doubles the speed of mathtext in my simple tests. JDH

2005-06-16

Applied David Cooke's subplot make_key patch

0.82 (2005-06-15)

2005-06-15

Added subplot config tool to GTK* backends -- note you must now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas -- see examples/embedding_in_gtk2.py. Ditto for wx backend -- see examples/embedding_in_wxagg.py

2005-06-15

backend_cairo.py: updated to use pycairo 0.5.0 - SC

2005-06-14

Wrote some GUI neutral widgets (Button, Slider, RadioButtons, CheckButtons) in matplotlib.widgets. See examples/widgets/*.py - JDH

2005-06-14

Exposed subplot parameters as rc vars and as the fig SubplotParams instance subplotpars. See figure.SubplotParams, figure.Figure.subplots_adjust and the pylab method subplots_adjust and examples/subplots_adjust.py . Also added a GUI neutral widget for adjusting subplots, see examples/subplot_toolbar.py - JDH

2005-06-13

Exposed cap and join style for lines with new rc params and line properties:

```
lines.dash_joinstyle : miter        # miter|round|bevel
lines.dash_capstyle : butt          # butt|round|projecting
lines.solid_joinstyle : miter       # miter|round|bevel
lines.solid_capstyle : projecting   # butt|round|projecting
```

2005-06-13

Added kwargs to Axes init

2005-06-13

Applied Baptiste's tick patch - JDH

2005-06-13

Fixed rc alias 'l' bug reported by Fernando by removing aliases for mainlevel rc options. - JDH

2005-06-10

Fixed bug #1217637 in ticker.py - DSD

2005-06-07

Fixed a bug in texmanager.py: .aux files not being removed - DSD

2005-06-08

Added Sean Richard's hist binning fix -- see API_CHANGES - JDH

2005-06-07

Fixed a bug in texmanager.py: .aux files not being removed - DSD

0.81 (2005-06-07)

2005-06-06

Added autoscale_on prop to axes

2005-06-06

Added Nick's picker "among" patch - JDH

2005-06-05

Fixed a TeX/LaTeX font discrepancy in backend_ps. - DSD

2005-06-05

Added a ps.distill option in rc settings. If True, postscript output will be distilled using ghostscript, which should trim the file size and allow it to load more quickly. Hopefully this will address the issue of large ps files due to font definitions. Tested with gnu-ghostscript-8.16. - DSD

2005-06-03

Improved support for tex handling of text in backend_ps. - DSD

2005-06-03

Added rc options to render text with tex or latex, and to select the latex font package. - DSD

2005-06-03

Fixed a bug in ticker.py causing a ZeroDivisionError

2005-06-02

backend_gtk.py remove DBL_BUFFER, add line to expose_event to try to fix pygtk 2.6 redraw problem - SC

2005-06-01

The default behavior of ScalarFormatter now renders scientific notation and large numerical offsets in a label at the end of the axis. - DSD

2005-06-01

Added Nicholas' frombyte image patch - JDH

2005-05-31

Added vertical TeX support for agg - JDH

2005-05-31

Applied Eric's cntr patch - JDH

2005-05-27

Finally found the pesky agg bug (which Maxim was kind enough to fix within hours) that was causing a segfault in the win32 cached marker drawing. Now windows users can get the enormous performance benefits of cached markers w/o those occasional pesy screenshots. - JDH

2005-05-27

Got win32 build system working again, using a more recent version of gtk and pygtk in the win32 build, gtk 2.6 from https://web.archive.org/web/20050527002647/https://www.gimp.org/~tml/gimp/win32/downloads.html (you will also need libpng12.dll to use these). I haven't tested whether this binary build of mpl for win32 will work with older gtk runtimes, so you may need to upgrade.

2005-05-27

Fixed bug where 2nd wxapp could be started if using wxagg backend. - ADS

2005-05-26

Added Daishi text with dash patch -- see examples/dashtick.py

2005-05-26

Moved backend_latex functionality into backend_ps. If text.usetex=True, the PostScript backend will use LaTeX to generate the .ps or .eps file. Ghostscript is required for eps output. - DSD

2005-05-24

Fixed alignment and color issues in latex backend. - DSD

2005-05-21

Fixed raster problem for small rasters with dvipng -- looks like it was a premultiplied alpha problem - JDH

2005-05-20

Added linewidth and faceted kwarg to scatter to control edgewidth and color. Also added autolegend patch to inspect line segments.

2005-05-18

Added Orsay and JPL qt fixes - JDH

2005-05-17

Added a psfrag latex backend -- some alignment issues need to be worked out. Run with -dLaTeX and a *.tex file and *.eps file are generated. latex and dvips the generated latex file to get ps output. Note xdvi *does* not work, you must generate ps.- JDH

2005-05-13

Added Florent Rougon's Axis set_label1 patch

2005-05-17

pcolor optimization, fixed bug in previous pcolor patch - JSWHIT

2005-05-16

Added support for masked arrays in pcolor - JSWHIT

2005-05-12

Started work on TeX text for antigrain using pngdvi -- see examples/tex_demo.py and the new module matplotlib.texmanager. Rotated text not supported and rendering small glyphs is not working right yet. But large fontsizes and/or high dpi saved figs work great.

2005-05-10

New image resize options interpolation options. New values for the interp kwarg are

> 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'

See help(imshow) for details, particularly the interpolation, filternorm and filterrad kwargs

2005-05-10

Applied Eric's contour mem leak fixes - JDH

2005-05-10

Extended python agg wrapper and started implementing backend_agg2, an agg renderer based on the python wrapper. This will be more flexible and easier to extend than the current backend_agg. See also examples/agg_test.py - JDH

2005-05-09

Added Marcin's no legend patch to exclude lines from the autolegend builder:

```
plot(x, y, label='nolegend')
```

2005-05-05

Upgraded to agg23

2005-05-05

Added newscalarformatter_demo.py to examples. -DSD

2005-05-04

Added NewScalarFormatter. Improved formatting of ticklabels, scientific notation, and the ability to plot large numbers with small ranges, by determining a numerical offset. See ticker.NewScalarFormatter for more details. -DSD

2005-05-03

Added the option to specify a delimiter in pylab.load -DSD

2005-04-28

Added Darren's line collection example

2005-04-28

Fixed aa property in agg - JDH

2005-04-27

Set postscript page size in .matplotlibrc - DSD

2005-04-26

Added embedding in qt example. - JDH

2005-04-14

Applied Michael Brady's qt backend patch: 1) fix a bug where keyboard input was grabbed by the figure and not released 2) turn on cursor changes 3) clean up a typo and commented-out print statement. - JDH

2005-04-14

Applied Eric Firing's masked data lines patch and contour patch. Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A "valid_only" kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points. - see examples/masked_demo.py - JDH

2005-04-13

Applied Tim Leslie's arrow key event handling patch - JDH

0.80

2005-04-11

Applied a variant of rick's xlim/ylim/axis patch. These functions now take kwargs to let you selectively alter only the min or max if desired. e.g., xlim(xmin=2) or axis(ymax=3). They always return the new lim. - JDH

2005-04-11

Incorporated Werner's wx patch -- wx backend should be compatible with wxpython2.4 and recent versions of 2.5. Some early versions of wxpython 2.5 will not work because there was a temporary change in the dc API that was rolled back to make it 2.4 compliant

2005-04-11

modified tkagg show so that new figure window pops up on call to figure

2005-04-11

fixed wxapp init bug

2005-04-02

updated backend_ps.draw_lines, draw_markers for use with the new API - DSD

2005-04-01

Added editable polygon example

0.74 (2005-03-31)

2005-03-30

Fixed and added checks for floating point inaccuracy in ticker.Base - DSD

2005-03-30

updated /ellipse definition in backend_ps.py to address bug #1122041 - DSD

2005-03-29

Added unicode support for Agg and PS - JDH

2005-03-28

Added Jarrod's svg patch for text - JDH

2005-03-28

Added Ludal's arrow and quiver patch - JDH

2005-03-28

Added label kwarg to Axes to facilitate forcing the creation of new Axes with otherwise identical attributes

2005-03-28

Applied boxplot and OSX font search patches

2005-03-27

Added ft2font NULL check to fix Japanese font bug - JDH

2005-03-27

Added sprint legend patch plus John Gill's tests and fix -- see examples/legend_auto.py - JDH

0.73.1 (2005-03-19)

2005-03-19

Reverted wxapp handling because it crashed win32 - JDH

2005-03-18

Add .number attribute to figure objects returned by figure() - FP

0.73 (2005-03-18)

2005-03-16

Fixed labelsep bug

2005-03-16

Applied Darren's ticker fix for small ranges - JDH

2005-03-16

Fixed tick on horiz colorbar - JDH

2005-03-16

Added Japanese winreg patch - JDH

2005-03-15

backend_gtkagg.py: changed to use double buffering, this fixes the problem reported Joachim Berdal Haga - "Parts of plot lagging from previous frame in animation". Tested with anim.py and it makes no noticeable difference to performance (23.7 before, 23.6 after) - SC

2005-03-14

add src/_backend_gdk.c extension to provide a substitute function for pixbuf.get_pixels_array(). Currently pixbuf.get_pixels_array() only works with Numeric, and then only works if pygtk has been compiled with Numeric support. The change provides a function pixbuf_get_pixels_array() which works with Numeric and numarray and is always available. It means that backend_gtk should be able to display images and mathtext in all circumstances. - SC

2005-03-11

Upgraded CXX to 5.3.1

2005-03-10

remove GraphicsContextPS.set_linestyle() and GraphicsContextSVG.set_linestyle() since they do no more than the base class GraphicsContext.set_linestyle() - SC

2005-03-09

Refactored contour functionality into dedicated module

2005-03-09

Added Eric's contourf updates and Nadia's clabel functionality

2005-03-09

Moved colorbar to figure.Figure to expose it for API developers - JDH

2005-03-09

backend_cairo.py: implemented draw_markers() - SC

2005-03-09

cbook.py: only use enumerate() (the python version) if the builtin version is not available. Add new function 'izip' which is set to itertools.izip if available and the python equivalent if not available. - SC

2005-03-07

backend_gdk.py: remove PIXELS_PER_INCH from points_to_pixels(), but still use it to adjust font sizes. This allows the GTK version of line_styles.py to more closely match GTKAgg, previously the markers were being drawn too large. - SC

2005-03-01

Added Eric's contourf routines

2005-03-01

Added start of proper agg SWIG wrapper. I would like to expose agg functionality directly a the user level and this module will serve that purpose eventually, and will hopefully take over most of the functionality of the current _image and _backend_agg modules. - JDH

2005-02-28

Fixed polyfit / polyval to convert input args to float arrays - JDH

2005-02-25

Add experimental feature to backend_gtk.py to enable/disable double buffering (DBL_BUFFER=True/False) - SC

2005-02-24

colors.py change ColorConverter.to_rgb() so it always returns rgb (and not rgba), allow cnames keys to be cached, change the exception raised from RuntimeError to ValueError (like hex2color()) hex2color() use a regular expression to check the color string is valid - SC

2005-02-23

Added rc param ps.useafm so backend ps can use native afm fonts or truetype. afme breaks mathtext but causes much smaller font sizes and may result in images that display better in some contexts (e.g., pdfs incorporated into latex docs viewed in acrobat reader). I would like to extend this approach to allow the user to use truetype only for mathtext, which should be easy.

2005-02-23

Used sequence protocol rather than tuple in agg collection drawing routines for greater flexibility - JDH

0.72.1 (2005-02-22)

2005-02-21

fixed linestyles for collections -- contour now dashes for levels <0

2005-02-21

fixed ps color bug - JDH

2005-02-15

fixed missing qt file

2005-02-15

banished error_msg and report_error. Internal backend methods like error_msg_gtk are preserved. backend writers, check your backends, and diff against 0.72 to make sure I did the right thing! - JDH

2005-02-14

Added enthought traits to matplotlib tree - JDH

0.72 (2005-02-14)

2005-02-14

fix bug in cbook alltrue() and onetrue() - SC

2005-02-11

updated qtagg backend from Ted - JDH

2005-02-11

matshow fixes for figure numbering, return value and docs - FP

2005-02-09

new zorder example for fine control in zorder_demo.py - FP

2005-02-09

backend renderer draw_lines now has transform in backend, as in draw_markers; use numerix in _backend_agg, added small line optimization to agg

2005-02-09

subplot now deletes axes that it overlaps

2005-02-08

Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).

2005-02-08

Small optimizations in PS backend. They may have a big impact for large plots, otherwise they don't hurt - FP

2005-02-08

Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).

2005-02-07

Added newstyle path drawing for markers - only implemented in agg currently - JDH

2005-02-05

Some superscript text optimizations for ticking log plots

2005-02-05

Added some default key press events to pylab figures: 'g' toggles grid - JDH

2005-02-05

Added some support for handling log switching for lines that have nonpos data - JDH

2005-02-04

Added Nadia's contour patch - contour now has matlab compatible syntax; this also fixed an unequal sized contour array bug- JDH

2005-02-04

Modified GTK backends to allow the FigureCanvas to be resized smaller than its original size - SC

2005-02-02

Fixed a bug in dates mx2num - JDH

2005-02-02

Incorporated Fernando's matshow - JDH

2005-02-01

Added Fernando's figure num patch, including experimental support for pylab backend switching, LineCOllection.color warns, savefig now a figure method, fixed a close(fig) bug - JDH

2005-01-31

updated datalim in contour - JDH

2005-01-30

Added backend_qtagg.py provided by Sigve Tjora - SC

2005-01-28

Added tk.inspect rc param to .matplotlibrc. IDLE users should set tk.pythoninspect:True and interactive:True and backend:TkAgg

2005-01-28

Replaced examples/interactive.py with an updated script from Fernando Perez - SC

2005-01-27

Added support for shared x or y axes. See examples/shared_axis_demo.py and examples/ganged_plots.py

2005-01-27

Added Lee's patch for missing symbols leq and LEFTbracket to _mathtext_data - JDH

2005-01-26

Added Baptiste's two scales patch -- see help(twinx) in the pylab interface for more info. See also examples/two_scales.py

2005-01-24

Fixed a mathtext parser bug that prevented font changes in sub/superscripts - JDH

2005-01-24

Fixed contour to work w/ interactive changes in colormaps, clim, etc - JDH

0.71 (2005-01-21)

2005-01-21

Refactored numerix to solve vexing namespace issues - JDH

2005-01-21

Applied Nadia's contour bug fix - JDH

2005-01-20

Made some changes to the contour routine - particularly region=1 seems t fix a lot of the zigzag strangeness. Added colormaps as default for contour - JDH

2005-01-19

Restored builtin names which were overridden (min, max, abs, round, and sum) in pylab. This is a potentially significant change for those who were relying on an array version of those functions that previously overrode builtin function names. - ADS

2005-01-18

Added accents to mathtext: hat, breve, grave, bar, acute, tilde, vec, dot, ddot. All of them have the same syntax, e.g., to make an overbar you do bar{o} or to make an o umlaut you do ddot{o}. The shortcuts are also provided, e.g., "o 'e `e ~n .x ^y - JDH

2005-01-18

Plugged image resize memory leaks - JDH

2005-01-18

Fixed some mathtext parser problems relating to superscripts

2005-01-17

Fixed a yticklabel problem for colorbars under change of clim - JDH

2005-01-17

Cleaned up Destroy handling in wx reducing memleak/fig from approx 800k to approx 6k- JDH

2005-01-17

Added kappa to latex_to_bakoma - JDH

2005-01-15

Support arbitrary colorbar axes and horizontal colorbars - JDH

2005-01-15

Fixed colormap number of colors bug so that the colorbar has the same discretization as the image - JDH

2005-01-15

Added Nadia's x,y contour fix - JDH

2005-01-15

backend_cairo: added PDF support which requires pycairo 0.1.4. Its not usable yet, but is ready for when the Cairo PDF backend matures - SC

2005-01-15

Added Nadia's x,y contour fix

2005-01-12

Fixed set clip_on bug in artist - JDH

2005-01-11

Reverted pythoninspect in tkagg - JDH

2005-01-09

Fixed a backend_bases event bug caused when an event is triggered when location is None - JDH

2005-01-07

Add patch from Stephen Walton to fix bug in pylab.load() when the % character is included in a comment. - ADS

2005-01-07

Added markerscale attribute to Legend class. This allows the marker size in the legend to be adjusted relative to that in the plot. - ADS

2005-01-06

Add patch from Ben Vanhaeren to make the FigureManagerGTK vbox a public attribute - SC

2004-12-30

Release 0.70

2004-12-28

Added coord location to key press and added a examples/picker_demo.py

2004-12-28

Fixed coords notification in wx toolbar - JDH

2004-12-28

Moved connection and disconnection event handling to the FigureCanvasBase. Backends now only need to connect one time for each of the button press, button release and key press/release functions. The base class deals with callbacks and multiple connections. This fixes flakiness on some backends (tk, wx) in the presence of multiple connections and/or disconnect - JDH

2004-12-27

Fixed PS mathtext bug where color was not set - Jochen please verify correct - JDH

2004-12-27

Added Shadow class and added shadow kwarg to legend and pie for shadow effect - JDH

2004-12-27

Added pie charts and new example/pie_demo.py

2004-12-23

Fixed an agg text rotation alignment bug, fixed some text kwarg processing bugs, and added examples/text_rotation.py to explain and demonstrate how text rotations and alignment work in matplotlib. - JDH

0.65.1 (2004-12-22)

2004-12-22

Fixed colorbar bug which caused colorbar not to respond to changes in colormap in some instances - JDH

2004-12-22

Refactored NavigationToolbar in tkagg to support app embedding , init now takes (canvas, window) rather than (canvas, figman) - JDH

2004-12-21

Refactored axes and subplot management - removed add_subplot and add_axes from the FigureManager. classic toolbar updates are done via an observer pattern on the figure using add_axobserver. Figure now maintains the axes stack (for gca) and supports axes deletion. Ported changes to GTK, Tk, Wx, and FLTK. Please test! Added delaxes - JDH

2004-12-21

Lots of image optimizations - 4x performance boost over 0.65 JDH

2004-12-20

Fixed a figimage bug where the axes is shown and modified tkagg to move the destroy binding into the show method.

2004-12-18

Minor refactoring of NavigationToolbar2 to support embedding in an application - JDH

2004-12-14

Added linestyle to collections (currently broken) - JDH

2004-12-14

Applied Nadia's setupext patch to fix libstdc++ link problem with contour and solaris -JDH

2004-12-14

A number of pychecker inspired fixes, including removal of True and False from cbook which I erroneously thought was needed for python2.2 - JDH

2004-12-14

Finished porting doc strings for set introspection. Used silent_list for many get funcs that return lists. JDH

2004-12-13

dates.py: removed all timezone() calls, except for UTC - SC

0.65 (2004-12-13)

2004-12-13

colors.py: rgb2hex(), hex2color() made simpler (and faster), also rgb2hex() - added round() instead of integer truncation hex2color() - changed 256.0 divisor to 255.0, so now '#ffffff' becomes (1.0,1.0,1.0) not (0.996,0.996,0.996) - SC

2004-12-11

Added ion and ioff to pylab interface - JDH

2004-12-11

backend_template.py: delete FigureCanvasTemplate.realize() - most backends don't use it and its no longer needed

backend_ps.py, backend_svg.py: delete show() and draw_if_interactive() - they are not needed for image backends

backend_svg.py: write direct to file instead of StringIO

- SC

2004-12-10

Added zorder to artists to control drawing order of lines, patches and text in axes. See examples/zoder_demo.py - JDH

2004-12-10

Fixed colorbar bug with scatter - JDH

2004-12-10

Added Nadia Dencheva <dencheva@stsci.edu> contour code - JDH

2004-12-10

backend_cairo.py: got mathtext working - SC

2004-12-09

Added Norm Peterson's svg clipping patch

2004-12-09

Added Matthew Newville's wx printing patch

2004-12-09

Migrated matlab to pylab - JDH

2004-12-09

backend_gtk.py: split into two parts

- backend_gdk.py - an image backend
- backend_gtk.py - A GUI backend that uses GDK - SC

2004-12-08

backend_gtk.py: remove quit_after_print_xvfb(*args), show_xvfb(), Dialog_MeasureTool(gtk.Dialog) one month after sending mail to matplotlib-users asking if anyone still uses these functions - SC

2004-12-02

backend_bases.py, backend_template.py: updated some of the method documentation to make them consistent with each other - SC

2004-12-04

Fixed multiple bindings per event for TkAgg mpl_connect and mpl_disconnect. Added a "test_disconnect" command line parameter to coords_demo.py JTM

2004-12-04

Fixed some legend bugs JDH

2004-11-30

Added over command for oneoff over plots. e.g., over(plot, x, y, lw=2). Works with any plot function.

2004-11-30

Added bbox property to text - JDH

2004-11-29

Zoom to rect now respect reversed axes limits (for both linear and log axes). - GL

2004-11-29

Added the over command to the matlab interface. over allows you to add an overlay plot regardless of hold state. - JDH

2004-11-25

Added Printf to mplutils for printf style format string formatting in C++ (should help write better exceptions)

2004-11-24

IMAGE_FORMAT: remove from agg and gtkagg backends as its no longer used - SC

2004-11-23

Added matplotlib compatible set and get introspection. See set_and_get.py

2004-11-23

applied Norbert's patched and exposed legend configuration to kwargs - JDH

2004-11-23

backend_gtk.py: added a default exception handler - SC

2004-11-18

backend_gtk.py: change so that the backend knows about all image formats and does not need to use IMAGE_FORMAT in other backends - SC

2004-11-18

Fixed some report_error bugs in string interpolation as reported on SF bug tracker- JDH

2004-11-17

backend_gtkcairo.py: change so all print_figure() calls render using Cairo and get saved using backend_gtk.print_figure() - SC

2004-11-13

backend_cairo.py: Discovered the magic number (96) required for Cairo PS plots to come out the right size. Restored Cairo PS output and added support for landscape mode - SC

2004-11-13

Added ishold - JDH

2004-11-12

Added many new matlab colormaps - autumn bone cool copper flag gray hot hsv jet pink prism spring summer winter - PG

2004-11-11

greatly simplify the emitted postscript code - JV

2004-11-12

Added new plotting functions spy, spy2 for sparse matrix visualization - JDH

2004-11-11

Added rgrids, thetragrids for customizing the grid locations and labels for polar plots - JDH

2004-11-11

make the Gtk backends build without an X-server connection - JV

2004-11-10

matplotlib/__init__.py: Added FROZEN to signal we are running under py2exe (or similar) - is used by backend_gtk.py - SC

2004-11-09

backend_gtk.py: Made fix suggested by maffew@cat.org.au to prevent problems when py2exe calls pygtk.require(). - SC

2004-11-09

backend_cairo.py: Added support for printing to a fileobject. Disabled cairo PS output which is not working correctly. - SC

0.64 (2004-11-08)

2004-11-04

Changed -dbackend processing to only use known backends, so we don't clobber other non-matplotlib uses of -d, like -debug.

2004-11-04

backend_agg.py: added IMAGE_FORMAT to list the formats that the backend can save to. backend_gtkagg.py: added support for saving JPG files by using the GTK backend - SC

2004-10-31

backend_cairo.py: now produces png and ps files (although the figure sizing needs some work). pycairo did not wrap all the necessary functions, so I wrapped them myself, they are included in the backend_cairo.py doc string. - SC

2004-10-31

backend_ps.py: clean up the generated PostScript code, use the PostScript stack to hold intermediate values instead of storing them in the dictionary. - JV

2004-10-30

backend_ps.py, ft2font.cpp, ft2font.h: fix the position of text in the PostScript output. The new FT2Font method get_descent gives the distance between the lower edge of the bounding box and the baseline of a string. In backend_ps the text is shifted upwards by this amount. - JV

2004-10-30

backend_ps.py: clean up the code a lot. Change the PostScript output to be more DSC compliant. All definitions for the generated PostScript are now in a PostScript dictionary 'mpldict'. Moved the long comment about drawing ellipses from the PostScript output into a Python comment. - JV

2004-10-30

backend_gtk.py: removed FigureCanvasGTK.realize() as its no longer needed. Merged ColorManager into GraphicsContext backend_bases.py: For set_capstyle/joinstyle() only set cap or joinstyle if there is no error. - SC

2004-10-30

backend_gtk.py: tidied up print_figure() and removed some of the dependency on widget events - SC

2004-10-28

backend_cairo.py: The renderer is complete except for mathtext, draw_image() and clipping. gtkcairo works reasonably well. cairo does not yet create any files since I can't figure how to set the 'target surface', I don't think pycairo wraps the required functions - SC

2004-10-28

backend_gtk.py: Improved the save dialog (GTK 2.4 only) so it presents the user with a menu of supported image formats - SC

2004-10-28

backend_svg.py: change print_figure() to restore original face/edge color backend_ps.py : change print_figure() to ensure original face/edge colors are restored even if there's an IOError - SC

2004-10-27

Applied Norbert's errorbar patch to support barsabove kwarg

2004-10-27

Applied Norbert's legend patch to support None handles

2004-10-27

Added two more backends: backend_cairo.py, backend_gtkcairo.py They are not complete yet, currently backend_gtkcairo just renders polygons, rectangles and lines - SC

2004-10-21

Added polar axes and plots - JDH

2004-10-20

Fixed corrcoef bug exposed by corrcoef(X) where X is matrix - JDH

2004-10-19

Added kwarg support to xticks and yticks to set ticklabel text properties -- thanks to T. Edward Whalen for the suggestion

2004-10-19

Added support for PIL images in imshow(), image.py - ADS

2004-10-19

Re-worked exception handling in _image.py and _transforms.py to avoid masking problems with shared libraries. - JTM

2004-10-16

Streamlined the matlab interface wrapper, removed the noplot option to hist - just use mlab.hist instead.

2004-09-30

Added Andrew Dalke's strftime code to extend the range of dates supported by the DateFormatter - JDH

2004-09-30

Added barh - JDH

2004-09-30

Removed fallback to alternate array package from numerix so that ImportErrors are easier to debug. - JTM

2004-09-30

Add GTK+ 2.4 support for the message in the toolbar. SC

2004-09-30

Made some changes to support python22 - lots of doc fixes. - JDH

2004-09-29

Added a Verbose class for reporting - JDH

2004-09-28

Released 0.63.0

2004-09-28

Added save to file object for agg - see examples/print_stdout.py

2004-09-24

Reorganized all py code to lib subdir

2004-09-24

Fixed axes resize image edge effects on interpolation - required upgrade to agg22 which fixed an agg bug related to this problem

2004-09-20

Added toolbar2 message display for backend_tkagg. JTM

2004-09-17

Added coords formatter attributes. These must be callable, and return a string for the x or y data. These will be used to format the x and y data for the coords box. Default is the axis major formatter. e.g.:

```
# format the coords message box
def price(x): return '$%1.2f'%x
ax.format_xdata = DateFormatter('%Y-%m-%d')
ax.format_ydata = price
```

2004-09-17

Total rewrite of dates handling to use python datetime with num2date, date2num and drange. pytz for timezone handling, dateutils for spohisticated ticking. date ranges from 0001-9999 are supported. rrules allow arbitrary date ticking. examples/date_demo*.py converted to show new usage. new example examples/date_demo_rrule.py shows how to use rrules in date plots. The date locators are much more general and almost all of them have different constructors. See matplotlib.dates for more info.

2004-09-15

Applied Fernando's backend __init__ patch to support easier backend maintenance. Added his numutils to mlab. JDH

2004-09-16

Re-designated all files in matplotlib/images as binary and w/o keyword substitution using "cvs admin -kb *.svg ...". See binary files in "info cvs" under Linux. This was messing up builds from CVS on windows since CVS was doing lf -> cr/lf and keyword substitution on the bitmaps. - JTM

2004-09-15

Modified setup to build array-package-specific extensions for those extensions which are array-aware. Setup builds extensions automatically for either Numeric, numarray, or both, depending on what you have installed. Python proxy modules for the array-aware extensions import the version optimized for numarray or Numeric determined by numerix. - JTM

2004-09-15

Moved definitions of infinity from mlab to numerix to avoid divide by zero warnings for numarray - JTM

2004-09-09

Added axhline, axvline, axhspan and axvspan

0.62.4 (2004-08-30)

2004-08-30

Fixed a multiple images with different extent bug, Fixed markerfacecolor as RGB tuple

2004-08-27

Mathtext now more than 5x faster. Thanks to Paul Mcguire for fixes both to pyparsing and to the matplotlib grammar! mathtext broken on python2.2

2004-08-25

Exposed Darren's and Greg's log ticking and formatting options to semilogx and friends

2004-08-23

Fixed grid w/o args to toggle grid state - JDH

2004-08-11

Added Gregory's log patches for major and minor ticking

2004-08-18

Some pixel edge effects fixes for images

2004-08-18

Fixed TTF files reads in backend_ps on win32.

2004-08-18

Added base and subs properties for logscale plots, user modifiable using set_[x,y]scale('log',base=b,subs=[mt1,mt2,...]) - GL

2004-08-18

fixed a bug exposed by trying to find the HOME dir on win32 thanks to Alan Issac for pointing to the light - JDH

2004-08-18

fixed errorbar bug in setting ecolor - JDH

2004-08-12

Added Darren Dale's exponential ticking patch

2004-08-11

Added Gregory's fltkagg backend

0.61.0 (2004-08-09)

2004-08-08

backend_gtk.py: get rid of the final PyGTK deprecation warning by replacing gtkOptionMenu with gtkMenu in the 2.4 version of the classic toolbar.

2004-08-06

Added Tk zoom to rect rectangle, proper idle drawing, and keybinding - JDH

2004-08-05

Updated installing.html and INSTALL - JDH

2004-08-01

backend_gtk.py: move all drawing code into the expose_event()

2004-07-28

Added Greg's toolbar2 and backend_*agg patches - JDH

2004-07-28

Added image.imread with support for loading png into numerix arrays

2004-07-28

Added key modifiers to events - implemented dynamic updates and rubber banding for interactive pan/zoom - JDH

2004-07-27

did a readthrough of SVG, replacing all the string additions with string interps for efficiency, fixed some layout problems, added font and image support (through external pngs) - JDH

2004-07-25

backend_gtk.py: modify toolbar2 to make it easier to support GTK+ 2.4. Add GTK+ 2.4 toolbar support. - SC

2004-07-24

backend_gtk.py: Simplified classic toolbar creation - SC

2004-07-24

Added images/matplotlib.svg to be used when GTK+ windows are minimised - SC

2004-07-22

Added right mouse click zoom for NavigationToolbar2 panning mode. - JTM

2004-07-22

Added NavigationToolbar2 support to backend_tkagg. Minor tweak to backend_bases. - JTM

2004-07-22

Incorporated Gergory's renderer cache and buffer object cache - JDH

2004-07-22

Backend_gtk.py: Added support for GtkFileChooser, changed FileSelection/FileChooser so that only one instance pops up, and made them both modal. - SC

2004-07-21

Applied backend_agg memory leak patch from hayden - jocallo@online.no. Found and fixed a leak in binary operations on transforms. Moral of the story: never incref where you meant to decref! Fixed several leaks in ft2font: moral of story: almost always return Py::asObject over Py::Object - JDH

2004-07-21

Fixed a to string memory allocation bug in agg and image modules - JDH

2004-07-21

Added mpl_connect and mpl_disconnect to matlab interface - JDH

2004-07-21

Added beginnings of users_guide to CVS - JDH

2004-07-20

ported toolbar2 to wx

2004-07-20

upgraded to agg21 - JDH

2004-07-20

Added new icons for toolbar2 - JDH

2004-07-19

Added vertical mathtext for *Agg and GTK - thanks Jim Benson! - JDH

2004-07-16

Added ps/eps/svg savefig options to wx and gtk JDH

2004-07-15

Fixed python framework tk finder in setupext.py - JDH

2004-07-14

Fixed layer images demo which was broken by the 07/12 image extent fixes - JDH

2004-07-13

Modified line collections to handle arbitrary length segments for each line segment. - JDH

2004-07-13

Fixed problems with image extent and origin - set_image_extent deprecated. Use imshow(blah, blah, extent=(xmin, xmax, ymin, ymax) instead - JDH

2004-07-12

Added prototype for new nav bar with codified event handling. Use mpl_connect rather than connect for matplotlib event handling. toolbar style determined by rc toolbar param. backend status: gtk: prototype, wx: in progress, tk: not started - JDH

2004-07-11

backend_gtk.py: use builtin round() instead of redefining it. - SC

2004-07-10

Added embedding_in_wx3 example - ADS

2004-07-09

Added dynamic_image_wxagg to examples - ADS

2004-07-09

added support for embedding TrueType fonts in PS files - PEB

2004-07-09

fixed a sfnt bug exposed if font cache is not built

2004-07-09

added default arg None to matplotlib.matlab grid command to toggle current grid state

---

0.60.2 (2004-07-08)

2004-07-08

fixed a mathtext bug for '6'

2004-07-08

added some numarray bug workarounds

0.60 (2004-07-07)

2004-07-07

Fixed a bug in dynamic_demo_wx

2004-07-07

backend_gtk.py: raise SystemExit immediately if 'import pygtk' fails - SC

2004-07-05

Added new mathtext commands over{sym1}{sym2} and under{sym1}{sym2}

2004-07-05

Unified image and patch collections colormapping and scaling args. Updated docstrings for all - JDH

2004-07-05

Fixed a figure legend bug and added examples/figlegend_demo.py - JDH

2004-07-01

Fixed a memory leak in image and agg to string methods

2004-06-25

Fixed fonts_demo spacing problems and added a kwargs version of the fonts_demo fonts_demo_kw.py - JDH

2004-06-25

finance.py: handle case when urlopen() fails - SC

2004-06-24

Support for multiple images on axes and figure, with blending. Support for upper and lower image origins. clim, jet and gray functions in matlab interface operate on current image - JDH

2004-06-23

ported code to Perry's new colormap and norm scheme. Added new rc attributes image.aspect, image.interpolation, image.cmap, image.lut, image.origin

2004-06-20

backend_gtk.py: replace gtk.TRUE/FALSE with True/False. simplified _make_axis_menu(). - SC

2004-06-19

anim_tk.py: Updated to use TkAgg by default (not GTK) backend_gtk_py: Added '_' in front of private widget creation functions - SC

2004-06-17

backend_gtk.py: Create a GC once in realise(), not every time draw() is called. - SC

2004-06-16

Added new py2exe FAQ entry and added frozen support in get_data_path for py2exe - JDH

2004-06-16

Removed GTKGD, which was always just a proof-of-concept backend - JDH

2004-06-16

backend_gtk.py updates to replace deprecated functions gtk.mainquit(), gtk.mainloop(). Update NavigationToolbar to use the new GtkToolbar API - SC

2004-06-15

removed set_default_font from font_manager to unify font customization using the new function rc. See API_CHANGES for more info. The examples fonts_demo.py and fonts_demo_kw.py are ported to the new API - JDH

2004-06-15

Improved (yet again!) axis scaling to properly handle singleton plots - JDH

2004-06-15

Restored the old FigureCanvasGTK.draw() - SC

2004-06-11

More memory leak fixes in transforms and ft2font - JDH

2004-06-11

Eliminated numerix .numerix file and environment variable NUMERIX. Fixed bug which prevented command line overrides: --numarray or --numeric. - JTM

2004-06-10

Added rc configuration function rc; deferred all rc param setting until object creation time; added new rc attrs: lines.markerfacecolor, lines.markeredgecolor, lines.markeredgewidth, patch.linewidth, patch.facecolor, patch.edgecolor, patch.antialiased; see examples/customize_rc.py for usage - JDH

0.54.2 (2004-06-09)

2004-06-08

Rewrote ft2font using CXX as part of general memory leak fixes; also fixed transform memory leaks - JDH

2004-06-07

Fixed several problems with log ticks and scaling - JDH

2004-06-07

Fixed width/height issues for images - JDH

2004-06-03

Fixed draw_if_interactive bug for semilogx;

2004-06-02

Fixed text clipping to clip to axes - JDH

2004-06-02

Fixed leading newline text and multiple newline text - JDH

2004-06-02

Fixed plot_date to return lines - JDH

2004-06-01

Fixed plot to work with x or y having shape N,1 or 1,N - JDH

2004-05-31

Added renderer markeredgewidth attribute of Line2D. - ADS

2004-05-29

Fixed tick label clipping to work with navigation.

2004-05-28

Added renderer grouping commands to support groups in

SVG/PS. - JDH

2004-05-28

Fixed, this time I really mean it, the singleton plot plot([0]) scaling bug; Fixed Flavio's shape = N,1 bug - JDH

2004-05-28

added colorbar - JDH

2004-05-28

Made some changes to the matplotlib.colors.Colormap to properly support clim - JDH

0.54.1 (2004-05-27)

2004-05-27

Lots of small bug fixes: rotated text at negative angles, errorbar capsize and autoscaling, right tick label position, gtkagg on win98, alpha of figure background, singleton plots - JDH

2004-05-26

Added Gary's errorbar stuff and made some fixes for length one plots and constant data plots - JDH

2004-05-25

Tweaked TkAgg backend so that canvas.draw() works more like the other backends. Fixed a bug resulting in 2 draws per figure manager show(). - JTM

0.54 (2004-05-19)

2004-05-18

Added newline separated text with rotations to text.Text layout - JDH

2004-05-16

Added fast pcolor using PolyCollections. - JDH

2004-05-14

Added fast polygon collections - changed scatter to use them. Added multiple symbols to scatter. 10x speedup on large scatters using *Agg and 5X speedup for ps. - JDH

2004-05-14

On second thought... created an "nx" namespace in numerix which maps type names onto typecodes the same way for both numarray and Numeric. This undoes my previous change immediately below. To get a typename for Int16 usable in a Numeric extension: say nx.Int16. - JTM

2004-05-15

Rewrote transformation class in extension code, simplified all the artist constructors - JDH

2004-05-14

Modified the type definitions in the numarray side of numerix so that they are Numeric typecodes and can be used with Numeric compilex extensions. The original numarray types were renamed to type<old_name>. - JTM

2004-05-06

Gary Ruben sent me a bevy of new plot symbols and markers. See matplotlib.matlab.plot - JDH

2004-05-06

Total rewrite of mathtext - factored ft2font stuff out of layout engine and defined abstract class for font handling to lay groundwork for ps mathtext. Rewrote parser and made layout engine much more precise. Fixed all the layout hacks. Added spacing commands / and hspace. Added composite chars and defined angstrom. - JDH

2004-05-05

Refactored text instances out of backend; aligned text with arbitrary rotations is now supported - JDH

2004-05-05

Added a Matrix capability for numarray to numerix. JTM

2004-05-04

Updated whats_new.html.template to use dictionary and template loop, added anchors for all versions and items; updated goals.txt to use those for links. PG

2004-05-04

Added fonts_demo.py to backend_driver, and AFM and TTF font caches to font_manager.py - PEB

2004-05-03

Redid goals.html.template to use a goals.txt file that has a pseudo restructured text organization. PG

2004-05-03

Removed the close buttons on all GUIs and added the python #! bang line to the examples following Steve Chaplin's advice on matplotlib dev

2004-04-29

Added CXX and rewrote backend_agg using it; tracked down and fixed agg memory leak - JDH

2004-04-29

Added stem plot command - JDH

2004-04-28

Fixed PS scaling and centering bug - JDH

2004-04-26

Fixed errorbar autoscale problem - JDH

2004-04-22

Fixed copy tick attribute bug, fixed singular datalim ticker bug; fixed mathtext fontsize interactive bug. - JDH

2004-04-21

Added calls to draw_if_interactive to axes(), legend(), and pcolor(). Deleted duplicate pcolor(). - JTM

2004-04-21

matplotlib 0.53 release

2004-04-19

Fixed vertical alignment bug in PS backend - JDH

2004-04-17

Added support for two scales on the "same axes" with tick different ticking and labeling left right or top bottom. See examples/two_scales.py - JDH

2004-04-17

Added default dirs as list rather than single dir in setupext.py - JDH

2004-04-16

Fixed wx exception swallowing bug (and there was much rejoicing!) - JDH

2004-04-16

Added new ticker locator a formatter, fixed default font return - JDH

2004-04-16

Added get_name method to FontProperties class. Fixed font lookup in GTK and WX backends. - PEB

2004-04-16

Added get- and set_fontstyle methods. - PEB

2004-04-10

Mathtext fixes: scaling with dpi, - JDH

2004-04-09

Improved font detection algorithm. - PEB

2004-04-09

Move deprecation warnings from text.py to __init__.py - PEB

2004-04-09

Added default font customization - JDH

2004-04-08

Fixed viewlim set problem on axes and axis. - JDH

2004-04-07

Added validate_comma_sep_str and font properties parameters to __init__. Removed font families and added rcParams to FontProperties __init__ arguments in font_manager. Added default font property parameters to .matplotlibrc file with descriptions. Added deprecation warnings to the get_ - and set_fontXXX methods of the Text object. - PEB

2004-04-06

Added load and save commands for ASCII data - JDH

2004-04-05

Improved font caching by not reading AFM fonts until needed. Added better documentation. Changed the behaviour of the get_family, set_family, and set_name methods of FontProperties. - PEB

2004-04-05

Added WXAgg backend - JDH

2004-04-04

Improved font caching in backend_agg with changes to font_manager - JDH

2004-03-29

Fixed fontdicts and kwargs to work with new font manager - JDH

This is the Old, stale, never used changelog

2002-12-10

- Added a TODO file and CHANGELOG. Lots to do -- get crackin'!
- Fixed y zoom tool bug
- Adopted a compromise fix for the y data clipping problem. The problem was that for solid lines, the y data clipping (as opposed to the gc clipping) caused artifactual horizontal solid lines near the ylim boundaries. I did a 5% offset hack in Axes set_ylim functions which helped, but didn't cure the problem for very high gain y zooms. So I disabled y data clipping for connected lines . If you need extensive y clipping, either plot(y,x) because x data clipping is always enabled, or change the _set_clip code to 'if 1' as indicated in the lines.py src. See _set_clip in lines.py and set_ylim in figure.py for more information.

2002-12-11

- Added a measurement dialog to the figure window to measure axes position and the delta x delta y with a left mouse drag. These defaults can be overridden by deriving from Figure and overriding button_press_event, button_release_event, and motion_notify_event, and _dialog_measure_tool.

- fixed the navigation dialog so you can check the axes the navigation buttons apply to.

2003-04-23

Released matplotlib v0.1

2003-04-24

Added a new line style PixelLine2D which is the plots the markers as pixels (as small as possible) with format symbol ','

Added a new class Patch with derived classes Rectangle, RegularPolygon and Circle

2003-04-25

Implemented new functions errorbar, scatter and hist

Added a new line type '|' which is a vline. syntax is plot(x, Y, '|') where y.shape = len(x),2 and each row gives the ymin,ymax for the respective values of x. Previously I had implemented vlines as a list of lines, but I needed the efficiency of the numeric clipping for large numbers of vlines outside the viewport, so I wrote a dedicated class Vline2D which derives from Line2D

2003-05-01

Fixed ytick bug where grid and tick show outside axis viewport with gc clip

2003-05-14

Added new ways to specify colors 1) matlab format string 2) html-style hex string, 3) rgb tuple. See examples/color_demo.py

2003-05-28

Changed figure rendering to draw form a pixmap to reduce flicker. See examples/system_monitor.py for an example where the plot is continuously updated w/o flicker. This example is meant to simulate a system monitor that shows free CPU, RAM, etc...

2003-08-04

Added Jon Anderson's GTK shell, which doesn't require pygtk to have threading built-in and looks nice!

2003-08-25

Fixed deprecation warnings for python2.3 and pygtk-1.99.18

2003-08-26

Added figure text with new example examples/figtext.py

2003-08-27

Fixed bugs in figure text with font override dictionaries and fig text that was placed outside the window bounding box

2003-09-01 through 2003-09-15

Added a postscript and a GD module backend

2003-09-16

Fixed font scaling and point scaling so circles, squares, etc on lines will scale with DPI as will fonts. Font scaling is not fully implemented on the gtk backend because I have not figured out how to scale fonts to arbitrary sizes with GTK

2003-09-17

Fixed figure text bug which crashed X windows on long figure text extending beyond display area. This was, I believe, due to the vestigial erase functionality that was no longer needed since I began rendering to a pixmap

2003-09-30

Added legend

2003-10-01

Fixed bug when colors are specified with rgb tuple or hex string.

2003-10-21

Andrew Straw provided some legend code which I modified and incorporated. Thanks Andrew!

2003-10-27

Fixed a bug in axis.get_view_distance that affected zoom in versus out with interactive scrolling, and a bug in the axis text reset system that prevented the text from being redrawn on a interactive gtk view lim set with the widget

Fixed a bug in that prevented the manual setting of ticklabel strings from working properly

2003-11-02

- Do a nearest neighbor color pick on GD when allocate fails

2003-11-02

- Added pcolor plot
- Added MRI example
- Fixed bug that screwed up label position if xticks or yticks were empty
- added nearest neighbor color picker when GD max colors exceeded
- fixed figure background color bug in GD backend

2003-11-10 - 2003-11-11

major refactoring.

- Ticks (with labels, lines and grid) handled by dedicated class
- Artist now know bounding box and dpi
- Bounding boxes and transforms handled by dedicated classes
- legend in dedicated class. Does a better job of alignment and bordering. Can be initialized with specific line instances. See examples/legend_demo2.py

2003-11-14

Fixed legend positioning bug and added new position args

2003-11-16

Finished porting GD to new axes API

2003-11-20

- add TM for matlab on website and in docs

2003-11-20

- make a nice errorbar and scatter screenshot

2003-11-20

- auto line style cycling for multiple line types broken

2003-11-18

(using inkrect) :logical rect too big on gtk backend

2003-11-18

ticks don't reach edge of axes in gtk mode -- rounding error?

2003-11-20

- port Gary's errorbar code to new API before 0.40

2003-11-20

- problem with stale _set_font. legend axes box doesn't resize on save in GTK backend -- see htdocs legend_demo.py

2003-11-21

- make a dash-dot dict for the GC

2003-12-15

- fix install path bug

9.21.2 What's new in Matplotlib 0.99 (Aug 29, 2009)

Table of Contents

- *What's new in Matplotlib 0.99 (Aug 29, 2009)*
  - *New documentation*
  - *mplot3d*
  - *axes grid toolkit*
  - *Axis spine placement*

New documentation

Jae-Joon Lee has written two new guides *Legend guide* and *Advanced annotation*. Michael Sarahan has written *Image tutorial*. John Hunter has written two new tutorials on working with paths and transformations: *Path Tutorial* and *Transformations Tutorial*.

mplot3d

Reinier Heeres has ported John Porter's mplot3d over to the new matplotlib transformations framework, and it is now available as a toolkit mpl_toolkits.mplot3d (which now comes standard with all mpl installs). See *3D plotting* and *The mplot3d toolkit*.

axes grid toolkit

Jae-Joon Lee has added a new toolkit to ease displaying multiple images in matplotlib, as well as some support for curvilinear grids to support the world coordinate system. The toolkit is included standard with all new mpl installs. See *Module - axes_grid1*, *Module - axisartist*, *The axes_grid1 toolkit* and *axisartist*

Axis spine placement

Andrew Straw has added the ability to place "axis spines" -- the lines that denote the data limits -- in various arbitrary locations. No longer are your axis lines constrained to be a simple rectangle around the figure -- you can turn on or off left, bottom, right and top, as well as "detach" the spine to offset it away from the data. See *Spine placement* and `matplotlib.spines.Spine`.

9.21.3 Changes beyond 0.99.x

- The default behavior of `matplotlib.axes.Axes.set_xlim()`, `matplotlib.axes.Axes.set_ylim()`, and `matplotlib.axes.Axes.axis()`, and their corresponding pyplot functions, has been changed: when view limits are set explicitly with one of these methods, autoscaling is turned off for the matching axis. A new *auto* kwarg is available to control this behavior. The limit kwargs have been renamed to *left* and *right* instead of *xmin* and *xmax*, and *bottom* and *top* instead of *ymin* and *ymax*. The old names may still be used, however.
- There are five new Axes methods with corresponding pyplot functions to facilitate autoscaling, tick location, and tick label formatting, and the general appearance of ticks and tick labels:
  - `matplotlib.axes.Axes.autoscale()` turns autoscaling on or off, and applies it.
  - `matplotlib.axes.Axes.margins()` sets margins used to autoscale the `matplotlib.axes.Axes.viewLim` based on the `matplotlib.axes.Axes.dataLim`.
  - `matplotlib.axes.Axes.locator_params()` allows one to adjust axes locator parameters such as *nbins*.
  - `matplotlib.axes.Axes.ticklabel_format()` is a convenience method for controlling the `matplotlib.ticker.ScalarFormatter` that is used by default with linear axes.

  - *matplotlib.axes.Axes.tick_params()* controls direction, size, visibility, and color of ticks and their labels.

- The *matplotlib.axes.Axes.bar()* method accepts a *error_kw* kwarg; it is a dictionary of kwargs to be passed to the errorbar function.
- The *matplotlib.axes.Axes.hist()* *color* kwarg now accepts a sequence of color specs to match a sequence of datasets.
- The *EllipseCollection* has been changed in two ways:
  - There is a new *units* option, 'xy', that scales the ellipse with the data units. This matches the :class:'~matplotlib.patches.Ellipse` scaling.
  - The *height* and *width* kwargs have been changed to specify the height and width, again for consistency with *Ellipse*, and to better match their names; previously they specified the half-height and half-width.
- There is a new rc parameter `axes.color_cycle`, and the color cycle is now independent of the rc parameter `lines.color`. `matplotlib.Axes.set_default_color_cycle` is deprecated.
- You can now print several figures to one pdf file and modify the document information dictionary of a pdf file. See the docstrings of the class *matplotlib.backends.backend_pdf.PdfPages* for more information.
- Removed configobj and enthought.traits packages, which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently.
- The new rc parameter `savefig.extension` sets the filename extension that is used by *matplotlib.figure.Figure.savefig()* if its *fname* argument lacks an extension.
- In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```
draw_path_collection(self, master_transform, cliprect, clippath,
                     clippath_trans, paths, all_transforms,␣
 ↪offsets,
                     offsetTrans, facecolors, edgecolors,␣
 ↪linewidths,
                     linestyles, antialiaseds, urls)

# is now

draw_path_collection(self, gc, master_transform, paths, all_
 ↪transforms,
                     offsets, offsetTrans, facecolors, edgecolors,
                     linewidths, linestyles, antialiaseds, urls)

draw_quad_mesh(self, master_transform, cliprect, clippath,
               clippath_trans, meshWidth, meshHeight, coordinates,
               offsets, offsetTrans, facecolors, antialiased,
```

(continues on next page)

(continued from previous page)

```
                showedges)

# is now

draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
                coordinates, offsets, offsetTrans, facecolors,
                antialiased, showedges)

draw_image(self, x, y, im, bbox, clippath=None, clippath_
 ↪trans=None)

# is now

draw_image(self, gc, x, y, im)
```

- There are four new Axes methods with corresponding pyplot functions that deal with unstructured triangular grids:
  - *matplotlib.axes.Axes.tricontour()* draws contour lines on a triangular grid.
  - *matplotlib.axes.Axes.tricontourf()* draws filled contours on a triangular grid.
  - *matplotlib.axes.Axes.tripcolor()* draws a pseudocolor plot on a triangular grid.
  - *matplotlib.axes.Axes.triplot()* draws a triangular grid as lines and/or markers.

9.21.4 Changes in 0.99

- pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary NumPy arrays.
- User-generated colormaps can now be added to the set recognized by `matplotlib.cm.get_cmap`. Colormaps can be made the default and applied to the current image using *matplotlib.pyplot.set_cmap()*.
- changed use_mrecords default to False in mlab.csv2rec since this is partially broken
- Axes instances no longer have a "frame" attribute. Instead, use the new "spines" attribute. Spines is a dictionary where the keys are the names of the spines (e.g., 'left','right' and so on) and the values are the artists that draw the spines. For normal (rectilinear) axes, these artists are Line2D instances. For other axes (such as polar axes), these artists may be Patch instances.
- Polar plots no longer accept a resolution kwarg. Instead, each Path must specify its own number of interpolation steps. This is unlikely to be a user-visible change -- if interpolation of data is required, that should be done before passing it to Matplotlib.

9.21.5 What's new in Matplotlib 0.98.4

Table of Contents

- *What's new in Matplotlib 0.98.4*
  - *Legend enhancements*
  - *Fancy annotations and arrows*
  - *Native OS X backend*
  - *psd amplitude scaling*
  - *Fill between*
  - *Lots more*

It's been four months since the last matplotlib release, and there are a lot of new features and bug-fixes.

Thanks to Charlie Moad for testing and preparing the source release, including binaries for OS X and Windows for python 2.4 and 2.5 (2.6 and 3.0 will not be available until numpy is available on those releases). Thanks to the many developers who contributed to this release, with contributions from Jae-Joon Lee, Michael Droettboom, Ryan May, Eric Firing, Manuel Metz, Jouni K. Seppänen, Jeff Whitaker, Darren Dale, David Kaplan, Michiel de Hoon and many others who submitted patches

Legend enhancements

Jae-Joon has rewritten the legend class, and added support for multiple columns and rows, as well as fancy box drawing. See *legend()* and *matplotlib.legend.Legend*.

Fancy annotations and arrows

Jae-Joon has added lots of support to annotations for drawing fancy boxes and connectors in annotations. See *annotate()* and *BoxStyle*, *ArrowStyle*, and *ConnectionStyle*.

Native OS X backend

Michiel de Hoon has provided a native Mac OSX backend that is almost completely implemented in C. The backend can therefore use Quartz directly and, depending on the application, can be orders of magnitude faster than the existing backends. In addition, no third-party libraries are needed other than Python and NumPy. The backend is interactive from the usual terminal application on Mac using regular Python. It hasn't been tested with ipython yet, but in principle it should to work there as well. Set 'backend : macosx' in your matplotlibrc file, or run your script with:

```
> python myfile.py -dmacosx
```

psd amplitude scaling

Ryan May did a lot of work to rationalize the amplitude scaling of *psd()* and friends. See *Power spectral density (PSD)*. The changes should increase MATLAB compatibility and increase scaling options.

Fill between

Added a *fill_between()* function to make it easier to do shaded region plots in the presence of masked data. You can pass an *x* array and a *ylower* and *yupper* array to fill between, and an optional *where* argument which is a logical mask where you want to do the filling.

Lots more

Here are the 0.98.4 notes from the CHANGELOG:

```
Added mdehoon's native macosx backend from sf patch 2179017 - JDH

Removed the prints in the set_*style commands.  Return the list of
pretty-printed strings instead - JDH

Some of the changes Michael made to improve the output of the
property tables in the rest docs broke of made difficult to use
some of the interactive doc helpers, e.g., setp and getp.  Having all
the rest markup in the ipython shell also confused the docstrings.
I added a new rc param docstring.harcopy, to format the docstrings
differently for hardcopy and other use.  The ArtistInspector
could use a little refactoring now since there is duplication of
effort between the rest out put and the non-rest output - JDH

Updated spectral methods (psd, csd, etc.) to scale one-sided
densities by a factor of 2 and, optionally, scale all densities by
the sampling frequency.  This gives better MATLAB
compatibility. -RM

Fixed alignment of ticks in colorbars. -MGD

drop the deprecated "new" keyword of np.histogram() for numpy 1.2
or later.  -JJL

Fixed a bug in svg backend that new_figure_manager() ignores
keywords arguments such as figsize, etc. -JJL

Fixed a bug that the handlelength of the new legend class set too
short when numpoints=1 -JJL

Added support for data with units (e.g., dates) to
Axes.fill_between. -RM
```

(continues on next page)

(continued from previous page)

```
Added fancybox keyword to legend. Also applied some changes for
better look, including baseline adjustment of the multiline texts
so that it is center aligned. -JJL

The transmuter classes in the patches.py are reorganized as
subclasses of the Style classes. A few more box and arrow styles
are added. -JJL

Fixed a bug in the new legend class that didn't allowed a tuple of
coordinate values as loc. -JJL

Improve checks for external dependencies, using subprocess
(instead of deprecated popen*) and distutils (for version
checking) - DSD

Reimplementation of the legend which supports baseline alignment,
multi-column, and expand mode. - JJL

Fixed histogram autoscaling bug when bins or range are given
explicitly (fixes Debian bug 503148) - MM

Added rcParam axes.unicode_minus which allows plain hyphen for
minus when False - JDH

Added scatterpoints support in Legend. patch by Erik Tollerud -
JJL

Fix crash in log ticking. - MGD

Added static helper method BrokenHBarCollection.span_where and
Axes/pyplot method fill_between.  See
examples/pylab/fill_between.py - JDH

Add x_isdata and y_isdata attributes to Artist instances, and use
them to determine whether either or both coordinates are used when
updating dataLim.  This is used to fix autoscaling problems that
had been triggered by axhline, axhspan, axvline, axvspan. - EF

Update the psd(), csd(), cohere(), and specgram() methods of Axes
and the csd() cohere(), and specgram() functions in mlab to be in
sync with the changes to psd().  In fact, under the hood, these
all call the same core to do computations. - RM

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow
controlling of zero padding and returning of negative frequency
```

(continues on next page)

(continued from previous page)

```
components, respectively.  These are added in a way that does not
change the API. - RM

Fix handling of c kwarg by scatter; generalize is_string_like to
accept numpy and numpy.ma string array scalars. - RM and EF

Fix a possible EINTR problem in dviread, which might help when
saving pdf files from the qt backend. - JKS

Fix bug with zoom to rectangle and twin axes - MGD

Added Jae Joon's fancy arrow, box and annotation enhancements --
see examples/pylab_examples/annotation_demo2.py

Autoscaling is now supported with shared axes - EF

Fixed exception in dviread that happened with Minion - JKS

set_xlim, ylim now return a copy of the viewlim array to avoid
modify inplace surprises

Added image thumbnail generating function
matplotlib.image.thumbnail.  See examples/misc/image_thumbnail.py
- JDH

Applied scatleg patch based on ideas and work by Erik Tollerud and
Jae-Joon Lee. - MM

Fixed bug in pdf backend: if you pass a file object for output
instead of a filename, e.g., in a wep app, we now flush the object
at the end. - JKS

Add path simplification support to paths with gaps. - EF

Fix problem with AFM files that don't specify the font's full name
or family name. - JKS

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for
easy access to the set_powerlimits method of the major
ScalarFormatter. - EF

Experimental new kwarg borderpad to replace pad in legend, based
on suggestion by Jae-Joon Lee.  - EF

Allow spy to ignore zero values in sparse arrays, based on patch
by Tony Yu.  Also fixed plot to handle empty data arrays, and
```

(continues on next page)

(continued from previous page)

```
fixed handling of markers in figlegend. - EF

Introduce drawstyles for lines. Transparently split linestyles
like 'steps--' into drawstyle 'steps' and linestyle '--'.  Legends
always use drawstyle 'default'. - MM

Fixed quiver and quiverkey bugs (failure to scale properly when
resizing) and added additional methods for determining the arrow
angles - EF

Fix polar interpolation to handle negative values of theta - MGD

Reorganized cbook and mlab methods related to numerical
calculations that have little to do with the goals of those two
modules into a separate module numerical_methods.py Also, added
ability to select points and stop point selection with keyboard in
ginput and manual contour labeling code.  Finally, fixed contour
labeling bug. - DMK

Fix backtick in Postscript output. - MGD

[ 2089958 ] Path simplification for vector output backends
Leverage the simplification code exposed through path_to_polygons
to simplify certain well-behaved paths in the vector backends
(PDF, PS and SVG).  "path.simplify" must be set to True in
matplotlibrc for this to work.  - MGD

Add "filled" kwarg to Path.intersects_path and
Path.intersects_bbox. - MGD

Changed full arrows slightly to avoid an xpdf rendering problem
reported by Friedrich Hagedorn. - JKS

Fix conversion of quadratic to cubic Bezier curves in PDF and PS
backends. Patch by Jae-Joon Lee. - JKS

Added 5-point star marker to plot command q- EF

Fix hatching in PS backend - MGD

Fix log with base 2 - MGD

Added support for bilinear interpolation in
NonUniformImage; patch by Gregory Lielens. - EF

Added support for multiple histograms with data of
```

(continues on next page)

(continued from previous page)

```
different length - MM

Fix step plots with log scale - MGD

Fix masked arrays with markers in non-Agg backends - MGD

Fix clip_on kwarg so it actually works correctly - MGD

Fix locale problems in SVG backend - MGD

fix quiver so masked values are not plotted - JSW

improve interactive pan/zoom in qt4 backend on windows - DSD

Fix more bugs in NaN/inf handling.  In particular, path
simplification (which does not handle NaNs or infs) will be turned
off automatically when infs or NaNs are present.  Also masked
arrays are now converted to arrays with NaNs for consistent
handling of masks and NaNs - MGD and EF

Added support for arbitrary rasterization resolutions to the SVG
backend. - MW
```

9.21.6 Changes for 0.98.x

- `psd()`, `csd()`, and `cohere()` will now automatically wrap negative frequency components to the beginning of the returned arrays. This is much more sensible behavior and makes them consistent with `specgram()`. The previous behavior was more of an oversight than a design decision.
- Added new keyword parameters *nonposx*, *nonposy* to *matplotlib.axes.Axes* methods that set log scale parameters. The default is still to mask out non-positive values, but the kwargs accept 'clip', which causes non-positive values to be replaced with a very small positive value.
- Added new *matplotlib.pyplot.fignum_exists()* and *matplotlib.pyplot.get_fignums()*; they merely expose information that had been hidden in `matplotlib._pylab_helpers`.
- Deprecated numerix package.
- Added new *matplotlib.image.imsave()* and exposed it to the *matplotlib.pyplot* interface.
- Remove support for pyExcelerator in exceltools -- use xlwt instead
- Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults
- Following keyword parameters for *matplotlib.legend.Legend* are now deprecated and new set of parameters are introduced. The new parameters are given as a fraction of the font-size. Also, *scatteryoffsets*, *fancybox* and *columnspacing* are added as keyword parameters.

Deprecated	New
pad	borderpad
labelsep	labelspacing
handlelen	handlelength
handlestextsep	handletextpad
axespad	borderaxespad

- Removed the configobj and experimental traits rc support
- Modified *matplotlib.mlab.psd()*, *matplotlib.mlab.csd()*, *matplotlib.mlab.cohere()*, and *matplotlib.mlab.specgram()* to scale one-sided densities by a factor of 2. Also, optionally scale the densities by the sampling frequency, which gives true values of densities that can be integrated by the returned frequency values. This also gives better MATLAB compatibility. The corresponding *matplotlib.axes.Axes* methods and *matplotlib.pyplot* functions were updated as well.
- Font lookup now uses a nearest-neighbor approach rather than an exact match. Some fonts may be different in plots, but should be closer to what was requested.
- *matplotlib.axes.Axes.set_xlim()*, *matplotlib.axes.Axes.set_ylim()* now return a copy of the `viewlim` array to avoid modify-in-place surprises.
- `matplotlib.afm.AFM.get_fullname` and `matplotlib.afm.AFM.get_familyname` no longer raise an exception if the AFM file does not specify these optional attributes, but returns a guess based on the required FontName attribute.
- Changed precision kwarg in *matplotlib.pyplot.spy()*; default is 0, and the string value 'present' is used for sparse arrays only to show filled locations.
- *matplotlib.collections.EllipseCollection* added.
- Added `angles` kwarg to *matplotlib.pyplot.quiver()* for more flexible specification of the arrow angles.
- Deprecated (raise NotImplementedError) all the mlab2 functions from *matplotlib.mlab* out of concern that some of them were not clean room implementations.
- Methods *matplotlib.collections.Collection.get_offsets()* and *matplotlib.collections.Collection.set_offsets()* added to *Collection* base class.
- `matplotlib.figure.Figure.figurePatch` renamed `matplotlib.figure.Figure.patch`; `matplotlib.axes.Axes.axesPatch` renamed `matplotlib.axes.Axes.patch`; `matplotlib.axes.Axes.axesFrame` renamed `matplotlib.axes.Axes.frame`. `matplotlib.axes.Axes.get_frame`, which returns `matplotlib.axes.Axes.patch`, is deprecated.
- Changes in the *matplotlib.contour.ContourLabeler* attributes (*matplotlib.pyplot.clabel()* function) so that they all have a form like `.labelAttribute`. The three attributes that are most likely to be used by end users, `.cl`, `.cl_xy` and `.cl_cvalues` have been maintained for the moment (in addition to their renamed versions), but they are deprecated and will eventually be removed.

- Moved several functions in *matplotlib.mlab* and *matplotlib.cbook* into a separate module `matplotlib.numerical_methods` because they were unrelated to the initial purpose of mlab or cbook and appeared more coherent elsewhere.

9.21.7 Changes for 0.98.1

- Removed broken `matplotlib.axes3d` support and replaced it with a non-implemented error pointing to 0.91.x

9.21.8 Changes for 0.98.0

- *matplotlib.image.imread()* now no longer always returns RGBA data---if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.
- Rewrote the *matplotlib.cm.ScalarMappable* callback infrastructure to use *matplotlib.cbook.CallbackRegistry* rather than custom callback handling. Any users of `matplotlib.cm.ScalarMappable.add_observer` of the *ScalarMappable* should use the `matplotlib.cm.ScalarMappable.callbacksSM` *CallbackRegistry* instead.
- New axes function and Axes method provide control over the plot color cycle: `matplotlib.axes.set_default_color_cycle` and `matplotlib.axes.Axes.set_color_cycle`.
- Matplotlib now requires Python 2.4, so *matplotlib.cbook* will no longer provide `set`, `enumerate()`, `reversed()` or `izip` compatibility functions.
- In Numpy 1.0, bins are specified by the left edges only. The axes method *matplotlib.axes.Axes.hist()* now uses future Numpy 1.3 semantics for histograms. Providing `binedges`, the last value gives the upper-right edge now, which was implicitly set to +infinity in Numpy 1.0. This also means that the last bin doesn't contain upper outliers any more by default.
- New axes method and pyplot function, *hexbin()*, is an alternative to *scatter()* for large datasets. It makes something like a *pcolor()* of a 2-D histogram, but uses hexagonal bins.
- New kwarg, `symmetric`, in *matplotlib.ticker.MaxNLocator* allows one require an axis to be centered around zero.
- Toolkits must now be imported from `mpl_toolkits` (not `matplotlib.toolkits`)

Notes about the transforms refactoring

A major new feature of the 0.98 series is a more flexible and extensible transformation infrastructure, written in Python/Numpy rather than a custom C extension.

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is mostly an internal improvement, and the possible user-visible changes it allows are yet to come.

See *matplotlib.transforms* for a description of the design of the new transformation framework.

For efficiency, many of these functions return views into Numpy arrays. This means that if you hold on to a reference to them, their contents may change. If you want to store a snapshot of their current values, use the Numpy array method copy().

The view intervals are now stored only in one place -- in the *matplotlib.axes.Axes* instance, not in the locator instances as well. This means locators must get their limits from their *matplotlib.axis.Axis*, which in turn looks up its limits from the *Axes*. If a locator is used temporarily and not assigned to an Axis or Axes, (e.g., in *matplotlib.contour*), a dummy axis must be created to store its bounds. Call *matplotlib.ticker.TickHelper.create_dummy_axis()* to do so.

The functionality of `Pbox` has been merged with *Bbox*. Its methods now all return copies rather than modifying in place.

The following lists many of the simple changes necessary to update code from the old transformation framework to the new one. In particular, methods that return a copy are named with a verb in the past tense, whereas methods that alter an object in place are named with a verb in the present tense.

matplotlib.transforms

Old method	New method
`Bbox.get_bounds`	*transforms.Bbox.bounds*
`Bbox.width`	*transforms.Bbox.width*
`Bbox.height`	*transforms.Bbox.height*
`Bbox.intervalx().get_bounds()` `Bbox.intervalx().set_bounds()`	*transforms.Bbox.intervalx* [It is now a property.]
`Bbox.intervaly().get_bounds()` `Bbox.intervaly().set_bounds()`	*transforms.Bbox.intervaly* [It is now a property.]
`Bbox.xmin`	*transforms.Bbox.x0* or *transforms.Bbox.xmin*[1]
`Bbox.ymin`	*transforms.Bbox.y0* or *transforms.Bbox.ymin*[1]
`Bbox.xmax`	*transforms.Bbox.x1* or *transforms.Bbox.xmax*[1]
`Bbox.ymax`	*transforms.Bbox.y1* or *transforms.Bbox.ymax*[1]
`Bbox.overlaps(bboxes)`	*Bbox.count_overlaps(bboxes)*
`bbox_all(bboxes)`	*Bbox.union(bboxes)* [It is a staticmethod.]
`lbwh_to_bbox(l, b, w, h)`	*Bbox.from_bounds(x0, y0, w, h)* [It is a staticmethod.]
`inverse_transform_bbox(trans, bbox)`	`bbox.inverse_transformed(trans)`
`Interval.contains_open(v)`	*interval_contains_open(tuple, v)*
`Interval.contains(v)`	*interval_contains(tuple, v)*
`identity_transform()`	*transforms.IdentityTransform*
`blend_xy_sep_transform(xtrans, ytrans)`	*blended_transform_factory(xtrans, ytrans)*
`scale_transform(xs, ys)`	*Affine2D().scale(xs[, ys])*
`get_bbox_transform(boxin, boxout)`	*BboxTransform(boxin, boxout)* or *BboxTransformFrom(boxin)* or *BboxTransformTo(boxout)*
`Transform.seq_xy_tup(points)`	*Transform.transform(points)*
`Transform.inverse_xy_tup(points)`	*Transform.inverted()*.transform(points)

[1] The *Bbox* is bound by the points (x0, y0) to (x1, y1) and there is no defined order to these points, that is, x0 is not necessarily the left edge of the box. To get the left edge of the *Bbox*, use the read-only property *xmin*.

matplotlib.axes

Old method	New method
`Axes.get_position()`	*matplotlib.axes.Axes.get_position()*[2]
`Axes.set_position()`	*matplotlib.axes.Axes.set_position()*[3]
`Axes.toggle_log_lineary()`	*matplotlib.axes.Axes.set_yscale()*[4]
`Subplot` class	removed

The `Polar` class has moved to *matplotlib.projections.polar*.

matplotlib.artist

Old method	New method
`Artist.set_clip_path(path)`	`Artist.set_clip_path(path, transform)`[5]

matplotlib.collections

Old method	New method
linestyle	*linestyles*[6]

matplotlib.colors

Old method	New method
`ColorConvertor.to_rgba_list(c)`	`colors.to_rgba_array(c)` [*matplotlib.colors.to_rgba_array()* returns an Nx4 NumPy array of RGBA color quadruples.]

[2] *matplotlib.axes.Axes.get_position()* used to return a list of points, now it returns a *matplotlib.transforms.Bbox* instance.

[3] *matplotlib.axes.Axes.set_position()* now accepts either four scalars or a *matplotlib.transforms.Bbox* instance.

[4] Since the refactoring allows for more than two scale types ('log' or 'linear'), it no longer makes sense to have a toggle. `Axes.toggle_log_lineary()` has been removed.

[5] *matplotlib.artist.Artist.set_clip_path()* now accepts a *matplotlib.path.Path* instance and a *matplotlib.transforms.Transform* that will be applied to the path immediately before clipping.

[6] Linestyles are now treated like all other collection attributes, i.e. a single value or multiple values may be provided.

matplotlib.contour

Old method	New method
`Contour._segments`	`matplotlib.contour.Contour.get_paths` [Returns a list of *matplotlib.path.Path* instances.]

matplotlib.figure

Old method	New method
`Figure.dpi.get()` `Figure.dpi.set()`	*matplotlib.figure.Figure.dpi (a property)*

matplotlib.patches

Old method	New method
`Patch.get_verts()`	*matplotlib.patches.Patch.get_path()* [Returns a *matplotlib.path.Path* instance]

matplotlib.backend_bases

Old method	New method
`GraphicsContext.set_clip_rectangle(tuple)`	*GraphicsContext.set_clip_rectangle(bbox)*
`GraphicsContext.get_clip_path()`	*GraphicsContext.get_clip_path()*[7]
`GraphicsContext.set_clip_path()`	*GraphicsContext.set_clip_path()*[8]

RendererBase

New methods:

- *draw_path(self, gc, path, transform, rgbFace)*
- *draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace)*

[7] *matplotlib.backend_bases.GraphicsContextBase.get_clip_path()* returns a tuple of the form (*path*, *affine_transform*), where *path* is a *matplotlib.path.Path* instance and *affine_transform* is a *matplotlib.transforms.Affine2D* instance.

[8] *matplotlib.backend_bases.GraphicsContextBase.set_clip_path()* now only accepts a *matplotlib.transforms.TransformedPath* instance.

- *draw_path_collection(self, master_transform, cliprect, clippath, clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds)* *[optional]*

Changed methods:

- `draw_image(self, x, y, im, bbox)` is now *draw_image(self, x, y, im, bbox, clippath, clippath_trans)*

Removed methods:

- `draw_arc`
- `draw_line_collection`
- `draw_line`
- `draw_lines`
- `draw_point`
- `draw_quad_mesh`
- `draw_poly_collection`
- `draw_polygon`
- `draw_rectangle`
- `draw_regpoly_collection`

9.21.9 Changes for 0.91.2

- For `csv2rec`, checkrows=0 is the new default indicating all rows will be checked for type inference
- A warning is issued when an image is drawn on log-scaled axes, since it will not log-scale the image data.
- Moved `rec2gtk` to `matplotlib.toolkits.gtktools`
- Moved `rec2excel` to `matplotlib.toolkits.exceltools`
- Removed, dead/experimental ExampleInfo, Namespace and Importer code from *matplotlib*

9.21.10 Changes for 0.91.0

- Changed `cbook.is_file_like` to `cbook.is_writable_file_like` and corrected behavior.
- Added *ax* keyword argument to *pyplot.colorbar()* and *Figure.colorbar()* so that one can specify the axes object from which space for the colorbar is to be taken, if one does not want to make the colorbar axes manually.
- Changed `cbook.reversed` so it yields a tuple rather than a (index, tuple). This agrees with the Python reversed builtin, and cbook only defines reversed if Python doesn't provide the builtin.
- Made skiprows=1 the default on `csv2rec`
- The gd and paint backends have been deleted.

- The errorbar method and function now accept additional kwargs so that upper and lower limits can be indicated by capping the bar with a caret instead of a straight line segment.
- The *matplotlib.dviread* file now has a parser for files like psfonts.map and pdftex.map, to map TeX font names to external files.
- The file `matplotlib.type1font` contains a new class for Type 1 fonts. Currently it simply reads pfa and pfb format files and stores the data in a way that is suitable for embedding in pdf files. In the future the class might actually parse the font to allow e.g., subsetting.
- `matplotlib.ft2font` now supports `FT_Attach_File`. In practice this can be used to read an afm file in addition to a pfa/pfb file, to get metrics and kerning information for a Type 1 font.
- The `AFM` class now supports querying CapHeight and stem widths. The get_name_char method now has an isord kwarg like get_width_char.
- Changed *pcolor()* default to `shading='flat'`; but as noted now in the docstring, it is preferable to simply use the *edgecolor* keyword argument.
- The mathtext font commands (`\cal`, `\rm`, `\it`, `\tt`) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of `$\cal{R}$` should be changed to `${\cal R}$`. Alternatively, you may use the new LaTeX-style font commands (`\mathcal`, `\mathrm`, `\mathit`, `\mathtt`) which do affect the following group, e.g., `$\mathcal{R}$`.
- Text creation commands have a new default linespacing and a new `linespacing` kwarg, which is a multiple of the maximum vertical extent of a line of ordinary text. The default is 1.2; `linespacing=2` would be like ordinary double spacing, for example.
- Changed default kwarg in *matplotlib.colors.Normalize* to `clip=False`; clipping silently defeats the purpose of the special over, under, and bad values in the colormap, thereby leading to unexpected behavior. The new default should reduce such surprises.
- Made the emit property of *set_xlim()* and *set_ylim()* `True` by default; removed the Axes custom callback handling into a 'callbacks' attribute which is a *CallbackRegistry* instance. This now supports the 'xlim_changed' and 'ylim_changed' Axes events.

9.21.11 Changes for 0.90.1

```
The file dviread.py has a (very limited and fragile) dvi reader
for usetex support. The API might change in the future so don't
depend on it yet.

Removed deprecated support for a float value as a gray-scale;
now it must be a string, like '0.5'.  Added alpha kwarg to
ColorConverter.to_rgba_list.

New method set_bounds(vmin, vmax) for formatters, locators sets
the viewInterval and dataInterval from floats.

Removed deprecated colorbar_classic.
```

(continues on next page)

(continued from previous page)

```
Line2D.get_xdata and get_ydata valid_only=False kwarg is replaced
by orig=True.  When True, it returns the original data, otherwise
the processed data (masked, converted)

Some modifications to the units interface.
units.ConversionInterface.tickers renamed to
units.ConversionInterface.axisinfo and it now returns a
units.AxisInfo object rather than a tuple.  This will make it
easier to add axis info functionality (e.g., I added a default label
on this iteration) w/o having to change the tuple length and hence
the API of the client code every time new functionality is added.
Also, units.ConversionInterface.convert_to_value is now simply
named units.ConversionInterface.convert.

Axes.errorbar uses Axes.vlines and Axes.hlines to draw its error
limits int he vertical and horizontal direction.  As you'll see
in the changes below, these functions now return a LineCollection
rather than a list of lines.  The new return signature for
errorbar is  ylins, caplines, errorcollections where
errorcollections is a xerrcollection, yerrcollection

Axes.vlines and Axes.hlines now create and returns a LineCollection,␣
 ↪not a list
of lines.  This is much faster.  The kwarg signature has changed,
so consult the docs

MaxNLocator accepts a new Boolean kwarg ('integer') to force
ticks to integer locations.

Commands that pass an argument to the Text constructor or to
Text.set_text() now accept any object that can be converted
with '%s'.  This affects xlabel(), title(), etc.

Barh now takes a **kwargs dict instead of most of the old
arguments. This helps ensure that bar and barh are kept in sync,
but as a side effect you can no longer pass e.g., color as a
positional argument.

ft2font.get_charmap() now returns a dict that maps character codes
to glyph indices (until now it was reversed)

Moved data files into lib/matplotlib so that setuptools' develop
mode works. Re-organized the mpl-data layout so that this source
structure is maintained in the installation. (i.e., the 'fonts' and
'images' sub-directories are maintained in site-packages.).
```

(continues on next page)

(continued from previous page)

```
Suggest removing site-packages/matplotlib/mpl-data and
~/.matplotlib/ttffont.cache before installing
```

9.21.12 Changes for 0.90.0

```
All artists now implement a "pick" method which users should not
call.  Rather, set the "picker" property of any artist you want to
pick on (the epsilon distance in points for a hit test) and
register with the "pick_event" callback.  See
examples/pick_event_demo.py for details

Bar, barh, and hist have "log" binary kwarg: log=True
sets the ordinate to a log scale.

Boxplot can handle a list of vectors instead of just
an array, so vectors can have different lengths.

Plot can handle 2-D x and/or y; it plots the columns.

Added linewidth kwarg to bar and barh.

Made the default Artist._transform None (rather than invoking
identity_transform for each artist only to have it overridden
later).  Use artist.get_transform() rather than artist._transform,
even in derived classes, so that the default transform will be
created lazily as needed

New LogNorm subclass of Normalize added to colors.py.
All Normalize subclasses have new inverse() method, and
the __call__() method has a new clip kwarg.

Changed class names in colors.py to match convention:
normalize -> Normalize, no_norm -> NoNorm.  Old names
are still available for now.

Removed obsolete pcolor_classic command and method.

Removed lineprops and markerprops from the Annotation code and
replaced them with an arrow configurable with kwarg arrowprops.
See examples/annotation_demo.py - JDH
```

9.21.13 Changes for 0.87.7

```
Completely reworked the annotations API because I found the old
API cumbersome.  The new design is much more legible and easy to
read.  See matplotlib.text.Annotation and
examples/annotation_demo.py

markeredgecolor and markerfacecolor cannot be configured in
matplotlibrc any more. Instead, markers are generally colored
automatically based on the color of the line, unless marker colors
are explicitly set as kwargs - NN

Changed default comment character for load to '#' - JDH

math_parse_s_ft2font_svg from mathtext.py & mathtext2.py now returns
width, height, svg_elements. svg_elements is an instance of Bunch (
cmbook.py) and has the attributes svg_glyphs and svg_lines, which are␣
 ↪both
lists.

Renderer.draw_arc now takes an additional parameter, rotation.
It specifies to draw the artist rotated in degrees anti-
clockwise.  It was added for rotated ellipses.

Renamed Figure.set_figsize_inches to Figure.set_size_inches to
better match the get method, Figure.get_size_inches.

Removed the copy_bbox_transform from transforms.py; added
shallowcopy methods to all transforms.  All transforms already
had deepcopy methods.

FigureManager.resize(width, height): resize the window
specified in pixels

barh: x and y args have been renamed to width and bottom
respectively, and their order has been swapped to maintain
a (position, value) order.

bar and barh: now accept kwarg 'edgecolor'.

bar and barh: The left, height, width and bottom args can
now all be scalars or sequences; see docstring.

barh: now defaults to edge aligned instead of center
aligned bars

bar, barh and hist: Added a keyword arg 'align' that
```

(continues on next page)

(continued from previous page)

```
controls between edge or center bar alignment.

Collections: PolyCollection and LineCollection now accept
vertices or segments either in the original form [(x,y),
(x,y), ...] or as a 2D numerix array, with X as the first column
and Y as the second. Contour and quiver output the numerix
form.  The transforms methods Bbox.update() and
Transformation.seq_xy_tups() now accept either form.

Collections: LineCollection is now a ScalarMappable like
PolyCollection, etc.

Specifying a grayscale color as a float is deprecated; use
a string instead, e.g., 0.75 -> '0.75'.

Collections: initializers now accept any mpl color arg, or
sequence of such args; previously only a sequence of rgba
tuples was accepted.

Colorbar: completely new version and api; see docstring.  The
original version is still accessible as colorbar_classic, but
is deprecated.

Contourf: "extend" kwarg replaces "clip_ends"; see docstring.
Masked array support added to pcolormesh.

Modified aspect-ratio handling:
    Removed aspect kwarg from imshow
    Axes methods:
        set_aspect(self, aspect, adjustable=None, anchor=None)
        set_adjustable(self, adjustable)
        set_anchor(self, anchor)
    Pylab interface:
        axis('image')

 Backend developers: ft2font's load_char now takes a flags
 argument, which you can OR together from the LOAD_XXX
 constants.
```

9.21.14 Changes for 0.86

```
Matplotlib data is installed into the matplotlib module.
This is similar to package_data.  This should get rid of
having to check for many possibilities in _get_data_path().
The MATPLOTLIBDATA env key is still checked first to allow
```

(continues on next page)

(continued from previous page)

```
for flexibility.

1) Separated the color table data from cm.py out into
a new file, _cm.py, to make it easier to find the actual
code in cm.py and to add new colormaps. Everything
from _cm.py is imported by cm.py, so the split should be
transparent.
2) Enabled automatic generation of a colormap from
a list of colors in contour; see modified
examples/contour_demo.py.
3) Support for imshow of a masked array, with the
ability to specify colors (or no color at all) for
masked regions, and for regions that are above or
below the normally mapped region.  See
examples/image_masked.py.
4) In support of the above, added two new classes,
ListedColormap, and no_norm, to colors.py, and modified
the Colormap class to include common functionality. Added
a clip kwarg to the normalize class.
```

9.21.15 Changes for 0.85

```
Made xtick and ytick separate props in rc

made pos=None the default for tick formatters rather than 0 to
indicate "not supplied"

Removed "feature" of minor ticks which prevents them from
overlapping major ticks.  Often you want major and minor ticks at
the same place, and can offset the major ticks with the pad.  This
could be made configurable

Changed the internal structure of contour.py to a more OO style.
Calls to contour or contourf in axes.py or pylab.py now return
a ContourSet object which contains references to the
LineCollections or PolyCollections created by the call,
as well as the configuration variables that were used.
The ContourSet object is a "mappable" if a colormap was used.

Added a clip_ends kwarg to contourf. From the docstring:
         * clip_ends = True
           If False, the limits for color scaling are set to the
           minimum and maximum contour levels.
           True (default) clips the scaling limits.  Example:
           if the contour boundaries are V = [-100, 2, 1, 0, 1, 2,␣
```

(continues on next page)

(continued from previous page)

```
 ↪100],
           then the scaling limits will be [-100, 100] if clip_ends
           is False, and [-3, 3] if clip_ends is True.
Added kwargs linewidths, antialiased, and nchunk to contourf.  These
are experimental; see the docstring.

Changed Figure.colorbar():
    kw argument order changed;
    if mappable arg is a non-filled ContourSet, colorbar() shows
            lines instead hof polygons.
    if mappable arg is a filled ContourSet with clip_ends=True,
            the endpoints are not labelled, so as to give the
            correct impression of open-endedness.

Changed LineCollection.get_linewidths to get_linewidth, for
consistency.
```

9.21.16 Changes for 0.84

```
Unified argument handling between hlines and vlines.  Both now
take optionally a fmt argument (as in plot) and a keyword args
that can be passed onto Line2D.

Removed all references to "data clipping" in rc and lines.py since
these were not used and not optimized.  I'm sure they'll be
resurrected later with a better implementation when needed.

'set' removed - no more deprecation warnings.  Use 'setp' instead.

Backend developers: Added flipud method to image and removed it
from to_str.  Removed origin kwarg from backend.draw_image.
origin is handled entirely by the frontend now.
```

9.21.17 Changes for 0.83

```
- Made HOME/.matplotlib the new config dir where the matplotlibrc
  file, the ttf.cache, and the tex.cache live.  The new default
  filenames in .matplotlib have no leading dot and are not hidden.
  e.g., the new names are matplotlibrc, tex.cache, and ttffont.cache.
  This is how ipython does it so it must be right.

  If old files are found, a warning is issued and they are moved to
  the new location.

- backends/__init__.py no longer imports new_figure_manager,
```

(continues on next page)

(continued from previous page)

```
  draw_if_interactive and show from the default backend, but puts
  these imports into a call to pylab_setup.  Also, the Toolbar is no
  longer imported from WX/WXAgg.  New usage:

    from backends import pylab_setup
    new_figure_manager, draw_if_interactive, show = pylab_setup()

- Moved Figure.get_width_height() to FigureCanvasBase. It now
  returns int instead of float.
```

9.21.18 Changes for 0.82

```
- toolbar import change in GTKAgg, GTKCairo and WXAgg

- Added subplot config tool to GTK* backends -- note you must now
  import the NavigationToolbar2 from your backend of choice rather
  than from backend_gtk because it needs to know about the backend
  specific canvas -- see examples/embedding_in_gtk2.py.  Ditto for
  wx backend -- see examples/embedding_in_wxagg.py

- hist bin change

    Sean Richards notes there was a problem in the way we created
    the binning for histogram, which made the last bin
    underrepresented.  From his post:

      I see that hist uses the linspace function to create the bins
      and then uses searchsorted to put the values in their correct
      bin. That's all good but I am confused over the use of linspace
      for the bin creation. I wouldn't have thought that it does
      what is needed, to quote the docstring it creates a "Linear
      spaced array from min to max". For it to work correctly
      shouldn't the values in the bins array be the same bound for
      each bin? (i.e. each value should be the lower bound of a
      bin). To provide the correct bins for hist would it not be
      something like

      def bins(xmin, xmax, N):
        if N==1: return xmax
        dx = (xmax-xmin)/N # instead of N-1
        return xmin + dx*arange(N)

     This suggestion is implemented in 0.81.  My test script with these
```

(continues on next page)

(continued from previous page)

```
    changes does not reveal any bias in the binning

     from matplotlib.numerix.mlab import randn, rand, zeros, Float
     from matplotlib.mlab import hist, mean

     Nbins = 50
     Ntests = 200
     results = zeros((Ntests,Nbins), typecode=Float)
     for i in range(Ntests):
         print 'computing', i
         x = rand(10000)
         n, bins = hist(x, Nbins)
         results[i] = n
     print mean(results)
```

9.21.19 Changes for 0.81

```
- pylab and artist "set" functions renamed to setp to avoid clash
  with python2.4 built-in set.  Current version will issue a
  deprecation warning which will be removed in future versions

- imshow interpolation arguments changes for advanced interpolation
  schemes.  See help imshow, particularly the interpolation,
  filternorm and filterrad kwargs

- Support for masked arrays has been added to the plot command and
  to the Line2D object.  Only the valid points are plotted.  A
  "valid_only" kwarg was added to the get_xdata() and get_ydata()
  methods of Line2D; by default it is False, so that the original
  data arrays are returned. Setting it to True returns the plottable
  points.

- contour changes:

  Masked arrays: contour and contourf now accept masked arrays as
    the variable to be contoured.  Masking works correctly for
    contour, but a bug remains to be fixed before it will work for
    contourf.  The "badmask" kwarg has been removed from both
    functions.

   Level argument changes:

     Old version: a list of levels as one of the positional
     arguments specified the lower bound of each filled region; the
     upper bound of the last region was taken as a very large
```

(continues on next page)

(continued from previous page)

```
    number.  Hence, it was not possible to specify that z values
    between 0 and 1, for example, be filled, and that values
    outside that range remain unfilled.

    New version: a list of N levels is taken as specifying the
    boundaries of N-1 z ranges.  Now the user has more control over
    what is colored and what is not.  Repeated calls to contourf
    (with different colormaps or color specifications, for example)
    can be used to color different ranges of z.  Values of z
    outside an expected range are left uncolored.

    Example:
      Old: contourf(z, [0, 1, 2]) would yield 3 regions: 0-1, 1-2,␣
↪and >2.
      New: it would yield 2 regions: 0-1, 1-2.  If the same 3 regions␣
↪were
      desired, the equivalent list of levels would be [0, 1, 2,
      1e38].
```

9.21.20 Changes for 0.80

```
- xlim/ylim/axis always return the new limits regardless of
  arguments.  They now take kwargs which allow you to selectively
  change the upper or lower limits while leaving unnamed limits
  unchanged.  See help(xlim) for example
```

9.21.21 Changes for 0.73

```
- Removed deprecated ColormapJet and friends

- Removed all error handling from the verbose object

- figure num of zero is now allowed
```

9.21.22 Changes for 0.72

```
- Line2D, Text, and Patch copy_properties renamed update_from and
  moved into artist base class

- LineCollections.color renamed to LineCollections.set_color for
  consistency with set/get introspection mechanism,

- pylab figure now defaults to num=None, which creates a new figure
  with a guaranteed unique number
```

(continues on next page)

(continued from previous page)

```
- contour method syntax changed - now it is MATLAB compatible

    unchanged: contour(Z)
    old: contour(Z, x=Y, y=Y)
    new: contour(X, Y, Z)

  see http://matplotlib.sf.net/matplotlib.pylab.html#-contour

 - Increased the default resolution for save command.

 - Renamed the base attribute of the ticker classes to _base to avoid␣
 ↪conflict
   with the base method.  Sitt for subs

 - subs=none now does autosubbing in the tick locator.

 - New subplots that overlap old will delete the old axes.  If you
   do not want this behavior, use fig.add_subplot or the axes
   command
```

9.21.23 Changes for 0.71

```
Significant numerix namespace changes, introduced to resolve
namespace clashes between python built-ins and mlab names.
Refactored numerix to maintain separate modules, rather than
folding all these names into a single namespace.  See the following
mailing list threads for more information and background

  http://sourceforge.net/mailarchive/forum.php?thread_id=6398890&forum_
 ↪id=36187
  http://sourceforge.net/mailarchive/forum.php?thread_id=6323208&forum_
 ↪id=36187

OLD usage

  from matplotlib.numerix import array, mean, fft

NEW usage

  from matplotlib.numerix import array
  from matplotlib.numerix.mlab import mean
  from matplotlib.numerix.fft import fft
```

(continues on next page)

(continued from previous page)

```
numerix dir structure mirrors numarray (though it is an incomplete
implementation)

  numerix
  numerix/mlab
  numerix/linear_algebra
  numerix/fft
  numerix/random_array

but of course you can use 'numerix : Numeric' and still get the
symbols.

pylab still imports most of the symbols from Numerix, MLab, fft,
etc, but is more cautious.  For names that clash with python names
(min, max, sum), pylab keeps the builtins and provides the numeric
versions with an a* prefix, e.g., (amin, amax, asum)
```

9.21.24 Changes for 0.70

```
MplEvent factored into a base class Event and derived classes
MouseEvent and KeyEvent

Removed defunct set_measurement in wx toolbar
```

9.21.25 Changes for 0.65.1

```
removed add_axes and add_subplot from backend_bases.  Use
figure.add_axes and add_subplot instead.  The figure now manages the
current axes with gca and sca for get and set current axes.  If you
have code you are porting which called, e.g., figmanager.add_axes, you
can now simply do figmanager.canvas.figure.add_axes.
```

9.21.26 Changes for 0.65

```
mpl_connect and mpl_disconnect in the MATLAB interface renamed to
connect and disconnect

Did away with the text methods for angle since they were ambiguous.
fontangle could mean fontstyle (oblique, etc) or the rotation of the
text.  Use style and rotation instead.
```

9.21.27 Changes for 0.63

```
Dates are now represented internally as float days since 0001-01-01,
UTC.

All date tickers and formatters are now in matplotlib.dates, rather
than matplotlib.tickers

converters have been abolished from all functions and classes.
num2date and date2num are now the converter functions for all date
plots

Most of the date tick locators have a different meaning in their
constructors.  In the prior implementation, the first argument was a
base and multiples of the base were ticked.  e.g.,

  HourLocator(5)  # old: tick every 5 minutes

In the new implementation, the explicit points you want to tick are
provided as a number or sequence

   HourLocator(range(0,5,61))  # new: tick every 5 minutes

This gives much greater flexibility.  I have tried to make the
default constructors (no args) behave similarly, where possible.

Note that YearLocator still works under the base/multiple scheme.
The difference between the YearLocator and the other locators is
that years are not recurrent.

Financial functions:

  matplotlib.finance.quotes_historical_yahoo(ticker, date1, date2)

   date1, date2 are now datetime instances.  Return value is a list
   of quotes where the quote time is a float - days since gregorian
   start, as returned by date2num

   See examples/finance_demo.py for example usage of new API
```

9.21.28 Changes for 0.61

```
canvas.connect is now deprecated for event handling.  use
mpl_connect and mpl_disconnect instead.  The callback signature is
func(event) rather than func(widget, event)
```

9.21.29 Changes for 0.60

```
ColormapJet and Grayscale are deprecated.  For backwards
compatibility, they can be obtained either by doing

  from matplotlib.cm import ColormapJet

or

  from matplotlib.matlab import *

They are replaced by cm.jet and cm.grey
```

9.21.30 Changes for 0.54.3

```
removed the set_default_font / get_default_font scheme from the
font_manager to unify customization of font defaults with the rest of
the rc scheme.  See examples/font_properties_demo.py and help(rc) in
matplotlib.matlab.
```

9.21.31 Changes for 0.54

MATLAB interface

dpi

Several of the backends used a PIXELS_PER_INCH hack that I added to try and make images render consistently across backends. This just complicated matters. So you may find that some font sizes and line widths appear different than before. Apologies for the inconvenience. You should set the dpi to an accurate value for your screen to get true sizes.

pcolor and scatter

There are two changes to the MATLAB interface API, both involving the patch drawing commands. For efficiency, pcolor and scatter have been rewritten to use polygon collections, which are a new set of objects from matplotlib.collections designed to enable efficient handling of large collections of objects. These new collections make it possible to build large scatter plots or pcolor plots with no loops at the python level, and are significantly faster than their predecessors. The original pcolor and scatter functions are retained as pcolor_classic and scatter_classic.

The return value from pcolor is a PolyCollection. Most of the properties that are available on rectangles or other patches are also available on PolyCollections, e.g., you can say:

```
c = scatter(blah, blah)
c.set_linewidth(1.0)
c.set_facecolor('r')
c.set_alpha(0.5)
```

or:

```
c = scatter(blah, blah)
set(c, 'linewidth', 1.0, 'facecolor', 'r', 'alpha', 0.5)
```

Because the collection is a single object, you no longer need to loop over the return value of scatter or pcolor to set properties for the entire list.

If you want the different elements of a collection to vary on a property, e.g., to have different line widths, see matplotlib.collections for a discussion on how to set the properties as a sequence.

For scatter, the size argument is now in points^2 (the area of the symbol in points) as in MATLAB and is not in data coords as before. Using sizes in data coords caused several problems. So you will need to adjust your size arguments accordingly or use scatter_classic.

mathtext spacing

For reasons not clear to me (and which I'll eventually fix) spacing no longer works in font groups. However, I added three new spacing commands which compensate for this " (regular space), '/' (small space) and 'hspace{frac}' where frac is a fraction of fontsize in points. You will need to quote spaces in font strings, is:

```
title(r'$\rm{Histogram\ of\ IQ:}\ \mu=100,\ \sigma=15$')
```

Object interface - Application programmers

Autoscaling

The x and y axis instances no longer have autoscale view. These are handled by axes.autoscale_view

Axes creation

You should not instantiate your own Axes any more using the OO API. Rather, create a Figure as before and in place of:

```
f = Figure(figsize=(5,4), dpi=100)
a = Subplot(f, 111)
f.add_axis(a)
```

use:

```
f = Figure(figsize=(5,4), dpi=100)
a = f.add_subplot(111)
```

That is, add_axis no longer exists and is replaced by:

```
add_axes(rect, axisbg=defaultcolor, frameon=True)
add_subplot(num, axisbg=defaultcolor, frameon=True)
```

Artist methods

If you define your own Artists, you need to rename the _draw method to draw

Bounding boxes

matplotlib.transforms.Bound2D is replaced by matplotlib.transforms.Bbox. If you want to construct a bbox from left, bottom, width, height (the signature for Bound2D), use matplotlib.transforms.lbwh_to_bbox, as in:

```
bbox = clickBBox = lbwh_to_bbox(left, bottom, width, height)
```

The Bbox has a different API than the Bound2D. e.g., if you want to get the width and height of the bbox

OLD:

```
width  = fig.bbox.x.interval()
height = fig.bbox.y.interval()
```

NEW:

```
width  = fig.bbox.width()
height = fig.bbox.height()
```

Object constructors

You no longer pass the bbox, dpi, or transforms to the various Artist constructors. The old way or creating lines and rectangles was cumbersome because you had to pass so many attributes to the Line2D and Rectangle classes not related directly to the geometry and properties of the object. Now default values are added to the object when you call axes.add_line or axes.add_patch, so they are hidden from the user.

If you want to define a custom transformation on these objects, call o.set_transform(trans) where trans is a Transformation instance.

In prior versions of you wanted to add a custom line in data coords, you would have to do:

```
l = Line2D(dpi, bbox, x, y,
           color = color,
           transx = transx,
           transy = transy,
           )
```

now all you need is:

```
l = Line2D(x, y, color=color)
```

and the axes will set the transformation for you (unless you have set your own already, in which case it will eave it unchanged)

Transformations

The entire transformation architecture has been rewritten. Previously the x and y transformations where stored in the xaxis and yaxis instances. The problem with this approach is it only allows for separable transforms (where the x and y transformations don't depend on one another). But for cases like polar, they do. Now transformations operate on x,y together. There is a new base class matplotlib.transforms.Transformation and two concrete implementations, matplotlib.transforms.SeparableTransformation and matplotlib.transforms.Affine. The SeparableTransformation is constructed with the bounding box of the input (this determines the rectangular coordinate system of the input, i.e., the x and y view limits), the bounding box of the display, and possibly nonlinear transformations of x and y. The 2 most frequently used transformations, data coordinates -> display and axes coordinates -> display are available as ax.transData and ax.transAxes. See alignment_demo.py which uses axes coords.

Also, the transformations should be much faster now, for two reasons

- they are written entirely in extension code
- because they operate on x and y together, they can do the entire transformation in one loop. Earlier I did something along the lines of:

```
xt = sx*func(x) + tx
yt = sy*func(y) + ty
```

  Although this was done in numerix, it still involves 6 length(x) for-loops (the multiply, add, and function evaluation each for x and y). Now all of that is done in a single pass.

If you are using transformations and bounding boxes to get the cursor position in data coordinates, the method calls are a little different now. See the updated examples/coords_demo.py which shows you how to do this.

Likewise, if you are using the artist bounding boxes to pick items on the canvas with the GUI, the bbox methods are somewhat different. You will need to see the updated examples/object_picker.py.

See unit/transforms_unit.py for many examples using the new transformations.

9.21.32 Changes for 0.50

```
* refactored Figure class so it is no longer backend dependent.
  FigureCanvasBackend takes over the backend specific duties of the
  Figure.  matplotlib.backend_bases.FigureBase moved to
  matplotlib.figure.Figure.

* backends must implement FigureCanvasBackend (the thing that
  controls the figure and handles the events if any) and
  FigureManagerBackend (wraps the canvas and the window for MATLAB
  interface).  FigureCanvasBase implements a backend switching
  mechanism

* Figure is now an Artist (like everything else in the figure) and
  is totally backend independent
```

(continues on next page)

(continued from previous page)

```
* GDFONTPATH renamed to TTFPATH

* backend faceColor argument changed to rgbFace

* colormap stuff moved to colors.py

* arg_to_rgb in backend_bases moved to class ColorConverter in
  colors.py

* GD users must upgrade to gd-2.0.22 and gdmodule-0.52 since new gd
  features (clipping, antialiased lines) are now used.

* Renderer must implement points_to_pixels

Migrating code:

MATLAB interface:

  The only API change for those using the MATLAB interface is in how
  you call figure redraws for dynamically updating figures.  In the
  old API, you did

    fig.draw()

  In the new API, you do

    manager = get_current_fig_manager()
    manager.canvas.draw()

  See the examples system_monitor.py, dynamic_demo.py, and anim.py

API

  There is one important API change for application developers.
  Figure instances used subclass GUI widgets that enabled them to be
  placed directly into figures.  e.g., FigureGTK subclassed
  gtk.DrawingArea.  Now the Figure class is independent of the
  backend, and FigureCanvas takes over the functionality formerly
  handled by Figure.  In order to include figures into your apps,
  you now need to do, for example

    # gtk example
    fig = Figure(figsize=(5,4), dpi=100)
    canvas = FigureCanvasGTK(fig)  # a gtk.DrawingArea
    canvas.show()
```

(continues on next page)

(continued from previous page)

```
    vbox.pack_start(canvas)

  If you use the NavigationToolbar, this in now initialized with a
  FigureCanvas, not a Figure.  The examples embedding_in_gtk.py,
  embedding_in_gtk2.py, and mpl_with_glade.py all reflect the new
  API so use these as a guide.

  All prior calls to

   figure.draw()  and
   figure.print_figure(args)

  should now be

   canvas.draw()  and
   canvas.print_figure(args)

  Apologies for the inconvenience.  This refactorization brings
  significant more freedom in developing matplotlib and should bring
  better plotting capabilities, so I hope the inconvenience is worth
  it.
```

9.21.33 Changes for 0.42

```
* Refactoring AxisText to be backend independent.  Text drawing and
  get_window_extent functionality will be moved to the Renderer.

* backend_bases.AxisTextBase is now text.Text module

* All the erase and reset functionality removed from AxisText - not
  needed with double buffered drawing.  Ditto with state change.
  Text instances have a get_prop_tup method that returns a hashable
  tuple of text properties which you can use to see if text props
  have changed, e.g., by caching a font or layout instance in a dict
  with the prop tup as a key -- see RendererGTK.get_pango_layout in
  backend_gtk for an example.

* Text._get_xy_display renamed Text.get_xy_display

* Artist set_renderer and wash_brushes methods removed

* Moved Legend class from matplotlib.axes into matplotlib.legend

* Moved Tick, XTick, YTick, Axis, XAxis, YAxis from matplotlib.axes
  to matplotlib.axis
```

(continues on next page)

(continued from previous page)

```
* moved process_text_args to matplotlib.text

* After getting Text handled in a backend independent fashion, the
  import process is much cleaner since there are no longer cyclic
  dependencies

* matplotlib.matlab._get_current_fig_manager renamed to
  matplotlib.matlab.get_current_fig_manager to allow user access to
  the GUI window attribute, e.g., figManager.window for GTK and
  figManager.frame for wx
```

9.21.34 Changes for 0.40

```
- Artist
    * __init__ takes a DPI instance and a Bound2D instance which is
      the bounding box of the artist in display coords
    * get_window_extent returns a Bound2D instance
    * set_size is removed; replaced by bbox and dpi
    * the clip_gc method is removed.  Artists now clip themselves with
      their box
    * added _clipOn boolean attribute.  If True, gc clip to bbox.

- AxisTextBase
    * Initialized with a transx, transy which are Transform instances
    * set_drawing_area removed
    * get_left_right and get_top_bottom are replaced by get_window_
 ↪extent

- Line2D Patches now take transx, transy
    * Initialized with a transx, transy which are Transform instances

- Patches
   * Initialized with a transx, transy which are Transform instances

- FigureBase attributes dpi is a DPI instance rather than scalar and
  new attribute bbox is a Bound2D in display coords, and I got rid
  of the left, width, height, etc... attributes.  These are now
  accessible as, for example, bbox.x.min is left, bbox.x.interval()
  is width, bbox.y.max is top, etc...

- GcfBase attribute pagesize renamed to figsize

- Axes
    * removed figbg attribute
```

(continues on next page)

(continued from previous page)

```
    * added fig instance to __init__
    * resizing is handled by figure call to resize.

- Subplot
    * added fig instance to __init__

- Renderer methods for patches now take gcEdge and gcFace instances.
  gcFace=None takes the place of filled=False

- True and False symbols provided by cbook in a python2.3 compatible
  way

- new module transforms supplies Bound1D, Bound2D and Transform
  instances and more

- Changes to the MATLAB helpers API

  * _matlab_helpers.GcfBase is renamed by Gcf.  Backends no longer
    need to derive from this class.  Instead, they provide a factory
    function new_figure_manager(num, figsize, dpi).  The destroy
    method of the GcfDerived from the backends is moved to the derived
    FigureManager.

  * FigureManagerBase moved to backend_bases

  * Gcf.get_all_figwins renamed to Gcf.get_all_fig_managers

Jeremy:

  Make sure to self._reset = False in AxisTextWX._set_font.  This was
  something missing in my backend code.
```

Part V

Contribute

Matplotlib is a community project maintained for and by its users. See *Contribute* for the many ways you can help!

CHAPTER

TEN

CONTRIBUTE

Important

If you plan to contribute to Matplotlib, please read the development version of this document as it will have the most up to date installation instructions, workflow process, and contributing guidelines.

Thank you for your interest in helping to improve Matplotlib!

This project is a community effort, and everyone is welcome to contribute. Everyone within the community is expected to abide by our *code of conduct*.

There are various ways to contribute, such as optimizing and refactoring code, detailing unclear documentation and writing new examples, helping the community, reporting and fixing bugs, requesting and implementing new features...

10.1 GitHub issue tracker

The issue tracker serves as the centralized location for making feature requests, reporting bugs, identifying major projects to work on, and discussing priorities.

We have preloaded the issue creation page with markdown forms requesting the information we need to triage issues and we welcome you to add any additional information or context that may be necessary for resolving the issue:

Submit a bug report

Thank you for your help in keeping bug reports targeted and descriptive.

Report a bug

Request a new feature

Thank you for your help in keeping feature requests well defined and tightly scoped.

Request a feature

Since Matplotlib is an open source project with limited resources, we encourage users to also *participate* in fixing bugs and implementing new features.

10.2 Contributing guide

We welcome you to get more involved with the Matplotlib project! If you are new to contributing, we recommend that you first read our *contributing guide*:

10.2.1 Contributing guide

You've discovered a bug or something else you want to change in Matplotlib — excellent!

You've worked out a way to fix it — even better!

You want to tell us about it — best of all!

Below, you can find a number of ways to contribute, and how to connect with the Matplotlib community.

Ways to contribute

Do I really have something to contribute to Matplotlib?

100% yes! There are so many ways to contribute to our community. Take a look at the following sections to learn more.

There are a few typical new contributor profiles:

- **You are a Matplotlib user, and you see a bug, a potential improvement, or something that annoys you, and you can fix it.**

  You can search our issue tracker for an existing issue that describes your problem or open a new issue to inform us of the problem you observed and discuss the best approach to fix it. If your contributions would not be captured on GitHub (social media, communication, educational content), you can also reach out to us on gitter, Discourse or attend any of our community meetings.

- **You are not a regular Matplotlib user but a domain expert: you know about visualization, 3D plotting, design, technical writing, statistics, or some other field where Matplotlib could be improved.**

  Awesome -- you have a focus on a specific application and domain and can start there. In this case, maintainers can help you figure out the best implementation; open an issue or pull request with a starting point, and we'll be happy to discuss technical approaches.

  If you prefer, you can use the GitHub functionality for "draft" pull requests and request early feedback on whatever you are working on, but you should be aware that maintainers may not review your contribution unless it has the "Ready to review" state on GitHub.

- **You are new to Matplotlib, both as a user and contributor, and want to start contributing but have yet to develop a particular interest.**

  Having some previous experience or relationship with the library can be very helpful when making open-source contributions. It helps you understand why things are the way they are and how they *should* be. Having first-hand experience and context is valuable both for what you can bring to the conversation (and given the breadth of Matplotlib's usage, there is a good chance it is a unique context in any given conversation) and make it easier to understand where other people are coming from.

  Understanding the entire codebase is a long-term project, and nobody expects you to do this right away. If you are determined to get started with Matplotlib and want to learn, going through the basic

functionality, choosing something to focus on (3d, testing, documentation, animations, etc.) and gaining context on this area by reading the issues and pull requests touching these subjects is a reasonable approach.

Code

You want to implement a feature or fix a bug or help with maintenance - much appreciated! Our library source code is found in:

- Python library code: `lib/`
- C-extension code: `src/`
- Tests: `lib/matplotlib/tests/`

Because many people use and work on Matplotlib, we have guidelines for keeping our code consistent and mitigating the impact of changes.

- *Coding guidelines*
- *API guidelines*
- *Pull request guidelines*

Code is contributed through pull requests, so we recommend that you start at *Start a pull request* If you get stuck, please reach out on the *Contributor incubator*

Documentation

You, as an end-user of Matplotlib can make a valuable contribution because you can more clearly see the potential for improvement than a core developer. For example, you can:

- Fix a typo
- Clarify a docstring
- Write or update an *example plot*
- Write or update a comprehensive *tutorial*

Our code is documented inline in the source code files in `matplotlib/lib`. Our website structure mirrors our folder structure, meaning that a narrative document's URL roughly corresponds to its location in our folder structure:

using the library

- `galleries/plot_types/`
- `users/getting_started/`
- `galleries/user_explain/`
- `galleries/tutorials/`
- `galleries/examples/`
- `doc/api/`

information about the library

- `doc/install/`
- `doc/project/`
- `doc/devel/`
- `doc/users/resources/index.rst`
- `doc/users/faq.rst`

Other documentation is generated from the following external sources:

- matplotlib.org homepage: https://github.com/matplotlib/mpl-brochure-site
- cheat sheets: https://github.com/matplotlib/cheatsheets
- third party packages: https://github.com/matplotlib/mpl-third-party

Instructions and guidelines for contributing documentation are found in:

- *Write documentation*
- *Documentation style guide*
- *Tagging guidelines*

Documentation is contributed through pull requests, so we recommend that you start at *Start a pull request*. If that feels intimidating, we encourage you to open an issue describing what improvements you would make. If you get stuck, please reach out on the *Contributor incubator*

Triage

We appreciate your help keeping the issue tracker organized because it is our centralized location for feature requests, bug reports, tracking major projects, and discussing priorities. Some examples of what we mean by triage are:

- labeling issues and pull requests
- verifying bug reports
- debugging and resolving issues
- linking to related issues, discussion, and external work

Our triage process is discussed in detail in *Bug triaging and issue curation*.

If you have any questions about the process, please reach out on the *Contributor incubator*

Community

Matplotlib's community is built by its members, if you would like to help out see our *Community management guide*.

It helps us if you spread the word: reference the project from your blog and articles or link to it from your website!

If Matplotlib contributes to a project that leads to a scientific publication, please cite us following the *Citing Matplotlib* guidelines.

If you have developed an extension to Matplotlib, please consider adding it to our third party package list.

Restrictions on Generative AI Usage

We expect authentic engagement in our community. Be wary of posting output from Large Language Models or similar generative AI as comments on GitHub or our discourse server, as such comments tend to be formulaic and low content. If you use generative AI tools as an aid in developing code or documentation changes, ensure that you fully understand the proposed changes and can explain why they are the correct approach and an improvement to the current state.

New contributors

There is no pre-defined pathway for new contributors - we recommend looking at existing issue and pull request discussions, and following the conversations during pull request reviews to get context. Or you can deep-dive into a subset of the code-base to understand what is going on.

New contributors meeting

Once a month, we host a meeting to discuss topics that interest new contributors. Anyone can attend, present, or sit in and listen to the call. Among our attendees are fellow new contributors, as well as maintainers, and veteran contributors, who are keen to support onboarding of new folks and share their experience. You can find our community calendar link at the Scientific Python website, and you can browse previous meeting notes on GitHub. We recommend joining the meeting to clarify any doubts, or lingering questions you might have, and to get to know a few of the people behind the GitHub handles □. You can reach out to us on gitter for any clarifications or suggestions. We □ feedback!

Contributor incubator

The incubator is our non-public communication channel for new contributors. It is a private gitter (chat) room moderated by core Matplotlib developers where you can get guidance and support for your first few PRs. It's a place where you can ask questions about anything: how to use git, GitHub, how our PR review process works, technical questions about the code, what makes for good documentation or a blog post, how to get involved in community work, or get a "pre-review" on your PR.

To join, please go to our public community channel, and ask to be added to `#incubator`. One of our core developers will see your message and will add you.

Good first issues

While any contributions are welcome, we have marked some issues as particularly suited for new contributors by the label good first issue. These are well documented issues, that do not require a deep understanding of the internals of Matplotlib. The issues may additionally be tagged with a difficulty. `Difficulty: Easy` is suited for people with little Python experience. `Difficulty: Medium` and `Difficulty: Hard` require more programming experience. This could be for a variety of reasons, among them, though not necessarily all at the same time:

- The issue is in areas of the code base which have more interdependencies, or legacy code.

- It has less clearly defined tasks, which require some independent exploration, making suggestions, or follow-up discussions to clarify a good path to resolve the issue.
- It involves Python features such as decorators and context managers, which have subtleties due to our implementation decisions.

First contributions

If this is your first open source contribution, or your first time contributing to Matplotlib, and you need help or guidance finding a good first issue, look no further. This section will guide you through each step:

1. Navigate to the issues page.
2. Filter labels with "Difficulty: Easy" & "Good first Issue" (optional).
3. Click on an issue you would like to work on, and check to see if the issue has a pull request opened to resolve it.
   - A good way to judge if you chose a suitable issue is by asking yourself, "Can I independently submit a PR in 1-2 weeks?"
4. Check existing pull requests (e.g., PR #28476) and filter by the issue number to make sure the issue is not in progress:
   - If the issue has a pull request (is in progress), tag the user working on the issue, and ask to collaborate (optional).
   - If a pull request does not exist, create a draft pull request and follow the pull request guidelines.
5. Please familiarize yourself with the pull request template (see below), and ensure you understand/are able to complete the template when you open your pull request. Additional information can be found in the pull request guidelines.

Pull request template

```
<!--
Thank you so much for your PR!  To help us review your contribution, please check
out the development guide https://matplotlib.org/devdocs/devel/index.html
-->

## PR summary
<!-- Please describe the pull request, using the questions below as guidance, and link to any relevant issues and PRs:

- Why is this change necessary?
- What problem does it solve?
- What is the reasoning for this implementation?

Additionally, please summarize the changes in the title, for example
```

(continues on next page)

(continued from previous page)

```
 ↪"Raise ValueError on
non-numeric input to set_xlim" and avoid non-descriptive titles such␣
 ↪as "Addresses
issue #8576".

If possible, please provide a minimum self-contained example.  If you␣
 ↪have used
generative AI as an aid in preparing this PR, see
https://dev.matplotlib.org/devel/contributing.html#generative_ai.

-->

## PR checklist
<!-- Please mark any checkboxes that do not apply to this PR as [N/A].-
 ↪->

- [ ] "closes #0000" is in the body of the PR description to [link the␣
 ↪related issue](https://docs.github.com/en/issues/tracking-your-work-
 ↪with-issues/linking-a-pull-request-to-an-issue)
- [ ] new and changed code is [tested](https://matplotlib.org/devdocs/
 ↪devel/testing.html)
- [ ] *Plotting related* features are demonstrated in an␣
 ↪[example](https://matplotlib.org/devdocs/devel/document.html#write-
 ↪examples-and-tutorials)
- [ ] *New Features* and *API Changes* are noted with a [directive and␣
 ↪release note](https://matplotlib.org/devdocs/devel/api_changes.html
 ↪#announce-changes-deprecations-and-new-features)
- [ ] Documentation complies with [general](https://matplotlib.org/
 ↪devdocs/devel/document.html#write-rest-pages) and [docstring](https:/
 ↪/matplotlib.org/devdocs/devel/document.html#write-docstrings)␣
 ↪guidelines

<!--We understand that PRs can sometimes be overwhelming, especially␣
 ↪as the
reviews start coming in.  Please let us know if the reviews are␣
 ↪unclear or
the recommended next step seems overly demanding, if you would like␣
 ↪help in
addressing a reviewer's comments, or if you have been waiting too long␣
 ↪to hear
back on your PR.-->
```

Get connected

When in doubt, we recommend going together! Get connected with our community of active contributors, many of whom felt just like you when they started out and are happy to welcome you and support you as you get to know how we work, and where things are. You can reach out on any of our *Official communication channels*. For development questions we recommend reaching out on our development gitter chat room and for community questions reach out at community.

Choose an issue

In general, the Matplotlib project does not assign issues. Issues are "assigned" or "claimed" by opening a PR; there is no other assignment mechanism. If you have opened such a PR, please comment on the issue thread to avoid duplication of work. Please check if there is an existing PR for the issue you are addressing. If there is, try to work with the author by submitting reviews of their code or commenting on the PR rather than opening a new PR; duplicate PRs are subject to being closed. However, if the existing PR is an outline, unlikely to work, or stalled, and the original author is unresponsive, feel free to open a new PR referencing the old one.

Start a pull request

The preferred way to contribute to Matplotlib is to fork the main repository on GitHub, then submit a "pull request" (PR). To work on a a pull request:

1. **First** set up a development environment, either by cloning a copy of the Matplotlib repository to your own computer or by using Github codespaces, by following the instructions in *Setting up Matplotlib for development*
2. **Then** start a pull request by following the guidance in *development workflow*
3. **After starting** check that your contribution meets the *pull request guidelines* and *update the pull request* as needed.
4. **Finally** follow up with maintainers on the PR if waiting more than a few days for feedback.

If you have questions of any sort, reach out on the *Contributor incubator* and join the *New contributors meeting*.

How do I choose an issue?

How do I start a pull request?

10.3 Development workflow

If you are contributing code or documentation, please follow our guide for setting up and managing a development environment and workflow:

Install

10.3.1 Setting up Matplotlib for development

To set up Matplotlib for development follow these steps:

- *Fork the Matplotlib repository*
- *Retrieve the latest version of the code*
- *Create a dedicated environment*
- *Install external dependencies*
- *Install Matplotlib in editable mode*
  - *Build options*
- *Verify the Installation*
- *Install pre-commit hooks*

Fork the Matplotlib repository

Matplotlib is hosted at https://github.com/matplotlib/matplotlib.git. If you plan on solving issues or submitting pull requests to the main Matplotlib repository, you should first fork this repository by *clicking* the **Fork** button near the top of the project repository page.

This creates a copy of the code under your account on the GitHub server. See the GitHub documentation for more details.

Retrieve the latest version of the code

Now that your fork of the repository lives under your GitHub username, you can retrieve the most recent version of the source code with one of the following commands (replace `<your-username>` with your GitHub username):

https

```
git clone https://github.com/<your-username>/matplotlib.git
```

ssh

```
git clone git@github.com:<your-username>/matplotlib.git
```

This requires you to setup an SSH key in advance, but saves you from typing your password at every connection.

This will place the sources in a directory `matplotlib` below your current working directory and set the remote name `origin` to point to your fork. Change into this directory before continuing:

```
cd matplotlib
```

Now set the remote name `upstream` to point to the Matplotlib main repository:

https

```
git remote add upstream https://github.com/matplotlib/matplotlib.git
```

ssh

```
git remote add upstream git@github.com:matplotlib/matplotlib.git
```

You can now use `upstream` to retrieve the most current snapshot of the source code, as described in *Development workflow*.

Additional `git` and `GitHub` resources

For more information on `git` and `GitHub`, see:

- Git documentation
- GitHub-Contributing to a Project
- GitHub Skills
- Git for development
- Additional Git Resources
- Installing git
- Managing remote repositories
- https://tacaswell.github.io/think-like-git.html
- https://tom.preston-werner.com/2009/05/19/the-git-parable.html

Create a dedicated environment

You should set up a dedicated environment to decouple your Matplotlib development from other Python and Matplotlib installations on your system.

We recommend using one of the following options for a dedicated development environment because these options are configured to install the Python dependencies as part of their setup.

venv environment

Create a new venv environment with

```
python -m venv <file folder location>
```

and activate it with one of the following

```
source <file folder location>/bin/activate  # Linux/macOS
<file folder location>\Scripts\activate.bat  # Windows cmd.exe
<file folder location>\Scripts\Activate.ps1  # Windows PowerShell
```

On some systems, you may need to type `python3` instead of `python`. For a discussion of the technical reasons, see PEP-394.

Install the Python dependencies with

```
pip install -r requirements/dev/dev-requirements.txt
```

Remember to activate the environment whenever you start working on Matplotlib!

conda environment

Create a new conda environment and install the Python dependencies with

```
conda env create -f environment.yml
```

You can use `mamba` instead of `conda` in the above command if you have mamba installed.

Activate the environment using

```
conda activate mpl-dev
```

Remember to activate the environment whenever you start working on Matplotlib!

GitHub Codespaces

GitHub Codespaces is a cloud-based in-browser development environment that comes with the appropriate setup to contribute to Matplotlib.

1. Open codespaces on your fork by clicking on the green `Code` button on the GitHub web interface and selecting the `Codespaces` tab.
2. Next, click on "Open codespaces on <your branch name>". You will be able to change branches later, so you can select the default `main` branch.
3. After the codespace is created, you will be taken to a new browser tab where you can use the terminal to activate a pre-defined conda environment called `mpl-dev`:

   conda activate mpl-dev

Remember to activate the *mpl-dev* environment whenever you start working on Matplotlib.

If you need to open a GUI window with Matplotlib output on Codespaces, our configuration includes a lightweight Fluxbox-based desktop. You can use it by connecting to this desktop via your web browser. To do this:

1. Press `F1` or `Ctrl/Cmd+Shift+P` and select `Ports: Focus on Ports View` in the VSCode session to bring it into focus. Open the ports view in your tool, select the `noVNC` port, and click the Globe icon.
2. In the browser that appears, click the Connect button and enter the desktop password (`vscode` by default).

Check the GitHub instructions for more details on connecting to the desktop.

If you also built the documentation pages, you can view them using Codespaces. Use the "Extensions" icon in the activity bar to install the "Live Server" extension. Locate the `doc/build/html` folder in the Explorer, right click the file you want to open and select "Open with Live Server."

Install external dependencies

Python dependencies were installed as part of *setting up the environment*. Additionally, the following non-Python dependencies must also be installed locally:

- *c++ compiler*
- *documentation build dependencies*

For a full list of dependencies, see *Dependencies*. External dependencies do not need to be installed when working in codespaces.

Install Matplotlib in editable mode

Install Matplotlib in editable mode from the `matplotlib` directory using the command

```
python -m pip install --verbose --no-build-isolation --editable ".[dev]
↪"
```

The 'editable/develop mode' builds everything and places links in your Python environment so that Python will be able to import Matplotlib from your development source directory. This allows you to import your modified version of Matplotlib without having to re-install after changing a `.py` or compiled extension file.

When working on a branch that does not have Meson enabled, meaning it does not have PR #26621 in its history (log), you will have to reinstall from source each time you change any compiled extension code.

If the installation is not working, please consult the *troubleshooting guide*. If the guide does not offer a solution, please reach out via chat or *open an issue*.

Build options

If you are working heavily with files that need to be compiled, you may want to inspect the compilation log. This can be enabled by setting the environment variable `MESONPY_EDITABLE_VERBOSE` or by setting the `editable-verbose` config during installation

```
python -m pip install --no-build-isolation --config-settings=editable-
 ↪verbose=true --editable .
```

For more information on installation and other configuration options, see the Meson Python editable installs guide.

For a list of the other environment variables you can set before install, see *Environment variables*.

Verify the Installation

Run the following command to make sure you have correctly installed Matplotlib in editable mode. The command should be run when the virtual environment is activated:

```
python -c "import matplotlib; print(matplotlib.__file__)"
```

This command should return : `<matplotlib_local_repo>\lib\matplotlib\__init__.py`

We encourage you to run tests and build docs to verify that the code installed correctly and that the docs build cleanly, so that when you make code or document related changes you are aware of the existing issues beforehand.

- Run test cases to verify installation *Testing*
- Verify documentation build *Write documentation*

Install pre-commit hooks

pre-commit hooks save time in the review process by identifying issues with the code before a pull request is formally opened. Most hooks can also aide in fixing the errors, and the checks should have corresponding *development workflow* and *pull request* guidelines. Hooks are configured in .pre-commit-config.yaml and include checks for spelling and formatting, flake 8 conformity, accidentally committed files, import order, and incorrect branching.

Install pre-commit hooks

```
python -m pip install pre-commit
pre-commit install
```

Hooks are run automatically after the `git commit` stage of the *editing workflow*. When a hook has found and fixed an error in a file, that file must be *staged and committed* again.

Hooks can also be run manually. All the hooks can be run, in order as listed in `.pre-commit-config.yaml`, against the full codebase with

```
pre-commit run --all-files
```

To run a particular hook manually, run `pre-commit run` with the hook id

```
pre-commit run <hook id> --all-files
```

Please note that the `mypy` pre-commit hook cannot check the *Type hints* for new functions; instead the stubs for new functions are checked using the `stubtest` *CI check* and can be checked locally using `tox -e stubtest`.

Workflow

10.3.2 Development workflow

Workflow summary

To keep your work well organized, with readable history, and in turn make it easier for project maintainers (that might be you) to see what you've done, and why you did it, we recommend the following:

- Don't make changes in your local `main` branch!
- Before starting a new set of changes, fetch all changes from `upstream/main`, and start a new *feature branch* from that.
- Make a new branch for each feature or bug fix — "one task, one branch".
- Name your branch for the purpose of the changes - e.g. `bugfix-for-issue-14` or `refactor-database-code`.
- If you get stuck, reach out on Gitter or discourse.
- When you're ready or need feedback on your code, open a pull request so that the Matplotlib developers can give feedback and eventually include your suggested code into the `main` branch.

Overview

After *setting up a development environment*, the typical workflow is:

1. Fetch all changes from `upstream/main`:

```
git fetch upstream/main
```

2. Start a new *feature branch* from `upstream/main`:

```
git checkout -b my-feature upstream/main
```

3. When you're done editing, e.g., `lib/matplotlib/collections.py`, record your changes in Git:

```
git add lib/matplotlib/collections.py
git commit -m 'a commit message'
```

4. Push the changes to your GitHub fork:

```
git push -u origin my-feature
```

Update the `main` branch

First make sure you have followed *Setting up Matplotlib for development*.

From time to time you should fetch the upstream changes from GitHub:

```
git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit.

Make a new feature branch

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'. Making a new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example `add-ability-to-fly`, or `bugfix-for-issue-42`.

The process for creating a new feature branch is:

```
# Update the main branch
git fetch upstream
# Make new feature branch starting at current main
git branch my-new-feature upstream/main
git checkout my-new-feature
```

If you started making changes on your local `main` branch, you can convert the branch to a feature branch by renaming it:

```
git branch -m <newname>
```

Generally, you will want to keep your feature branches on your public GitHub fork of Matplotlib. To do this, you `git push` this new branch up to your GitHub repo. Generally, if you followed the instructions in these pages, and by default, git will have a link to your fork of the GitHub repo, called `origin`. You push up to your own fork with:

```
git push origin my-new-feature
```

The editing workflow

1. Make some changes
2. Save the changes
3. See which files have changed with `git status`. You'll see a listing like this one:

```
# On branch ny-new-feature
# Changed but not updated:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes in working␣
```

(continues on next page)

(continued from previous page)

```
 ↪directory)
#
#  modified:   README
#
# Untracked files:
#   (use "git add <file>..." to include in what will be committed)
#
#  INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```

4. Check what the actual changes are with `git diff`.
5. Add any new files to version control `git add new_file_name`.
6. To commit **all** modified files into the local copy of your repo, type:

   ```
   git commit -am 'A commit message'
   ```

   Note the `-am` options to `commit`. The `m` flag signals that you are going to type a message on the command line. The `a` flag stages every file that has been modified, except files listed in `.gitignore`. For more information, see why the -a flag? and the git commit manual page.
7. To push the changes up to your forked repo on GitHub, do a `git push`.

Open a pull request

When you are ready to ask for someone to review your code and consider a merge, submit your Pull Request (PR).

Go to the web page of *your fork* of the Matplotlib repo, and click `Compare & pull request` to send your changes to the maintainers for review. The base repository is `matplotlib/matplotlib` and the base branch is generally `main`.

Enter a title for the set of changes with some explanation of what you've done. Mention anything you'd like particular attention for - such as a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message and use the "Draft PR" feature of GitHub. This is a good way of getting some preliminary code review.

For more guidance on the mechanics of making a pull request, see GitHub's pull request tutorial.

Update a pull request

When updating your pull request after making revisions, instead of adding new commits, please consider amending your initial commit(s) to keep the commit history clean.

You can achieve this by using

```
git commit -a --amend --no-edit
git push [your-remote-repo] [your-branch] --force-with-lease
```

Tip

Instead of typing your branch name every time, you only need to type the following once to link the remote branch to the local branch:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that `my-new-feature` is related to the `my-new-feature` branch in the GitHub repo. After this, you will be able to push your changes with:

```
git push
```

Manage commit history

Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

Recover from mistakes

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles␣
 ↪immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-
 ↪branch onto 11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not␣
 ↪leak gzip obj
```

(continues on next page)

(continued from previous page)

```
...

# reset the branch to where it was before the botched rebase
git reset --hard cool-feature@{2}
```

Rewrite commit history

Note

Do this only for your own feature branches.

Is there an embarrassing typo in a commit you made? Or perhaps you made several false starts you don't want posterity to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2dec1ac Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
...
```

and `6ad92e5` is the last commit in the `cool-feature` branch. Suppose we want to make the following changes:

- Rewrite the commit message for `13d7934` to something more sensible.
- Combine the commits `2dec1ac`, `a815645`, `eadc391` into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs
```

(continues on next page)

(continued from previous page)

```
# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
#  p, pick = use commit
#  r, reword = use commit, but edit the commit message
#  e, edit = use commit, but stop for amending
#  s, squash = use commit, but meld into previous commit
#  f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
# However, if you remove everything, the rebase will be aborted.
#
```

To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for `13d7934`, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] FOO: First implementation
 2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
 1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and now, the history looks like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained *above*.

If you have not yet pushed this branch to github, you can carry on as normal, however if you *have* already pushed this commit see *Push with force* for how to replace your already published commits with the new ones.

Rebase onto `upstream/main`

Let's say you thought of some work you'd like to do. You *Update the main branch* and *Make a new feature branch* called `cool-feature`. At this stage, `main` is at some commit, let's call it E. Now you make some new commits on your `cool-feature` branch, let's call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, `main` has progressed from commit E to commit (say) G:

```
      A---B---C cool-feature
     /
D---E---F---G main
```

At this stage you consider merging `main` into your feature branch, and you remember that this page sternly advises you not to do that, because the history will get messy. Most of the time, you can just ask for a review without worrying about whether `main` has got a little ahead; however sometimes, the changes in `main` might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

`rebase` takes your changes (A, B, C) and replays them as if they had been made to the current state of `main`. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```
              A'--B'--C' cool-feature
             /
D---E---F---G main
```

See rebase without tears for more detail.

To do a rebase on `upstream/main`:

```
# Fetch changes from upstream/main
git fetch upstream
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto main
git rebase --onto upstream/main upstream/main cool-feature
```

In this situation, where you are already on branch `cool-feature`, the last command can be written more succinctly as:

```
git rebase upstream/main
```

When all looks good, you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at *Recover from mistakes*.

If you have made changes to files that have also changed in `main`, this may generate merge conflicts that you need to resolve - see the git rebase man page for some instructions at the end of the "Description" section.

There is some related help on merging in the git user manual - see resolving a merge.

If you have not yet pushed this branch to github, you can carry on as normal, however if you *have* already pushed this commit see *Push with force* for how to replace your already published commits with the new ones.

Push with force

If you have in some way re-written already pushed history (e.g. via *Rewrite commit history* or *Rebase onto upstream/main*) leaving you with a git history that looks something like

```
  A'--E cool-feature
 /
D---A---B---C origin/cool-feature
```

where you have pushed the commits `A`, `B`, `C` to your fork on GitHub (under the remote name *origin*) but now have the commits `A'` and `E` on your local branch *cool-feature*. If you try to push the new commits to GitHub, it will fail and show an error that looks like

```
$ git push
Pushing to github.com:origin/matplotlib.git
To github.com:origin/matplotlib.git
 ! [rejected]              cool_feature -> cool_feature (non-fast-
 ↪forward)
error: failed to push some refs to 'github.com:origin/matplotlib.git'
hint: Updates were rejected because the tip of your current branch is␣
 ↪behind
hint: its remote counterpart. Integrate the remote changes (e.g.
hint: 'git pull ...') before pushing again.
hint: See the 'Note about fast-forwards' in 'git push --help' for␣
 ↪details.
```

If this push had succeeded, the commits `A`, `B`, and `C` would no longer be referenced by any branch and they would be discarded:

```
D---A'---E cool-feature, origin/cool-feature
```

By default `git push` helpfully tries to protect you from accidentally discarding commits by rejecting the push to the remote. When this happens, GitHub also adds the helpful suggestion to pull the remote changes and then try pushing again. In some cases, such as if you and a colleague are both committing and pushing to the same branch, this is a correct course of action.

However, in the case of having intentionally re-written history, we *want* to discard the commits on the remote and replace them with the new-and-improved versions from our local branch. In this case, what we want to do is

```
$ git push --force-with-lease
```

which tells git you are aware of the risks and want to do the push anyway. We recommend using `--force-with-lease` over the `--force` flag. The `--force` will do the push no matter what, whereas

`--force-with-lease` will only do the push if the remote branch is where the local `git` client thought it was.

Be judicious with force-pushing. It is effectively re-writing published history, and if anyone has fetched the old commits, it will have a different view of history which can cause confusion.

Automated tests

Whenever a pull request is created or updated, various automated test tools will run on all supported platforms and versions of Python.

- tox is not used in the automated testing. It is supported for testing locally.
- Codecov and CodeQL are currently for information only. Their failure is not necessarily a blocker.

Make sure the Linting, GitHub Actions, AppVeyor, CircleCI, and Azure pipelines are passing before merging. All checks are listed at the bottom of the GitHub page of your pull request.

Name	Check	Tips for finding cause of failure
Linting	*code style*	Errors are displayed as annotations on the pull request diff.
Mypy	*static type hints*	Errors are displayed as annotations on the pull request diff.
Stubtest		
CircleCI	*documentation build*	Search the CircleCI log for `WARNING`.
	tests	
GitHub Actions AppVeyor Azure pipelines		Search the log for `FAILURES`. Subsequent section should contain information on failed tests. On Azure, find the images as *artifacts* of the Azure job: 1. Click *Details* on the check on the GitHub PR page. 2. Click *View more details on Azure Pipelines* to go to Azure. 3. On the overview page *artifacts* are listed in the section *Related*.

Skip CI checks

If you know only a subset of CI checks need to be run, you can skip unneeded CI checks on individual commits by including the following strings in the commit message:

String	Effect	Notes
`[ci doc]`	Only run documentation checks.	For when you have only changed documentation. `[ci doc]` is applied automatically when the changes are only to files in `doc/**/` or `galleries/**/`
`[skip doc]`	Skip documentation checks.	For when you didn't change documentation.
`[skip appveyor]`	Skip AppVeyor run.	Substring must be in first line of commit message.
`[skip azp]`	Skip Azure Pipelines.	
`[skip actions]`	Skip GitHub Actions.	
`[skip ci]`	Skip all CI checks.	Use only for changes where documentation checks and unit tests do not apply.

`[skip actions]` and `[skip ci]` only skip Github Actions CI workflows that are triggered on `on: push` and `on: pull_request` events. For more information, see Skipping workflow runs.

10.3.3 Troubleshooting

For guidance on debugging an installation, see *Frequently asked questions*.

Problems with git

First, make sure you have a clean build and install (see *How to completely remove Matplotlib*), get the latest git update, install it and run a simple test script in debug mode:

```
rm -rf /path/to/site-packages/matplotlib*
git clean -xfd
git pull
python -m pip install -v . > build.out
python -c "from pylab import *; set_loglevel('debug'); plot(); show()"␣
↪> run.out
```

and post `build.out` and `run.out` to the matplotlib-devel mailing list (please do not post git problems to the users list).

Of course, you will want to clearly describe your problem, what you are expecting and what you are getting, but often a clean build and install will help. See also *Get help*.

Unlink of file */_c_internal_utils.cp311-win_amd64.pyd failed

The DLL files may be loaded by multiple running instances of Matplotlib; therefore check that Matplotlib is not running in any other application before trying to unlink this file. Multiple versions of Matplotlib can be linked to the same DLL, for example a development version installed in a development conda environment and a stable version running in a Jupyter notebook. To resolve this error, fully close all running instances of Matplotlib.

Windows compilation errors

If the compiled extensions are not building on Windows due to errors in linking to Windows' header files, for example `../../src/_tkagg.cpp:133:10: error: 'WM_DPICHANGED' was not declared in this scope`, you should check which compiler Meson is using:

```
Build type: native build
Project name: matplotlib
Project version: 3.9.0.dev0
C compiler for the host machine: cc (gcc 7.2.0 "cc (Rev1, Built by␣
↪MSYS2 project) 7.2.0")
C linker for the host machine: cc ld.bfd 2.29.1
C++ compiler for the host machine: c++ (gcc 7.2.0 "c++ (Rev1, Built by␣
↪MSYS2 project) 7.2.0")
C++ linker for the host machine: c++ ld.bfd 2.29.1
```

Our *dependencies* documentation lists the minimum header version if you intended to use `MSYS2`. If you intended to use `MSVC` then you may need to force Meson to use MSVC.

10.4 Policies and guidelines

These policies and guidelines help us maintain consistency in the various types of maintenance work. If you are writing code or documentation, following these policies helps maintainers more easily review your work. If you are helping triage, community manage, or release manage, these guidelines describe how our current process works.

Code

10.4.1 Coding guidelines

We appreciate these guidelines being followed because it improves the readability, consistency, and maintainability of the code base.

API guidelines

If adding new features, changing behavior or function signatures, or removing public interfaces, please consult the *API guidelines*.

PEP8, as enforced by flake8

Formatting should follow the recommendations of PEP8, as enforced by flake8. Matplotlib modifies PEP8 to extend the maximum line length to 88 characters. You can check flake8 compliance from the command line with

```
python -m pip install flake8
flake8 /path/to/module.py
```

or your editor may provide integration with it. Note that Matplotlib intentionally does not use the black auto-formatter (1), in particular due to its inability to understand the semantics of mathematical expressions (2, 3).

Package imports

Import the following modules using the standard scipy conventions:

```
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches
```

In general, Matplotlib modules should **not** import *rcParams* using `from matplotlib import rcParams`, but rather access it as `mpl.rcParams`. This is because some modules are imported very early, before the *rcParams* singleton is constructed.

Variable names

When feasible, please use our internal variable naming convention for objects of a given class and objects of any child class:

base class	variable	multiples
FigureBase	`fig`	
Axes	`ax`	
Transform	`trans`	`trans_<source>_<target>` `trans_<source>` when target is screen

Generally, denote more than one instance of the same class by adding suffixes to the variable names. If a format isn't specified in the table, use numbers or letters as appropriate.

Type hints

If you add new public API or change public API, update or add the corresponding mypy type hints. We generally use stub files (`*.pyi`) to store the type information; for example `colors.pyi` contains the type information for `colors.py`. A notable exception is `pyplot.py`, which is type hinted inline.

Type hints can be validated by the stubtest tool, which can be run locally using `tox -e stubtest` and is a part of the *Automated tests* suite. Type hints for existing functions are also checked by the mypy *pre-commit hook*.

New modules and files: installation

- If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the `meson.build` in the corresponding directories.
- New modules *may* be typed inline or using parallel stub file like existing modules.

C/C++ extensions

- Extensions may be written in C or C++.
- Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).
- Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named `FOO_wrap.cpp` or `FOO_wrapper.cpp`.
- Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.
- C/C++ code in the `extern/` directory is vendored, and should be kept close to upstream whenever possible. It can be modified to fix bugs or implement new features only if the required changes cannot be made elsewhere in the codebase. In particular, avoid making style fixes to it.

Keyword argument processing

Matplotlib makes extensive use of `**kwargs` for pass-through customizations from one function to another. A typical example is *`text`*. The definition of *`matplotlib.pyplot.text`* is a simple pass-through to *`matplotlib.axes.Axes.text`*:

```
# in pyplot.py
def text(x, y, s, fontdict=None, **kwargs):
    return gca().text(x, y, s, fontdict=fontdict, **kwargs)
```

`matplotlib.axes.Axes.text` (simplified for illustration) just passes all `args` and `kwargs` on to `matplotlib.text.Text.__init__`:

```
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and `matplotlib.text.Text.__init__` (again, simplified) just passes them on to the *`matplotlib.artist.Artist.update`* method:

```
# in text.py
def __init__(self, x=0, y=0, text='', **kwargs):
```

(continues on next page)

(continued from previous page)

```
    super().__init__()
    self.update(kwargs)
```

`update` does the work looking for methods named like `set_property` if `property` is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of `**kwargs` should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the `**kwargs` idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off `**kwargs`, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in *`plot()`*, `scalex` and `scaley` are local arguments and the rest are passed on as *`Line2D()`* keyword arguments:

```
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

Using logging for debug messages

Matplotlib uses the standard Python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print` calls to do your debugging, try using `logging.debug` instead!

To include `logging` in your module, at the top of the module, you need to `import logging`. Then calls in your code like:

```
_log = logging.getLogger(__name__)  # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logging.WARNING` in their code with the Matplotlib-provided helper:

```
plt.set_loglevel("debug")
```

or manually with

```
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

Avoid using pre-computed strings (`f-strings`, `str.format`,etc.) for logging because of security and performance issues, and because they interfere with style handlers. For example, use `_log.error('hello %s', 'world')` rather than `_log.error('hello {}'.format('world'))` or `_log.error(f'hello {s}')`.

Which logging level to use?

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.
- `logging.warning` and *`_api.warn_external`* are used to warn the user, see below.
- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn't drawn because its position is `NaN`, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.
- `logging.debug` is the least likely to be displayed, and hence can be the most verbose. "Expected" code paths (e.g., reporting normal intermediate steps of layouting or rendering) should only log at this level.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The logging tutorial suggests that the difference between `logging.warning` and *`_api.warn_external`* (which uses `warnings.warn`) is that *`_api.warn_external`* should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that *`_api.warn_external`* will by default only emit a given warning *once* for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the `warn` call. This usually isn't more informative than the warning message itself. Therefore, Matplotlib uses *`_api.warn_external`* which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```
# in my_matplotlib_module.py
import warnings
```

(continues on next page)

(continued from previous page)

```
def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:

```
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0)  # set range
```

will display

```
UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')
```

Modifying the module to use *_api.warn_external*:

```
from matplotlib import _api

def set_range(bottom, top):
    if bottom == top:
        _api.warn_external('Attempting to set identical bottom==top')
```

and running the same script will display

```
UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0)  # set range
```

Licenses for contributed code

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right

to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

```
There is no GPL-like "copyleft" restriction. Distributing
binary-only versions of Python, modified or not, is allowed. There
is no requirement to release any of your source code. You can also
write extension modules for Python and provide them only in binary
form.
```

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early Matplotlib developers selected a BSD compatible license. Matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as enthought, out of legitimate concern that use of the GPL will "infect" their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use Matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

Licenses for contributed code

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

Why BSD compatible?

Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

10.4.2 API guidelines

API consistency and stability are of great value; Therefore, API changes (e.g. signature changes, behavior changes, removals) will only be conducted if the added benefit is worth the effort of adapting existing code.

Because we are a visualization library, our primary output is the final visualization the user sees; therefore, the appearance of the figure is part of the API and any changes, either semantic or aesthetic, are backwards-incompatible API changes.

Add new API and features

Every new function, parameter and attribute that is not explicitly marked as private (i.e., starts with an underscore) becomes part of Matplotlib's public API. As discussed above, changing the existing API is cumbersome. Therefore, take particular care when adding new API:

- Mark helper functions and internal attributes as private by prefixing them with an underscore.
- Carefully think about good names for your functions and variables.
- Try to adopt patterns and naming conventions from existing parts of the Matplotlib API.
- Consider making as many arguments keyword-only as possible. See also API Evolution the Right Way -- Add Parameters Compatibly.

Add or change colormaps, color sequences, and styles

Visual changes are considered an API break. Therefore, we generally do not modify existing colormaps, color sequences, or styles.

We put a high bar on adding new colormaps and styles to prevent excessively growing them. While the decision is case-by-case, evaluation criteria include:

- novelty: Does it support a new use case? e.g. slight variations of existing maps, sequences and styles are likely not accepted.
- usability and accessibility: Are colors of sequences sufficiently distinct? Has colorblindness been considered?
- evidence of wide spread usage: for example academic papers, industry blogs and whitepapers, or inclusion in other visualization libraries or domain specific tools
- open license: colormaps, sequences, and styles must have a BSD compatible license (see *Licenses for contributed code*)

Deprecate API

API changes in Matplotlib have to be performed following the deprecation process below, except in very rare circumstances as deemed necessary by the development team. Generally API deprecation happens in two stages:

- **introduce:** warn users that the API *will* change
- **expire:** API *is* changed as described in the introduction period

This ensures that users are notified before the change will take effect and thus prevents unexpected breaking of code.

Rules

- Deprecations are targeted at the next *meso release* (e.g. 3.x)
- Deprecated API is generally removed (expired) two point-releases after introduction of the deprecation. Longer deprecations can be imposed by core developers on a case-by-case basis to give more time for the transition
- The old API must remain fully functional during the deprecation period
- If alternatives to the deprecated API exist, they should be available during the deprecation period
- If in doubt, decisions about API changes are finally made by the API consistency lead developer.

Introduce deprecation

1. Create *deprecation notice*
2. If possible, issue a `MatplotlibDeprecationWarning` when the deprecated API is used. There are a number of helper tools for this:
    - Use `_api.warn_deprecated()` for general deprecation warnings

- Use the decorator `@_api.deprecated` to deprecate classes, functions, methods, or properties
- Use `@_api.deprecate_privatize_attribute` to annotate deprecation of attributes while keeping the internal private version.
- To warn on changes of the function signature, use the decorators `@_api.delete_parameter`, `@_api.rename_parameter`, and `@_api.make_keyword_only`

All these helpers take a first parameter *since*, which should be set to the next point release, e.g. "3.x".

You can use standard rst cross references in *alternative*.

3. Make appropriate changes to the type hints in the associated `.pyi` file. The general guideline is to match runtime reported behavior.
   - Items marked with `@_api.deprecated` or `@_api.deprecate_privatize_attribute` are generally kept during the expiry period, and thus no changes are needed on introduction.
   - Items decorated with `@_api.rename_parameter` or `@_api.make_keyword_only` report the *new* (post deprecation) signature at runtime, and thus *should* be updated on introduction.
   - Items decorated with `@_api.delete_parameter` should include a default value hint for the deleted parameter, even if it did not previously have one (e.g. `param: <type> = ...`).

Expire deprecation

1. Create *deprecation announcement*. For the content, you can usually copy the deprecation notice and adapt it slightly.
2. Change the code functionality and remove any related deprecation warnings.
3. Make appropriate changes to the type hints in the associated `.pyi` file.
   - Items marked with `@_api.deprecated` or `@_api.deprecate_privatize_attribute` are to be removed on expiry.
   - Items decorated with `@_api.rename_parameter` or `@_api.make_keyword_only` will have been updated at introduction, and require no change now.
   - Items decorated with `@_api.delete_parameter` will need to be updated to the final signature, in the same way as the `.py` file signature is updated.
   - Any entries in `ci/mypy-stubtest-allowlist.txt` which indicate a deprecation version should be double checked. In most cases this is not needed, though some items were never type hinted in the first place and were added to this file instead. For removed items that were not in the stub file, only deleting from the allowlist is required.

Announce new and deprecated API

When adding or changing the API in a backward in-compatible way, please add the appropriate *versioning directive* and document it for the release notes and add the entry to the appropriate folder:

	versioning directive	announcement folder
new feature	`.. versionadded:: 3.N`	`doc/users/next_whats_new/`
API change	`.. versionchanged:: 3.N`	`doc/api/next_api_changes/[kind]`

When deprecating API, please add a notice as described in the *deprecation guidelines* and summarized here:

stage	announcement folder
introduce deprecation	`doc/api/next_api_changes/deprecation`
expire deprecation	`doc/api/next_api_changes/[kind]`

Generally the introduction notices can be repurposed for the expiration notice as they are expected to be describing the same API changes and removals.

Versioning directives

When making a backward incompatible change, please add a versioning directive in the docstring. The directives should be placed at the end of a description block. For example:

```
class Foo:
    """
    This is the summary.

    Followed by a longer description block.

    Consisting of multiple lines and paragraphs.

    .. versionadded:: 3.5

    Parameters
    ----------
    a : int
        The first parameter.
    b: bool, default: False
        This was added later.

        .. versionadded:: 3.6
    """

    def set_b(b):
        """
        Set b.

        .. versionadded:: 3.6
```

(continues on next page)

(continued from previous page)

```
        Parameters
        ----------
        b: bool
```

For classes and functions, the directive should be placed before the *Parameters* section. For parameters, the directive should be placed at the end of the parameter description. The micro release version is omitted and the directive should not be added to entire modules.

Release notes

For both change notes and what's new, please avoid using cross-references in section titles as it causes links to be confusing in the table of contents. Instead, ensure that a cross-reference is included in the descriptive text.

API change notes

API change notes for future releases are collected in `doc/api/next_api_changes/`. They are divided into four subdirectories:

- **Deprecations**: Announcements of future changes. Typically, these will raise a deprecation warning and users of this API should change their code to stay compatible with future releases of Matplotlib. If possible, state what should be used instead.
- **Removals**: Parts of the API that got removed. If possible, state what should be used instead.
- **Behaviour changes**: API that stays valid but will yield a different result.
- **Development changes**: Changes to the build process, dependencies, etc.

Please place new entries in these directories with a new file named `99999-ABC.rst`, where `99999` would be the PR number, and `ABC` the author's initials. Typically, each change will get its own file, but you may also amend existing files when suitable. The overall goal is a comprehensible documentation of the changes.

A typical entry could look like this:

```
Locators
~~~~~~~~
The unused `Locator.autoscale()` method is deprecated (pass the axis
limits to `Locator.view_limits()` instead).
```

Please avoid using references in section titles, as it causes links to be confusing in the table of contents. Instead, ensure that a reference is included in the descriptive text.

What's new notes

Please place new portions of `whats_new.rst` in the `doc/users/next_whats_new/` directory.

When adding an entry please look at the currently existing files to see if you can extend any of them. If you create a file, name it something like `cool_new_feature.rst` if you have added a brand new feature or something like `updated_feature.rst` for extensions of existing features.

Include contents of the form:

```
Section title for feature
-------------------------

A bunch of text about how awesome the new feature is and examples of␣
 ↪how
to use it.

A sub-section
~~~~~~~~~~~~~
```

Please avoid using references in section titles, as it causes links to be confusing in the table of contents. Instead, ensure that a reference is included in the descriptive text.

10.4.3 Testing

Matplotlib uses the pytest framework.

The tests are in `lib/matplotlib/tests`, and customizations to the pytest testing infrastructure are in *`matplotlib.testing`*.

Requirements

To run the tests you will need to *set up Matplotlib for development*. Note in particular the *additional dependencies* for testing.

Note

We will assume that you want to run the tests in a development setup.

While you can run the tests against a regular installed version of Matplotlib, this is a far less common use case. You still need the *additional dependencies* for testing. You have to additionally get the reference images from the repository, because they are not distributed with pre-built Matplotlib packages.

Running the tests

In the root directory of your development repository run:

```
pytest
```

`pytest` can be configured via many command-line parameters. Some particularly useful ones are:

`-v` or `--verbose`	Be more verbose
`-n NUM`	Run tests in parallel over NUM processes (requires pytest-xdist)
`--capture=no` or `-s`	Do not capture stdout

To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

```
pytest lib/matplotlib/tests/test_simplification.py::test_clipping
```

If you want to use `pytest` as a module (via `python -m pytest`), then you will need to avoid clashes between `pytest`'s import mode and Python's search path:

- On more recent Python, you may `disable "unsafe import paths"` (i.e., stop adding the current directory to the import path) with the `-P` argument:

  ```
  python -P -m pytest
  ```

- On older Python, you may enable `isolated mode` (which stops adding the current directory to the import path, but has other repercussions):

  ```
  python -I -m pytest
  ```

- On any Python, set `pytest`'s import mode to the older `prepend` mode (but note that this will break `pytest`'s assert rewriting):

  ```
  python -m pytest --import-mode prepend
  ```

Viewing image test output

The output of *image-based* tests is stored in a `result_images` directory. These images can be compiled into one HTML page, containing hundreds of images, using the `visualize_tests` tool:

```
python tools/visualize_tests.py
```

Image test failures can also be analysed using the `triage_tests` tool:

```
python tools/triage_tests.py
```

The triage tool allows you to accept or reject test failures and will copy the new image to the folder where the baseline test images are stored. The triage tool requires that *QT* is installed.

Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib/tests/test_basic.py`:

```
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with `"test_"` and then within those files for functions beginning with `"test"` or classes beginning with `"Test"`.

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified *rcParams*). The pytest fixture `matplotlib.testing.conftest.mpl_test_settings` will automatically clean these up; there is no need to do anything further.

Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy's default random number generator use:

```
import numpy as np
rng = np.random.default_rng(19680801)
```

and then use `rng` when generating the random numbers.

The seed is *John Hunter's* birthday.

Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the "baseline", or expected, images in the *image_comparison* decorator. For example, this test generates a single image and automatically tests it:

```
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['line_dashes'], remove_text=True,
                  extensions=['png'], style='mpl20')
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_lines/test_line_dashes.png`) to the correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_lines`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

It is preferred that new tests use `style='mpl20'` as this leads to smaller figures and reflects the newer look of default Matplotlib plots. Also, if the texts (labels, tick labels, etc) are not really part of what is tested, use the `remove_text=True` argument or add the `text_placeholders` fixture as this will lead to smaller figures and reduce possible issues with font mismatch on different platforms.

Compare two methods of creating an image

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image comparison tests is to use the *check_figures_equal* decorator, which should be used to decorate a function taking two *Figure* parameters and draws the same images on the figures using two different methods (the tested method and the baseline method). The decorator will arrange for setting up the figures and then collect the drawn results and compare them.

For example, this test compares two different methods to draw the same circle: plotting a circle using a *matplotlib.patches.Circle* patch vs plotting the circle using the parametric equation of a circle

```
from matplotlib.testing.decorators import check_figures_equal
import matplotlib.patches as mpatches
import matplotlib.pyplot as plt
import numpy as np

@check_figures_equal()
def test_parametric_circle_plot(fig_test, fig_ref):

    xo, yo= (.5, .5)
    radius = 0.4

    ax_test = fig_test.subplots()
    theta = np.linspace(0, 2 * np.pi, 150)
    l, = ax_test.plot(xo + (radius * np.cos(theta)),
                      yo + (radius * np.sin(theta)), c='r')

    ax_ref = fig_ref.subplots()
    red_circle_ref = mpatches.Circle((xo, yo), radius, ec='r', fc='none
↪',
                                     lw=l.get_linewidth())
    ax_ref.add_artist(red_circle_ref)

    for ax in [ax_ref, ax_test]:
        ax.set(xlim=(0,1), ylim=(0,1), aspect='equal')
```

Both comparison decorators have a tolerance argument `tol` that is used to specify the tolerance for difference in color value between the two images, where 255 is the maximal difference. The test fails if the average pixel difference is greater than this value.

See the documentation of *image_comparison* and *check_figures_equal* for additional information about their use.

Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the `mathtext.py` module are in `test_mathtext.py`.

Using GitHub Actions for CI

GitHub Actions is a hosted CI system "in the cloud".

GitHub Actions is configured to receive notifications of new commits to GitHub repos and to run builds or tests when it sees these new commits. It looks for a YAML files in `.github/workflows` to see how to test the project.

GitHub Actions is already enabled for the main Matplotlib GitHub repository -- for example, see the Tests workflows.

GitHub Actions should be automatically enabled for your personal Matplotlib fork once the YAML workflow files are in it. It generally isn't necessary to look at these workflows, since any pull request submitted against the main Matplotlib repository will be tested. The Tests workflow is skipped in forked repositories but you can trigger a run manually from the GitHub web interface.

You can see the GitHub Actions results at https://github.com/your_GitHub_user_name/matplotlib/actions -- here's an example.

Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.10, 3.11) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system's $PATH (consider using your system package manager, e.g. apt-get, yum, or Homebrew, to install them).

tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here's how to use it:

```
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py310,py311
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called `detox`. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called `tox.ini`. You may need to edit this file if you want to add new environments to test (e.g., `py33`) or if you want to tweak the dependencies or the way the tests are run. For more info on the `tox.ini` file, see the Tox Configuration Specification.

Building old versions of Matplotlib

When running a `git bisect` to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

Testing released versions of Matplotlib

Running the tests on an installation of a released version (e.g. PyPI package or conda package) also requires additional setup.

Note

For an end-user, there is usually no need to run the tests on released versions of Matplotlib. Official releases are tested before publishing.

Install additional dependencies

Install the *additional dependencies for testing*.

Obtain the reference images

Many tests compare the plot result against reference images. The reference images are not part of the regular packaged versions (pip wheels or conda packages). If you want to run tests with reference images, you need to obtain the reference images matching the version of Matplotlib you want to test.

To do so, either download the matching source distribution `matplotlib-X.Y.Z.tar.gz` from PyPI or alternatively, clone the git repository and `git checkout vX.Y.Z`. Copy the folder `lib/matplotlib/tests/baseline_images` to the folder `matplotlib/tests` of your the matplotlib installation to test. The correct target folder can be found using:

```
python -c "import matplotlib.tests; print(matplotlib.tests.__file__.
↪rsplit('/', 1)[0])"
```

An analogous copying of `lib/mpl_toolkits/*/tests/baseline_images` is necessary for testing `mpl_toolkits`.

Run the tests

To run all the tests on your installed version of Matplotlib:

```
pytest --pyargs matplotlib.tests
```

The test discovery scope can be narrowed to single test modules or even single functions:

```
pytest --pyargs matplotlib.tests.test_simplification.py::test_clipping
```

Documentation

10.4.4 Write documentation

Getting started

General file structure

All documentation is built from the `doc/`. The `doc/` directory contains configuration files for Sphinx and reStructuredText (ReST; `.rst`) files that are rendered to documentation pages.

Documentation is created in three ways. First, API documentation (`doc/api`) is created by Sphinx from the docstrings of the classes in the Matplotlib library. Except for `doc/api/api_changes/`, `.rst` files in `doc/api` are created when the documentation is built. See *Write docstrings* below.

Second, our example pages, tutorials, and some of the narrative documentation are created by Sphinx Gallery. Sphinx Gallery converts example Python files to `*.rst` files with the result of Matplotlib plot calls as embedded images. See *Write examples and tutorials* below.

Third, Matplotlib has narrative docs written in ReST in subdirectories of `doc/users/`. If you would like to add new documentation that is suited to an `.rst` file rather than a gallery or tutorial example, choose an appropriate subdirectory to put it in, and add the file to the table of contents of `index.rst` of the subdirectory. See *Write ReST pages* below.

Note

Don't directly edit the `.rst` files in `doc/plot_types`, `doc/gallery`, `doc/tutorials`, and `doc/api` (excepting `doc/api/api_changes/`). Sphinx regenerates files in these directories when building documentation.

Set up the build

The documentation for Matplotlib is generated from reStructuredText (ReST) using the Sphinx documentation generation tool.

To build the documentation you will need to *set up Matplotlib for development*. Note in particular the *additional dependencies* required to build the documentation.

Build the docs

The documentation sources are found in the `doc/` directory. The configuration file for Sphinx is `doc/conf.py`. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, cd into `doc/` and run:

```
make html
```

Note

Since the documentation is very large, the first build may take 10-20 minutes, depending on your machine. Subsequent builds will be faster.

Other useful invocations include

```
# Build the html documentation, but skip generation of the gallery␣
 ↪images to
# save time.
make html-noplot

# Build the html documentation, but skip specific subdirectories.  If␣
 ↪a gallery
# directory is skipped, the gallery images are not generated.  The␣
```

(continues on next page)

(continued from previous page)

```
 ↪first
# time this is run, it creates ``.mpl_skip_subdirs.yaml`` which can be␣
 ↪edited
# to add or remove subdirectories
make html-skip-subdirs

# Delete built files.  May help if you get errors about missing paths␣
 ↪or
# broken links.
make clean

# Build pdf docs.
make latexpdf
```

The `SPHINXOPTS` variable is set to `-W --keep-going` by default to build the complete docs but exit with exit status 1 if there are warnings. To unset it, use

```
make SPHINXOPTS= html
```

You can use the `O` variable to set additional options:

- `make O=-j4 html` runs a parallel build with 4 processes.
- `make O=-Dplot_formats=png:100 html` saves figures in low resolution.

Multiple options can be combined, e.g. `make O='-j4 -Dplot_formats=png:100' html`.

On Windows, set the options as environment variables, e.g.:

```
set SPHINXOPTS= & set O=-j4 -Dplot_formats=png:100 & make html
```

Show locally built docs

The built docs are available in the folder `build/html`. A shortcut for opening them in your default browser is:

```
make show
```

Write ReST pages

Most documentation is either in the docstrings of individual classes and methods, in explicit `.rst` files, or in examples and tutorials. All of these use the ReST syntax and are processed by Sphinx.

The Sphinx reStructuredText Primer is a good introduction into using ReST. More complete information is available in the reStructuredText reference documentation.

This section contains additional information and conventions how ReST is used in the Matplotlib documentation.

Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

Section formatting

Use sentence case `Upper lower` for section titles, e.g., `Possible hangups` rather than `Possible Hangups`.

We aim to follow the recommendations from the Python documentation and the Sphinx reStructuredText documentation for section markup characters, i.e.:

- `#` with overline, for parts. This is reserved for the main title in `index.rst`. All other pages should start with "chapter" or lower.
- `*` with overline, for chapters
- =, for sections
- −, for subsections
- `^`, for subsubsections
- `"`, for paragraphs

This may not yet be applied consistently in existing docs.

Table formatting

Given the size of the table and length of each entry, use:

	small table	large table
short entry	simple or grid table	grid table
long entry	list table	csv table

For more information, see rst tables.

Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
Here is a description of *argument*
```

Do not use the `` `default role` ``:

```
Do not describe `argument` like this.  As per the next section,
this syntax will (unsuccessfully) attempt to resolve the argument as a
link to a class or method in the library.
```

nor the ``literal`` role:

```
Do not describe ``argument`` like this.
```

Refer to other documents and sections

Sphinx supports internal references:

Role	Links target	Representation in rendered HTML
:doc:	document	link to a page
:ref:	reference label	link to an anchor associated with a heading

Examples:

```
See the :doc:`/install/index`

See the tutorial :ref:`quick_start`

See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
```

will render as:

> See the *Installation*
>
> See the tutorial *Quick start guide*
>
> See the example *Line plot*

Sections can also be given reference labels. For instance from the *Installation* link:

```
.. _clean-install:

How to completely remove Matplotlib
===================================

Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```
.. _what-is-a-backend:
```

is better than:

```
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

Refer to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```
`matplotlib.collections.LineCollection`
```

generates a link like this: *matplotlib.collections.LineCollection*.

Note: We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

```
`.LineCollection`
```

and the link still works: *LineCollection*. Note that you should typically include the leading dot. It tells Sphinx to look for the given name in the whole project. See also the explanation at Sphinx: Cross-referencing Python objects.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

```
`.pyplot.plot` or `.Axes.plot`
```

These will show up as *pyplot.plot* or *Axes.plot*. To still show only the last segment you can add a tilde as prefix:

```
`~.pyplot.plot` or `~.Axes.plot`
```

will render as *plot* or *plot*.

Other packages can also be linked via intersphinx:

```
`numpy.mean`
```

will return this link: `numpy.mean`. This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). If external linking fails, you can check the full list of referenceable objects with the following commands:

```
python -m sphinx.ext.intersphinx 'https://docs.python.org/3/objects.inv
↪'
```

(continues on next page)

(continued from previous page)

```
python -m sphinx.ext.intersphinx 'https://numpy.org/doc/stable/objects.
↪inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/scipy/
↪objects.inv'
python -m sphinx.ext.intersphinx 'https://pandas.pydata.org/pandas-
↪docs/stable/objects.inv'
```

Include figures and files

Image files can directly included in pages with the `image::` directive. e.g., `tutorials/intermediate/constrainedlayout_guide.py` displays a couple of static images:

```
# .. image:: /_static/constrained_layout_1b.png
#    :align: center
```

Files can be included verbatim. For instance the `LICENSE` file is included at *License agreement* using

```
.. literalinclude:: ../../LICENSE/LICENSE
```

The examples directory is copied to `doc/gallery` by sphinx-gallery, so plots from the examples directory can be included using

```
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

Tools for writing mathematical expressions

In most cases, you will likely want to use one of Sphinx's builtin Math extensions. In rare cases we want the rendering of the mathematical text in the documentation html to exactly match with the rendering of the mathematical expression in the Matplotlib figure. In these cases, you can use the *`matplotlib.sphinxext.mathmpl`* Sphinx extension (See also the *Writing mathematical expressions* tutorial.)

Write docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

Note

Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

All new or edited docstrings should conform to the numpydoc docstring guide. Much of the ReST syntax discussed above (*Write ReST pages*) can be used for links and references. These docstrings eventually populate the `doc/api` directory and form the reference documentation for the library.

Example docstring

An example docstring looks like:

```
def hlines(self, y, xmin, xmax, colors=None, linestyles='solid',
           label='', **kwargs):
    """
    Plot horizontal lines at each *y* from *xmin* to *xmax*.

    Parameters
    ----------
    y : float or array-like
        y-indexes where to plot the lines.

    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are
        provided, all lines will have the same length.

    colors : list of colors, default: :rc:`lines.color`

    linestyles : {'solid', 'dashed', 'dashdot', 'dotted'}, optional

    label : str, default: ''

    Returns
    -------
    `~matplotlib.collections.LineCollection`

    Other Parameters
    ----------------
    data : indexable object, optional
        DATA_PARAMETER_PLACEHOLDER
    **kwargs :  `~matplotlib.collections.LineCollection` properties.

    See Also
    --------
    vlines : vertical lines
    axhline : horizontal line across the Axes
    """
```

See the *hlines* documentation for how this renders.

The Sphinx website also contains plenty of documentation concerning ReST markup and working with Sphinx in general.

Formatting conventions

The basic docstring conventions are covered in the numpydoc docstring guide and the Sphinx documentation. Some Matplotlib-specific formatting conventions to keep in mind:

Quote positions

The quotes for single line docstrings are on the same line (pydocstyle D200):

```
def get_linewidth(self):
    """Return the line width in points."""
```

The quotes for multi-line docstrings are on separate lines (pydocstyle D213):

```
def set_linestyle(self, ls):
"""
Set the linestyle of the line.

[...]
"""
```

Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
If *linestyles* is *None*, the default is 'solid'.
```

Do not use the `` `default role` `` or the ``` ``literal`` ``` role:

```
Neither `argument` nor ``argument`` should be used.
```

Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

```
If 'tight', try to figure out the tight bbox of the figure.

No ``'extra'`` literal quotes.
```

The use of extra literal quotes around the text is discouraged. While they slightly improve the rendered docs, they are cumbersome to type and difficult to read in plain-text docs.

Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the numpydoc docstring guide conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `(float, float)` to describe a 2D position. The parentheses should be included to make the tupleness more obvious.

Use `array-like` for homogeneous numeric sequences, which could typically be a numpy.array. Dimensionality may be specified using `2D`, `3D`, `n-dimensional`. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets (`(M, N) array-like`). When referring to them in the text they are easier read and no special formatting is needed. Use `array` instead of `array-like` for return types if the returned object is indeed a numpy array.

`float` is the implicit default dtype for array-likes. For other dtypes use `array-like of int`.

Some possible uses:

```
2D array-like
(N,) array-like
(M, N) array-like
(M, N, 3) array-like
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```
list of str
list of `.Artist`
```

Reference types

Generally, the rules from *referring-to-other-code* apply. More specifically:

Use full references `` `~matplotlib.colors.Normalize` `` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the ~-shortening keeps it more readable.

Use abbreviated links `` `.Normalize` `` in the text.

```
norm : `~matplotlib.colors.Normalize`, optional
     A `.Normalize` instance is used to scale luminance data to 0, 1.
```

Default values

As opposed to the numpydoc guide, parameters need not be marked as *optional* if they have a simple default:

- use `{name} : {type}, default: {val}` when possible.
- use `{name} : {type}, optional` and describe the default in the text if it cannot be explained sufficiently in the recommended manner.

The default value should provide semantic information targeted at a human reader. In simple cases, it restates the value in the function signature. If applicable, units should be added.

```
Prefer:
    interval : int, default: 1000ms
over:
    interval : int, default: 1000
```

If *None* is only used as a sentinel value for "parameter not specified", do not document it as the default. Depending on the context, give the actual default, or mark the parameter as optional if not specifying has no particular effect.

```
Prefer:
    dpi : float, default: :rc:`figure.dpi`
over:
    dpi : float, default: None

Prefer:
    textprops : dict, optional
        Dictionary of keyword parameters to be passed to the
        `~matplotlib.text.Text` instance contained inside TextArea.
over:
    textprops : dict, default: None
        Dictionary of keyword parameters to be passed to the
        `~matplotlib.text.Text` instance contained inside TextArea.
```

`See also` sections

Sphinx automatically links code elements in the definition blocks of `See also` sections. No need to use backticks there:

```
See Also
--------
vlines : vertical lines
axhline : horizontal line across the Axes
```

Wrap parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line continuation so that indent would result in a lot of whitespace within the line):

```
def add_axes(self, *args, **kwargs):
    """
    ...

    Parameters
    ----------
    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar',␣
 ↪\
'rectilinear'}, optional
        The projection type of the axes.

    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

rcParams

rcParams can be referenced with the custom `:rc:` role: `:rc:`foo`` yields `rcParams["foo"] = 'default'`, which is a link to the `matplotlibrc` file description.

Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the Python `property` decorator). By convention, these setters and getters are named `set_PROPERTYNAME` and `get_PROPERTYNAME`; the list of properties thusly defined on an artist and their values can be listed by the *setp* and *getp* functions.

The Parameters block of property setter methods is parsed to document the accepted values, e.g. the docstring of *Line2D.set_linestyle* starts with

```
def set_linestyle(self, ls):
    """
    Set the linestyle of the line.

    Parameters
    ----------
    ls : {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
        etc.
    """
```

which results in the following line in the output of `plt.setp(line)` or `plt.setp(line, "linestyle")`:

```
linestyle or ls: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

In some rare cases (mostly, setters which accept both a single tuple and an unpacked tuple), the accepted values cannot be documented in such a fashion; in that case, they can be documented as an `.. ACCEPTS:` block, e.g. for *axes.Axes.set_xlim*:

```
def set_xlim(self, left=None, right=None):
    """
    Set the x-axis view limits.

    Parameters
    ----------
    left : float, optional
        The left xlim in data coordinates. Passing *None* leaves the
        limit unchanged.

        The left and right xlims may also be passed as the tuple
        (*left*, *right*) as the first positional argument (or as
        the *left* keyword argument).

        .. ACCEPTS: (bottom: float, top: float)

    right : float, optional
        etc.
    """
```

Note that the leading `..` makes the `.. ACCEPTS:` block a reST comment, hiding it from the rendered docs.

Keyword arguments

Note

The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

Since Matplotlib uses a lot of pass-through `kwargs`, e.g., in every function that creates a line (*plot*, *semilogx*, *semilogy*, etc.), it can be difficult for the new user to know which `kwargs` are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a `**kwargs`. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.
2. as automated as possible so that as properties change, the docs are updated automatically.

The `@_docstring.interpd` decorator implements this. Any function accepting *Line2D* pass-through `kwargs`, e.g., *matplotlib.axes.Axes.plot*, can list a summary of the *Line2D* properties, as follows:

```
# in axes.py
@_docstring.interpd
def plot(self, *args, **kwargs):
    """
    Some stuff omitted

    Other Parameters
    ----------------
    scalex, scaley : bool, default: True
        These parameters determine if the view limits are adapted to␣
↪the
        data limits. The values are passed on to `autoscale_view`.

    **kwargs : `.Line2D` properties, optional
        *kwargs* are used to specify properties like a line label (for
        auto legends), linewidth, antialiasing, marker face color.
        Example::

        >>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1',␣
↪linewidth=2)
        >>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')

        If you specify multiple lines with one plot call, the kwargs␣
↪apply
        to all those lines. In case the label object is iterable, each
        element is used as labels for each set of data.

        Here is a list of available `.Line2D` properties:

        %(Line2D:kwdoc)s
    """
```

The `%(Line2D:kwdoc)` syntax makes `interpd` lookup an *Artist* subclass named `Line2D`, and call *artist.kwdoc* on that class. *artist.kwdoc* introspects the subclass and summarizes its properties as a substring, which gets interpolated into the docstring.

Note that this scheme does not work for decorating an Artist's `__init__`, as the subclass and its properties are not defined yet at that point. Instead, `@_docstring.interpd` can be used to decorate the class itself -- at that point, *kwdoc* can list the properties and interpolate them into `__init__.__doc__`.

Inherit docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```
class A:
    def foo():
        """The parent docstring."""
        pass

class B(A):
    def foo():
        # docstring inherited
        pass
```

Add figures

As above (see *Include figures and files*), figures in the examples gallery can be referenced with a `.. plot::` directive pointing to the python script that created the figure. For instance the *legend* docstring references the file `examples/text_labels_and_annotations/legend.py`:

```
"""
...

Examples
--------

.. plot:: gallery/text_labels_and_annotations/legend.py
"""
```

Note that `examples/text_labels_and_annotations/legend.py` has been mapped to `gallery/text_labels_and_annotations/legend.py`, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in *matplotlib.sphinxext.plot_directive*. A short example is:

```
"""
...

Examples
--------

.. plot::
   import matplotlib.image as mpimg
   img = mpimg.imread('_static/stinkbug.png')
   imgplot = plt.imshow(img)
"""
```

An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.

Write examples and tutorials

Examples and tutorials are Python scripts that are run by Sphinx Gallery. Sphinx Gallery finds `*.py` files in source directories and runs the files to create images and narrative that are embedded in `*.rst` files in a build location of the `doc/` directory. Files in the build location should not be directly edited as they will be overwritten by Sphinx gallery. Currently Matplotlib has four galleries as follows:

Source location	Build location
`galleries/plot_types`	`doc/plot_types`
`galleries/examples`	`doc/gallery`
`galleries/tutorials`	`doc/tutorials`
`galleries/users_explain`	`doc/users/explain`

The first three are traditional galleries. The last, `galleries/users_explain`, is a mixed gallery where some of the files are raw `*.rst` files and some are `*.py` files; Sphinx Gallery just copies these `*.rst` files from the source location to the build location (see *Raw restructured text files in the gallery*, below).

In the Python files, to exclude an example from having a plot generated, insert "sgskip" somewhere in the filename.

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as ReST text, the code is displayed, and figures are put into the built page. Matplotlib uses the `# %%` section separator so that IDEs will identify "code cells" to make it easy to re-run sub-sections of the example.

For instance the example *Line plot* example is generated from `/galleries/examples/lines_bars_and_markers/simple_plot.py`, which looks like:

```
"""
===========
Simple Plot
===========

Create a simple plot.
"""
import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)

ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
```

(continues on next page)

(continued from previous page)

```
ax.grid()
plt.show()
```

The first comment block is treated as ReST text. The other comment blocks render as comments in *Line plot*.

Tutorials are made with the exact same mechanism, except they are longer and typically have more than one comment block (i.e. *Quick start guide*). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by the line `# %%`:

```
"""
===========
Simple Plot
===========

Create a simple plot.
"""
...
ax.grid()
plt.show()

# %%
# Second plot
# ===========
#
# This is a second plot that is very nice

fig, ax = plt.subplots()
ax.plot(np.sin(range(50)))
```

In this way text, code, and figures are output in a "notebook" style.

Sample data

When sample data comes from a public dataset, please cite the source of the data. Sample data should be written out in the code. When this is not feasible, the data can be loaded using *`cbook.get_sample_data`*.

```
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```

If the data is too large to be included in the code, it should be added to `lib/matplotlib/mpl-data/sample_data/`

Create mini-gallery

The showcased Matplotlib functions should be listed in an admonition at the bottom as follows

```
# %%
#
# .. admonition:: References
#
#    The use of the following functions, methods, classes and modules␣
 ↪is shown
#    in this example:
#
#    - `matplotlib.axes.Axes.fill` / `matplotlib.pyplot.fill`
#    - `matplotlib.axes.Axes.axis` / `matplotlib.pyplot.axis`
```

This allows sphinx-gallery to place an entry to the example in the mini-gallery of the mentioned functions. Whether or not a function is mentioned here should be decided depending on if a mini-gallery link prominently helps to illustrate that function; e.g. mention `matplotlib.pyplot.subplots` only in examples that are about laying out subplots, not in every example that uses it.

Functions that exist in `pyplot` as well as in Axes or Figure should mention both references no matter which one is used in the example code. The `pyplot` reference should always be the second to mention; see the example above.

Order examples

The order of the sections of the *Tutorials* and the *Examples*, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- *Explicit order*: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.
- *Implicit order*: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

Raw restructured text files in the gallery

Sphinx Gallery folders usually consist of a `README.txt` and a series of Python source files that are then translated to an `index.rst` file and a series of `example_name.rst` files in the `doc/` subdirectories. However, Sphinx Gallery also allows raw `*.rst` files to be passed through a gallery (see Manually passing files in the Sphinx Gallery documentation). We use this feature in `galleries/users_explain`, where, for instance, `galleries/users_explain/colors` is a regular Sphinx Gallery subdirectory, but `galleries/users_explain/artists` has a mix of `*.rst` and `*py` files. For mixed subdirectories like this, we must add any `*.rst` files to a `:toctree:`, either in the `README.txt` or in a manual `index.rst`.

Examples guidelines

The gallery of examples contains visual demonstrations of matplotlib features. Gallery examples exist so that users can scan through visual examples. Unlike tutorials or user guides, gallery examples teach by demonstration, rather than by explanation or instruction.

Gallery examples should contain a very brief description of *what* is being demonstrated and, when relevant, *how* it is achieved. Explanations should be brief, providing only the minimal context necessary for understanding the example. Cross-link related documentation (e.g. tutorials, user guides and API entries) and tag the example with related concepts.

Format

All *Examples* should aim to follow these guidelines:

Title

Describe content in a short sentence (approx. 1-6 words). Do not use *demo* as this is implied by being an example. Avoid implied verbs such as *create*, *make*, etc, e.g. *annotated heatmaps* is preferred to *create annotated heatmaps*. Use the simple present tense when a verb is necessary, e.g. *Fill the area between two curves*

Description

In a short paragraph (approx 1-3 sentences) describe what visualization technique is being demonstrated and how library features are used to execute the technique, e.g. *Set bar color and bar label entries using the color and label parameters of ~Axes.bar*

Plot

Clearly demonstrate the subject and, when possible, show edge cases and different applications. While the plot should be visually appealing, prioritize keeping the plot uncluttered.

Code

Write the minimum necessary to showcase the feature that is the focus of the example. Avoid custom styling and annotation (titles, legends, colors, etc.) when it will not improve the clarity of the example.

Use short comments sparingly to describe what hard to follow parts of code are doing. When more context or explanation is required, add a text paragraph before the code example.

Identify whether artists intersect demonstrates the point of visual examples. This example is "messy" in that it's hard to categorize, but the gallery is the right spot for it because it makes sense to find it by visual search

Interactive adjustment of colormap range is an example of a good descriptive title that briefly summarizes how the showcased library features are used to implement the demonstrated visualization technique.

Lines with a ticked patheffect is an example of having a minimal amount of code necessary to showcase the feature. The lack of extraneous code makes it easier for the reader to map which parts of code correspond to which parts of the plot.

Figure size

When customizing figure sizes, we aim to avoid downscaling in rendered HTML docs. The current width limit (induced by *pydata-sphinx-theme*) is 720px, i.e. `figsize=(7.2, ...)`, or 896px if the page does not have subsections and thus does not have the "On this page" navigation on the right-hand side.

Miscellaneous

Move documentation

Sometimes it is desirable to move or consolidate documentation. With no action this will lead to links either going dead (404) or pointing to old versions of the documentation. Preferable is to replace the old page with an html refresh that immediately redirects the viewer to the new page. So, for example we move `/doc/topic/old_info.rst` to `/doc/topic/new_info.rst`. We remove `/doc/topic/old_info.rst` and in `/doc/topic/new_info.rst` we insert a `redirect-from` directive that tells sphinx to still make the old file with the html refresh/redirect in it (probably near the top of the file to make it noticeable)

```
.. redirect-from:: /topic/old_info
```

In the built docs this will yield an html file `/build/html/topic/old_info.html` that has a refresh to `new_info.html`. If the two files are in different subdirectories:

```
.. redirect-from:: /old_topic/old_info2
```

will yield an html file `/build/html/old_topic/old_info2.html` that has a (relative) refresh to `../topic/new_info.html`.

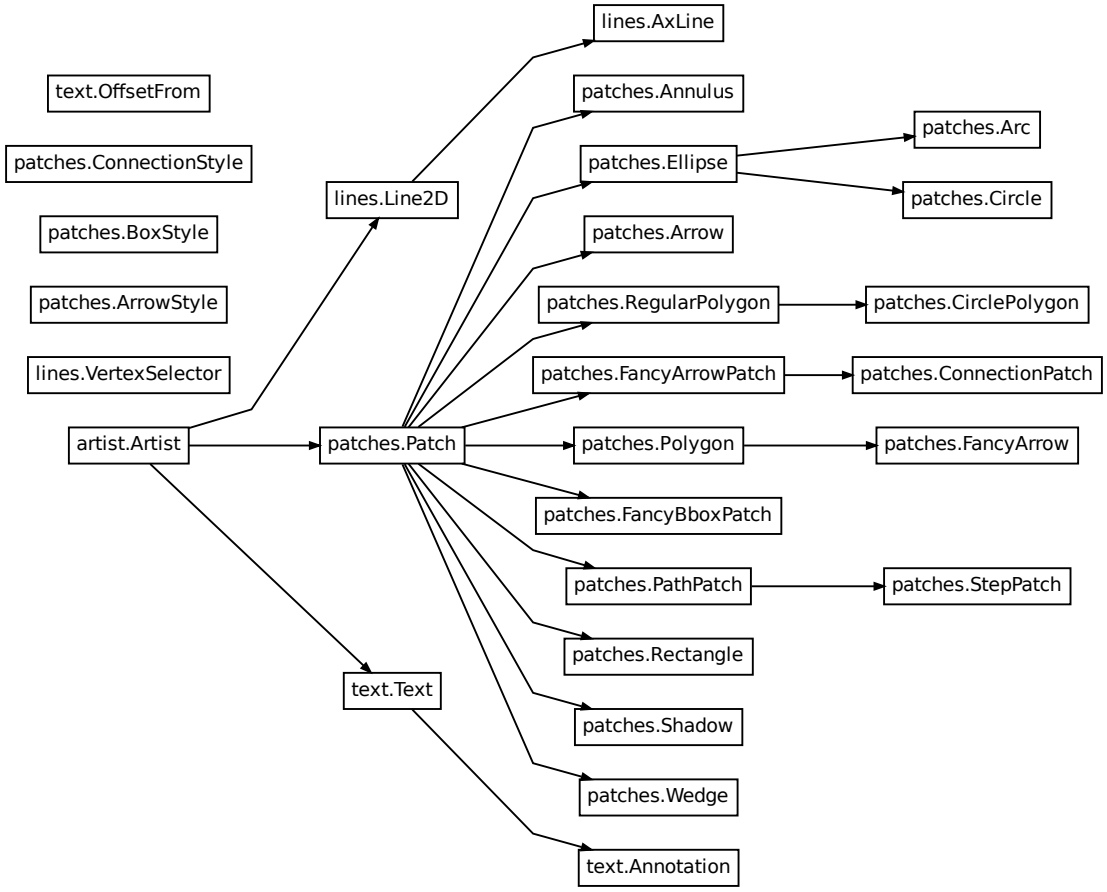
Use the full path for this directive, relative to the doc root at `https://matplotlib.org/stable/`. So `/old_topic/old_info2` would be found by users at `http://matplotlib.org/stable/old_topic/old_info2`. For clarity, do not use relative links.

Generate inheritance diagrams

Class inheritance diagrams can be generated with the Sphinx inheritance-diagram directive.

Example:

```
.. inheritance-diagram:: matplotlib.patches matplotlib.lines␣
↪matplotlib.text
   :parts: 2
```



Navbar and style

Matplotlib has a few subprojects that share the same navbar and style, so these are centralized as a sphinx theme at mpl_sphinx_theme. Changes to the style or topbar should be made there to propagate across all subprojects.

10.4.5 Documentation style guide

This guide contains best practices for the language and formatting of Matplotlib documentation.

See also

For more information about contributing, see the *Write documentation* section.

Expository language

For explanatory writing, the following guidelines are for clear and concise language use.

Terminology

There are several key terms in Matplotlib that are standards for reliability and consistency in documentation. They are not interchangeable.

Term	Description	Correct	Incorrect
`Figure`	Matplotlib working space for programming.	• *For Matplotlib objects*: Figure, "The Figure is the working space for the visual. • *Referring to class*: `Figure`, "Methods within the `Figure` provide the visuals." • *General language*: figure, "Michelle Kwan is a famous figure skater."	• "The figure is the working space for visuals." • "Methods in the figure provide the visuals." • "The `Figure` Four leglock is a wrestling move."
`Axes`	Subplots within Figure. Contains plot elements and is responsible for plotting and configuring additional details.	• *For Matplotlib objects*: Axes, "An Axes is a subplot within the Figure." • *Referring to class*: `Axes`, "Each `Axes` is specific to one Figure." • *General language*: axes, "Both loggers and lumberjacks use axes to chop wood." OR "There are no standard names for the coordinates in the three axes." (Plural of axis)	• "The axes methods transform the data." • "Each `Axes` is specific to a Figure." • "The musicians on stage call their guitars Axes." • "The point where the Axes meet is the origin of the coordinate system."
`Artist`	Broad variety of Matplotlib objects that display visuals.	• *For Matplotlib objects*: Artist, "Artists display visuals and are the visible elements when rendering a Figure." • *Referring to class*: `Artist`, "Each `Artist` has respective methods and functions." • *General language*: artist, "The artist in the museum is from France."	• "Configure the legend artist with its respective method." • "There is an `Artist` for that visual in the graph." • "Some Artists became famous only by accident."
`Axis`	Human-readable single dimensional object of reference marks containing ticks, tick labels, spines, and edges.	• *For Matplotlib objects*: Axis, "The Axis for the bar chart is a separate Artist." (plural, Axis objects) • *Referring to class*: `Axis`, "The `Axis` contains respective XAxis and YAxis objects." • *General language*: axis, "Rotation around a fixed axis is a special case of rotational motion."	• "Plot the graph onto the axis." • "Each Axis is usually named after the coordinate which is measured along it." • "In some computer graphics contexts, the ordinate `Axis` may be oriented downwards."

Grammar

Subject

Use second-person imperative sentences for directed instructions specifying an action. Second-person pronouns are for individual-specific contexts and possessive reference.

Correct	Incorrect
Install Matplotlib from the source directory using the Python `pip` installer program. Depending on your operating system, you may need additional support.	You can install Matplotlib from the source directory. You can find additional support if you are having trouble with your installation.

Tense

Use present simple tense for explanations. Avoid future tense and other modal or auxiliary verbs when possible.

Correct	Incorrect
The fundamental ideas behind Matplotlib for visualization involve taking data and transforming it through functions and methods.	Matplotlib will take data and transform it through functions and methods. They can generate many kinds of visuals. These will be the fundamentals for using Matplotlib.

Voice

Write in active sentences. Passive voice is best for situations or conditions related to warning prompts.

Correct	Incorrect
The function `plot` generates the graph.	The graph is generated by the `plot` function.
An error message is returned by the function if there are no arguments.	You will see an error message from the function if there are no arguments.

Sentence structure

Write with short sentences using Subject-Verb-Object order regularly. Limit coordinating conjunctions in sentences. Avoid pronoun references and subordinating conjunctive phrases.

Correct	Incorrect
The `pyplot` module in Matplotlib is a collection of functions. These functions create, manage, and manipulate the current Figure and plotting area.	The `pyplot` module in Matplotlib is a collection of functions which create, manage, and manipulate the current Figure and plotting area.
The `plot` function plots data to the respective Axes. The Axes corresponds to the respective Figure.	The `plot` function plots data within its respective Axes for its respective Figure.
The implicit approach is a convenient shortcut for generating simple plots.	Users that wish to have convenient shortcuts for generating plots use the implicit approach.

Formatting

The following guidelines specify how to incorporate code and use appropriate formatting for Matplotlib documentation.

Code

Matplotlib is a Python library and follows the same standards for documentation.

Comments

Examples of Python code have comments before or on the same line.

Correct	Incorrect
`# Data` `years = [2006, 2007, 2008]`	`years = [2006, 2007, 2008]` `# Data`
`years = [2006, 2007, 2008]  #␣` `↪Data`	

Outputs

When generating visuals with Matplotlib using `.py` files in examples, display the visual with *`matplotlib.pyplot.show`* to display the visual. Keep the documentation clear of Python output lines.

Correct	Incorrect
`plt.plot([1, 2, 3], [1, 2, 3])` `plt.show()`	`plt.plot([1, 2, 3], [1, 2, 3])`

`fig, ax = plt.subplots()`
`ax.plot([1, 2, 3], [1, 2, 3])`
`fig.show()`
	`fig, ax = plt.subplots()`
	`ax.plot([1, 2, 3], [1, 2, 3])`

reStructuredText

Matplotlib uses reStructuredText Markup for documentation. Sphinx helps to transform these documents into appropriate formats for accessibility and visibility.

- reStructuredText Specifications
- Quick Reference Document

Lists

Bulleted lists are for items that do not require sequencing. Numbered lists are exclusively for performing actions in a determined order.

Correct	Incorrect
The example uses three graphs.	The example uses three graphs.
• Bar • Line • Pie	1. Bar 2. Line 3. Pie
These four steps help to get started using Matplotlib.	The following steps are important to get started using Matplotlib.
1. Import the Matplotlib library. 2. Import the necessary modules. 3. Set and assign data to work on. 4. Transform data with methods and functions.	• Import the Matplotlib library. • Import the necessary modules. • Set and assign data to work on. • Transform data with methods and functions.

Tables

Use ASCII tables with reStructuredText standards in organizing content. Markdown tables and the csv-table directive are not accepted.

Correct

Correct	Incorrect
OK	Not OK

```
+----------+----------+
| Correct  | Incorrect|
+==========+==========+
| OK       | Not OK   |
+----------+----------+

==========  ==========
  Correct     Incorrect
==========  ==========
OK          Not OK
==========  ==========
```

Incorrect

```
| Correct | Incorrect |
| ------- | --------- |
| OK      | Not OK    |
```

```
.. csv-table::
   :header: "correct", "incorrect
 ↪"
   :widths: 10, 10

   "OK    ", "Not OK"
```

Additional resources

This style guide is not a comprehensive standard. For a more thorough reference of how to contribute to documentation, see the links below. These resources contain common best practices for writing documentation.

- Python Developer's Guide
- Google Developer Style Guide
- IBM Style Guide
- Red Hat Style Guide

10.4.6 Tagging guidelines

Why do we need tags?

Tags serve multiple purposes.

Tags have a one-to-many organization (i.e. one example can have several tags), while the gallery structure requires that examples are placed in only one location. This means tags provide a secondary layer of organization and make the gallery of examples more flexible and more user-friendly.

They allow for better discoverability, search, and browse functionality. They are helpful for users struggling to write a search query for what they're looking for.

Hidden tags provide additional functionality for maintainers and contributors.

How to tag?

Place the tag directive at the bottom of each page and add the tags underneath, e.g.:

```
.. tags::
   topic: tagging, purpose: reference
```

What gets a tag?

Every gallery example should be tagged with:

- 1+ content tags
- structural, domain, or internal tag(s) if helpful

Tags can repeat existing forms of organization (e.g. an example is in the Animation folder and also gets an `animation` tag).

Tags are helpful to denote particularly good "byproduct" examples. E.g. the explicit purpose of a gallery example might be to demonstrate a colormap, but it's also a good demonstration of a legend. Tag `legend` to indicate that, rather than changing the title or the scope of the example.

Tag Categories

Tag Glossary

- *API tags: what content from the API reference is in the example?*
- *Structural tags: what format is the example? What context can we provide?*
- *Domain tags: what discipline(s) might seek this example consistently?*
- *Internal tags: what information is helpful for maintainers or contributors?*

API tags: what content from the API reference is in the example?

tag	use case
Primary or relevant plot component	
`component: axes`	remarkable or very clear use of component
`component: axis`	
`component: marker`	
`component: label`	
`component: title`	
`component: legend`	
`component: subplot`	
`component: figure`	
`component: annotation`	

continues on next page

Table 1 – continued from previous page

tag	use case
`component: label`	
`component: ticks`	
`component: spines`	frequently paired with `component: axis`
`component: error`	
`component: animation`	
Styling	
Use these tags when plot contains a teachable example	
`styling: color`	
`styling: shape`	
`styling: size`	
`styling: position`	
`styling: texture`	
`styling: colormap`	
`styling: linestyle`	
`styling: small-multiples`	
`styling: conditional`	styling is determined programmatically by a condition being met
Interactivity	
`interactivity: event handling`	
`interactivity: click`	
`interactivity: mouseover`	
`interactivity: zoom`	
`interactivity: pan`	
`interactivity: brush`	
`interactivity: drag`	
`interactivity: scroll`	
Plot Type	
`plot-type: bar`	example contains a bar plot
`plot-type: line`	example contains a line plot
`plot-type: pie`	example contains a pie plot
`plot-type: polar`	example contains a polar plot
`plot-type: 3D`	example contains a 3D plot
`plot-type: histogram`	example contains a histogram
`plot-type: specialty`	
`plot-type: scatter`	

Structural tags: what format is the example? What context can we provide?

tag	use case
`level`	level refers to how much context/background the user will need
`level: beginner`	concepts are standalone, self-contained, require only one module
`level: intermediate`	concepts may require knowledge of other modules, have dependencies
`level: advanced`	concepts require multiple modules and have dependencies
`purpose`	what's it here for?
`purpose: storytelling`	storytelling exemplar -- build a visual argument
`purpose: reference`	**reference docs like "marker reference" or "list of named colors"** • dense collection of short-format information • well-defined scope, accessible information
`purpose: fun`	just for fun!
`purpose: showcase`	good showcase example

Domain tags: what discipline(s) might seek this example consistently?

It's futile to draw fences around "who owns what", and that's not the point of domain tags. See below for a list of existing domain tags. If you don't see the one you're looking for and you think it should exist, consider proposing it.

tag	use case
`domain`	for whom is the example relevant?
`domain: cartography`	
`domain: geometry`	
`domain: statistics`	
`domain: oceanography`	
`domain: signal-processing`	

Internal tags: what information is helpful for maintainers or contributors?

These tags should be used only for development purposes; therefore please add them separately behind a version guard:

```
.. ifconfig:: releaselevel == 'dev'
    .. tags::  internal: needs-review
```

tag	use case
`internal: high-bandwidth`	allows users to filter out bandwidth-intensive examples like animations
`internal: untagged`	allows docs contributors to easily find untagged examples
`internal: deprecated`	examples containing deprecated functionality or concepts
`internal: needs-review`	example needs to be reviewed for accuracy or pedagogical value
`internal: outstanding-todo`	example has an unfinished to-do
`internal: too-much`	the example should be refined, split into multiple examples, or reformatted into a tutorial or reference

See *Tag Glossary* for a complete list

Proposing new tags

1. Review existing tag list, looking out for similar entries (i.e. `axes` and `axis`).
2. If a relevant tag or subcategory does not yet exist, propose it. Each tag is two parts: `subcategory: tag`. Tags should be one or two words.
3. New tags should be added when they are relevant to existing gallery entries too. Avoid tags that will link to only a single gallery entry.
4. Tags can recreate other forms of organization.

Tagging organization aims to work for 80-90% of cases. Some examples fall outside of the tagging structure. Niche or specific examples shouldn't be given standalone tags that won't apply to other examples.

Triage And Review

10.4.7 Bug triaging and issue curation

The issue tracker is important to communication in the project because it serves as the centralized location for making feature requests, reporting bugs, identifying major projects to work on, and discussing priorities. For this reason, it is important to curate the issue list, adding labels to issues and closing issues that are resolved or unresolvable.

Writing well defined issues increases their chances of being successfully resolved. Guidelines on writing a good issue can be found in *here*. The recommendations in this page are adapted from the scikit learn and Pandas contributing guides.

Improve issue reports

Triaging issues does not require any particular expertise in the internals of Matplotlib, is extremely valuable to the project, and we welcome anyone to participate in issue triage! However, people who are not part of the Matplotlib organization do not have permissions to change milestones, add labels, or close issue.

If you do not have enough GitHub permissions do something (e.g. add a label, close an issue), please leave a comment with your recommendations!

The following actions are typically useful:

- documenting issues that are missing elements to reproduce the problem such as code samples
- suggesting better use of code formatting (e.g. triple back ticks in the markdown).
- suggesting to reformulate the title and description to make them more explicit about the problem to be solved
- linking to related issues or discussions while briefly describing how they are related, for instance "See also #xyz for a similar attempt at this" or "See also #xyz where the same thing was reported" provides context and helps the discussion
- verifying that the issue is reproducible
- classify the issue as a feature request, a long standing bug or a regression

Fruitful discussions

Online discussions may be harder than it seems at first glance, in particular given that a person new to open-source may have a very different understanding of the process than a seasoned maintainer.

Overall, it is useful to stay positive and assume good will. The following article explores how to lead online discussions in the context of open source.

Maintainers and triage team members

In addition to the above, maintainers and the triage team can do the following important tasks:

- Update labels for issues and PRs: see the list of available GitHub labels.
- Triage issues:
  - **reproduce the issue**, if the posted code is a bug label the issue with "status: confirmed bug".
  - **identify regressions**, determine if the reported bug used to work as expected in a recent version of Matplotlib and if so determine the last working version. Regressions should be milestoned for the next bug-fix release and may be labeled as "Release critical".
  - **close usage questions** and politely point the reporter to use discourse or Stack Overflow instead and label as "community support".
  - **close duplicate issues**, after checking that they are indeed duplicate. Ideally, the original submitter moves the discussion to the older, duplicate issue
  - **close issues that cannot be replicated**, after leaving time (at least a week) to add extra information

Closing issues: a tough call

When uncertain on whether an issue should be closed or not, it is best to strive for consensus with the original poster, and possibly to seek relevant expertise. However, when the issue is a usage question or has been considered as unclear for many years, then it should be closed.

Preparing PRs for review

Reviewing code is also encouraged. Contributors and users are welcome to participate to the review process following our *review guidelines*.

Triage workflow

The following workflow is a good way to approach issue triaging:

1. Thank the reporter for opening an issue

   The issue tracker is many people's first interaction with the Matplotlib project itself, beyond just using the library. As such, we want it to be a welcoming, pleasant experience.

2. Is this a usage question? If so close it with a polite message.

3. Is the necessary information provided?

   Check that the poster has filled in the issue template. If crucial information (the version of Python, the version of Matplotlib used, the OS, and the backend), is missing politely ask the original poster to provide the information.

4. Is the issue minimal and reproducible?

   For bug reports, we ask that the reporter provide a minimal reproducible example. See this useful post by Matthew Rocklin for a good explanation. If the example is not reproducible, or if it's clearly not minimal, feel free to ask the reporter if they can provide an example or simplify the provided one. Do acknowledge that writing minimal reproducible examples is hard work. If the reporter is struggling, you can try to write one yourself.

   If a reproducible example is provided, but you see a simplification, add your simpler reproducible example.

   If you cannot reproduce the issue, please report that along with your OS, Python, and Matplotlib versions.

   If we need more information from either this or the previous step please label the issue with "status: needs clarification".

5. Is this a regression?

   While we strive for a bug-free library, regressions are the highest priority. If we have broken user-code that *used to* work, we should fix that in the next micro release!

   Try to determine when the regression happened by running the reproduction code against older versions of Matplotlib. This can be done by released versions of Matplotlib (to get the version it last worked in) or by using git bisect to find the first commit where it was broken.

6. Is this a duplicate issue?

We have many open issues. If a new issue seems to be a duplicate, point to the original issue. If it is a clear duplicate, or consensus is that it is redundant, close it. Make sure to still thank the reporter, and encourage them to chime in on the original issue, and perhaps try to fix it.

If the new issue provides relevant information, such as a better or slightly different example, add it to the original issue as a comment or an edit to the original post.

Label the closed issue with "status: duplicate"

7. Make sure that the title accurately reflects the issue. If you have the necessary permissions edit it yourself if it's not clear.
8. Add the relevant labels, such as "Documentation" when the issue is about documentation, "Bug" if it is clearly a bug, "New feature" if it is a new feature request, ...

   If the issue is clearly defined and the fix seems relatively straightforward, label the issue as “Good first issue” (and possibly a description of the fix or a hint as to where in the code base to look to get started).

   An additional useful step can be to tag the corresponding module e.g. the "GUI/Qt" label when relevant.

Triage team

If you would like to join the triage team:

1. Correctly triage 2-3 issues.
2. Ask someone on in the Matplotlib organization (publicly or privately) to recommend you to the triage team (look for "Member" on the top-right of comments on GitHub). If you worked with someone on the issues triaged, they would be a good person to ask.
3. Responsibly exercise your new power!

Anyone with commit or triage rights may nominate a user to be invited to join the triage team by emailing matplotlib-steering-council@numfocus.org .

10.4.8 Pull request guidelines

Pull requests (PRs) on GitHub are the mechanism for contributing to Matplotlib's code and documentation.

We value contributions from people with all levels of experience. In particular, if this is your first PR not everything has to be perfect. We'll guide you through the PR process. Nevertheless, please try to follow our guidelines as well as you can to help make the PR process quick and smooth. If your pull request is incomplete or a work-in-progress, please mark it as a draft pull requests on GitHub and specify what feedback from the developers would be helpful.

Please be patient with reviewers. We try our best to respond quickly, but we have limited bandwidth. If there is no feedback within a couple of days, please ping us by posting a comment to your PR or reaching out on a *communication channel*

Summary for pull request authors

We recommend that you check that your contribution complies with the following guidelines before submitting a pull request:

- Changes, both new features and bugfixes, should have good test coverage. See *Testing* for more details.
- Update the *documentation* if necessary.
- All public methods should have informative docstrings with sample usage when appropriate. Use the *docstring standards*.
- For high-level plotting functions, consider adding a small example to the *examples gallery*.
- If you add a major new feature or change the API in a backward-incompatible way, please document it as described in *API guidelines*.
- Code should follow our conventions as documented in our *Coding guidelines*.
- When adding or changing public function signatures, add *type hints*.
- When adding keyword arguments, see our guide to *Keyword argument processing*.

When opening a pull request on Github, please ensure that:

- Changes were made on a *feature branch*.
- *pre-commit* checks for spelling, formatting, etc pass
- The pull request targets the *main branch*
- If your pull request addresses an issue, please use the title to describe the issue (e.g. "Add ability to plot timedeltas") and mention the issue number in the pull request description to ensure that a link is created to the original issue (e.g. "Closes #8869" or "Fixes #8869"). This will ensure the original issue mentioned is automatically closed when your PR is merged. For more details, see linking an issue and pull request.
- *Automated tests* pass

For guidance on creating and managing a pull request, please see our *contributing* and *pull request workflow* guides.

Summary for pull request reviewers

Please help review and merge PRs!

If you have commit rights, then you are trusted to use them. Please be patient and kind with contributors.

When reviewing, please ensure that the pull request satisfies the following requirements before merging it:

Content

- Is the feature / bugfix reasonable?
- Does the PR conform with the *Coding guidelines*?
- Is the *documentation* (docstrings, examples, what's new, API changes) updated?

- Is the change purely stylistic? Generally, such changes are discouraged when not part of other non-stylistic work because it obscures the git history of functional changes to the code. Reflowing a method or docstring as part of a larger refactor/rewrite is acceptable.

Workflow

- Make sure all *automated tests* pass.
- The PR should *target the main branch*.
- Tag with descriptive *labels*.
- Set the *milestone*.
- Keep an eye on the *number of commits*.
- Approve if all of the above topics are handled.
- *Merge* if a sufficient number of approvals is reached.

Detailed guidelines

Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the `Examples` section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go into a dedicated example file in the `examples` directory, which will be rendered to the examples gallery in the documentation.
- Build the docs and make sure all formatting warnings are addressed.
- See *Write documentation* for our documentation style guide.

Labels

- If you have the rights to set labels, tag the PR with descriptive labels. See the list of labels.
- If the PR makes changes to the wheel building Action, add the "Run cibuildwheel" label to enable testing wheels.

Milestones

Set the milestone according to these guidelines:

- *New features and API changes* are milestoned for the next meso release `v3.N.0`.
- *Bugfixes, tests for released code, and docstring changes* may be milestoned for the next micro release `v3.N.M`.
- *Documentation changes* (only .rst files and examples) may be milestoned `v3.N-doc`.

If multiple rules apply, choose the first matching from the above list. See *Backport strategy* for detailed guidance on what should or should not be backported.

The milestone marks the release a PR should go into. It states intent, but can be changed because of release planning or re-evaluation of the PR scope and maturity.

All Pull Requests should target the main branch. The milestone tag triggers an *automatic backport* for milestones which have a corresponding branch.

Merging

As a guiding principle, we require two approvals from core developers (those with commit rights) before merging a pull request. This two-pairs-of-eyes strategy shall ensure a consistent project direction and prevent accidental mistakes. It is permissible to merge with one approval if the change is not fundamental and can easily be reverted at any time in the future.

Some explicit rules following from this:

- *Documentation and examples* may be merged with a single approval. Use the threshold "is this better than it was?" as the review criteria.
- Minor *infrastructure updates*, e.g. temporary pinning of broken dependencies or small changes to the CI configuration, may be merged with a single approval.
- *Code changes* (anything in `src` or `lib`) must have two approvals.

  Ensure that all API changes are documented in a file in one of the subdirectories of `doc/api/next_api_changes`, and significant new features have an entry in `doc/user/whats_new`.

  - If a PR already has a positive review, a core developer (e.g. the first reviewer, but not necessarily) may champion that PR for merging. In order to do so, they should ping all core devs both on GitHub and on the dev mailing list, and label the PR with the "Merge with single review?" label. Other core devs can then either review the PR and merge or reject it, or simply request that it gets a second review before being merged. If no one asks for such a second review within a week, the PR can then be merged on the basis of that single review.

    A core dev should only champion one PR at a time and we should try to keep the flow of championed PRs reasonable.

After giving the last required approval, the author of the approval should merge the PR. PR authors should not self-merge except for when another reviewer explicitly allows it (e.g., "Approve modulo CI passing, may self merge when green", or "Take or leave the comments. You may self merge".).

Automated tests

Before being merged, a PR should pass the *Automated tests*. If you are unsure why a test is failing, ask on the PR or in our *Official communication channels*

Number of commits and squashing

- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.
- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.
- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

Branches and backports

Current branches

The current active branches are

main

The current development version. Future meso (*v3.N.0*) or macro (*v4.0.0*) will be branched from this.

v3.N.x

Maintenance branch for Matplotlib 3.N. Future micro releases will be tagged from this.

v3.N.M-doc

Documentation for the current micro release. On a micro release, this will be replaced by a properly named branch for the new release.

Branch selection for pull requests

Generally, all pull requests should target the main branch.

Other branches are fed through *automatic* or *manual*. Directly targeting other branches is only rarely necessary for special maintenance work.

Backport strategy

Backports to the micro release branch (*v3.N.x*) are the changes that will be included in the next patch (aka bug-fix) release. The goal of the patch releases is to fix bugs without adding any new regressions or behavior changes. We will always attempt to backport:

- critical bug fixes (segfault, failure to import, things that the user cannot work around)
- fixes for regressions introduced in the last two meso releases

and may attempt to backport fixes for regressions introduced in older releases.

In the case where the backport is not clean, for example if the bug fix is built on top of other code changes we do not want to backport, balance the effort and risk of re-implementing the bug fix vs the severity of the bug. When in doubt, err on the side of not backporting.

When backporting a Pull Request fails or is declined, re-milestone the original PR to the next meso release and leave a comment explaining why.

The only changes backported to the documentation branch (*v3.N.M-doc*) are changes to `doc` or `galleries`. Any changes to `lib` or `src`, including docstring-only changes, must not be backported to this branch.

Automated backports

We use MeeseeksDev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message `@meeseeksdev backport to BRANCH` on the PR. If there are conflicts MeeseeksDev will inform you that the backport needs to be done manually.

The target branch is configured by putting `on-merge: backport to TARGETBRANCH` in the milestone description on it's own line.

If the bot is not working as expected, please report issues to MeeseeksDev.

Manual backports

When doing backports please copy the form used by MeeseeksDev, `Backport PR #XXXX: TITLE OF PR`. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from main to v2.2.x assuming:

- `matplotlib` is a read-only remote branch of the matplotlib/matplotlib repo

The `TARGET_SHA` is the hash of the merge commit you would like to backport. This can be read off of the GitHub PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch `v2.2.x` (if not, then `git checkout -b v2.2.x`), and that your remote pointing to `https://github.com/matplotlib/matplotlib` is called `upstream`:

```
git fetch upstream
git checkout v2.2.x  # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by `git status`, and will have to be fixed by hand (search on >>>>>). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the `v2.2.x` upstream branch, not `main`!

Maintenance

10.4.9 Release guide

> **This document is only relevant for Matplotlib release managers.**
>
> A guide for developers who are doing a Matplotlib release.

Versioning Scheme

Matplotlib follows the Intended Effort Versioning (EffVer) versioning scheme: *macro.meso.micro*.

macro

A release that we expect a large effort from our users to upgrade to. The v1 to v2 transition included a complete overhaul of the default styles and the v2 to v3 transition involved dropping support for Python 2.

Future macro versions would include changes of a comparable scale that can not be done incrementally in meso releases.

meso

A release that we expect some effort from our users to upgrade to. We target a *Meso* release every 6 months. These release are primarily intended to release new features to our users, however they also contain intentional feature deprecations and removals per *our policy*.

micro

A release that we expect users to require little to no effort to upgrade to. Per our *Backport strategy* we only backport bug fixes to the maintenance branch. We expect minimal impact on users other than possibly breaking work arounds to a fixed bug or bugs being used as features.

These are released as-needed, but typically every 1-2 months between meso releases.

Making the release branch

> **Note**
>
> This assumes that a read-only remote for the canonical repository is `remote` and a read/write remote is `DANGER`

When a new meso release (vX.Y.0) is approaching, a new release branch must be made. When precisely this should happen is up to the release manager, but this point is where most new features intended for the meso release are merged and you are entering a feature freeze (i.e. newly implemented features will be going into vX.Y+1). This does not necessarily mean that no further changes will be made prior to release, just that those changes will be made using the backport system.

For an upcoming `v3.7.0` release, first create the branch:

```
git switch main
git pull
git switch -c v3.7.x
git push DANGER v3.7.x
```

Update the `v3.7.0` milestone so that the description reads:

```
New features and API changes

on-merge: backport to v3.7.x
```

Micro versions should instead read:

```
Bugfixes and docstring changes

on-merge: backport to v3.7.x
```

Check all active milestones for consistency. Older milestones should also backport to higher meso versions (e.g. `v3.6.3` and `v3.6-doc` should backport to both `v3.6.x` and `v3.7.x` once the `v3.7.x` branch exists and while PR backports are still targeting `v3.6.x`)

Create the milestone for the next-next meso release (i.e. `v3.9.0`, as `v3.8.0` should already exist). While most active items should go in the next meso release, this milestone can help with longer term planning, especially around deprecation cycles.

Testing

We use GitHub Actions for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```
pytest -n 8 .
```

In addition the following test should be run and manually inspected:

```
python tools/memleak.py agg 1000 agg.pdf
```

Run the User Acceptance Tests for the NBAgg and ipympl backends:

```
jupyter notebook lib/matplotlib/backends/web_backend/nbagg_uat.ipynb
```

For ipympl, restart the kernel, add a cell for `%matplotlib widget` and do not run the cell with `matplotlib.use('nbagg')`. Tests which check `connection_info`, use `reshow`, or test the OO interface are not expected to work for `ipympl`.

GitHub statistics

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. To prepare this list:

1. Archive the existing GitHub statistics page.

a. Copy the current `doc/users/github_stats.rst` to `doc/users/prev_whats_new/github_stats_X.Y.Z.rst`.

b. Change the link target at the top of the file.

c. Remove the "Previous GitHub Stats" section at the end.

For example, when updating from v3.7.0 to v3.7.1:

```
cp doc/users/github_stats.rst doc/users/prev_whats_new/github_
 ↪stats_3.7.0.rst
$EDITOR doc/users/prev_whats_new/github_stats_3.7.0.rst
# Change contents as noted above.
git add doc/users/prev_whats_new/github_stats_3.7.0.rst
```

2. Re-generate the updated stats:

```
python tools/github_stats.py --since-tag v3.7.0 --milestone=v3.7.1␣
 ↪\
    --project 'matplotlib/matplotlib' --links > doc/users/github_
 ↪stats.rst
```

3. Review and commit changes. Some issue/PR titles may not be valid reST (the most common issue is `*` which is interpreted as unclosed markup). Also confirm that `codespell` does not find any issues.

Note

Make sure you authenticate against the GitHub API. If you do not, you will get blocked by GitHub for going over the API rate limits. You can authenticate in one of two ways:

- using the `keyring` package; `pip install keyring` and then when running the stats script, you will be prompted for user name and password, that will be stored in your system keyring, or,
- using a personal access token; generate a new token on this GitHub page with the `repo:public_repo` scope and place the token in `~/.ghoauth`.

Update and validate the docs

Merge `*-doc` branch

Merge the most recent 'doc' branch (e.g., `v3.7.0-doc`) into the branch you are going to tag on and delete the doc branch on GitHub.

Update supported versions in Security Policy

When making macro or meso releases, update the supported versions in the Security Policy in `SECURITY.md`.

For meso version release update the table in `SECURITY.md` to specify that the two most recent meso releases in the current macro version series are supported.

For a macro version release update the table in `SECURITY.md` to specify that the last meso version in the previous macro version series is still supported. Dropping support for the last version of a macro version series will be handled on an ad-hoc basis.

Update release notes

What's new

Only needed for macro and meso releases. Bugfix releases should not have new features.

Merge the contents of all the files in `doc/users/next_whats_new/` into a single file `doc/users/prev_whats_new/whats_new_X.Y.0.rst` and delete the individual files.

API changes

Primarily needed for macro and meso releases. We may sometimes have API changes in micro releases.

Merge the contents of all the files in `doc/api/next_api_changes/` into a single file `doc/api/prev_api_changes/api_changes_X.Y.Z.rst` and delete the individual files.

Release notes TOC

Update `doc/users/release_notes.rst`:

- For macro and meso releases add a new section

```
X.Y
===
.. toctree::
    :maxdepth: 1

    prev_whats_new/whats_new_X.Y.0.rst
    ../api/prev_api_changes/api_changes_X.Y.0.rst
    prev_whats_new/github_stats_X.Y.0.rst
```

- For micro releases add the GitHub stats and (if present) the API changes to the existing X.Y section

```
../api/prev_api_changes/api_changes_X.Y.Z.rst
prev_whats_new/github_stats_X.Y.Z.rst
```

Update version switcher

Update `doc/_static/switcher.json`:

- If a micro release, *X.Y.Z*, no changes are needed.
- If a meso release, *X.Y.0*, change the name of `name: X.Y+1 (dev)` and `name: X.Y (stable)` as well as adding a new version for the previous stable (`name: X.Y-1`).

Verify that docs build

Finally, make sure that the docs build cleanly:

```
make -Cdoc O=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use `linkchecker` for this:

```
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on Circle CI, so this should only flag failed external links.

Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message:

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message:

```
git tag -a -s v3.7.0
```

which will prompt you for your GPG key password and an annotation. For pre-releases it is important to follow **PEP 440** so that the build artifacts will sort correctly in PyPI.

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag[1]:

```
git commit --allow-empty
```

Finally, push the tag to GitHub:

```
git push DANGER v3.7.x v3.7.0
```

[1] The tarball that is provided by GitHub is produced using git archive. We use setuptools_scm which uses a format string in `lib/matplotlib/_version.py` to have `git` insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by `setuptools_scm` to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone who checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use:

```
git archive v3.7.0 -o matplotlib-3.7.0.tar.gz --prefix=matplotlib-3.7.0/
```

Congratulations, the scariest part is done! This assumes the release branch has already been made. Usually this is done at the time of feature freeze for a meso release (which often coincides with the last micro release of the previous meso version)

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

```
git branch v3.7.0-doc
git push DANGER v3.7.0-doc
```

Update (or create) the `v3.7-doc` milestone. The description should include the instruction for meeseeksmachine to backport changes with the `v3.7-doc` milestone to both the `v3.7.x` branch and the `v3.7.0-doc` branch:

```
Documentation changes (.rst files and examples)

on-merge: backport to v3.7.x
on-merge: backport to v3.7.0-doc
```

Check all active milestones for consistency. Older doc milestones should also backport to higher meso versions (e.g. `v3.6-doc` should backport to both `v3.6.x` and `v3.7.x` if the `v3.7.x` branch exists)

Release management / DOI

Via the GitHub UI, turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases, also get the DOI from Zenodo (which will automatically produce one once the tag is pushed). Add the DOI post-fix and version to the dictionary in `tools/cache_zenodo_svg.py` and run the script.

This will download the new SVG to `doc/_static/zenodo_cache/`*`postfix`*`.svg` and edit `doc/project/citing.rst`. Commit the new SVG, the change to `tools/cache_zenodo_svg.py`, and the changes to `doc/project/citing.rst` to the VER-doc branch and push to GitHub.

```
git checkout v3.7.0-doc
$EDITOR tools/cache_zenodo_svg.py
python tools/cache_zenodo_svg.py
git commit -a
git push DANGER v3.7.0-doc:v3.7.0-doc
```

Building binaries

We distribute macOS, Windows, and many Linux wheels as well as a source tarball via PyPI. Most builders should trigger automatically once the tag is pushed to GitHub:

- Windows, macOS and manylinux wheels are built on GitHub Actions. Builds are triggered by the GitHub Action defined in `.github/workflows/cibuildwheel.yml`, and wheels will be available as artifacts of the build. Both a source tarball and the wheels will be automatically uploaded to PyPI once all of them have been built.

- The auto-tick bot should open a pull request into the conda-forge feedstock. Review and merge (if you have the power to).

Warning

Because this is automated, it is extremely important to bump all branches away from the tag as discussed in *Create release commit and tag*.

Manually uploading to PyPI

Note

As noted above, the GitHub Actions workflow should build and upload source tarballs and wheels automatically. If for some reason, you need to upload these artifacts manually, then follow the instructions in this section.

Once you have collected all of the wheels (expect this to take a few hours), generate the tarball:

```
git checkout v3.7.0
git clean -xfd
python -m build --sdist
```

and copy all of the wheels into `dist` directory. First, check that the dist files are OK:

```
twine check dist/*
```

and then use `twine` to upload all of the files to PyPI

```
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

Build and deploy documentation

To build the documentation you must have the tagged version installed, but build the docs from the `ver-doc` branch. An easy way to arrange this is:

```
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v3.7.0-doc
git clean -xfd
make -Cdoc O="-t release -j$(nproc)" html latexpdf LATEXMKOPTS="-
 ↪silent -f"
```

which will build both the HTML and PDF version of the documentation.

The built documentation exists in the matplotlib.github.com repository. Pushing changes to main automatically updates the website.

The documentation is organized in subdirectories by version. The latest stable release is symlinked from the `stable` directory. The documentation for current main is built on Circle CI and pushed to the devdocs repository. These are available at matplotlib.org/devdocs.

Assuming you have this repository checked out in the same directory as matplotlib

```
cd ../matplotlib.github.com
cp -a ../matplotlib/doc/build/html 3.7.0
rm 3.7.0/.buildinfo
cp ../matplotlib/doc/build/latex/Matplotlib.pdf 3.7.0
```

which will copy the built docs over. If this is a final release, link the `stable` subdirectory to the newest version:

```
rm stable
ln -s 3.7.0 stable
```

You will also need to edit `sitemap.xml` and `versions.html` to include the newly released version. Now commit and push everything to GitHub

```
git add *
git commit -a -m 'Updating docs for v3.7.0'
git push DANGER main
```

Congratulations you have now done the third scariest part!

If you have access, clear the CloudFlare caches.

It typically takes about 5-10 minutes for the website to process the push and update the live web page (remember to clear your browser cache).

Merge up changes to main

After a release is done, the changes from the release branch should be merged into the `main` branch. This is primarily done so that the released tag is on the main branch so `git describe` (and thus `setuptools-scm`) has the most current tag. Secondarily, changes made during release (including removing individualized release notes, fixing broken links, and updating the version switcher) are bubbled up to `main`.

Git conflicts are very likely to arise, though aside from changes made directly to the release branch (mostly as part of the release), they should be relatively-easily resolved by using the version from `main`. This is not a universal rule, and care should be taken to ensure correctness:

```
git switch main
git pull
git switch -c merge_up_v3.7.0
git merge v3.7.x
```

(continues on next page)

(continued from previous page)

```
# resolve conflicts
git merge --continue
```

Due to branch protections for the `main` branch, this is merged via a standard pull request, though the PR cleanliness status check is expected to fail. The PR should not be squashed because the intent is to merge the branch histories.

Publicize this release

After the release is published to PyPI and conda, it should be announced through our communication channels:

- Send a short version of the release notes and acknowledgments to all the *Mailing lists*
- Post highlights and link to *What's new* on the active *social media accounts*
- Add a release announcement to the "News" section of matplotlib.org by editing `docs/body.html`. Link to the auto-generated announcement discourse post, which is in Announcements > matplotlib-announcements.

Conda packages

The Matplotlib project itself does not release conda packages. In particular, the Matplotlib release manager is not responsible for conda packaging.

For information on the packaging of Matplotlib for conda-forge see https://github.com/conda-forge/matplotlib-feedstock.

10.4.10 Community management guide

These guidelines are applicable when **acting as a representative** of Matplotlib, for example at sprints or when giving official talks or tutorials, and in any community venue managed by Matplotlib.

Our approach to community engagement is foremost guided by our *Mission Statement*:

- We demonstrate that we care about visualization as a practice
- We deepen our practice and the community's capacity to support users, facilitate exploration, produce high quality visualizations, and be understandable and extensible
- We showcase advanced use of the library without adding maintenance burden to the documentation and recognize contributions that happen outside of the github workflow.
- We use communications platforms to maintain relationships with contributors who may no longer be active on GitHub, build relationships with potential contributors, and connect with other projects and communities who use Matplotlib.
- In prioritizing understandability and extensibility, we recognize that people using Matplotlib, in whatever capacity, are part of our community. Doing so empowers our community members to build community with each other, for example by creating educational resources, building third party tools, and building informal mentoring networks.

Official communication channels

The Scientific Python community uses various communications platforms to stay updated on new features and projects, to contribute by telling us what is on their mind and suggest issues and bugs, and to showcase their use cases and the tools they have built.

The following venues are managed by Matplotlib maintainers and contributors:

- library and docs: https://github.com/matplotlib/matplotlib
- forum: https://discourse.matplotlib.org/
- chat: https://matrix.to/#/#matplotlib:matrix.org
- blog: https://blog.scientific-python.org/

Social media

Active social media

- https://twitter.com/matplotlib
- https://instagram.com/matplotart/

Official accounts

- https://bsky.app/profile/matplotlib.bsky.social
- https://fosstodon.org/@matplotlib
- https://www.tiktok.com/@matplotart
- https://www.youtube.com/matplotlib

Mailing lists

- matplotlib-announce@python.org
- matplotlib-users@python.org
- matplotlib-devel@python.org

Social media coordination

- Team mailing list: matplotlib-social@numfocus.org
- Public chat room: https://matrix.to/#/#matplotlib_community:gitter.im

Maintenance

If you are interested in moderating the chat or forum or accessing the social media accounts:

- Matplotlib maintainers should reach out to the community-manager.
- Everyone else should send an email to matplotlib-social-admin@numfocus.org:

  - Introduce yourself - github handle and participation in the community.
  - Describe the reason for wanting to moderate or contribute to social.

Content guidelines

Communication on official channels, such as the Matplotlib homepage or on Matplotlib social accounts, should conform to the following standards. If you are unsure if content that you would like to post or share meets these guidelines, ask on the *Social media coordination* channels before posting.

General guidelines

- Focus on Matplotlib, 3rd party packages, and visualizations made with Matplotlib.
- These are also acceptable topics:
  - Visualization best practices and libraries.
  - Projects and initiatives by NumFOCUS and Scientific Python.
  - How to contribute to open source projects.
  - Projects, such as scientific papers, that use Matplotlib.
- No gratuitous disparaging of other visualization libraries and tools, but criticism is acceptable so long as it serves a constructive purpose.
- Follow communication best practices:
  - Do not share non-expert visualizations when it could cause harm:
    - e.g. https://twitter.com/matplotlib/status/1244178154618605568
  - Clearly state when the visualization data/conclusions cannot be verified.
  - Do not rely on machine translations for sensitive visualization.
- Verify sourcing of content (especially on instagram & blog):
  - Instagram/blog: ensure mpl has right to repost/share content
  - Make sure content is clearly cited:
    - e.g. a tutorial reworking an example must credit the original example
- Limited self/corporate promotion is acceptable.
  - Should be no more than about a quarter of the content.

Visual media guidelines

Visual media, such as images and videos, must not violate the *code of conduct*, nor any platform's rules. Specifically:

- Visual media must conform to the guidelines of all sites it may be posted on:
  - https://help.twitter.com/en/rules-and-policies/twitter-rules

  - https://help.instagram.com/477434105621119

- Emphasize the visualization techniques demonstrated by the visual media.
- Clearly state that sharing is not an endorsement of the content.
  - e.g. bitcoin related visualizations

Accessibility

Visual media in communications should be made as accessible as possible:

- Add alt text to images and videos when the platform allows:
  - alt text for data viz
  - general alt text guide
- Warn on bright, strobing, images & turn off autoplay if possible.
- For images and videos made by the social media team:
  - Make graphic perceivable to people who cannot perceive color well due to color-blindness, low vision, or any other reason.
  - Do not make bright, strobing images.
  - More guidelines at https://webaim.org/techniques/images/.

Social media

Matplotlib aims for a single voice across all social media platforms to build and maintain a consistent brand identity for Matplotlib as an organization. This depersonalization is the norm on social media platforms because it enables constructive and productive conversations; People generally feel more comfortable giving negative and constructive feedback to a brand than to specific contributors.

The current Matplotlib voice and persona aims to be kind, patient, supportive and educational. This is so that it can de-escalate tensions and facilitate constructive conversations; being perceived as negative or argumentative can escalate very fast into long-lasting brand damage, being perceived as personal leads to aggression and accusations faster than an impersonal account, and being perceived as friendly and approachable leads to higher engagement. Instead of speaking with a directive authority, which can be intimidating and lead to negative engagement, it speaks as a peer or educator to empower participation. The current voice encourages more input from folks we engage with, and also makes it possible for folks who are not in the core team to participate in managing the account.

While the *brand identity* is casual, the showcased content is high quality, peer-led resource building. Please follow these guidelines to maintain a consistent brand identity across platforms.

Persona

On social media, Matplotlib:

- Acts as a sentient visualization library, so talks about itself as a we, us, our, and it. Avoids talking about itself in the 3rd person. Never uses 1st person.

- Is very earnest, eager to please, and aims to be patient & painfully oblivious to snark and sarcasm.
- Gets over-excited over shiny visualizations - lots of emojis and the like - and encourages folks to share their work.
- Highlights various parts of the library, especially the more obscure bits and bobbles.
- Acknowledges that it is a sometimes frustrating tangle of bits & bobbles that can confuse even the folks who work on it & signal boosts their confuzzlment.

Behavior

When acting as a representative of the library, keep responses polite and assume user statements are in good faith unless they violate the *code of conduct*.

Social graph

Only follow **organizations and projects**, do not follow individual accounts for any reason, even maintainers/project leads/famous Python people!

Following these types of accounts is encouraged:

- NumFocus and Scientific Python projects
- 3rd party packages
- Visualization related projects and organizations
- Open Source community projects
- Sponsors

Recurring campaigns

Typically the social media accounts will promote the following:

- Matplotlib releases:
  - Highlight new features & major deprecations
  - Link to download/install instructions
  - Ask folks to try it out.
- third party packages
- NumFocus/Scientific Python/open source visualization project releases
- GSOC/GSOD recruiting and progress

Retired campaigns

- John Hunter Excellence in Plotting, submission and winners

Changing the guidelines

As the person tasked with implementing these guidelines, the community-manager should be alerted to proposed changes. Similarly, specific platform guidelines (e.g. twitter, instagram) should be reviewed by the person responsible for that platform, when different from the community manager. If there is no consensus, decisions about guidelines revert to the community manager.

10.4.11 Dependency version policy

For the purpose of this document, 'minor version' is in the sense of SemVer (major, minor, patch) or 'meso version' in the sense of EffVer (macro, meso, micro). It includes both major/macro and minor/meso releases. For projects that use date-based versioning, every release is a 'minor version'.

Matplotlib follows NEP 29.

Python and NumPy

Matplotlib supports:

- All minor versions of Python released 42 months prior to the project, and at minimum the two latest minor versions.
- All minor versions of `numpy` released in the 24 months prior to the project, and at minimum the last three minor versions.

In `pyproject.toml`, the `requires-python` variable should be set to the minimum supported version of Python. All supported minor versions of Python should be in the test matrix and have binary artifacts built for the release.

Minimum Python and NumPy version support should be adjusted upward on every major and minor release, but never on a patch release.

See also the *List of dependency versions*.

Python dependencies

For Python dependencies we should support at least:

with compiled extensions

> minor versions initially released in the 24 months prior to our planned release date or the oldest that support our minimum Python + NumPy

without compiled extensions

> minor versions initially released in the 12 months prior to our planned release date or the oldest that supports our minimum Python.

We will only bump these dependencies as we need new features or the old versions no longer support our minimum NumPy or Python.

We will work around bugs in our dependencies when practical.

IPython and Matplotlib do not formally depend on each other, however there is practical coupling for the integration of Matplotlib's UI into IPython and IPykernel. We will ensure this integration works with at least

minor or major versions of IPython and IPykernel released in the 24 months prior to our planned release date. Matplotlib may or may not work with older versions and we will not warn if used with IPython or IPykernel outside of this window.

Test and documentation dependencies

As these packages are only needed for testing or building the docs and not needed by end-users, we can be more aggressive about dropping support for old versions. However, we need to be careful to not over-run what down-stream packagers support (as most of the run the tests and build the documentation as part of the packaging process).

We will support at least minor versions of the development dependencies released in the 12 months prior to our planned release. Specific versions that are known to be buggy may be excluded from support using the finest-grained filtering that is practical.

We will only bump these as needed or versions no longer support our minimum Python and NumPy.

System and C-dependencies

For system or C-dependencies (FreeType, GUI frameworks, LaTeX, Ghostscript, FFmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.

In the case of GUI frameworks for which we rely on Python bindings being available, we will also drop support for bindings so old that they don't support any Python version that we support.

Security issues in dependencies

Generally, we do not adjust the supported versions of dependencies based on security vulnerabilities. We are a library not an application and the version constraints on our dependencies indicate what will work (not what is wise to use). Users and packagers can install newer versions of the dependencies at their discretion and evaluation of risk and impact. In contrast, if we were to adjust our minimum supported version it is very hard for a user to override our judgment.

If Matplotlib aids in exploiting the underlying vulnerability we should treat that as a critical bug in Matplotlib.

List of dependency versions

The following list shows the minimal versions of Python and NumPy dependencies for different versions of Matplotlib. Follow the links for the full specification of the dependencies.

Matplotlib	Python	NumPy
3.10	3.10	1.23.0
3.9	3.9	1.23.0
3.8	3.9	1.21.0
3.7	3.8	1.20.0
3.6	3.8	1.19.0
3.5	3.7	1.17.0
3.4	3.7	1.16.0
3.3	3.6	1.15.0
3.2	3.6	1.11.0
3.1	3.6	1.11.0
3.0	3.5	1.10.0
2.2	2.7, 3.4	1.7.1
2.1	2.7, 3.4	1.7.1
2.0	2.7, 3.4	1.7.1
1.5	2.7, 3.4	1.6
1.4	2.6, 3.3	1.6
1.3	2.6, 3.3	1.5
1.2	2.6, 3.1	1.4
1.1	2.4	1.1
1.0	2.4	1.1

10.4.12 Matplotlib Enhancement Proposals

Matplotlib Enhancement Proposals (MEP), inspired by cpython's PEP's but less formal, are design documents for large or controversial changes to Matplotilb. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on *the template* to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

MEP Template

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*

- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.

Status

MEPs go through a number of phases in their lifetime:

- **Discussion**: The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress**: Consensus was reached and implementation work has begun.
- **Completed**: The implementation has been merged into main.
- **Superseded**: This MEP has been abandoned in favor of another approach.
- **Rejected**: There are currently no plans to implement the proposal.

Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.

All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

Abstract

The abstract should be a short description of what the MEP will achieve.

Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.

Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

MEP8: PEP8

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

Status

Superseded

Current guidelines for style, including usage of pep8 are maintained in our pull request guidelines.

We are currently enforcing a sub-set of pep8 on new code contributions.

Branches and Pull requests

None so far.

Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.

For the most part, class/function/variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.

This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.

Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

MEP9: Global interaction manager

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Current summary of the mixin*
- *Backward compatibility*
- *Alternatives*

Add a global manager for all user interactivity with artists; make any artist resizeable, moveable, highlightable, and selectable as desired by the user.

Status

Discussion

Branches and Pull requests

https://github.com/dhyams/matplotlib/tree/MEP9

Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to matplotlib.artist.Artist: _moveable_, _resizeable_, _selectable_, and _highlightable_. Setting any one of these keywords to True would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. legend.draggable()), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:

  - get_pixel_position_ll(self): get the pixel position of the lower left corner of the artist's bounding box
  - get_pixel_size(self): get the size of the artist's bounding box, in pixels
  - set_pixel_position_and_size(self,x,y,dx,dy): set the new size of the artist, such that it fits within the specified bounding box.

- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position
- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.

Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I'm enamoured with Powerpoint, but because that's what most people understand. An artist can also be selectable, which means that the artist will receive the on_activated() callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizeable

To be moveable (draggable) or resizeable, the object that is the target of the mixin must support the following protocols:

- get_pixel_position_ll(self)
- get_pixel_size(self)
- set_pixel_position_and_size(self,x,y,sx,sy)

Note that nonresizeable objects are free to ignore the sx and sy parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- get_highlight(self)

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not an matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist *somewhere* that is being drawn. Typically your object would just route these calls to that artist.

- get_figure(self)
- get_axes(self)
- contains(self,event)
- set_animated(self,flag)
- draw(self,renderer)
- get_visible(self)

The following notifications are called on the artist, and the artist can optionally implement these.

- on_select_begin(self)
- on_select_end(self)
- on_drag_begin(self)
- on_drag_end(self)
- on_activated(self)
- on_highlight(self)
- on_right_click(self,event)
- on_left_click(self,event)
- on_middle_click(self,event)
- on_context_click(self,event)
- on_key_up(self,event)
- on_key_down(self,event)

The following notifications are called on the canvas, if no interactive artist handles the event:

- on_press(self,event)
- on_left_click(self,event)
- on_middle_click(self,event)
- on_right_click(self,event)
- on_context_click(self,event)
- on_key_up(self,event)
- on_key_down(self,event)

The following functions, if present, can be used to modify the behavior of the interactive object:

- press_filter(self,event) # determines if the object wants to have the press event routed to it
- handle_unpicked_cursor() # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

- Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater then me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.
- the mixin only works for wx backends because of two things: 1) the cursors are hardcoded, and 2) there is a call to wx.GetMousePosition() Both of these shortcomings are reasonably fixed by having each backend supply these things.

Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like legend.draggable())

Alternatives

None that I know of.

MEP10: Docstring consistency

- *Status*
- *Branches and Pull requests*

- *Detailed description*
  - *Numpy docstring format*
  - *Cross references*
  - *Overriding signatures*
  - *Linking rather than duplicating*
  - *autosummary extension*
  - *Examples linking to relevant documentation*
  - *Documentation using help() vs. a browser*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

Status

Progress

This is still an on-going effort

Branches and Pull requests

Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.

Numpy docstring format

Numpy docstring format: This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: `:func:`myfunction``. As of Sphinx 0.4, there is a "default_role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write `` `myfunction` `` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like `` `~matplotlib.axes.Axes.set_xlim` `` could be written as `` `~axes.Axes.set_xlim` ``.

Overriding signatures

Many methods in matplotlib use the `*args` and `**kwargs` syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```
def annotate(self, *args, **kwargs):
    """
```

(continues on next page)

(continued from previous page)

```
    Create an annotation: a piece of text referring to a data
    point.

    Call signature::

      annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the `autodoc_docstring_signature` config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)

    Create an annotation: a piece of text referring to a data
    point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.

Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables are the same across many docstrings, it inserts a lot of redundant information in the docs -- particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. `Axes`) should be documented with one method per page, whereas smaller classes should have all of their methods together.

Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

Documentation using help() vs. a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using help() look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions -- it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.
2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `` `:func:`myfunc` `` to `` `func` ``) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.
3. Reorganize the API docs using autosummary and `sphinx-autogen`. This should hopefully have minimal impact on the narrative documentation.
4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.
5. Use `sphinx-quickstart` to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
   - Copying of some static content
   - Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

Alternatives

None yet discussed.

MEP11: Third-party dependencies

- *Status*
- *Branches and Pull requests*
- *Abstract*

- *Backward compatibility*
- *Alternatives*

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.

Status

Completed -- needs to be merged

Branches and Pull requests

#1157: Use automatic dependency resolution

#1290: Debundle pyparsing

#1261: Update six to 1.2

Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, setuptools, easy_install and PyPI were not mature enough to be relied on. However, at present, we should be able to safely leverage the "modern" versions of those tools, distribute and pip.

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six -- required by dateutil (pure Python)
- pyparsing (pure Python)

- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)

Current behavior

When installing from source, a **`git`** checkout or pip:

- `setup.py` attempts to `import numpy`. If this fails, the installation fails.
- For each of dateutil, pytz and six, `setup.py` attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- pyparsing is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with pip, because no pip dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that pyparsing is installed in the matplotlib namespace has reportedly (#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, dateutil, pytz and six are installed at the top-level *always*, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to deal with the fact that we handle dateutil, pytz and six in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging pip, distribute and PyPI.

dateutil, pytz, and pyparsing should be made into optional dependencies -- though obviously some features would fail if they aren't installed. This will allow the user to decide whether they want to bother installing a particular feature.

Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using distribute and following the instructions here. The only anticipated change to the matplotlib library code will be to import pyparsing from the top-level namespace rather than from within matplotlib. Note that distribute will also allow us to remove the direct dependency on six, since it is, strictly speaking, only a direct dependency of dateutil.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):

1. The distutils wininst installer allows a post-install script to run. It might be possible to get this script to run pip to install the other dependencies. (See this thread for someone who has trod that ground before).
2. Continue to ship dateutil, pytz, six and pyparsing in our installer, but use the post-install-script to install them *only* if they cannot already be found.
3. Move all of these packages inside a (new) `matplotlib.extern` namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core matplotlib codebase so dateutil (at the top-level) is tried first, and failing that `matplotlib.extern.dateutil` is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree -- and this is exacerbated by the fact that they are used less -- only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working PyPI) will be required to install matplotlib for the first time. (Subsequent matplotlib updates or development work will run without accessing the network).

Alternatives

Distributing binary eggs doesn't feel like a usable solution. That requires getting easy_install installed first, and Windows users generally prefer the well known `.exe` or `.msi` installer that works out of the box.

MEP12: Improve Gallery and Examples

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
  - *Gallery sections*
  - *Clean up guidelines*
    - *Additional suggestions*
- *Backward compatibility*
- *Alternatives*

– *Tags*

Status

Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where `pylab` is imported has been converted over to use *`matplotlib.pyplot`* and `numpy`.

Branches and Pull requests

#1623, #1924, #2181

PR #2474 demonstrates a single example being cleaned up and moved to the appropriate section.

Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.

Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR[1], the current example sections (`api`, `pylab_examples`) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the `api` and `pylab_examples` directories.

Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections

[1] https://github.com/matplotlib/matplotlib/pull/714

- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: 'mplot3d', 'axes_grid', 'units', 'widgets')

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

Clean up guidelines

The current examples in the `api` and `pylab_examples` sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- sphinx-gallery docstrings: a title and a description of the example formatted as follows, at the top of the example:

```
"""
================================
Colormaps alter your perception
================================

Here I plot the function

.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your␣
↪perception!
"""
```

- PEP8 clean-ups (running flake8, or a similar checker, is highly recommended)
- Commented-out code should be removed.
- Replace uses of *pylab* interface with *pyplot* (+ `numpy`, etc.). See c25ef1e
- Remove shebang line, e.g.:

```
#!/usr/bin/env python
```

- Use consistent imports. In particular:

```
import numpy as np

import matplotlib.pyplot as plt
```

  Avoid importing specific functions from these modules (e.g. `from numpy import sin`)

- Each example should focus on a specific feature (excluding `showcase` examples, which will show more "polished" plots). Tweaking unrelated to that feature should be removed. See f7b2217, e57b5fc, and 1458aa8

Use of *`pylab`* should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

Note: When moving an existing example, you should search for references to that example. For example, the API documentation for `axes.py` and `pyplot.py` may use these examples to generate plots. Use your favorite search tool (e.g., grep, ack, grin, pss) to search the matplotlib package. See 2dc9a46 and aa6b410

Additional suggestions

- Provide links (both ways) between examples and API docs for the methods/objects used. (issue #2222)
- Use `plt.subplots` (note trailing "s") in preference over `plt.subplot`.
- Rename the example to clarify it's purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` (*not* `imshow_demo2.py`).
- Split up examples that try to do too much. See 5099675 and fc2ab07
- Delete examples that don't show anything new.
- Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the `unit` directory located in the root directory of the package.
- Add plot titles to clarify intent of the example. See bd2b13c

Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

Alternatives

Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

Abstract

Wrap all of the matplotlib getter and setter methods with python properties, allowing them to be read and written like class attributes.

Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with get_ and set_, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

Implementation

1. All existing getter and setter methods will need to have two aliases, one with the get_ or set_ prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.

2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.
3. Getter and setter methods that provide additional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.
4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.
5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.
6. Automatic alias generation will need to be modified so it will also create aliases for the properties.
7. All instances of getter and setter method calls will need to be changed to attribute access.
8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several macro releases after everything else.

Backward compatibility

All existing getter methods that do not have a prefix (such as get_) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are set_ATTR_on() and set_ATTR_off() methods will be changed to ATTR_on properties.

Examples

axes.Axes.set_axis_off/set_axis_on

Current implementation:

```
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```
True = axes.Axes.axis_on
False = axes.Axes.axis_on
axes.Axes.axis_on = True
axes.Axes.axis_on = False
```

axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on

Current implementation:

```
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit,␣
 ↪auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit,␣
 ↪auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit,␣
 ↪auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)

axes.Axes.set_autoscalex_on(auto)
```

New implementation:

```
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on

axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right

axes.Axes.autoscalex_on = auto

axes.Axes.emit_xlim = emit
```

axes.Axes.get_title/set_title

Current implementation:

```
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```
string = axes.Axes.title
string = axes.Axes.title_text.text

text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict
```

(continues on next page)

(continued from previous page)

```
axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

axes.Axes.get_xticklabels/set_xticklabels

Current implementation:

```
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False,␣
↪**kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)
```

New implementation:

```
[text.Text] = axes.Axes.xticklabels
[text.Text] = axes.Axes.xminorticklabels
axes.Axes.xticklabels = [string]
axes.Axes.xminorticklabels = [string]
axes.Axes.xticklabels = [text.Text]
axes.Axes.xminorticklabels = [text.Text]
```

Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert `set_xlim`, `set_xlabel`, `set_title`, etc. to `xlim`, `xlabel`, `title`,... to make the transition from `plt` functions to `axes` methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.

MEP14: Text handling

- *Alternatives*

Status

- **Discussion**

Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent

Detailed description

Text layout

At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "mathtext" system for rendering mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines in strewn about many source files, including every backend, where one finds clauses like

```
if rcParams['text.usetex']: # do one thing else: # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking -- it cannot break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:

- pango/harfbuzz
- QtTextLayout
- Microsoft DirectWrite
- Apple Core Text

Of the above options, it should be noted that harfbuzz is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using WebKit, and possibly whether than represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

Font selection

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm -- it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and cannot use TrueType fonts directly. Unfortunately, despite the different semantics for font selection, the same set of font properties are used for each. This is true of both the *FontProperties* class and the font-related *rcParams* (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by

name in the "built-in" using *rcParams["font.family"]* (default: ['sans-serif']), but the same is not possible with "usetex". It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding "usetex", there are different ways to find fonts. The default is to use the font list cache in *font_manager* which matches fonts using our own algorithm based on the CSS font matching algorithm. It doesn't always do the same thing as the native font selection algorithms on Linux (fontconfig), Mac and Windows, and it doesn't always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don't always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the OS-native font lookup systems can handle this case.

There is also experimental support for using fontconfig for font selection in matplotlib, turned off by default. fontconfig is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and CoreText etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That's what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a fontconfig implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of "given a dictionary of font properties, give me a matching font file".

Font subsetting

Font subsetting is currently handled using ttconv. ttconv was a standalone commandline utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn't handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this -- they'd rather just depend on the upstream STIX fonts. ttconv has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and paths on SVG). Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using fontforge (which is a heavy and not terribly cross-platform dependency).

Freetype wrappers

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

Text anchoring and alignment and rotation

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and the offset of the anchor point within that box. Therefore, if the va of a block was "top", the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine -- that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

Other minor problems to fix

The mathtext code has backend-specific code -- it should instead provide its output as just another text engine. However, it's still desirable to have mathtext layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It's an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it's either all on or all off. We should continue to have a global rcParam to choose the text engine ("text.layout_engine"), but it should under the hood be an overridable property on the *Text* object, so the same figure can combine the results of multiple text layout engines if necessary.

Implementation

A concept of a "text engine" will be introduced. Each text engine will implement a number of abstract classes. The `TextFont` interface will represent text for a given set of font properties. It isn't necessarily limited to a single font file -- if the layout engine supports rich text, it may handle a number of font files in a family. Given a `TextFont` instance, the user can get a `TextLayout` instance, which represents the layout for a given string of text in a given font. From a `TextLayout`, an iterator over `TextSpans` is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the `TextSpan` instance:

```
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font␣
 ↪properties.
        """
        pass

    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and verticalalignment␣
 ↪(top,
        center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines.  For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text.  Useful for raster␣
 ↪backends,
        like Agg.

        In all likelihood, this will be overridden in the backend, as␣
 ↪it can
        be created from get_layout(), but certain backends may want to
        override it if their library provides it (as freetype does).
        """
        pass
```

(continues on next page)

(continued from previous page)

```
    def get_rectangles(self):
        """
        Returns an iterator over the filled black rectangles in the␣
↪layout.
        Used by TeX and mathtext for drawing, for example, fraction␣
↪lines.
        """
        pass

    def get_path(self):
        """
        Returns a single Path object of the entire laid out text.

        [Not strictly necessary, but might be useful for textpath
        functionality]
        """
        pass

class TextSpan(TextSpanBase):
    x, y      # Position of the span -- relative to the text layout as␣
↪a whole
              # where (0, 0) is the anchor.  y is the baseline of the␣
↪span.
    fontfile  # The font file to use for the span
    text      # The text content of the span

    def get_path(self):
        pass  # See TextLayout.get_path

    def get_chars(self):
        """
        Returns an iterator over the characters in the span.
        """
        pass

class TextChar(TextCharBase):
    x, y      # Position of the character -- relative to the text␣
↪layout as
              # a whole, where (0, 0) is the anchor.  y is in the␣
↪baseline
              # of the character.
    codepoint # The unicode code point of the character -- only for␣
↪informational
              # purposes, since the mapping of codepoint to glyph_id␣
↪may have been
              # handled in a complex way by the layout engine.  This␣
```

(continues on next page)

(continued from previous page)

```
↪is an int
                # to avoid problems on narrow Unicode builds.
    glyph_id    # The index of the glyph within the font
    fontfile    # The font file to use for the char

    def get_path(self):
        """
        Get the path for the character.
        """
pass
```

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The "usetex" functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, `TextLayout` would implement `get_spans` for most backends, but add `get_ps` for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to `get_spans`. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1) Rewriting the freetype wrapper, and removing ttconv.
    a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf fonts
    b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).
2) Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.
3) Implementing support for advanced text layout libraries.

(1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn't get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.

Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

TBD

MEP15: Fix axis autoscaling when limits are specified for one axis only

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

Status

Discussion

Branches and Pull requests

None so far.

Abstract

When one Axis of a 2-dimensional plot is overridden via `set_xlim` or `set_ylim`, automatic scaling of the remaining Axis should be based on the data that falls within the specified limits of the first Axis.

Detailed description

When axis limits for a 2-D plot are specified for one axis only (via `set_xlim` or `set_ylim`), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

Alternatives

The only alternative that I can see is to maintain the status quo.

MEP19: Continuous Integration

Status

Completed

Branches and Pull requests

Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

Detailed description

Current state-of-the-art

Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to "post mortem" analyse what went wrong. This is particularly frustrating when the failure cannot be subsequently reproduced locally.
- It is not extremely fast. matplotlib's cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI's integration with github -- automatically testing all pending pull requests -- is exceptional.

Builds

There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don't know how automated that is)
- @r-owen: Makes OS-X builds (don't know how automated that is)

Documentation

Documentation of main is now built by travis and uploaded to https://matplotlib.org/devdocs/index.html

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

Peculiarities of matplotlib

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

Requirements

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the GitHub API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well -- storing build configuration in the git repository, rather than elsewhere, is a very good design.)

8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: https://docs.google.com/spreadsheets/d/1jbK0J4cIkyBNncnS-gP7pINSliNy9lI-N4JHwxlNSXE/edit
9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

Alternatives

Hangout Notes

CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.
- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to GitHub using the GitHub API. This may be of general use to the Scipy community.
- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

The test framework itself

- We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help

- We should be covering more things, particularly more backends
- We should have more unit tests, fewer integration tests, if possible

- **Discussion**: This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

Branches and Pull requests

Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another `` `hex -> RGB` ``, `` `RGB -> hex` ``, `` `HSV -> RGB` `` etc.
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

- Keeping the NavigationToolbar classes https://github.com/matplotlib/matplotlib/pull/2759 **CLOSED**
- Navigation by events: https://github.com/matplotlib/matplotlib/pull/3652

Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for `Tools` where the most popular can be added into the main distribution.

Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see https://github.com/matplotlib/matplotlib/issues/2694 also the shortcuts are hardcoded and again not easily modifiable https://github.com/matplotlib/matplotlib/issues/2699

The proposed solution is to take the actions out of the `Toolbar` and the shortcuts out of the `Canvas`. The actions and shortcuts will be in the form of `Tools`.

A new class `Navigation` will be the bridge between the events from the `Canvas` and `Toolbar` and redirect them to the appropriate `Tool`.

At the end the user interaction will be divided into three classes:

- NavigationBase: This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- ToolbarBase: This existing class is relegated only as a GUI access to Tools.
- ToolBase: Is the basic definition of Tools.

Implementation

ToolBase(object)

Tools can have a graphical representation as the `SubplotTool` or not even be present in the Toolbar as `Quit`.

The *`ToolBase`* has the following class attributes for configuration at definition time

- keymap = None: Key(s) to be used to trigger the tool
- description = '': Small description of the tool
- image = None: Image that is used in the toolbar

The following instance attributes are set at instantiation:

- name
- navigation

Methods

- `trigger(self, event)`: This is the main method of the Tool, it is called when the Tool is triggered by:
  - Toolbar button click
  - keypress associated with the Tool Keymap
  - Call to navigation.trigger_tool(name)
- `set_figure(self, figure)`: Set the figure and navigation attributes
- `destroy(self, *args)`: Destroy the `Tool` graphical interface (if exists)

Available Tools

- ToolQuit
- ToolEnableAllNavigation
- ToolEnableNavigation
- ToolToggleGrid
- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale
- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

ToolToggleBase(ToolBase)

The *ToolToggleBase* has the following class attributes for configuration at definition time

- radio_group = None: Attribute to group 'radio' like tools (mutually exclusive)
- cursor = None: Cursor to use when the tool is active

The **Toggleable** Tools, can capture keypress, mouse moves, and mouse button press

Methods

- `enable(self, event)`: Called by *ToolToggleBase.trigger* method
- `disable(self, event)`: Called when the tool is untoggled
- `toggled`: **Property** True or False

Available Tools

- ToolZoom
- ToolPan

NavigationBase

Defines the following attributes:

- canvas:
- keypresslock: Lock to know if the `canvas` `key_press_event` is available and process it
- messagelock: Lock to know if the message is available to write

Methods (intended for the end user)

- `nav_connect(self, s, func)`: Connect to navigation for events
- `nav_disconnect(self, cid)`: Disconnect from navigation event
- `message_event(self, message, sender=None)`: Emit a tool_message_event event
- `active_toggle(self)`: **Property** The currently toggled tools or None
- `get_tool_keymap(self, name)`: Return a list of keys that are associated with the tool
- `set_tool_keymap(self, name, ``*keys)``: Set the keys for the given tool
- `remove_tool(self, name)`: Removes tool from the navigation control.
- `add_tools(self, tools)`: Add multiple tools to `Navigation`
- `add_tool(self, name, tool, group=None, position=None)`: Add a tool to the `Navigation`
- `tool_trigger_event(self, name, sender=None, canvasevent=None, data=None)`: Trigger a tool and fire the event

- `tools`: **Property** A dict with available tools with corresponding keymaps, descriptions and objects
- `get_tool(self, name)`: Return the tool object

ToolbarBase

Methods (for backend implementation)

- `add_toolitem(self, name, group, position, image, description, toggle)`: Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by navigation)
- `set_message(self, s)`: Display a message on toolbar or in status bar
- `toggle_toolitem(self, name)`: Toggle the toolitem without firing event.
- `remove_toolitem(self, name)`: Remove a toolitem from the `Toolbar`

Backward compatibility

For backward compatibility added 'navigation' to the list of values supported by *`rcParams["toolbar"]`* (default: `'toolbar2'`), that is used for `Navigation` classes instantiation instead of the NavigationToolbar classes

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

Status

Discussion

Branches and Pull requests

Previous work - https://github.com/matplotlib/matplotlib/pull/2465 **To-delete**

Abstract

Add the possibility to have multiple figures grouped under the same *FigureManager*

Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window. See PR #2194.

The proposed solution modifies *FigureManagerBase* to contain and manage more than one `Canvas`. The `backend.multifigure` rcParam controls when the **MultiFigure** behaviour is desired.

Note

It is important to note, that the proposed solution, assumes that the MEP22. is already in place. This is simply because the actual implementation of the `Toolbar` makes it pretty hard to switch between canvases.

Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.

`FigureManagerBase`

will add the following new methods

- `add_canvas`: To add a canvas to an existing *FigureManager* object
- `remove_canvas`: To remove a canvas from a *FigureManager* object, if it is the last one, it will be destroyed
- `move_canvas`: To move a canvas from one *FigureManager* to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
- `get_active_canvas`: To get the canvas that is in the foreground and is subject to the gui events. There is no `set_active_canvas` because the active canvas, is defined when `show` is called on a `Canvas` object.

new_figure_manager

To control which *FigureManager* will contain the new figures, an extra optional parameter *figuremanager* will be added, this parameter value will be passed to `new_figure_manager_given_figure`.

new_figure_manager_given_figure

- If *figuremanager* parameter is given, this *FigureManager* object will be used instead of creating a new one.
- If `rcParams['backend.multifigure']` is True: The last *FigureManager* object will be used instead of creating a new one.

NavigationBase

Modifies the `NavigationBase` to keep a list of canvases, directing the actions to the active one.

Backward compatibility

For the **MultiFigure** properties to be visible, the user has to activate them directly setting `rcParams['backend.multifigure'] = True`

It should be backwards compatible for backends that adhere to the current *FigureManagerBase* structure even if they have not implemented the **MultiFigure** magic yet.

Alternatives

Instead of modifying the *FigureManagerBase* it could be possible to add a parallel class, that handles the cases where `rcParams['backend.multifigure'] = True`. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

MEP24: Negative radius in polar plots

- *Detailed description*
- *Implementation*
- *Related Issues*
- *Backward compatibility*
- *Alternatives*

Status

Discussion

Branches and Pull requests

None

Abstract

It is clear that polar plots need to be able to gracefully handle negative r values (not by clipping or reflection).

Detailed description

One obvious application that we should support is bB plots (see https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is `r==0`, however it would be good to be able to set the center to be at any `r` (with any value less than the offset clipped).

This work is important, but this particular effort has stalled.

Branches and Pull requests

- development branches:
- related pull requests:

Abstract

This MEP aims at adding a serializable `Controller` objects to act as an `Artist` managers. Users would then communicate changes to an `Artist` via a `Controller`. In this way, functionality of the `Controller` objects may be added incrementally since each `Artist` is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an `Artist` has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The *Model* will be the user defined data, style, and semantics. The *Views* are the ensemble of each individual `Artist`, which are responsible for producing the final image based on the *model*. The *Controller* will be the `Controller` object managing its set of `Artist` objects.

The `Controller` must be able to export the information that it's carrying about the figure on command, perhaps via a `to_json` method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the rcParams object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacaswell

Additional Notes:

- The "raw data" does not necessarily need to be a `list`, `ndarray`, etc. Rather, it can more abstractly just have a method to yield data when needed.
- Because the `Controller` will contain extra information that users may not want to keep around, it should *not* be created by default. You should be able to both (a) instantiate a `Controller` with a figure and (b) build a figure with a `Controller`.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

```
import json
from matplotlib.controllers import Controller
with open('my_figure') as f:
    o = json.load(f)
c = Controller(o)
fig = c.figure
```

2. Manage artists from the controller (e.g., Line2D):

```
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
# ?
```

3. Export serializable figure representation:

```
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

Implementation

1. Create base `Controller` objects that are able to manage `Artist` objects (e.g., `Hist`)

   Comments:

   - initialization should happen via unpacking `**`, so we need a copy of call signature parameter for the `Artist` we're ultimately trying to control. Unfortunate hard-coded repetition...
   - should the additional `**kwargs` accepted by each `Artist` be tracked at the `Controller`
   - how does a `Controller` know which artist belongs where? E.g., do we need to pass `axes` references?

   Progress:

   - A simple NB demonstrating some functionality for `Line2DController` objects: https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0

2. Write in protocols for the `Controller` to *update* the model.

   Comments:

   - how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
   - in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the `Controllers`
4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)
5. Be able to instantiate from a serialized representation
6. Reimplement the existing pyplot and Axes method, e.g. `pyplot.hist` and `Axes.hist` in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by *get updates* from each `Artist`?

^ Yup. The `Controller` *shouldn't* need to get updated. This just happens in #3. Delete comments when you see this.

Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

Branches and Pull requests

Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D, etc.) can only be updated via `set_` and `get_` methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the `line color` and `line style` separately for differing *`Line2D`* objects).

The initial development should concentrate on allowing styling of artist primitives (those *`Artist`*s that do not contain other *`Artist`*s), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id, etc.
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.

- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The *GraphicsContextBase* class already provides a the basis of a `Style` class and an artist's *draw* method can be refactored to use the `Style` class rather than setting up its own *GraphicsContextBase* and transferring its style-related properties to it. A minimal example of how this could be implemented is shown here: https://github.com/JamesRamm/mpl_experiment

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```
RuleSet ::= SelectorSequence "{"Declaration"}"

SelectorSequence :: = Selector {"," Selector}

Declaration ::= propName":" propValue";"

Selector ::= ArtistIdent{"#"Ident}

propName ::= Ident

propValue ::= Ident | Number | Colour | "None"
```

`ArtistIdent`, `Ident`, `Number` and `Colour` are tokens (the basic building blocks of the expression) which are defined by regular expressions.

Syntax

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of `attribute: value` pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for *Artist* primitives. It does not address the question of how to set properties on *Container* types (whose properties may themselves be *Artist*s with settable properties), however, a future solution to this could simply be nested RuleSets

Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

Artist Type Selector

Select an *Artist* by it's type. E.g *Line2D* or *Text*:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:

```
ArtistIdent = r'(?P<ArtistIdent>\bLine2D\b|\bText\b|\bAxesImage\b|\
 ↪bFigureImage\b|\bPatch\b)'
```

GID selector

Select an *Artist* by its gid:

```
Line2D#myGID {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```
Ident = r'(?P<Ident>[a-zA-Z_][a-zA-Z_0-9]*)'
```

The above selectors roughly correspond to their CSS counterparts (http://www.w3.org/TR/CSS21/selector.html)

Attributes and values

- Attributes are any valid (settable) property for the *Artist* in question.
- Values are any valid value for the property (Usually a string, or number).

Parsing

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook as well.

Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each `node` would be an artist in the figure. A `visit_` method would need to be implemented for each mpl artist, to handle the different properties for each

```
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An `evaluator` class would then take the stylesheet rules and implement the visitor on each one of them.

Backward compatibility

Implementing a separate `Style` class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the `Style` class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

Appendix

Matplotlib primitives

This will form the initial selectors which stylesheets can use.

- *Alternatives*
- *Questions*

Status

Progress

Branches and Pull requests

Main PR (including GTK3):

- https://github.com/matplotlib/matplotlib/pull/4143

Backend specific branch diffs:

- https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-tkagg
- https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-qt
- https://github.com/OceanWolf/matplotlib/compare/backend-refactor...backend-refactor-wx

Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. `FigureManagerBase` and its derived classes into the core functionality class `FigureManager` and a backend specific class `WindowBase` and
2. `ShowBase` and its derived classes into `Gcf.show_all` and `MainLoopBase`.

Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes `_pylab_helpers` and `Gcf`), and push code to a more appropriate level in matplotlib. With this we automatically remove inconsistencies that appear in the backends, such as

`FigureManagerBase.resize(w, h)` which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from `FigureManagerBase` and `ShowBase`.

1. `FigureManagerBase` has **three** jobs at the moment:
    1. The documentation describes it as a *Helper class for pyplot mode, wraps everything up into a neat bundle*
    2. But it doesn't just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: `self.set_window_title("Figure %d" % num)` This combines backend specific code `self.set_window_title(title)` with matplotlib generic code `title = "Figure %d" % num`.
    3. Currently the backend specific subclass of `FigureManager` decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.
2. `ShowBase` has two jobs:
    1. It has the job of going through all figure managers registered in `_pylab_helpers.Gcf` and telling them to show themselves.
    2. And secondly it has the job of performing the backend specific `mainloop` to block the main programme and thus keep the figures from dying.

Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of `FigureManagerBase` letting it simply wrap this new class along with the other backend classes. Create a new `WindowBase` class that can handle this functionality, with pass-through methods (:arrow_right:) to `WindowBase`. Classes that subclass `WindowBase` should also subclass the GUI specific window class to ensure backward compatibility (`manager.window == manager.window`).
2. Refactor the mainloop of `ShowBase` into `MainLoopBase`, which encapsulates the end of the loop as well. We give an instance of `MainLoop` to `FigureManager` as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.
3. Now that `FigureManagerBase` has no backend specifics in it, to rename it to `FigureManager`, and move to a new file `backend_managers.py` noting that:
    1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing `FigureManagerBase` class and its dependencies intact.
    2. And this also anticipates MEP22 where the new `NavigationBase` has morphed into a backend independent `ToolManager`.

FigureManager-Base(canvas, num)	FigureMan-ager(figure, num)	`Window-Base(title)`	Notes
show		show	
destroy	calls destroy on all components	destroy	
full_screen_toggle	handles logic	set_fullscreen	
resize		resize	
key_press	key_press		
get_window_title		get_window_title	
set_window_title		set_window_title	
	_get_toolbar		A common method to all subclasses of FigureManagerBase
		set_default_size	
		add_element_to_	

Show-Base	MainLoop-Base	Notes
mainloop	begin	
	end	Gets called automagically when no more instances of the subclass exist
__call__		Method moved to Gcf.show_all

Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from `FigureManagerBase`. With this code, this only needs to get made in the single `FigureManager` class. This also makes the later deprecation of `NavigationToolbar2` very straightforward, only needing to touch the single `FigureManager` class

MEP 23 makes for another use case where this refactored code will come in very handy.

Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used `FigureManager.resize` to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as `NavigationToolbar2`, also note that the change in call signature to the `FigureCanvasWx` constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

back-end	man-ager.resize(w,h)	Extra
gtk3	window	
Tk	canvas	
Qt	window	
Wx	canvas	FigureManagerWx had `frame` as an alias to window, so this also breaks BC.

Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the `MainLoopBase` class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in MainLoopBase. With all the backend-code specifics refactored out of `FigureManager` also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

Discussion

Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

1. Deprecate redundant statistical kwargs in `Axes.boxplot`: https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations
2. Deprecate redundant style options in `Axes.boxplot`: https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations
3. Deprecate passings 2D NumPy arrays as input: None
4. Add pre- & post-processing options to `cbook.boxplot_stats`: https://github.com/phobson/matplotlib/tree/boxplot-stat-transforms
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None
6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None

Abstract

Over the past few releases, the `Axes.boxplot` method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to `Axes.boxplot` being split off into multiple parts. The statistics needed to draw a boxplot are computed in `cbook.boxplot_stats`, while the actual artists are drawn by `Axes.bxp`. The original method, `Axes.boxplot` remains as the most public API that handles passing the user-supplied data to `cbook.boxplot_stats`, feeding the results to `Axes.bxp`, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion that the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplots_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidences intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplots_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.

Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how `Axes.boxplot` classifies outliers of lognormal data differently depending one these types of transforms.

```
import numpy as np
import matplotlib.pyplot as plt
```

(continues on next page)

(continued from previous page)

```
from matplotlib import cbook
np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed
↪'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

Implementation

Passing transform functions to `cbook.boxplots_stats`

This MEP proposes that two parameters (e.g., `transform_in` and `transform_out` be added to the cookbook function that computes the statistics for the boxplot function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The `transform_in` function will be applied to the data as the `boxplot_stats` function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the `transform_out` function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of `Axes.boxplot` with little impact to that method's complexity. This is because they can be directly passed to `cbook.boxplot_stats`. Alternatively, `Axes.boxplot` could be modified to accept an optional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like seaborn would have complete control via the `Axes.boxplot` method. More importantly, at the very least, seaborn would require no changes to its API to allow users to take advantage of these new options.

Simplifications to the `Axes.boxplot` API and other functions

Simplifying the boxplot method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. `usermedians` - processed by 10 SLOC, 3 `if` blocks, a `for` loop
2. `conf_intervals` - handled by 15 SLOC, 6 `if` blocks, a `for` loop
3. `sym` - processed by 12 SLOC, 4 `if` blocks

Removing the `sym` option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the `notch` parameter could be renamed `shownotches` to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the `whis`, `bootstrap`, `autorange` could be rolled into the kwargs passed to the new `statfxn` parameter.

Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters `usermedians`, `conf_intervals`, and `sym`. Cursory searches on GitHub indicated that `usermedians`, `conf_intervals` are used by few users, who all seem to have a very strong knowledge of matplotlib. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of `sym` however, may have a much broader reach into the matplotlib userbase.

Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to `cbook.boxplots_stats`, expose in `Axes.boxplot`
2. v2.1.0 Initial Deprecations , and using 2D NumPy arrays as input
    a. Using 2D NumPy arrays as input. The semantics around 2D arrays are generally confusing.
    b. `usermedians`, `conf_intervals`, `sym` parameters
3. v2.2.0
    a. remove `usermedians`, `conf_intervals`, `sym` parameters
    b. deprecate `notch` in favor of `shownotches` to be consistent with other parameters and `Axes.bxp`
4. v2.3.0
    a. remove `notch` parameter
    b. move all style and artist toggling logic to `Axes.bxp` such `Axes.boxplot` is little more than a broker between `Axes.bxp` and `cbook.boxplots_stats`

Anticipated Impacts to Users

As described above deprecating `usermedians` and `conf_intervals` will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the `sym` option may import more users and effort should be taken to collect community feedback on this.

Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for seaborn and python-ggplot to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by seaborn. The seaborn APIs that use matplotlib's boxplot function allow user's to pass arbitrary `**kwargs` through to matplotlib's API. Thus seaborn users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

Python-ggplot has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

Alternatives

Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in `cbook.boxplot_stats`
2. Exposing that transformation in the `Axes.boxplot` API
3. Removing redundant statistical options in `Axes.boxplot`
4. Shifting all styling parameter processing from `Axes.boxplot` to `Axes.bxp`.

With this approach, #2 depends and #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new `transform_in` and `transform_out` parameters of `cbook.boxplot_stats` in `Axes.boxplot` and pass them directly.

The second approach would be to add `statfxn` and `statfxn_args` parameters to `Axes.boxplot`. Under this implementation, the default value of `statfxn` would be `cbook.boxplot_stats`, but users could pass their own function. Then `transform_in` and `transform_out` would then be passed as elements of the `statfxn_args` parameter.

```
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x

    if transform_out is None:
        transform_out = lambda x: x

    output = []
```

(continues on next page)

(continued from previous page)

```
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.item():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=None, transform_
↪out=None):
        stats = cbook.boxplot_stats(data, ...,
                                    transform_in=transform_in,
                                    transform_out=transform_out)
        return self.bxp(stats, ...)

    def boxplot_option2(data, ..., statfxn=None, **statopts):
        if statfxn is None:
            statfxn = boxplot_stats
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)
```

Both cases would allow users to do the following:

```
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                               transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                        whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                       kind='box', palette="PRGn", shownotches=True,
                       statfxn=my_box_stats, bootstrap_method='BCA',
                       whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes.boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

Doing less

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

MEP29: Text light markup

- *Status*
- *Branches and Pull requests*

- *Detailed description*
- *Implementation*
  - *Improvements*
  - *Problems*

- *Backward compatibility*
- *Alternatives*

Status

Discussion

Branches and Pull requests

None at the moment, proof of concept only.

Abstract

This MEP proposes to add lightweight markup to the text artist.

Detailed description

Using different size/color/family in a text annotation is difficult because the `text` method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: *Concatenate text objects with different properties*

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>`
Hello <span color="blue">world!</span>
```

Implementation

A proof of concept is provided in markup_example.py but it currently only handles the horizontal direction.

Improvements

- This proof of concept uses regex to parse the text but it may be better to use the html.parser from the standard library.
- Computation of text fragment positions could benefit from the OffsetFrom class. See for example item 5 in Using Complex Coordinates with Annotations

Problems

- One serious problem is how to deal with text having both LaTeX and HTML-like tags. For example, consider the following:

  ```
  $<b>Bold$</b>
  ```

  Recommendation would be to have mutual exclusion.

Backward compatibility

None at the moment since it is only a proof of concept

Alternatives

As proposed by @anntzer, this could be also implemented as improvements to mathtext. For example:

```
r"$\text{Hello \textbf{world}}$"
r"$\text{Hello \textcolor{blue}{world}}$"
r"$\text{Hello \textsf{\small world}}$"
```

Part VI

About us

Matplotlib was created by neurobiologist John Hunter to work with EEG data. It grew to be used and developed by many people in many different fields. John's goal was that Matplotlib make easy things easy and hard things possible.

CHAPTER

ELEVEN

PROJECT INFORMATION

11.1 Mission Statement

The Matplotlib developer community develops, maintains, and supports Matplotlib and its extensions to provide data visualization tools for the Scientific Python Ecosystem.

Adapting the requirements *laid out by John Hunter* Matplotlib should:

- Support users of the Scientific Python ecosystem;
- Facilitate interactive data exploration;
- Produce high-quality raster and vector format outputs suitable for publication;
- Provide a simple graphical user interface and support embedding in applications;
- Be understandable and extensible by people familiar with data processing in Python;
- Make common plots easy, and novel or complex visualizations possible.

We believe that a diverse developer community creates the best software, and we welcome anyone who shares our mission, and our values described in the code of conduct.

11.2 History

Note

The following introductory text was written in 2008 by John D. Hunter (1968-2012), the original author of Matplotlib.

Matplotlib is a library for making 2D plots of arrays in Python. Although it has its origins in emulating the MATLAB graphics commands, it is independent of MATLAB, and can be used in a Pythonic, object-oriented way. Although Matplotlib is written primarily in pure Python, it makes heavy use of NumPy and other extension code to provide good performance even for large arrays.

Matplotlib is designed with the philosophy that you should be able to create simple plots with just a few commands, or just one! If you want to see a histogram of your data, you shouldn't need to instantiate objects, call methods, set properties, and so on; it should just work.

For years, I used to use MATLAB exclusively for data analysis and visualization. MATLAB excels at making nice looking plots easy. When I began working with EEG data, I found that I needed to write applications to interact with my data, and developed an EEG analysis application in MATLAB. As the application grew in complexity, interacting with databases, http servers, manipulating complex data structures, I began to strain against the limitations of MATLAB as a programming language, and decided to start over in Python. Python more than makes up for all of MATLAB's deficiencies as a programming language, but I was having difficulty finding a 2D plotting package (for 3D VTK more than exceeds all of my needs).

When I went searching for a Python plotting package, I had several requirements:

- Plots should look great - publication quality. One important requirement for me is that the text looks good (antialiased, etc.)
- Postscript output for inclusion with TeX documents
- Embeddable in a graphical user interface for application development
- Code should be easy enough that I can understand it and extend it
- Making plots should be easy

Finding no package that suited me just right, I did what any self-respecting Python programmer would do: rolled up my sleeves and dived in. Not having any real experience with computer graphics, I decided to emulate MATLAB's plotting capabilities because that is something MATLAB does very well. This had the added advantage that many people have a lot of MATLAB experience, and thus they can quickly get up to steam plotting in python. From a developer's perspective, having a fixed user interface (the pylab interface) has been very useful, because the guts of the code base can be redesigned without affecting user code.

The Matplotlib code is conceptually divided into three parts: the *pylab interface* is the set of functions provided by `pylab` which allow the user to create plots with code quite similar to MATLAB figure generating code (*Pyplot tutorial*). The *Matplotlib frontend* or *Matplotlib API* is the set of classes that do the heavy lifting, creating and managing figures, text, lines, plots and so on (*Artist tutorial*). This is an abstract interface that knows nothing about output. The *backends* are device-dependent drawing devices, aka renderers, that transform the frontend representation to hardcopy or a display device (*What is a backend?*). Example backends: PS creates PostScript® hardcopy, SVG creates Scalable Vector Graphics hardcopy, Agg creates PNG output using the high quality Anti-Grain Geometry library that ships with Matplotlib, GTK embeds Matplotlib in a Gtk+ application, GTKAgg uses the Anti-Grain renderer to create a figure and embed it in a Gtk+ application, and so on for PDF, WxWidgets, Tkinter, etc.

Matplotlib is used by many people in many different contexts. Some people want to automatically generate PostScript files to send to a printer or publishers. Others deploy Matplotlib on a web application server to generate PNG output for inclusion in dynamically-generated web pages. Some use Matplotlib interactively from the Python shell in Tkinter on Windows. My primary use is to embed Matplotlib in a Gtk+ EEG application that runs on Windows, Linux and Macintosh OS X.

Matplotlib's original logo (2003 -- 2008).

Matplotlib logo (2008 - 2015).

11.3 Contributor Covenant Code of Conduct

11.3.1 Our Pledge

We as members, contributors, and leaders pledge to make participation in our community a harassment-free experience for everyone, regardless of age, body size, visible or invisible disability, ethnicity, sex characteristics, gender identity and expression, level of experience, education, socio-economic status, nationality, personal appearance, race, religion, or sexual identity and orientation.

We pledge to act and interact in ways that contribute to an open, welcoming, diverse, inclusive, and healthy community.

11.3.2 Our Standards

Examples of behavior that contributes to a positive environment for our community include:

- Demonstrating empathy and kindness toward other people
- Being respectful of differing opinions, viewpoints, and experiences
- Giving and gracefully accepting constructive feedback
- Accepting responsibility and apologizing to those affected by our mistakes, and learning from the experience
- Focusing on what is best not just for us as individuals, but for the overall community

Examples of unacceptable behavior include:

- The use of sexualized language or imagery, and sexual attention or advances of any kind
- Trolling, insulting or derogatory comments, and personal or political attacks
- Public or private harassment
- Publishing others' private information, such as a physical or email address, without their explicit permission
- Other conduct which could reasonably be considered inappropriate in a professional setting

11.3.3 Enforcement Responsibilities

Community leaders are responsible for clarifying and enforcing our standards of acceptable behavior and will take appropriate and fair corrective action in response to any behavior that they deem inappropriate, threatening, offensive, or harmful.

Community leaders have the right and responsibility to remove, edit, or reject comments, commits, code, wiki edits, issues, and other contributions that are not aligned to this Code of Conduct, and will communicate reasons for moderation decisions when appropriate.

11.3.4 Scope

This Code of Conduct applies within all community spaces, and also applies when an individual is officially representing the community in public spaces. Examples of representing our community include using an official e-mail address, posting via an official social media account, or acting as an appointed representative at an online or offline event.

11.3.5 Enforcement

Instances of abusive, harassing, or otherwise unacceptable behavior may be reported to the community leaders responsible for enforcement at matplotlib-coc@numfocus.org which is monitored by the CoC subcommittee or a report can be made using the NumFOCUS Code of Conduct report form. If community leaders cannot come to a resolution about enforcement, reports will be escalated to the NumFocus Code of Conduct committee (conduct@numfocus.org). All complaints will be reviewed and investigated promptly and fairly.

All community leaders are obligated to respect the privacy and security of the reporter of any incident.

11.3.6 Enforcement Guidelines

Community leaders will follow these Community Impact Guidelines in determining the consequences for any action they deem in violation of this Code of Conduct:

1. Correction

Community Impact: Use of inappropriate language or other behavior deemed unprofessional or unwelcome in the community.

Consequence: A private, written warning from community leaders, providing clarity around the nature of the violation and an explanation of why the behavior was inappropriate. A public apology may be requested.

2. Warning

Community Impact: A violation through a single incident or series of actions.

Consequence: A warning with consequences for continued behavior. No interaction with the people involved, including unsolicited interaction with those enforcing the Code of Conduct, for a specified period of time. This includes avoiding interactions in community spaces as well as external channels like social media. Violating these terms may lead to a temporary or permanent ban.

3. Temporary Ban

Community Impact: A serious violation of community standards, including sustained inappropriate behavior.

Consequence: A temporary ban from any sort of interaction or public communication with the community for a specified period of time. No public or private interaction with the people involved, including unsolicited interaction with those enforcing the Code of Conduct, is allowed during this period. Violating these terms may lead to a permanent ban.

4. Permanent Ban

Community Impact: Demonstrating a pattern of violation of community standards, including sustained inappropriate behavior, harassment of an individual, or aggression toward or disparagement of classes of individuals.

Consequence: A permanent ban from any sort of public interaction within the community.

11.3.7 Attribution

This Code of Conduct is adapted from the Contributor Covenant, version 2.0, available at https://www.contributor-covenant.org/version/2/0/code_of_conduct.html.

Community Impact Guidelines were inspired by Mozilla's code of conduct enforcement ladder.

For answers to common questions about this code of conduct, see the FAQ at https://www.contributor-covenant.org/faq. Translations are available at https://www.contributor-covenant.org/translations.

11.5 License

Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g., LGPL) are acceptable in matplotlib toolkits. For a discussion of the motivations behind the licencing choice, see *Licenses for contributed code*.

11.5.1 Copyright policy

John Hunter began Matplotlib around 2003. Since shortly before his passing in 2012, Michael Droettboom has been the lead maintainer of Matplotlib, but, as has always been the case, Matplotlib is the work of many.

Prior to July of 2013, and the 1.3.0 release, the copyright of the source code was held by John Hunter. As of July 2013, and the 1.3.0 release, matplotlib has moved to a shared copyright model.

Matplotlib uses a shared copyright model. Each contributor maintains copyright over their contributions to Matplotlib. But, it is important to note that these contributions are typically only changes to the repositories. Thus, the Matplotlib source code, in its entirety, is not the copyright of any single person or institution. Instead, it is the collective copyright of the entire Matplotlib Development Team. If individual contributors want to maintain a record of what changes/contributions they have specific copyright on, they should indicate their copyright in the commit message of the change, when they commit the change to one of the matplotlib repositories.

The Matplotlib Development Team is the set of all contributors to the matplotlib project. A full list can be obtained from the git version control logs.

11.5.2 License agreement

License agreement for Matplotlib versions 1.3.0 and later

```
License agreement for matplotlib versions 1.3.0 and later
=========================================================

1. This LICENSE AGREEMENT is between the Matplotlib Development Team
("MDT"), and the Individual or Organization ("Licensee") accessing and
otherwise using matplotlib software in source or binary form and its
associated documentation.

2. Subject to the terms and conditions of this License Agreement, MDT
hereby grants Licensee a nonexclusive, royalty-free, world-wide license
to reproduce, analyze, test, perform and/or display publicly, prepare
```

(continues on next page)

(continued from previous page)

```
derivative works, distribute, and otherwise use matplotlib
alone or in any derivative version, provided, however, that MDT's
License Agreement and MDT's notice of copyright, i.e., "Copyright (c)
2012- Matplotlib Development Team; All Rights Reserved" are retained in
matplotlib  alone or in any derivative version prepared by
Licensee.

3. In the event Licensee prepares a derivative work that is based on or
incorporates matplotlib or any part thereof, and wants to
make the derivative work available to others as provided herein, then
Licensee hereby agrees to include in any such work a brief summary of
the changes made to matplotlib .

4. MDT is making matplotlib available to Licensee on an "AS
IS" basis.  MDT MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR
IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, MDT MAKES NO AND
DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS
FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB
WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. MDT SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB
 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR
LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING
MATPLOTLIB , OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF
THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material
breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any
relationship of agency, partnership, or joint venture between MDT and
Licensee.  This License Agreement does not grant permission to use MDT
trademarks or trade name in a trademark sense to endorse or promote
products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib ,
Licensee agrees to be bound by the terms and conditions of this License
Agreement.

License agreement for matplotlib versions prior to 1.3.0
========================================================

1. This LICENSE AGREEMENT is between John D. Hunter ("JDH"), and the
Individual or Organization ("Licensee") accessing and otherwise using
matplotlib software in source or binary form and its associated
documentation.
```

(continues on next page)

(continued from previous page)

```
2. Subject to the terms and conditions of this License Agreement, JDH
hereby grants Licensee a nonexclusive, royalty-free, world-wide license
to reproduce, analyze, test, perform and/or display publicly, prepare
derivative works, distribute, and otherwise use matplotlib
alone or in any derivative version, provided, however, that JDH's
License Agreement and JDH's notice of copyright, i.e., "Copyright (c)
2002-2011 John D. Hunter; All Rights Reserved" are retained in
matplotlib  alone or in any derivative version prepared by
Licensee.

3. In the event Licensee prepares a derivative work that is based on or
incorporates matplotlib  or any part thereof, and wants to
make the derivative work available to others as provided herein, then
Licensee hereby agrees to include in any such work a brief summary of
the changes made to matplotlib.

4. JDH is making matplotlib  available to Licensee on an "AS
IS" basis.  JDH MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR
IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, JDH MAKES NO AND
DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS
FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB
WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. JDH SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB
 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR
LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING
MATPLOTLIB , OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF
THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material
breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any
relationship of agency, partnership, or joint venture between JDH and
Licensee.  This License Agreement does not grant permission to use JDH
trademarks or trade name in a trademark sense to endorse or promote
products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib,
Licensee agrees to be bound by the terms and conditions of this License
Agreement.

# CC0 1.0 Universal

## Statement of Purpose

The laws of most jurisdictions throughout the world automatically␣
 ↪confer
exclusive Copyright and Related Rights (defined below) upon the␣
 ↪creator and
subsequent owner(s) (each and all, an “owner”) of an original work of
authorship and/or a database (each, a “Work”).

Certain owners wish to permanently relinquish those rights to a Work␣
 ↪for the
purpose of contributing to a commons of creative, cultural and␣
 ↪scientific works
(“Commons”) that the public can reliably and without fear of later␣
 ↪claims of
infringement build upon, modify, incorporate in other works, reuse and
redistribute as freely as possible in any form whatsoever and for any␣
 ↪purposes,
including without limitation commercial purposes. These owners may␣
 ↪contribute
to the Commons to promote the ideal of a free culture and the further
production of creative, cultural and scientific works, or to gain␣
 ↪reputation or
greater distribution for their Work in part through the use and␣
 ↪efforts of
others.

For these and/or other purposes and motivations, and without any␣
 ↪expectation of
additional consideration or compensation, the person associating CC0␣
 ↪with a
Work (the “Affirmer”), to the extent that he or she is an owner of␣
 ↪Copyright
and Related Rights in the Work, voluntarily elects to apply CC0 to the␣
 ↪Work and
publicly distribute the Work under its terms, with knowledge of his or␣
 ↪her
Copyright and Related Rights in the Work and the meaning and intended␣
 ↪legal
effect of CC0 on those rights.

```

(continues on next page)

(continued from previous page)

```
1. Copyright and Related Rights. A Work made available under CC0 may be
   protected by copyright and related or neighboring rights␣
 ↪(“Copyright and
   Related Rights”). Copyright and Related Rights include, but are not␣
 ↪limited
   to, the following:
   1. the right to reproduce, adapt, distribute, perform, display,␣
 ↪communicate,
      and translate a Work;
   2. moral rights retained by the original author(s) and/or␣
 ↪performer(s);
   3. publicity and privacy rights pertaining to a person’s image or␣
 ↪likeness
      depicted in a Work;
   4. rights protecting against unfair competition in regards to a␣
 ↪Work,
      subject to the limitations in paragraph 4(i), below;
   5. rights protecting the extraction, dissemination, use and reuse␣
 ↪of data in
      a Work;
   6. database rights (such as those arising under Directive 96/9/EC␣
 ↪of the
      European Parliament and of the Council of 11 March 1996 on the␣
 ↪legal
      protection of databases, and under any national implementation␣
 ↪thereof,
      including any amended or successor version of such directive);␣
 ↪and
   7. other similar, equivalent or corresponding rights throughout the␣
 ↪world
      based on applicable law or treaty, and any national␣
 ↪implementations
      thereof.

2. Waiver. To the greatest extent permitted by, but not in␣
 ↪contravention of,
   applicable law, Affirmer hereby overtly, fully, permanently,␣
 ↪irrevocably and
   unconditionally waives, abandons, and surrenders all of Affirmer’s␣
 ↪Copyright
   and Related Rights and associated claims and causes of action,␣
 ↪whether now
   known or unknown (including existing as well as future claims and␣
 ↪causes of
   action), in the Work (i) in all territories worldwide, (ii) for the␣
 ↪maximum
```

(continues on next page)

(continued from previous page)

```
    duration provided by applicable law or treaty (including future time
    extensions), (iii) in any current or future medium and for any␣
 ↪number of
    copies, and (iv) for any purpose whatsoever, including without␣
 ↪limitation
    commercial, advertising or promotional purposes (the “Waiver”).␣
 ↪Affirmer
    makes the Waiver for the benefit of each member of the public at␣
 ↪large and
    to the detriment of Affirmer’s heirs and successors, fully␣
 ↪intending that
    such Waiver shall not be subject to revocation, rescission,␣
 ↪cancellation,
    termination, or any other legal or equitable action to disrupt the␣
 ↪quiet
    enjoyment of the Work by the public as contemplated by Affirmer’s␣
 ↪express
    Statement of Purpose.

3. Public License Fallback. Should any part of the Waiver for any␣
 ↪reason be
    judged legally invalid or ineffective under applicable law, then␣
 ↪the Waiver
    shall be preserved to the maximum extent permitted taking into␣
 ↪account
    Affirmer’s express Statement of Purpose. In addition, to the extent␣
 ↪the
    Waiver is so judged Affirmer hereby grants to each affected person a
    royalty-free, non transferable, non sublicensable, non exclusive,
    irrevocable and unconditional license to exercise Affirmer’s␣
 ↪Copyright and
    Related Rights in the Work (i) in all territories worldwide, (ii)␣
 ↪for the
    maximum duration provided by applicable law or treaty (including␣
 ↪future time
    extensions), (iii) in any current or future medium and for any␣
 ↪number of
    copies, and (iv) for any purpose whatsoever, including without␣
 ↪limitation
    commercial, advertising or promotional purposes (the “License”).␣
 ↪The License
    shall be deemed effective as of the date CC0 was applied by␣
 ↪Affirmer to the
    Work. Should any part of the License for any reason be judged␣
 ↪legally
    invalid or ineffective under applicable law, such partial␣
```

(continues on next page)

(continued from previous page)

```
 ↪invalidity or
   ineffectiveness shall not invalidate the remainder of the License,␣
 ↪and in
   such case Affirmer hereby affirms that he or she will not (i)␣
 ↪exercise any
   of his or her remaining Copyright and Related Rights in the Work or␣
 ↪(ii)
   assert any associated claims and causes of action with respect to␣
 ↪the Work,
   in either case contrary to Affirmer's express Statement of Purpose.

4. Limitations and Disclaimers.
   1. No trademark or patent rights held by Affirmer are waived,␣
 ↪abandoned,
      surrendered, licensed or otherwise affected by this document.
   2. Affirmer offers the Work as-is and makes no representations or␣
 ↪warranties
      of any kind concerning the Work, express, implied, statutory or
      otherwise, including without limitation warranties of title,
      merchantability, fitness for a particular purpose, non␣
 ↪infringement, or
      the absence of latent or other defects, accuracy, or the present␣
 ↪or
      absence of errors, whether or not discoverable, all to the␣
 ↪greatest
      extent permissible under applicable law.
   3. Affirmer disclaims responsibility for clearing rights of other␣
 ↪persons
      that may apply to the Work or any use thereof, including without
      limitation any person's Copyright and Related Rights in the Work.
      Further, Affirmer disclaims responsibility for obtaining any␣
 ↪necessary
      consents, permissions or other rights required for any use of␣
 ↪the Work.
   4. Affirmer understands and acknowledges that Creative Commons is␣
 ↪not a
      party to this document and has no duty or obligation with␣
 ↪respect to this
      CC0 or use of the Work.

                                  AUTHOR

David H. Munro wrote Yorick and Gist.  Berkeley Yacc (byacc) generated
the Yorick parser.  The routines in Math are from LAPACK and FFTPACK;
MathC contains C translations by David H. Munro.  The algorithms for
Yorick's random number generator and several special functions in
Yorick/include were taken from Numerical Recipes by Press, et. al.,
```

(continues on next page)

(continued from previous page)

```
although the Yorick implementations are unrelated to those in
Numerical Recipes.  A small amount of code in Gist was adapted from
the X11R4 release, copyright M.I.T. -- the complete copyright notice
may be found in the (unused) file Gist/host.c.

This Font Software is licensed under the SIL Open Font License,␣
 ↪Version 1.1.
This license is copied below, and is also available with a FAQ at:
http://scripts.sil.org/OFL

-----------------------------------------------------------
SIL OPEN FONT LICENSE Version 1.1 - 26 February 2007
-----------------------------------------------------------

PREAMBLE
The goals of the Open Font License (OFL) are to stimulate worldwide
development of collaborative font projects, to support the font␣
 ↪creation
efforts of academic and linguistic communities, and to provide a free␣
 ↪and
open framework in which fonts may be shared and improved in partnership
with others.

The OFL allows the licensed fonts to be used, studied, modified and
redistributed freely as long as they are not sold by themselves. The
fonts, including any derivative works, can be bundled, embedded,
redistributed and/or sold with any software provided that any reserved
```

(continues on next page)

(continued from previous page)

```
names are not used by derivative works. The fonts and derivatives,
however, cannot be released under any other type of license. The
requirement for fonts to remain under this license does not apply
to any document created using the fonts or their derivatives.

DEFINITIONS
"Font Software" refers to the set of files released by the Copyright
Holder(s) under this license and clearly marked as such. This may
include source files, build scripts and documentation.

"Reserved Font Name" refers to any names specified as such after the
copyright statement(s).

"Original Version" refers to the collection of Font Software␣
 ↪components as
distributed by the Copyright Holder(s).

"Modified Version" refers to any derivative made by adding to,␣
 ↪deleting,
or substituting -- in part or in whole -- any of the components of the
Original Version, by changing formats or by porting the Font Software␣
 ↪to a
new environment.

"Author" refers to any designer, engineer, programmer, technical
writer or other person who contributed to the Font Software.

PERMISSION & CONDITIONS
Permission is hereby granted, free of charge, to any person obtaining
a copy of the Font Software, to use, study, copy, merge, embed, modify,
redistribute, and sell modified and unmodified copies of the Font
Software, subject to the following conditions:

1) Neither the Font Software nor any of its individual components,
in Original or Modified Versions, may be sold by itself.

2) Original or Modified Versions of the Font Software may be bundled,
redistributed and/or sold with any software, provided that each copy
contains the above copyright notice and this license. These can be
included either as stand-alone text files, human-readable headers or
in the appropriate machine-readable metadata fields within text or
binary files as long as those fields can be easily viewed by the user.

3) No Modified Version of the Font Software may use the Reserved Font
Name(s) unless explicit written permission is granted by the␣
 ↪corresponding
```

(continues on next page)

(continued from previous page)

```
Copyright Holder. This restriction only applies to the primary font␣
 ↪name as
presented to the users.

4) The name(s) of the Copyright Holder(s) or the Author(s) of the Font
Software shall not be used to promote, endorse or advertise any
Modified Version, except to acknowledge the contribution(s) of the
Copyright Holder(s) and the Author(s) or with their explicit written
permission.

5) The Font Software, modified or unmodified, in part or in whole,
must be distributed entirely under this license, and must not be
distributed under any other license. The requirement for fonts to
remain under this license does not apply to any document created
using the Font Software.

TERMINATION
This license becomes null and void if any of the above conditions are
not met.

DISCLAIMER
THE FONT SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND,
EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTIES OF
MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT
OF COPYRIGHT, PATENT, TRADEMARK, OR OTHER RIGHT. IN NO EVENT SHALL THE
COPYRIGHT HOLDER BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY,
INCLUDING ANY GENERAL, SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL
DAMAGES, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING
FROM, OUT OF THE USE OR INABILITY TO USE THE FONT SOFTWARE OR FROM
OTHER DEALINGS IN THE FONT SOFTWARE.

Some earlier contributors not included above are (with apologies to any we have missed):

Charles Twardy, Gary Ruben, John Gill, David Moore, Paul Barrett, Jared Wahlstrand, Jim Benson, Paul Mcguire, Andrew Dalke, Nadia Dencheva, Baptiste Carvello, Sigve Tjoraand, Ted Drain, James Amundson, Daishi Harada, Nicolas Young, Paul Kienzle, John Porter, and Jonathon Taylor.

Thanks to Tony Yu for the original logo design.

We also thank all who have reported bugs, commented on proposed changes, or otherwise contributed to Matplotlib's development and usefulness.
